Selling [*verausserung*] is the practical aspect of alienation [*Entausserung*]. Just as man, as long as he is in the grip of religion, is able to objectify his essential nature only by turning it into something *alien*, something fantastic, so under the domination of egoistic need he can be active practically, and produce objects in practice, only by putting his products, and his activity, under the domination of an alien being, and bestowing the significance of an alien entity – money – on them.

In its perfected practice, Christian egoism of heavenly bliss is necessarily transformed into the corporal egoism of the Jew, heavenly need is turned into world need, subjectivism into self-interest. We explain the tenacity of the Jew not by his religion, but, on the contrary, by the human basis of his religion – practical need, egoism.

Since in civil society the real nature of the Jew has been universally realized and secularized, civil society could not convince the Jew of the *unreality* of his *religious* nature, which is indeed only the ideal aspect of practical need. Consequently, not only in the Pentateuch and the Talmud, but in present-day society we find the nature of the modern Jew, and not as an abstract nature but as one that is in the highest degree empirical, not merely as a narrowness of the Jew, but as the Jewish narrowness of society.

Once society has succeeded in abolishing the *empirical* essence of Judaism – huckstering and its preconditions – the Jew will have become *impossible*, because his consciousness no longer has an object, because the subjective basis of Judaism, practical need, has been humanized, and because the conflict between man's individual-sensuous existence and his species-existence has been abolished.

The *social* emancipation of the Jew is the *emancipation of society from Judaism*.

## Preface

||XXXIX| I have already announced in the *Deutsch-Französische Jahrbücher* the critique of jurisprudence and political science in the form of a critique of the *Hegelian* philosophy of law. While preparing it for publication, the intermingling of criticism directed only against speculation with criticism of the various subjects themselves proved utterly unsuitable, hampering the development of the argument and rendering comprehension difficult. Moreover, the wealth and diversity of the subjects to be treated could have been compressed into *one* work only in a purely aphoristic style; whilst an aphoristic presentation of this kind, for its part, would have given the *impression* of arbitrary systematism. I shall therefore publish the critique of law, ethics, politics, etc., in a series of distinct, independent pamphlets, and afterwards try in a special work to present them again as a connected whole showing the interrelationship of the separate parts, and lastly attempt a critique of the speculative elaboration of that material. For this reason it will be found that the interconnection between political economy and the state, law, ethics, civil life, etc., is touched upon in the present work only to the extent to which political economy itself expressly touches upon these subjects.

It is hardly necessary to assure the reader conversant with political economy that my results have been attained by means of a wholly empirical analysis based on a conscientious critical study of political economy.

(Whereas the uninformed reviewer who tries to hide his complete ignorance and intellectual poverty by hurling the “utopian phrase” at the positive critic’s head, or again such phrases as “quite pure, quite resolute, quite critical criticism,” the “not merely legal but social – utterly social – society”, the “compact, massy mass”, the “outspoken spokesmen of the massy mass”<sup>2</sup> this reviewer has yet to furnish the first proof that besides his theological family affairs he has anything to contribute to a discussion of *worldly* matters.)

It goes without saying that besides the French and English socialists I have also used German socialist works. The only *original* German works of substance in this science, however – other than Weitling’s writings – are the essays by *Hess* published in *Einundzwanzig Bogen*<sup>3</sup> and *Umriss zu einer Kritik der Nationalökonomie* by Engels in the *Deutsch-Französische Jahrbücher*, where also the basic elements of this work [*Economic and Philosophic Manuscripts of 1844*] have been indicated by me in a very general way.

(Besides being indebted to these authors who have given critical attention to political economy, positive criticism as a whole – and therefore also German positive criticism of political economy – owes its true foundation to the discoveries of Feuerbach, against whose *Philosophie der Zukunft*

and *Thesen zur Reform der Philosophie in the Anekdoten*, despite the tacit use that is made of them, the petty envy of some and the veritable wrath of others seem to have instigated a regular conspiracy of silence.

It is only with *Feuerbach* that *positive*, humanistic and naturalistic criticism begins. The less noise they make, the more certain, profound, extensive, and enduring is the effect of *Feuerbach's* writings, the only writings since Hegel's *Phänomenologie* and *Logik* to contain a real theoretical revolution.

In contrast to the *critical theologian* of our day, I have deemed the concluding chapter of this work – a critical discussion of *Hegelian dialectic* and philosophy as a whole to be absolutely necessary, ||XL| a task not yet performed. This lack of thoroughness is not accidental, since even the *critical theologian* remains a *theologian*. Hence, either he has to start from certain presuppositions of philosophy accepted as authoritative; or, if in the process of criticism and as a result of other people's discoveries doubts about these philosophical presuppositions have arisen in him, he abandons them in a cowardly and unwarrantable fashion, *abstracts* from them, thus showing his servile dependence on these presuppositions and his resentment at this servility merely in a negative, unconscious and sophistical manner.

(He does this either by constantly repeating assurances concerning the *purity* of his own criticism, or by trying to make it seem as though all that was left for criticism to deal with now was some other limited form of criticism outside itself – say eighteenth-century criticism – and also the limitations of the *masses*, in order to divert the observer's attention as well as his own from the *necessary* task of settling accounts between *criticism* and its point of origin – Hegelian *dialectic* and German philosophy as a whole – that is, from this necessary raising of modern criticism above its own limitation and crudity. Eventually, however, whenever discoveries (such as *Feuerbach's*) are made regarding the nature of his own philosophic presuppositions, the critical theologian partly makes it appear as if *he* were the one who had accomplished this, producing that appearance by taking the results of these discoveries and, without being able to develop them, hurling them in the form of *catch-phrases* at writers still caught in the confines of philosophy. He partly even manages to acquire a sense of his own superiority to such discoveries by asserting in a mysterious way and in a veiled, malicious and skeptical fashion elements of the Hegelian *dialectic* which he still finds lacking in the criticism of that dialectic (which have not yet been critically served up to him for his use) against such criticism – not having tried to bring such elements into their proper relation or having been capable of doing so, asserting, say, the category of mediating proof against the category of positive, self-originating truth, [...] in a way *peculiar* to Hegelian dialectic. For to the theological critic it seems quite natural that everything has to be *done* by philosophy, so that he can *chatter away* about purity, resoluteness, and quite critical criticism; and he fancies himself the true *conqueror of philosophy* whenever he happens to *feel* some element<sup>4</sup> in Hegel to be lacking in Feuerbach – for however much he practices the spiritual idolatry of “*self-consciousness*” and “*mind*” the theological critic does not get beyond feeling to consciousness.)

On close inspection *theological criticism* – genuinely progressive though it was at the inception of the movement – is seen in the final analysis to be nothing but the culmination and consequence of the old *philosophical*, and especially the *Hegelian, transcendentalism*, twisted into a *theological caricature*. This interesting example of historical justice, which now assigns to theology, ever philosophy's spot of infection, the further role of portraying in itself the negative dissolution of philosophy, i.e., the process of its decay – this historical nemesis I shall demonstrate on another occasion.<sup>5</sup>

(How far, on the other hand, *Feuerbach's* discoveries about the nature of philosophy still, for their *proof* at least, called for a critical discussion of philosophical dialectic will be seen from my exposition itself.) |XL|

## Wages of Labor

Wages are determined through the antagonistic struggle between capitalist and worker. Victory goes necessarily to the capitalist. The capitalist can live longer without the worker than can the worker without the capitalist. Combination among the capitalists is customary and effective; workers' combination is prohibited and painful in its consequences for them. Besides, the landowner and the capitalist can make use of industrial advantages to augment their revenues; the worker has neither rent nor interest on capital to supplement his industrial income. Hence the intensity of the competition among the workers. Thus only for the workers is the separation of capital, landed property, and labour an inevitable, essential and detrimental separation. Capital and landed property need not remain fixed in this abstraction, as must the labor of the workers.

The separation of capital, rent, and labor is thus fatal for the worker.

The lowest and the only necessary wage rate is that providing for the subsistence of the worker for the duration of his work and as much more as is necessary for him to support a family and for the race of laborers not to die out. The ordinary wage, according to Smith, is the lowest compatible with common humanity<sup>6</sup>, that is, with cattle-like existence.

The demand for men necessarily governs the production of men, as of every other commodity. Should supply greatly exceed demand, a section of the workers sinks into beggary or starvation. The worker's existence is thus brought under the same condition as the existence of every other commodity. The worker has become a commodity, and it is a bit of luck for him if he can find a buyer. And the demand on which the life of the worker depends, depends on the whim of the rich and the capitalists. Should supply exceed demand, then one of the constituent parts of the price — profit, rent or wages — is paid below its rate, [a part of these] factors is therefore withdrawn from this application, and thus the market price gravitates [towards the] natural price as the center-point. But (1) where there is considerable division of labor it is most difficult for the worker to direct his labor into other channels; (2) because of his subordinate relation to the capitalist, he is the first to suffer.

Thus in the gravitation of market price to natural price it is the worker who loses most of all and necessarily. And it is just the capacity of the capitalist to direct his capital into another channel which either renders the worker, who is restricted to some particular branch of labor, destitute, or forces him to submit to every demand of this capitalist.

The accidental and sudden fluctuations in market price hit rent less than they do that part of the price which is resolved into profit and wages; but they hit profit less than they do wages. In most cases, for every wage that rises, one remains stationary and one falls.

***The worker need not necessarily gain when the capitalist does, but he necessarily loses when the latter loses.*** Thus, the worker does not gain if the capitalist keeps the market price above the natural price by virtue of some manufacturing or trading secret, or by virtue of monopoly or the favorable situation of his land.

Furthermore, the prices of labor are much more constant than the prices of provisions. Often they stand in inverse proportion. In a dear year wages fall on account of the decrease in demand, but rise on account of the increase in the prices of provisions — and thus balance. In any case, a number of workers are left without bread. In cheap years wages rise on account of the rise in demand, but decrease on account of the fall in the prices of provisions — and thus balance.

Another respect in which the worker is at a disadvantage:

***The labor prices of the various kinds of workers show much wider differences than the profits in the various branches in which capital is applied.*** In labor all the natural, spiritual, and social variety of individual activity is manifested and is variously rewarded, whilst dead capital always keeps the same pace and is indifferent to real individual activity.

In general we should observe that in those cases where worker and capitalist equally suffer, the worker suffers in his very existence, the capitalist in the profit on his dead mammon.

The worker has to struggle not only for his physical means of subsistence; he has to struggle to get work, i.e., the possibility, the means, to perform his activity.

Let us take the three chief conditions in which society can find itself and consider the situation of the worker in them:

(1) If the wealth of society declines the worker suffers most of all, and for the following reason: although the working class cannot gain so much as can the class of property owners in a prosperous state of society, *no one suffers so cruelly from its decline as the working class.*

(2) Let us now take a society in which wealth is increasing. This condition is the only one favorable to the worker. Here competition between the capitalists sets in. The demand for workers exceeds their supply. But:

*In the first place*, the raising of wages gives rise to overwork among the workers. The more they wish to earn, the more must they sacrifice their time and carry out slave-labor, completely losing all their freedom, in the service of greed. Thereby they shorten their lives. This shortening of their life-span is a favorable circumstance for the working class as a whole, for as a result of it an ever-fresh supply of labor becomes necessary. This class has always to sacrifice a part of itself in order not to be wholly destroyed.

***Furthermore:*** When does a society find itself in a condition of advancing wealth? When the capitals and the revenues of a country are growing. But this is only possible:

(a) As the result of the accumulation of much labor, capital being accumulated labor; as the result, therefore, of the fact that more and more of his products are being taken away from the worker, that to an increasing extent his own labor confronts him as another man's property and that the means of his existence and his activity are increasingly concentrated in the hands of the capitalist.

(b) The accumulation of capital increases the division of labor, and the division of labor increases the number of workers. Conversely, the number of workers increases the division of labor, just as the division of labor increases the accumulation of capital. With this division of labor on the one hand and the accumulation of capital on the other, the worker becomes ever more exclusively dependent on labor, and on a particular, very one-sided, machine-like labor at that. Just as he is thus depressed spiritually and physically to the condition of a machine and from being a man becomes an abstract activity and a belly, so he also becomes ever more dependent on every fluctuation in market price, on the application of capital, and on the whim of the rich. Equally, the increase in the class of people wholly dependent on work intensifies competition among the workers, thus lowering their price. In the factory system this situation of the worker reaches its climax.

(c) In an increasingly prosperous society only the richest of the rich can continue to live on money interest. Everyone else has to carry on a business with his capital, or venture it in trade. As a result, the competition between the capitalists becomes more intense. The concentration of capital increases, the big capitalists ruin the small, and a section of the erstwhile capitalists sinks into the working class, which as a result of this supply again suffers to some extent a depression of wages and passes into a still greater dependence on the few big capitalists. The number of capitalists having been diminished, their competition with respect to the workers scarcely exists any longer; and the number of workers having been increased, their competition among themselves has become all the more intense, unnatural, and violent. Consequently, a section of

the working class falls into beggary or starvation just as necessarily as a section of the middle capitalists falls into the working class.

Hence even in the condition of society most favorable to the worker, the inevitable result for the worker is overwork and premature death, decline to a mere machine, a bond servant of capital, which piles up dangerously over and against him, more competition, and starvation or beggary for a section of the workers.

The raising of wages excites in the worker the capitalist's mania to get rich, which he, however, can only satisfy by the sacrifice of his mind and body. The raising of wages presupposes and entails the accumulation of capital, and thus sets the product of labor against the worker as something ever more alien to him. Similarly, the division of labor renders him ever more one-sided and dependent, bringing with it the competition not only of men but also of machines. Since the worker has sunk to the level of a machine, he can be confronted by the machine as a competitor. Finally, as the amassing of capital increases the amount of industry and therefore the number of workers, it causes the same amount of industry to manufacture *a larger amount of products*, which leads to over-production and thus either ends by throwing a large section of workers out of work or by reducing their wages to the most miserable minimum.

Such are the consequences of a state of society most favorable to the worker — namely, of a state of growing, advancing wealth.

Eventually, however, this state of growth must sooner or later reach its peak. What is the worker's position now?

3) "In a country which had acquired that full complement of riches both the wages of labor and the profits of stock would probably be very low the competition for employment would necessarily be so great as to reduce the wages of labor to what was barely sufficient to keep up the number of laborers, and, the country being already fully peopled, that number could never be augmented." [Adam Smith, *Wealth of Nations*, Vol. I, p. 84.]

The surplus would have to die.

Thus in a declining state of society — increasing misery of the worker; in an advancing state — misery with complications; and in a fully developed state of society — static misery.

Since, however, according to Smith, a society is not happy, of which the greater part suffers — yet even the wealthiest state of society leads to this suffering of the majority — and since the economic system<sup>7</sup> (and in general a society based on private interest) leads to this wealthiest condition, it follows that the goal of the economic system is the *unhappiness* of society.

Concerning the relationship between worker and capitalist we should add that the capitalist is more than compensated for rising wages by the reduction in the amount of labor time, and that rising wages and rising interest on capital operate on the price of commodities like simple and compound interest respectively.

Let us put ourselves now wholly at the standpoint of the political economist, and follow him in comparing the theoretical and practical claims of the workers.

He tells us that originally and in theory the whole product of labor belongs to the worker. But at the same time he tells us that in actual fact what the worker gets is the smallest and utterly indispensable part of the product — as much, only, as is necessary for his existence, not as a human being, but as a worker, and for the propagation, not of humanity, but of the slave class of workers.

The political economist tells us that everything is bought with labor and that capital is nothing but accumulated labor; but at the same time he tells us that the worker, far from being able to buy everything, must sell himself and his humanity.

Whilst the rent of the idle landowner usually amounts to a third of the product of the soil, and the profit of the busy capitalist to as much as twice the interest on money, the “something more” which the worker himself earns at the best of times amounts to so little that of four children of his, two must starve and die.

Whilst according to the political economists it is solely through labor that man enhances the value of the products of nature, whilst labor is man’s active possession, according to this same political economy the landowner and the capitalist, who *qua* landowner and capitalist are merely privileged and idle gods, are everywhere superior to the worker and lay down the law to him.

Whilst according to the political economists labor is the sole unchanging price of things, there is nothing more fortuitous than the price of labor, nothing exposed to greater fluctuations.

Whilst the division of labor raises the productive power of labor and increases the wealth and refinement of society, it impoverishes the worker and reduces him to a machine. Whilst labor brings about the accumulation of capital and with this the increasing prosperity of society, it renders the worker ever more dependent on the capitalist, leads him into competition of a new intensity, and drives him into the headlong rush of overproduction, with its subsequent corresponding slump.

Whilst the interest of the worker, according to the political economists, never stands opposed to the interest of society, society always and necessarily stands opposed to the interest of the worker.

According to the political economists, the interest of the worker is never opposed to that of society: (1) because the rising wages are more than compensated by the reduction in the amount of labor time, together with the other consequences set forth above; and (2) because in relation to society the whole gross product is the net product, and only in relation to the private individual has the net product any significance.

But that labor itself, not merely in present conditions but insofar as its purpose in general is the mere increase of wealth — that labor itself, I say, is harmful and pernicious — follows from the political economist’s line of argument, without his being aware of it.

In theory, rent of land and profit on capital are *deductions* suffered by wages. In actual fact, however, wages are a deduction which land and capital allow to go to the worker, a concession from the product of labor to the workers, to labor.

When society is in a state of decline, the worker suffers most severely. The specific severity of his burden he owes to his position as a worker, but the burden as such to the position of society.

But when society is in a state of progress, the ruin and impoverishment of the worker is the product of his labor and of the wealth produced by him. The misery results, therefore, from the *essence* of present-day labor itself.

Society in a state of maximum wealth — an ideal, but one which is approximately attained, and which at least is the aim of political economy as of civil society — means for the workers *static* misery.

It goes without saying that the *proletarian*, i.e., the man who, being without capital and rent, lives purely by labor, and by a one-sided, abstract labor, is considered by political economy only as a *worker*. Political economy can therefore advance the proposition that the proletarian, the same as any horse, must get as much as will enable him to work. It does not consider him when he is not working, as a human being; but leaves such consideration to criminal law, to doctors, to religion, to the statistical tables, to politics and to the poor-house overseer.

Let us now rise above the level of political economy and try to answer two questions on the basis of the above exposition, which has been presented almost in the words of the political economists:

- (1) What in the evolution of mankind is the meaning of this reduction of the greater part of mankind to abstract labor?
- (2) What are the mistakes committed by the piecemeal reformers, who either want to raise wages and in this way to improve the situation of the working class, or regard equality of wages (as Proudhon does) as the goal of social revolution?

In political economy *labor* occurs only in the form of *activity* as a *source of livelihood*.

“It can be asserted that those occupations which presuppose specific talents or longer training have become on the whole more lucrative; whilst the proportionate reward for mechanically monotonous activity in which one person can be trained as easily and quickly as another has fallen with growing competition, and was inevitably bound to fall. And it is just *this* sort of work which in the present state of the organization of labor is still by far the commonest. If therefore a worker in the first category now earns seven times as much as he did, say, fifty years ago, whilst the earnings of another in the second category have remained unchanged, then of course both are earning *on the average* four times as much. But if the first category comprises only a thousand workers in a particular country, and the second a million, then 999,000 are no better off than fifty years ago — and they are *worse off* if at the same time the prices of the necessaries of life have risen. With such superficial *calculations of averages* people try to deceive themselves about the most numerous class of the population. Moreover, the size of the *wage* is only one factor in the estimation of the *worker's income*, because it is essential for the measurement of the latter to take into account the certainty of its *duration* — which is obviously out of the question in the anarchy of so-called free competition, with its ever-recurring fluctuations and periods of stagnation. Finally, *the hours of work* customary formerly and now have to be considered. And for the English cotton-workers these have been increased, as a result of the entrepreneurs' mania for profit. to between twelve and sixteen hours a day during the past twenty-five years or so — that is to say, precisely during the period of the introduction of labor-saving machines; and this increase in one country and in one branch of industry inevitably asserted itself elsewhere to a greater or lesser degree, for the right of the unlimited exploitation of the poor by the rich is still universally recognised.” (Wilhelm Schulz, *Die Bewegung der Production*, p. 65)

“But even if it were as true as it is false that the average income of *every* class of society has increased, the income-differences and *relative* income-distances may nevertheless have become greater and the contrasts between wealth and poverty accordingly stand out more sharply. For just *because* total production rises — and in the same measure as it rises — needs, desires and claims also multiply and thus *relative* poverty can increase whilst absolute poverty diminishes. The Samoyed living on fish oil and rancid fish is not poor because in his secluded society all have the same needs. But in a state *that is forging ahead*, which in the course of a decade, say, increased by a third its total production in proportion to the population, the worker who is getting as much at the end of ten years as at the beginning has not remained as well off, but has become poorer by a third.” (Ibid. pp. 65-66)

But political economy knows the worker only as a working animal — as a beast reduced to the strictest bodily needs.

“To develop in greater spiritual freedom, a people must break their bondage to their bodily needs — they must cease to be the slaves of the body. They must, above all, have *time* at their disposal for spiritual creative activity and spiritual enjoyment. The developments in the labor organism gain this time. Indeed, with

new motive forces and improved machinery, a single worker in the cotton mills now often performs the work formerly requiring a hundred, or even 250 to 350 workers. Similar results can be observed in all branches of production, because external natural forces are being compelled to participate to an ever-greater degree in human labor. If the satisfaction of a given amount of material needs formerly required a certain expenditure of time and human effort which has later been reduced by half, then without any loss of material comfort the scope for spiritual activity and enjoyment has been simultaneously extended by as much.... But again the way in which the booty, that we win from old Kronos himself in his most private domain, is shared out is still decided by the dice-throw of blind, unjust Chance. In France it has been calculated that at the present stage in the development of production an average working period of five hours a day by every person capable of work could suffice for the satisfaction of all the material interests of society.... Notwithstanding the time saved by the perfecting of machinery. the duration of the slave-labor performed by a large population in the factories has only increased.” (Schulz, op. cit., pp. 67, 68.)

“The transition from compound manual labor rests on a break-down of the latter into its simple operations. At first, however, only some of the uniformly-recurring operations will devolve on machines, while some will devolve on men. From the nature of things, and from confirmatory experience, it is clear that unendingly monotonous activity of this kind is as harmful to the mind as to the body; thus this combination of machinery with mere division of labor among a greater number of hands must inevitably show all the disadvantages of the latter. These disadvantages appear, among other things, in the greater mortality of factory workers.... Consideration has not been given ... to this big distinction as to how far men work through machines or how far as machines.” (Ibid. p. 69)

“In the future life of the peoples, however, the inanimate forces of nature working in machines will be our slaves and serfs.” (Ibid. p. 74)

“The English spinning mills employ 196,818 women and only 158,818 men. For every 100 male workers in the cotton mills of Lancashire there are 103 female workers, and in Scotland as many as 209. In the English flax mills of Leeds, for every 100 male workers there were found to be 147 female workers. In Dundee and on the east coast of Scotland as many as 280. In the English silk mills ... many female workers; male workers predominate in the wool-mills where the work requires greater physical strength. In 1833, no fewer than 38,927 women were employed alongside 18,593 men in the North American cotton mills. As a result of the changes in the labor organism, a wider sphere of gainful employment has thus fallen to the share of the female sex.... Women now occupying an economically more independent position ... the two sexes are drawn closer together in their social conditions.” (Ibid. pp. 71, 72)

“Working in the English steam- and water-driven spinning mills in 1835 were: 20,558 children between the ages of eight and twelve; 35,867 between the ages of twelve and thirteen; and, lastly, 108,208 children between the ages of thirteen and eighteen.... Admittedly, further advances in mechanization, by more and more removing all monotonous work from human hands, are operating in the direction of a gradual elimination of this evil. But standing in the way of these more rapid advances is the very circumstance that the capitalists can, in the easiest and cheapest fashion, appropriate the energies of the lower classes down to the children, to be used instead of mechanical devices.” (Ibid. pp. 70-71)

“Lord Brougham’s call to the workers — ‘Become capitalists’. ... This is the evil that millions are able to earn a bare subsistence for themselves only by strenuous

labor which shatters the body and cripples them morally and intellectually; that they are even obliged to consider the misfortune of finding such work a piece of good fortune.” (Ibid. p. 60)

“In order to live, then, the non-owners are obliged to place themselves, directly or indirectly, at the service of the owners — to put themselves, that is to say, into a position of dependence upon them.” (Pecqueur, *Théorie nouvelle d'économie soc.*, etc., p. 409)

“Servants — pay: workers — wages; employees — salary or emoluments.” (Ibid. pp. 409-410)

“To hire out one’s labor”, “to lend one’s labor at interest”, “to work in another’s place.”

“To hire out the materials of labor”, “to lend the materials of labor at interest”, “to make others work in one’s place.” (Ibid. p. 411)

“Such an economic order condemns men to occupations so mean, to a degradation so devastating and bitter, that by comparison savagery seems like a kingly condition.... (Ibid. pp. 417, 418) “Prostitution of the non-owning class in all its forms.” (Ibid. p. 421f) “Ragmen.”

Charles Loudon in the book *Solution du problème de la population, etc.*, Paris, 1842<sup>8</sup>, declares the number of prostitutes in England to be between sixty and seventy thousand. The number of women of doubtful virtue is said to be equally large (p. 228).

“The average life of these unfortunate creatures on the streets, after they have embarked on their career of vice, is about six or seven years. To maintain the number of sixty to seventy thousand prostitutes, there must be in the three kingdoms at least eight to nine thousand women who commit themselves to this abject profession each year, or about twenty-four new victims each day — an average of *one* per hour; and it follows that if the same proportion holds good over the whole surface of the globe, there must constantly be in existence one and a half million unfortunate women of this kind”. (Ibid. p. 229)

“The numbers of the poverty-stricken grow with their poverty, and at the extreme limit of destitution human beings are crowded together in the greatest numbers contending with each other for the right to suffer.... In 1821 the population of Ireland was 6,801,827. In 1831 it had risen to 7,764,010 — an increase of 14 per cent in ten years. In Leinster, the wealthiest province, the population increased by only 8 per cent; whilst in Connaught, the most poverty-stricken province, the increase reached 21 per cent. (*Extract from the Enquiries Published in England on Ireland, Vienna, 1840.*)” (Buret, *De la misère, etc.*, t. 1, pp. 36, 37)

Political economy considers labor in the abstract as a thing; “labor is a commodity.” If the price is high, then the commodity is in great demand; if the price is low, then the commodity is in great supply: “the price of labor as a commodity must fall lower and lower.” (Buret, op. cit.) This is made inevitable partly by the competition between capitalist and worker, partly by the competition amongst the workers. “The working population, the seller of labor, is necessarily reduced to accepting the most meager part of the product.... Is the theory of labor as a commodity anything other than a theory of disguised bondage?” (Ibid. p. 43)

“Why then has nothing but an exchange-value been seen in labor?” (Ibid. p. 44)

The large workshops prefer to buy the labor of women and children, because this costs less than that of men. (Op. cit.) “The worker is not at all in the position of a *free seller vis-à-vis* the one who employs him.... The capitalist is always free to employ labor, and the worker is always forced to sell it. The value of labor is

completely destroyed if it is not sold every instant. Labor can neither be accumulated nor even be saved, unlike true [commodities].

“Labor is life, and if life is not each day exchanged for food, it suffers and soon perishes. To claim that human life is a commodity, one must, therefore, admit slavery.” (Ibid. pp. 49, 50) If then labor is a commodity, it is a commodity with the most unfortunate attributes. But even by the principles of political economy it is no commodity, for it is not the “*free result of a free transaction.*” The present economic regime “simultaneously lowers the price and the remuneration of labor; it perfects the worker and degrades the man.” (Ibid. pp. 52, 53) “Industry has become a war, and commerce a gamble.” (Ibid. p. 62)

The cotton-working machines (in England) alone represent 84,000,000 manual workers. (Ibid. p. 193)

Up to the present, industry has been in a state of war, a war of conquest: “It has squandered the lives of the men who made up its army with the same indifference as the great conquerors. Its aim was the possession of wealth, not the happiness of men.” (Buret, op. cit., p. 20) “These interests” (that is, economic interests), “freely left to themselves ... must necessarily come into conflict; they have no other arbiter but war, and the decisions of war assign defeat and death to some, in order to give victory to the others.... It is in the conflict of opposed forces that science seeks order and equilibrium: *perpetual war*, according to it, is the sole means of obtaining peace; that war is called competition.” (Ibid. p. 23)

“The industrial war, to be conducted with success, demands large armies which it can amass on one spot and profusely decimate. And it is neither from devotion nor from duty that the soldiers of this army bear the exertions imposed on them, but only to escape the hard necessity of hunger. They feel neither attachment nor gratitude towards their bosses, nor are these bound to their subordinates by any feeling of benevolence. They do not know them as men, but only as instruments of production which have to yield as much as possible with as little cost as possible. These populations of workers, ever more crowded together, have not even the assurance of always being employed. Industry, which has called them together, only lets them live while it needs them, and as soon as it can get rid of them it abandons them without the slightest scruple; and the workers are compelled to offer their persons and their powers for whatever price they can get. The longer, more painful and more disgusting the work they are given, the less they are paid. There are those who, with sixteen hours’ work a day and unremitting exertion, scarcely buy the right not to die.” (Ibid. pp. 68-69)

“We are convinced ... as are the commissioners charged with the inquiry into the condition of the hand-loom weavers, that the large industrial towns would in a short time lose their population of workers if they were not all the time receiving from the neighboring rural areas constant recruitments of healthy men, a constant flow of fresh blood.” (Ibid. p. 362)

## Profit of Capital

### 1. Capital

What is the basis of capital, that is, of private property in the products of other men’s labor?

“Even if capital itself does not merely amount to theft or fraud, it still requires the cooperation of legislation to sanctify inheritance.” (Say, *Traité d’économie politique*, t. I. P. 136, footnote)<sup>9</sup>

How does one become a proprietor of productive stock? How does one become owner of the products created by means of this stock?

By virtue of positive law. (Say, t. II, p. 4 )

What does one acquire with capital, with the inheritance of a large fortune, for instance?

“The person who [either acquires, or] succeeds to a great fortune, does not necessarily [acquire or] succeed to any political power [... ] The power which that possession immediately and directly conveys to him, is the power of purchasing; a certain command over all the labor, or over all the produce of labor, which is then in the market.” (Wealth of Nations, by Adam Smith, Vol. I, pp. 26-27.)<sup>10</sup>

Capital is thus the governing power over labor and its products. The capitalist possesses this power, not on account of his personal or human qualities, but inasmuch as he is an owner of capital. His power is the purchasing power of his capital, which nothing can withstand.

Later we shall see first how the capitalist, by means of capital, exercises his governing power over labor, then, however, we shall see the governing power of capital over the capitalist himself.

What is capital?

“A certain quantity of *labor stocked* and stored up to be employed.” (Adam Smith, op. cit., Vol. I, p. 295.)

Capital is *stored-up labor*.

(2) *Funds*, or stock, is any accumulation of products of the soil or of manufacture. Stock is called *capital* only when it yields to its owner a revenue or profit. (Adam Smith, op. cit., p. 243)

## 2. The Profit of Capital

The *profit or gain of capital* is altogether different from the wages of labor. This difference is manifested in two ways: in the first place, the profits of capital are regulated altogether by the value of the capital employed, although the labor of inspection and direction associated with different capitals may be the same. Moreover in large works the whole of this labor is committed to some principal clerk, whose salary bears no regular proportion to the capital of which he oversees the management. And although the labor of the proprietor is here reduced almost to nothing, he still demands profits in proportion to his capital. (Adam Smith, op. cit., Vol. I, p. 43)<sup>11</sup>

Why does the capitalist demand this proportion between profit and capital?

He would have no *interest* in employing the workers, unless he expected from the sale of their work something more than is necessary to replace the stock advanced by him as wages and he would have no *interest* to employ a great stock rather than a small one, unless his profits were to bear some proportion to the extent of his stock. (Adam Smith, op. cit., Vol. I, p. 42)

The capitalist thus makes a profit, first, on the wages, and secondly on the raw materials advanced by him.

What proportion, then, does profit bear to capital?

If it is already difficult to determine the usual average level of wages at a particular place and at a particular time, it is even more difficult to determine the profit on capitals. A change in the price of the commodities in which the capitalist deals, the good or bad fortune of his rivals and customers, a thousand other accidents to which commodities are exposed both in transit and in the warehouses — all produce a daily, almost hourly variation in profit. (Adam Smith, op. cit., Vol. I, pp. 78-79) But though it is impossible to determine with precision what are the profits on capitals, some notion may be formed of them from the *interest of*

*money*. Wherever a great deal can be made by the use of money, a great deal will be given for the use of it; wherever little can be made by it, little will be given. (Adam Smith, op. cit., Vol. I, p. 79) The proportion which the usual market rate of interest ought to bear to the rate of clear profit, necessarily varies as profit rises or falls. Double interest is in Great Britain reckoned what the merchants call a good, moderate, reasonable profit, terms which mean no more than a *common and usual profit*. (Adam Smith, op. cit., Vol. I, p. 87)

What is the *lowest* rate of profit? And what the *highest*?

The *lowest rate of ordinary profit* on capital must always be something more than what is sufficient to compensate the occasional losses to which every employment of stock is exposed. It is this surplus only which is neat or clear profit. The same holds for the lowest rate of interest. (Adam Smith, op. cit., Vol. I, p. 86)

The *highest rate* to which ordinary profits can rise is that which in the price of the greater part of commodities *eats up the whole of the rent of the land*, and reduces the wages of labor contained in the commodity supplied to the *lowest rate*, the bare subsistence of the laborer during his work. The worker must always be fed in some way or other while he is required to work; rent can disappear entirely. For example: the servants of the East India Company in Bengal. (Adam Smith, op. cit., Vol. I, pp. 86-87)

Besides all the advantages of limited competition which the capitalist may *exploit* in this case, he can keep the market price above the natural price by quite decorous means.

*For one thing*, by keeping *secrets in trade* if the market is at a great distance from those who supply it, that is, by concealing a price change, its rise above the natural level. This concealment has the effect that other capitalists do not follow him in investing their capital in this branch of industry or trade.

*Then again* by keeping *secrets in manufacture*, which enable the capitalist to reduce the costs of production and supply his commodity at the same or even at lower prices than his competitors while obtaining a higher profit. (Deceiving by keeping secrets is not immoral? Dealings on the Stock Exchange.) *Furthermore*, where production is restricted to a particular locality (as in the case of a rare wine), and where the *effective demand* can never be satisfied. *Finally*, through monopolies exercised by individuals or companies. Monopoly price is the highest possible. (Adam Smith, op. cit., Vol. I, pp. 53-54)

Other fortuitous causes which can raise the profit on capital: the acquisition of new territories, or of new branches of trade, often increases the profit on capital even in a wealthy country, because they withdraw some capital from the old branches of trade, reduce competition, and cause the market to be supplied with fewer commodities, the prices of which then rise: those who deal in these commodities can then afford to borrow at a higher rate of interest. (Adam Smith, op. cit., Vol. I, p. 83)

The more a commodity comes to be manufactured — the more it becomes an object of manufacture — the greater becomes that part of the price which resolves itself into wages and profit in proportion to that which resolves itself into rent. In the progress of the manufacture of a commodity, not only the number of profits increases, but every subsequent profit is greater than the foregoing; because the capital from which it is derived must always be greater. The capital which employs the weavers, for example, must always be greater than that which employs the spinners; because it not only replaces that capital with its profits, but pays, besides, the wages of weavers; and the profits must always bear some proportion to the capital. (Op. cit., Vol. I, p. 45)

Thus the advance made by human labor in converting the product of nature into the manufactured product of nature increases, not the wages of labor, but in part the number of profitable capital investments, and in part the size of every subsequent capital in comparison with the foregoing.

More about the advantages which the capitalist derives from the division of labor, later.

He profits doubly — first, by the division of labor; and secondly, in general, by the advance which human labor makes on the natural product. The greater the human share in a commodity, the greater the profit of dead capital.

In one and the same society the average rates of profit on capital are much more nearly on the same level than the wages of the different sorts of labor. (Op. cit., Vol. I, p. 100.) In the different employments of capital, the ordinary rate of profit varies with the certainty or uncertainty of the returns.

The ordinary profit of stock, though it rises with the risk, does not always seem to rise in proportion to it. (Op. cit., Vol. I, pp. 99-100.)

It goes without saying that profits also rise if the means of circulation become less expensive or easier available (e.g., paper money).

### **3. The Rule of Capital over Labor and the Motives of the Capitalist**

The consideration of his own private profit is the sole motive which determines the owner of any capital to employ it either in agriculture, in manufactures, or in some particular branch of the wholesale or retail trade. The different quantities of productive Labor which it may put into motion, and the different values which it may add to the annual produce of the land and labor of his country, according as it is employed in one or other of those different ways, never enter into his thoughts. (Adam Smith, op. cit., Vol. I, p. 335)

The most useful employment of capital for the capitalist is that which, risks being equal, yields him the greatest profit. This employment is not always the most useful for society; the most useful employment is that which utilizes the productive powers of nature. (Say, t. II, pp. 130-31.)

The plans and speculations of the employers of capitals regulate and direct all the most important operations of labor, and profit is the end proposed by all those plans and projects. But the rate of profit does not, like rent and wages, rise with the prosperity and fall with the decline of the society. On the contrary, it is naturally low in rich and high in poor countries, and it is always highest in the countries which are going fastest to ruin. The interest of this class, therefore, has not the same connection with the general interest of the society as that of the other two.... The particular interest of the dealers in any particular branch of trade or manufactures is always in some respects different from, and frequently even in sharp opposition to, that of the public. To widen the market and to narrow the sellers' competition is always the interest of the dealer.... This is a class of people whose interest is never exactly the same as that of society, a class of people who have generally an interest to deceive and to oppress the public. (Adam Smith, op. cit., Vol. I, pp. 231-32)

### **4. The Accumulation of Capitals and the Competition among the Capitalists**

The increase of stock, which raises wages, tends to lower the capitalists' profit, because of the competition amongst the capitalists. (Adam Smith, op. cit., Vol. I, p. 78)

If, for example, the capital which is necessary for the grocery trade of a particular town "is divided between two different grocers, their competition will tend to make both of them sell cheaper than if it were in the hands of one only; and if it were divided among twenty, their competition would be just so much the greater,

and the chance of their combining together, in order to raise the price, just so much the less.” (Adam Smith, op. cit., Vol. I, p. 322)

Since we already know that monopoly prices are as high as possible, since the interest of the capitalists, even from the point of view commonly held by political economists, stands in hostile opposition to society, and since a rise of profit operates like compound interest on the price of the commodity (Adam Smith, op. cit., Vol. I, pp. 87-88), it follows that the sole defense against the capitalists is *competition*, which according to the evidence of political economy acts beneficently by both raising wages and lowering the prices of commodities to the advantage of the consuming public.

But competition is only possible if capital multiplies, and is held in many hands. The formation of many capital investments is only possible as a result of multilateral accumulation, since capital comes into being only by accumulation; and multilateral accumulation necessarily turns into unilateral accumulation. Competition among capitalists increases the accumulation of capital. Accumulation, where private property prevails, is the concentration of capital in the hands of a few, it is in general an inevitable consequence if capital is left to follow its natural course, and it is precisely through competition that the way is cleared for this natural disposition of capital.

We have been told that the profit on capital is in proportion to the size of the capital. A large capital therefore accumulates more quickly than a small capital in proportion to its size, even if we disregard for the time being deliberate competition.

<sup>12</sup>Accordingly, the accumulation of large capital proceeds much more rapidly than that of smaller capital, quite irrespective of competition. But let us follow this process further.

With the increase of capital the profit on capital diminishes, because of competition. The first to suffer, therefore, is the small capitalist.

The increase of capitals and a large number of capital investments presuppose, further, a condition of advancing wealth in the country.

“In a country which had acquired its full complement of riches [ ... ] the ordinary rate of clear profit would be very small, so the usual [market] rate of interest which could be afforded out of it would be so low as to render it impossible for any but the very wealthiest people to live upon the interest of their money. All people of [...] middling fortunes would be obliged to superintend themselves the employment of their own stocks. It would be necessary that almost every man should be a man of business, or engage in some sort of trade.” (Adam Smith, op. cit., Vol. I, p. 86)

This is the situation most dear to the heart of political economy.

“The proportion between capital and revenue, therefore, seems everywhere to regulate the proportion between industry and idleness; wherever capital predominates, industry prevails; wherever revenue, idleness.” (Adam Smith, op. cit., Vol. I, p. 301.)

What about the employment of capital, then, in this condition of increased competition?

“As stock increases, the quantity of stock to be lent at interest grows gradually greater and greater. As the quantity of stock to be lent at interest increases, the interest ... diminishes (i) because the market price of things commonly diminishes as their quantity increases. ... and (ii) because with the increase of capitals in any country, “it becomes gradually more and more difficult to find within the country a profitable method of employing any new capital. There arises in consequence a competition between different capitals, the owner of one endeavoring to get possession of that employment which is occupied by another. But upon most occasions he can hope to jostle that other out of this employment by no other

means but by dealing upon more reasonable terms. He must not only sell what he deals in somewhat cheaper, but in order to get it to sell, he must sometimes, too, buy it dearer. The demand for productive labor, by the increase of the funds which are destined for maintaining it, grows every day greater and greater. Laborers easily find employment, but the owners of capitals find it difficult to get laborers to employ. Their competition raises the wages of labor and sinks the profits of stock.” (Adam Smith, op. cit., Vol. I, p. 316)

Thus the small capitalist has the choice: (1) either to consume his capital, since he can no longer live on the interest — and thus cease to be a capitalist; or (2) to set up a business himself, sell his commodity cheaper, buy dearer than the wealthier capitalist, and pay higher wages — thus ruining himself, the market price being already very low as a result of the intense competition presupposed. If, however, the big capitalist wants to squeeze out the smaller capitalist, he has all the advantages over him which the capitalist has as a capitalist over the worker. The larger size of his capital compensates him for the smaller profits, and he can even bear temporary losses until the smaller capitalist is ruined and he finds himself freed from this competition. In this way, he accumulates the small capitalist’s profits.

Furthermore: the big capitalist always buys cheaper than the small one, because he buys bigger quantities. He can therefore well afford to sell cheaper.

But if a fall in the rate of interest turns the middle capitalists from rentiers into businessmen, the increase in business capital and the resulting smaller profit produce conversely a fall in the rate of interest.

“When the profits which can be made by the use of a capital are diminished the price which can be paid for the use of it [...] must necessarily be diminished with them.” (Adam Smith, loc. cit., Vol. I, p. 316)

“As riches, improvement, and population have increased, interest has declined,” and consequently the profits of capitalists, “after these [profits] are diminished, stock may not only continue to increase, but to increase much faster than before. [...] A great stock though with small profits, generally increases faster than a small stock with great profits. Money, says the proverb, makes money.” (op. cit., Vol. I, p. 83)

When, therefore, this large capital is opposed by small capitals with small profits, as it is under the presupposed condition of intense competition, it crushes them completely.

The necessary result of this competition is a general deterioration of commodities, adulteration, fake production and universal poisoning, evident in large towns.

An important circumstance in the competition of large and small capital is, furthermore, the relation between *fixed capital* and *circulating capital*.

*Circulating capital* is a capital which is “employed in raising” provisions, “manufacturing, or purchasing goods, and selling them again. [...] The capital employed in this manner yields no revenue or profit to its employer, while it either remains in his possession, or continues in the same shape. [...] His capital is continually going from him in one shape, and returning to him in another, and it is only by means of such circulation, or successive exchanges” and transformations “that it can yield him any profit.” *Fixed capital* consists of capital invested “in the improvement of land, in the purchase of useful machines and instruments of trade, or in such-like things.” (Adam Smith, op. cit., Vol. I, pp. 243-44)

“Every saving in the expense of supporting the fixed capital is an improvement of the net revenue of the society. The whole capital of the undertaker of every work is necessarily divided between his fixed and his circulating capital. [Marx uses the French terms *capital fixe* and *capital circulant*. – Ed.] While his whole capital

remains the same, the smaller the one part, the greater must necessarily be the other. It is the circulating capital which furnishes the materials and wages of labor, and puts industry into motion. Every saving, therefore, in the expense of maintaining the fixed capital, which does not diminish the productive powers of labor, must increase the fund which puts industry into motion.” (Adam Smith, *op. cit.*, Vol. I, p. 257)

It is clear from the outset that the relation of fixed capital and circulating capital is much more favorable to the big capitalist than to the smaller capitalist. The extra fixed capital required by a very big banker as against a very small one is insignificant. Their fixed capital amounts to nothing more than the office. The equipment of the bigger landowner does not increase in proportion to the size of his estate. Similarly, the credit which a big capitalist enjoys compared with a smaller one means for him all the greater saving in fixed capital — that is, in the amount of ready money he must always have at hand. Finally, it is obvious that where industrial labor has reached a high level, and where therefore almost all manual labor has become factory labor, the entire capital of a small capitalist does not suffice to provide him even with the necessary fixed capital. [*As is well known, large-scale cultivation usually provides employment only for a small number of hands.* Note by Marx in French.]

It is generally true that the accumulation of large capital is also accompanied by a proportional concentration and simplification of fixed capital, as compared to the smaller capitalists. The big capitalist introduces for himself some kind of organization of the instruments of labor.

“Similarly, in the sphere of industry every manufactory and mill is already a comprehensive combination of a large material fortune with numerous and varied intellectual capacities and technical skills serving the common purpose of production.... Where legislation preserves landed property in large units, the surplus of a growing population flocks into trades, and it is therefore as in Great Britain in the field of industry, principally, that proletarians aggregate in great numbers. Where, however, the law permits the continuous division of the land, the number of small, debt-encumbered proprietors increases, as in France; and the continuing process of fragmentation throws them into the class of the needy and the discontented. When eventually this fragmentation and indebtedness reaches a higher degree still, big landed property once more swallows up small property, just as large-scale industry destroys small industry. And as larger estates are formed again, large numbers of propertyless workers not required for the cultivation of the soil are again driven into industry.” (Schulz, *Bewegung der Production*, pp. 58, 59.)

“Commodities of the same kind change in character as a result of changes in the method of production, and especially as a result of the use of machinery. Only by the exclusion of human power has it become possible to spin from a pound of cotton worth 3 shillings and 8 pence 350 hanks of a total length of 167 English miles (i.e., 36 German miles), and of a commercial value of 25 guineas.” (*op. cit.*, p. 62.)

“On the average the prices of cotton-goods have decreased in England during the past 45 years by eleven-twelfths, and according to Marshall’s calculations the same amount of manufactured goods for which 16 shillings was still paid in 1814 is now supplied at 1 shilling and 10 pence. The greater cheapness of industrial products expands both consumption at home and the market abroad, and because of this the number of workers in cotton has not only not fallen in Great Britain after the introduction of machines but has risen from forty thousand to one and a half million. As to the earnings of industrial entrepreneurs and workers, the growing competition between the factory owners has resulted in their profits

necessarily falling relative to the amount of products supplied by them. In the years 1820-33 the Manchester manufacturer's gross profit on a piece of calico fell from four shillings 1 1/3 pence to one shilling 9 pence. But to make up for this loss, the volume of manufacture has been correspondingly increased. The consequence of this is that separate branches of industry experience over-production to some extent, that frequent bankruptcies occur causing property to fluctuate and vacillate unstably within the class of capitalists and masters of labor, thus throwing into the proletariat some of those who have been ruined economically; and that, frequently and suddenly, close-downs or cuts in employment become necessary, the painful effects of which are always bitterly felt by the class of wage-laborers." (Op. cit., p. 63.)

"To hire out one's labor is to begin one's enslavement. To hire out the materials of labor is to establish one's freedom.... Labor is man; the materials, on the other hand, contain nothing human." (Pecqueur, *Théorie sociale*, etc.)

"The material element, which is quite incapable of creating wealth without the other element, labor, acquires the magical virtue of being fertile for them [who own this material element] as if by their own action they had placed there this indispensable element." (Op. cit.)

"Supposing that the daily labor of a worker brings him on the average 400 francs a year and that this sum suffices for every adult to live some sort of crude life, then any proprietor receiving 2,000 francs in interest or rent, from a farm, a house, etc., compels indirectly five men to work for him; an income of 100,000 francs represents the labor of 250 men, and that of 1,000,000 francs the labor of 2,500 individuals (hence, 300 million [Louis Philippe] therefore the labor of 750,000 workers)." (Op. cit., pp. 412-13.)

"The human law has given owners the right to use and to abuse — that is to say, the right to do what they will with the materials of labor.... They are in no way obliged by law to provide work for the propertyless when required and at all times, or to pay them always an adequate wage, etc. (Op. cit., p. 413.) "Complete freedom concerning the nature, the quantity, the quality and the expediency of production; concerning the use and the disposal of wealth; and full command over the materials of all labor. Everyone is free to exchange what belongs to him as he thinks fit, without considering anything other than his own interest as an individual." (Op. cit. p. 413.)

"Competition is merely the expression of the freedom to exchange, which itself is the immediate and logical consequence of the individual's right to use and abuse all the instruments of production. The right to use and abuse, freedom of exchange, and arbitrary competition — these three economic moments, which form one unit, entail the following consequences; each produces what he wishes, as he wishes, when he wishes, where he wishes, produces well or produces badly, produces too much or not enough, too soon or too late, at too high a price or too low a price; none knows whether he will sell, to whom he will sell, how he will sell, when he will sell, where he will sell. And it is the same with regard to purchases. The producer is ignorant of needs and resources, of demand and supply. He sells when he wishes, when he can, where he wishes, to whom he wishes, at the price he wishes. And he buys in the same way. In all this he is ever the plaything of chance, the slave of the law of the strongest, of the least harassed, of the richest.... Whilst at one place there is scarcity, at another there is glut and waste. Whilst one producer sells a lot or at a very high price, and at an enormous profit, the other sells nothing or sells at a loss.... The supply does not know the demand, and the demand does not know the supply. You produce, trusting to a

taste, a fashion, which prevails amongst the consuming public. But by the time you are ready to deliver the commodity, the whim has already passed and has settled on some other kind of product.... The inevitable consequences: bankruptcies occurring constantly and universally; miscalculations, sudden ruin and unexpected fortunes, commercial crises, stoppages, periodic gluts or shortages; instability and depreciation of wages and profits, the loss or enormous waste of wealth, time and effort in the arena of fierce competition.” (Op. cit., pp. 414-16.)

Ricardo in his book [*On the Principles of Political Economy and Taxation (rent of land)*]: Nations are merely production-shops; man is a machine for consuming and producing; human life is a kind of capital; economic laws blindly rule the world. For Ricardo men are nothing, the product everything. In the 26th chapter of the French translation it says:

“To an individual with a capital of £20,000 whose profits were £2,000 per annum, it would be a matter quite indifferent whether his capital would employ a hundred or a thousand men.... Is not the real interest of the nation similar? Provided its net real income, its rent and profits be the same, it is of no importance whether the nation consists of ten or twelve millions of inhabitants.” — [t. II, pp. 194, 195.]

“In fact, says M. Sismondi (*Nouveaux principes d'économie politique*, t. II, p. 331), nothing remains to be desired but that the King, living quite alone on the island, should by continuously turning a crank cause automatons to do all the work of England.”<sup>13</sup>

“The master who buys the worker’s labor at such a low price that it scarcely suffices for the worker’s most pressing needs is responsible neither for the inadequacy of the wage nor for the excessive duration of the labor: he himself has to submit to the law which he imposes.... Poverty is not so much caused by men as by the power of things.” (Buret, op. cit., p. 82.)

“The inhabitants of many different parts of Great Britain have not capital sufficient to improve and cultivate all their lands. The wool of the southern counties of Scotland is, a great part of it, after a long land carriage through very bad roads, manufactured in Yorkshire, for want of capital to manufacture it at home. There are many little manufacturing towns in Great Britain, of which the inhabitants have not capital sufficient to transport the produce of their own industry to those distant markets where there is demand and consumption for it. If there are any merchants among them, they are properly only the agents of wealthier merchants who reside in some of the greater commercial cities.” (Adam Smith, *Wealth of Nations*, Vol. I, pp. 326-27)

“The annual produce of the land and labor of any nation can be increased in its value by no other means but by increasing either the number of its productive laborers, or the productive power of those laborers who had before been employed.... In either case an additional capital is almost always required.” (Adam Smith, op. cit., Vol. I, pp. 306-07.)

“As the accumulation of stock must, in the nature of things, be previous to the division of labor, so labor can be more and more subdivided in proportion only as stock is previously more and more accumulated. The quantity of materials which the same number of people can work up, increases in a great proportion as labor comes to be more and more subdivided; and as the operations of each workman are gradually reduced to a greater degree of simplicity, a variety of new machines come to be invented for facilitating and abridging those operations. As the division of labor advances, therefore, in order to give constant employment to an equal number of workmen, an equal stock of provisions, and a greater stock of

materials and tools than what would have been necessary in a ruder state of things, must be accumulated beforehand. But the number of workmen in every branch of business generally increases with the division of labor in that branch, or rather it is the increase of their number which enables them to class and subdivide themselves in this manner.” (Adam Smith, op. cit., Vol. I, pp. 241-42)

“As the accumulation of stock is previously necessary for carrying on this great improvement in the productive powers of labor, so that accumulation naturally leads to this improvement. The person who employs his stock in maintaining labor, necessarily wishes to employ it in such a manner as to produce as great a quantity of work as possible. He endeavors, therefore, both to make among his workmen the most proper distribution of employment, and to furnish them with the best machines [...]. His abilities in both these respects are generally in proportion to the extent of his stock, or to the number of people whom it can employ. The quantity of industry, therefore, not only increases in every country with the increase of the stock which employs it, but, in consequence of that increase, the same quantity of industry produces a much greater quantity of work.” (Adam Smith, op. cit., Vol. I, p. 242) Hence *overproduction*.

“More comprehensive combinations of productive forces ... in industry and trade by uniting more numerous and more diverse human and natural powers in larger-scale enterprises. Already here and there, closer association of the chief branches of production. Thus, big manufacturers will try to acquire also large estates in order to become independent of others for at least a part of the raw materials required for their industry; or they will go into trade in conjunction with their industrial enterprises, not only to sell their own manufactures, but also to purchase other kinds of products and to sell these to their workers. In England, where a single factory owner sometimes employs ten to twelve thousand workers ... it is already not uncommon to find such combinations of various branches of production controlled by one brain, such smaller states or provinces within the state. Thus, the mine owners in the Birmingham area have recently taken over the whole process of iron production, which was previously distributed among various entrepreneurs and owners, (See “Der bergmännische Distrikt bei Birmingham,” Deutsche Vierteljahr-Schrift No. 3, 1838.) Finally in the large joint-stock enterprises which have become so numerous, we see far-reaching combinations of the financial resources of many participants with the scientific and technical knowledge and skills of others to whom the carrying-out of the work is handed over. The capitalists are thereby enabled to apply their savings in more diverse ways and perhaps even to employ them simultaneously in agriculture, industry and commerce. As a consequence their interest becomes more comprehensive, and the contradictions between agricultural, industrial, and commercial interests are reduced and disappear. But this increased possibility of applying capital profitably in the most diverse ways cannot but intensify the antagonism between the propertied and the non-propertied classes.” (Schulz, op. cit., pp. 40-41.)

The enormous profit which the landlords of houses make out of poverty. House rent stands in inverse proportion to industrial poverty. So does the interest obtained from the vices of the ruined proletarians. (Prostitution, drunkenness, pawnbroking.)

The accumulation of capital increases and the competition between capitalists decreases, when capital and landed property are united in the same hand, also when capital is enabled by its size to combine different branches of production.

Indifference towards men. Smith's twenty lottery-tickets.<sup>14</sup> Say's net and gross revenue. [XVII]

## Rent of Land

Landlords' right has its origin in robbery. (Say, t. 1) The landlords, like all other men, love to reap where they never sowed, and demand a rent even for the natural produce of the earth. (Adam Smith, op. cit., Vol. I, p. 44.)

“The rent of land, it may be thought, is frequently no more than a reasonable profit or interest for the stock laid out by the landlord upon its improvement. This, no doubt, may be partly the case upon some occasions.... The landlord demands” (1) “a rent even for unimproved land, and the supposed interest or profit upon the expense of improvement is generally an addition to this original rent.” (2) “Those improvements, besides, are not always made by the stock of the landlord, but sometimes by that of the tenant. When the lease comes to be renewed, however, the landlord commonly demands the same augmentation of rent as if they had been all made by his own.” (3) “He sometimes demands rent for what is altogether incapable of human improvement.” (Adam Smith, op. cit., Vol. I, p. 131.)

Smith cites as an instance of the last case kelp,

“a species of seaweed, which, when burnt, yields an alkaline salt, useful for making glass, soap, etc. It grows in several parts of Great Britain, particularly in Scotland, upon such rocks only as lie within the high-water mark, which are twice every day covered with the sea, and of which the produce, therefore, was never augmented by human industry. The landlord, however, whose estate is bounded by a kelp shore of this kind, demands a rent for it as much as for his corn fields. The sea in the neighborhood of the Islands of Shetland is more than commonly abundant in fish, which make a great part of the subsistence of their inhabitants. But in order to profit by the produce of the water they must have a habitation upon the neighboring land. The rent of the landlord is in proportion, not to what the farmer can make by the land, but to what he can make both by the land and by the water.” (Adam Smith, op. cit., Vol. I, p. 131.)

“This rent may be considered as the produce of those *powers of nature*, the use of which the landlord lends to the farmer. It is greater or smaller according to the supposed extent of those powers, or in other words, according to the supposed natural or improved fertility of the land. It is the work of nature which remains after deducting or compensating everything which can be regarded as the work of man.” (Adam Smith, op. cit., Vol. I, pp. 324-25.)

“The *rent of land*, therefore, considered as the price paid for the use of the land, is naturally a *monopoly price*. It is not at all proportioned to what the landlord may have laid out upon the improvement of the land, or to what he can afford to take; but to what the farmer can afford to give.” (Adam Smith, op. cit., p. 131.)

Of the three original classes, that of the landlords is the one “whose revenue costs them neither labor nor care, but comes to them, as it were, of its own accord, and independent of any plan or project of their own”. (Adam Smith, op. cit., Vol. I, p. 230.)

We have already learnt that the size of the rent depends on the degree of *fertility* of the land.

Another factor in its determination is situation.

“The rent of land not only varies with its *fertility*, whatever be its produce, but with its situation whatever be its fertility.” (Adam Smith, op. cit., Vol. I, p. 133.)

“The produce of land, mines, and fisheries, when their natural fertility is equal, is in proportion to the extent and proper application of the capitals employed about them. When the capitals are equal and equally well applied, it is in proportion to their natural fertility.” (Op. cit., Vol. I, p. 249.)

These propositions of Smith are important, because, given equal costs of production and capital of equal size, they reduce the rent of land to the greater or lesser fertility of the soil. Thereby showing clearly the perversion of concepts in political economy, which turns the fertility of the land into an attribute of the landlord.

Now, however, let us consider the rent of land as it is formed in real life.

The rent of land is established as a result of *the struggle between tenant and landlord*. We find that the hostile antagonism of interests, the struggle, the war is recognised throughout political economy as the basis of social organization.

Let us see now what the relations are between landlord and tenant.

“In adjusting the terms of the lease, the landlord endeavors to leave him no greater share of the produce than what is sufficient to keep up the stock from which he furnishes the seed, pays the labor, and purchases and maintains the cattle and other instruments of husbandry, together with the ordinary profits of farming stock in the neighborhood. This is evidently the smallest share with which the tenant can content himself without being a loser, and the landlord seldom means to leave him any more. Whatever part of the produce, or, what is the same thing, whatever part of its price is over and above this share, he naturally endeavors to reserve to himself as the rent of his land, which is evidently the highest the tenant can afford to pay in the actual circumstances of the land. [...] This portion, however, may still be considered as the natural rent of land, or the rent for which it is naturally meant that land should for the most part be let.” (Adam Smith, op. cit., Vol. I, pp. 130-31)

“The landlords,” says Say, “operate a certain kind of monopoly against the tenants. The demand for their commodity, site and soil, can go on expanding indefinitely; but there is only a given, limited amount of their commodity.... The bargain struck between landlord and tenant is always advantageous to the former in the greatest possible degree.... Besides the advantage he derives from the nature of the case, he derives a further advantage from his position, his larger fortune and greater credit and standing. But the first by itself suffices to enable him and him alone to profit from the favorable circumstances of the land. The opening of a canal, or a road; the increase of population and of the prosperity of a district, always raises the rent.... Indeed, the tenant himself may improve the ground at his own expense; but he only derives the profit from this capital for the duration of his lease, with the expiry of which it remains with the proprietor of the land; henceforth it is the latter who reaps the interest thereon, without having made the outlay, for there is now a proportionate increase in the rent.” (Say, t. II.)

“Rent, considered as the price paid for the use of land, is naturally the highest which the tenant can afford to pay in the actual circumstances of the land.” (Adam Smith, op. cit., Vol. I, p. 130.)

“The rent of an estate above ground commonly amounts to what is supposed to be a third of the gross produce; and it is generally a rent certain and independent of the occasional variations in the crop.” (Adam Smith, op. cit., Vol. I, p. 153.) This rent “is seldom less than a fourth ... of the whole produce”. (Op. cit., Vol. I, p. 325.)

*Rent* cannot be paid on all commodities. For instance, in many districts no rent is paid for stones.

“Such parts only of the produce of land can commonly be brought to market of which the ordinary price is sufficient to replace the stock which must be employed in bringing them thither, together with its ordinary profits. If the ordinary price is more than this, the surplus part of it will naturally go to the rent of the land. If it is

not more, though the commodity may be brought to market, it can afford no rent to the landlord. Whether the price is or is not more depends upon the demand.”

(Adam Smith, op. cit., Vol. I, p. 132.)

“Rent, it is to be observed, therefore, enters into the composition of the price of commodities in a different way from wages and profit. High or low wages and profit are the causes of high or low price; high or low rent is the effect of it.”

(Adam Smith, op. cit., Vol. I, p. 132.)

*Food* belongs to the products which always yield a *rent*.

As men, like all other animals, naturally multiply in proportion to the means of their subsistence, food is always, more or less, in demand. It can always purchase or command a greater or smaller quantity of labor, and somebody can always be found who is willing to do something in order to obtain it. The quantity of labor, indeed, which it can purchase is not always equal to what it could maintain, if managed in the most economical manner, on account of the high wages which are sometimes given to labor. But it can always purchase such a quantity of labor as it can maintain, according to the rate at which the sort of labor is commonly maintained in the neighborhood.

“But land, in almost any situation, produces a greater quantity of food than what is sufficient to maintain all the labor necessary for bringing it to market [... ] The surplus, too, is always more than sufficient to replace the stock which employed that labor, together with its profits. Something, therefore, always remains for a rent to the landlord.” (Adam Smith, op. cit., Vol. I, pp. 132-33.)

“Food is in this manner not only the original source of rent, but every other part of the produce of land which afterwards affords rent derives that part of its value from the improvement of the powers of labor in producing food by means of the improvement and cultivation of land.” (Adam Smith, op. cit., Vol. I, p. 150.)

“Human food seems to be the only produce of land which always and necessarily affords some rent to the landlord.” (Op. cit., Vol. I, p. 147.)

“Countries are populous not in proportion to the number of people whom their produce can clothe and lodge, but in proportion to that of those whom it can feed.” (Adam Smith, op. cit., Vol. I, p. 149.)

“After food, clothing and lodging are the two great wants of mankind.” They usually yield a rent, but not inevitably. (Op. cit., Vol. I, p. 147.)

<sup>15</sup> Let us now see how the landlord exploits everything from which society benefits.

(1) The rent of land increases with population. (Adam Smith, op. cit., Vol. I, p. 146.)

(2) We have already learnt from Say how the rent of land increases with railways, etc., with the improvement, safety, and multiplication of the means of communication.

(3) “Every improvement in the circumstances of the society tends either directly or indirectly to raise the real rent of land, to increase the real wealth of the landlord, his power of purchasing the labor, or the produce of the labor of other people.

“The extension of improvement and cultivation tends to raise it directly. The landlord’s share of the produce necessarily increases with the increase of the produce.

“That rise in the real price of those parts of the rude produce of land [...] the rise in the price of cattle, for example, tends too to raise the rent of land directly, and in a still greater proportion. The real value of the landlord’s share, his real command of the labor of other people, not only rises with the real value of the produce, but the proportion of his share to the whole produce rises with it. That produce, after

the rise in its real price, requires no more labor to collect it than before. A smaller proportion of it will, therefore, be sufficient to replace, with the ordinary profit, the stock which employs that labor. A greater proportion of it must, consequently, belong to the landlord.” (Adam Smith, *op. cit.*, Vol. I, pp. 228-29.)

The greater demand for raw produce, and therefore the rise in value, may in part result from the increase of population and from the increase of their needs. But every new invention, every new application in manufacture of a previously unused or little-used raw material, augments rent. Thus, for example, there was a tremendous rise in the rent of coal mines with the advent of the railways, steamships, etc.

Besides this advantage which the landlord derives from manufacture, discoveries, and labor, there is yet another, as we shall presently see.

(4) “All those improvements in the productive powers of labor, which tend directly to reduce the real price of manufactures, tend indirectly to raise the real rent of land. The landlord exchanges that part of his rude produce, which is over and above his own consumption, or what comes to the same thing, the price of that part of it, for manufactured produce. Whatever reduces the real price of the latter, raises that of the former. An equal quantity of the former becomes thereby equivalent to a greater quantity of the latter; and the landlord is enabled to purchase a greater quantity of the conveniences, ornaments, or luxuries, which he has occasion for.” (Adam Smith, *op. cit.*, Vol. I, p. 229)

But it is silly to conclude, as Smith does, that since the landlord exploits every benefit which comes to society the interest of the landlord is always identical with that of society. (*Op. cit.*, Vol. I, p. 230.) In the economic system, under the rule of private property, the interest which an individual has in society is in precisely inverse proportion to the interest society has in him — just as the interest of the usurer in the spendthrift is by no means identical with the interest of the spendthrift.

We shall mention only in passing the landlord’s obsession with monopoly directed against the landed property of foreign countries, from which the Corn Laws<sup>16</sup>, for instance, originate. Likewise, we shall here pass over medieval serfdom, the slavery in the colonies, and the miserable condition of the country folk, the day-laborers, in Great Britain. Let us confine ourselves to the propositions of political economy itself.

(1) The landlord being interested in the welfare of society means, according to the principles of political economy, that he is interested in the growth of its population and manufacture, in the expansion of its needs — in short, in the increase of wealth; and this increase of wealth is, as we have already seen, identical with the increase of poverty and slavery. The relation between increasing house rent and increasing poverty is an example of the landlord’s interest in society, for the ground rent, the interest obtained from the land on which the house stands, goes up with the rent of the house.

(2) According to the political economists themselves, the landlord’s interest is inimically opposed to the interest of the tenant farmer—and thus already to a significant section of society.

(3) As the landlord can demand all the more rent from the tenant farmer the less wages the farmer pays, and as the farmer forces down wages all the lower the more rent the landlord demands, it follows that the interest of the landlord is just as hostile to that of the farm workers as is that of the manufacturers to their workers. He likewise forces down wages to the minimum.

(4) Since a real reduction in the price of manufactured products raises the rent of land, the landowner has a direct interest in lowering the wages of industrial workers, in competition amongst the capitalists, in over-production, in all the misery associated with industrial production.

(5) While, thus, the landlord's interest, far from being identical with the interest of society, stands inimically opposed to the interest of tenant farmers, farm laborers, factory workers and capitalists, on the other hand, the interest of one landlord is not even identical with that of another, on account of the competition which we will now consider.

In general the relationship of large and small landed property is like that of big and small capital. But in addition, there are special circumstances which lead inevitably to the accumulation of large landed property and to the absorption of small property by it.

(1) Nowhere does the relative number of workers and implements decrease more with increases in the size of the stock than in landed property. Likewise, the possibility of all-round exploitation, of economizing production costs, and of effective division of labor, increases nowhere more with the size of the stock than in landed property. However small a field may be, it requires for its working a certain irreducible minimum of implements (plough, saw, etc.), whilst the size of a piece of landed property can be reduced far below this minimum.

(2) Big landed property accumulates to itself the interest on the capital which the tenant farmer has employed to improve the land. Small landed property has to employ its own capital, and therefore does not get this profit at all.

(3) While every social improvement benefits the big estate, it harms small property, because it increases its need for ready cash.

(4) Two important laws concerning this competition remain to be considered:

(a) The rent of the cultivated land, of which the produce is human food, regulates the rent of the greater part of other cultivated land. (Adam Smith, *op. cit.*, Vol. I, p. 144.)

Ultimately, only the big estate can produce such food as cattle, etc. Therefore it regulates the rent of other land and can force it down to a minimum.

The small landed proprietor working on his own land stands then to the big landowner in the same relation as an artisan possessing his own tool to the factory owner. Small property in land has become a mere instrument of labor.<sup>17</sup> Rent entirely disappears for the small proprietor; there remains to him at the most the interest on his capital, and his wages. For rent can be driven down by competition till it is nothing more than the interest on capital not invested by the proprietor.

(b) In addition, we have already learnt that with equal fertility and equally efficient exploitation of lands, mines and fisheries, the produce is proportionate to the size of the capital. Hence the victory of the big landowner. Similarly, where equal capitals are employed the product is proportionate to the fertility. Hence, where capitals are equal, victory goes to the proprietor of the more fertile soil.

(c) "A mine of any kind may be said to be either fertile or barren, according as the quantity of mineral which can be brought from it by a certain quantity of labor is greater or less than what can be brought by an equal quantity from the greater part of other mines of the same kind." (Adam Smith, *op. cit.*, Vol. I, p. 151.)

"The most fertile coal-mine, too, regulates the price of coal at all the other mines in its neighborhood. Both the proprietor and the undertaker of the work find, the one that he can get a greater rent, the other that he can get a greater profit, by somewhat underselling all their neighbors. Their neighbors are soon obliged to sell at the same price, though they cannot so well afford it, and though it always diminishes, and sometimes takes away altogether both their rent and their profit. Some works are abandoned altogether; others can afford no rent, and can be wrought only by the proprietor." (Adam Smith, *op. cit.*, Vol. I, pp. 152-53.)

"After the discovery of the mines of Peru, the silver mines of Europe were, the greater part of them, abandoned.... This was the case, too, with the mines of Cuba

and St. Domingo, and even with the ancient mines of Peru, after the discovery of those of Potosi.” (Op. cit., Vol. I, p. 154.)

What Smith here says of mines applies more or less to landed property generally:

(d) “The ordinary market price of land, it is to be observed, depends everywhere upon the ordinary market rate of interest.... If the rent of land should fall short of the interest of money by a greater difference, nobody would buy land, which would soon reduce its ordinary price. On the contrary, if the advantages should much more than compensate the difference, everybody would buy land, which again would soon raise its ordinary price.” (Op. cit., Vol. I, p. 320.)

From this relation of rent of land to interest on money it follows that rent must fall more and more, so that eventually only the wealthiest people can live on rent. Hence the ever greater competition between landowners who do not lease their land to tenants. Ruin of some of these; further accumulation of large landed property.

This competition has the further consequence that a large part of landed property falls into the hands of the capitalists and that capitalists thus become simultaneously landowners, just as the smaller landowners are on the whole already nothing more than capitalists. Similarly, a section of large landowners become at the same time industrialists.

The final consequence is thus the abolition of the distinction between capitalist and landowner, so that there remain altogether only two classes of the population — the working class and the class of capitalists. This huckstering with landed property, the transformation of landed property into a commodity, constitutes the final overthrow of the old and the final establishment of the money aristocracy.

(1) We will not join in the sentimental tears wept over this by romanticism. Romanticism always confuses the shamefulness of *huckstering the land* with the perfectly rational consequence, inevitable and desirable within the realm of private property, of the *huckstering of private property* in land. In the first place, feudal landed property is already by its very nature huckstered land — the earth which is estranged from man and hence confronts him in the shape of a few great lords.

The domination of the land as an alien power over men is already inherent in feudal landed property. The serf is the adjunct of the land. Likewise, the lord of an entailed estate, the first-born son, belongs to the land. It inherits him. Indeed, the dominion of private property begins with property in land — that is its basis. But in feudal landed property the lord at least *appears* as the king of the estate. Similarly, there still exists the semblance of a more intimate connection between the proprietor and the land than that of mere *material* wealth. The estate is individualized with its lord: it has his rank, is baronial or ducal with him, has his privileges, his jurisdiction, his political position, etc. It appears as the inorganic body of its lord. Hence the proverb *nulle terre sans maître* [There is no land without its master. – Ed.], which expresses the fusion of nobility and landed property. Similarly, the rule of landed property does not appear directly as the rule of mere capital. For those belonging to it, the estate is more like their fatherland. It is a constricted sort of nationality.

In the same way, feudal landed property gives its name to its lord, as does a kingdom to its king. His family history, the history of his house, etc. — all this individualizes the estate for him and makes it literally his house, personifies it. Similarly those working on the estate have not the position of *day-laborers*; but they are in part themselves his property, as are serfs; and in part they are bound to him by ties of respect, allegiance, and duty. His relation to them is therefore directly political, and has likewise a human, intimate side. Customs, character, etc., vary from one estate to another and seem to be one with the land to which they belong; whereas later, it is only his purse and not his character, his individuals, which connects a man with an estate. Finally, the feudal lord does not try to extract the utmost advantage from his land. Rather, he consumes what

is there and calmly leaves the worry of producing to the serfs and the tenants. Such is *nobility's* relationship to landed property, which casts a romantic glory on its lords.

It is necessary that this appearance be abolished — that landed property, the root of private property, be dragged completely into the movement of private property and that it become a commodity; that the rule of the proprietor appear as the undisguised rule of private property, of capital, freed of all political tincture; that the relationship between proprietor and worker be reduced to the economic relationship of exploiter and exploited; that all [ ... ] a personal relationship between the proprietor and his property cease, property becoming merely *objective*, material wealth; that the marriage of convenience should take the place of the marriage of honor with the land; and that the land should likewise sink to the status of a commercial value, like man. It is essential that that which is the root of landed property — filthy self-interest — make its appearance, too, in its cynical form. It is essential that the immovable monopoly turn into the mobile and restless monopoly, into competition; and that the idle enjoyment of the products of other people's blood and sweat turn into a bustling commerce in the same commodity. Lastly, it is essential that in this competition landed property, in the form of capital, manifest its dominion over both the working class and the proprietors themselves who are either being ruined or raised by the laws governing the movement of capital. The medieval proverb *nulle terre sans seigneur* [There is no land without its lord. – Ed.] is thereby replaced by that other proverb, *l'argent n'a pas de maître* [Money knows no master. – Ed.], wherein is expressed the complete domination of dead matter over man.

(2) Concerning the argument of division or non-division of landed property, the following is to be observed.

The *division of landed property* negates the *large-scale monopoly* of property in land — abolishes it; but only by *generalizing* this monopoly. It does not abolish the source of monopoly, private property. It attacks the existing form, but not the essence, of monopoly. The consequence is that it falls victim to the laws of private property. For the division of landed property corresponds to the movement of competition in the sphere of industry. In addition to the economic disadvantages of such a dividing-up of the instruments of labor, and the dispersal of labor (to be clearly distinguished from the division of labor: in separated labor the work is not shared out amongst many, but each carries on the same work by himself, it is a multiplication of the same work), this division [of land], like that competition [in industry], necessarily turns again into accumulation.

Therefore, where the division of landed property takes place, there remains nothing for it but to return to monopoly in a still more malignant form, or to negate, to abolish the division of landed property itself. To do that, however, is not to return to feudal ownership, but to abolish private property in the soil altogether. The first abolition of monopoly is always its generalization, the broadening of its existence. The abolition of monopoly, once it has come to exist in its utmost breadth and inclusiveness, is its total annihilation. Association, applied to land, shares the economic advantage of large-scale landed property, and first brings to realization the original tendency inherent in [land] division, namely, equality. In the same way association also re-establishes, now on a rational basis, no longer mediated by serfdom, overlordship and the silly mysticism of property, the intimate ties of man with the earth, since the earth ceases to be an object of huckstering, and through free labor and free enjoyment becomes once more a true personal property of man. A great advantage of the division of landed property is that the masses, which can no longer resign themselves to servitude, perish through property in a different way than in industry.

As for large landed property, its defenders have always, sophistically, identified the economic advantages offered by large-scale agriculture with large-scale landed property, as if it were not precisely as a result of the abolition of property that this advantage, for one thing, would receive its greatest possible extension, and, for another, only then would be of social benefit. In the same way, they have attacked the huckstering spirit of small landed property, as if large landed

property did not contain huckstering latent within it, even in its feudal form — not to speak of the modern English form, which combines the landlord's feudalism with the tenant farmer's huckstering and industry.

Just as large landed property can return the reproach of monopoly leveled against it by partitioned land, since partitioned land is also based on the monopoly of private property, so can partitioned landed property likewise return to large landed property the reproach of partition, since partition also prevails there, though in a rigid and frozen form. Indeed, private property rests altogether on partitioning. Moreover, just as division of the land leads back to large landed property as a form of capital wealth, so must feudal landed property necessarily lead to partitioning or at least fall into the hands of the capitalists, turn and twist as it may.

For large landed property, as in England, drives the overwhelming majority of the population into the arms of industry and reduces its own workers to utter wretchedness. Thus, it engenders and enlarges the power of its enemy, capital, industry, by throwing poor people and an entire activity of the country on to the other side. It makes the majority of the people of the country industrial and thus opponents of large landed property. Where industry has attained to great power, as in England at the present time, it progressively forces from large landed property its monopoly against foreign countries and throws it into competition with landed property abroad. For under the sway of industry landed property could keep its feudal grandeur secure only by means of monopolies against foreign countries, thereby protecting itself against the general laws of trade, which are incompatible with its feudal character. Once thrown into competition, landed property obeys the laws of competition, like every other commodity subjected to competition. It begins thus to fluctuate, to decrease and to increase, to fly from one hand to another; and no law can keep it any longer in a few predestined hands. The immediate consequence is the splitting up of the land amongst many hands, and in any case subjection to the power of industrial capitals.

Finally, large landed property which has been forcibly preserved in this way and which has begotten by its side a tremendous industry leads to crisis even more quickly than the partitioning of land, in comparison with which the power of industry remains constantly of second rank.

Large landed property, as we see in England, has already cast off its feudal character and adopted an industrial character insofar as it is aiming to make as much money as possible. To the owner it yields the utmost possible rent, to the tenant farmer the utmost possible profit on his capital. The workers on the land, in consequence, have already been reduced to the minimum, and the class of tenant farmers already represents within landed property the power of industry and capital. As a result of foreign competition, rent in most cases can no longer form an independent income. A large number of landowners are forced to displace tenant farmers, some of whom in this way [ ...] sink into the proletariat. On the other hand, many tenant farmers will take over landed property; for the big proprietors, who with their comfortable incomes have mostly given themselves over to extravagance and for the most part are not competent to conduct large-scale agriculture, often possess neither the capital nor the ability for the exploitation of the land. Hence a section of this class, too, is completely ruined. Eventually wages, which have already been reduced to a minimum, must be reduced yet further, to meet the new competition. This then necessarily leads to revolution.

Landed property had to develop in each of these two ways so as to experience in both its necessary downfall, just as industry both in the form of monopoly and in that of competition had to ruin itself so as to learn to believe in man. [XXI]

## [Estranged Labor]

||XXII| We have proceeded from the premises of political economy. We have accepted its language and its laws. We presupposed private property, the separation of labor, capital and land, and of wages, profit of capital and rent of land – likewise division of labor, competition, the concept of exchange value, etc. On the basis of political economy itself, in its own words, we have shown that the worker sinks to the level of a commodity and becomes indeed the most wretched of commodities; that the wretchedness of the worker is in inverse proportion to the power and magnitude of his production; that the necessary result of competition is the accumulation of capital in a few hands, and thus the restoration of monopoly in a more terrible form; and that finally the distinction between capitalist and land rentier, like that between the tiller of the soil and the factory worker, disappears and that the whole of society must fall apart into the two classes – property owners and propertyless workers.

Political economy starts with the fact of private property; it does not explain it to us. It expresses in general, abstract formulas the *material* process through which private property actually passes, and these formulas it then takes for *laws*. It does not *comprehend* these laws – i.e., it does not demonstrate how they arise from the very nature of private property. Political economy throws no light on the cause of the division between labor and capital, and between capital and land. When, for example, it defines the relationship of wages to profit, it takes the interest of the capitalists to be the ultimate cause, i.e., it takes for granted what it is supposed to explain. Similarly, competition comes in everywhere. It is explained from external circumstances. As to how far these external and apparently accidental circumstances are but the expression of a necessary course of development, political economy teaches us nothing. We have seen how exchange itself appears to it as an accidental fact. The only wheels which political economy sets in motion are *greed*, and the *war amongst the greedy – competition*. [After this paragraph the following sentence is crossed out in the manuscript: “We now have to examine the nature of this *material* movement of property.” – *Ed.*]

Precisely because political economy does not grasp the way the movement is connected, it was possible to oppose, for instance, the doctrine of competition to the doctrine of monopoly, the doctrine of the freedom of the crafts to the doctrine of the guild, the doctrine of the division of landed property to the doctrine of the big estate – for competition, freedom of the crafts and the division of landed property were explained and comprehended only as accidental, premeditated and violent consequences of monopoly, of the guild system, and of feudal property, not as their necessary, inevitable and natural consequences.

Now, therefore, we have to grasp the intrinsic connection between private property, greed, the separation of labor, capital and landed property; the connection of exchange and competition, of value and the devaluation of man, of monopoly and competition, etc. – the connection between this whole estrangement and the *money* system.

Do not let us go back to a fictitious primordial condition as the political economist does, when he tries to explain. Such a primordial condition explains nothing; it merely pushes the question away into a grey nebulous distance. The economist assumes in the form of a fact, of an event, what he is supposed to deduce – namely, the necessary relationship between two things – between, for example, division of labor and exchange. Thus the theologian explains the origin of evil by the fall of man – that is, he assumes as a fact, in historical form, what has to be explained.

We proceed from an *actual* economic fact.

The worker becomes all the poorer the more wealth he produces, the more his production increases in power and size. The worker becomes an ever cheaper commodity the more commodities he creates. The *devaluation* of the world of men is in direct proportion to the *increasing value* of the world of things. Labor produces not only commodities; it produces itself

and the worker as a *commodity* – and this at the same rate at which it produces commodities in general.

This fact expresses merely that the object which labor produces – labor's product – confronts it as *something alien*, as a *power independent* of the producer. The product of labor is labor which has been embodied in an object, which has become material: it is the *objectification* of labor. Labor's realization is its objectification. Under these economic conditions this realization of labor appears as *loss of realization* for the workers;<sup>18</sup> objectification as *loss of the object and bondage to it*; appropriation as *estrangement*, as *alienation*.<sup>19</sup>

So much does labor's realization appear as loss of realization that the worker loses realization to the point of starving to death. So much does objectification appear as loss of the object that the worker is robbed of the objects most necessary not only for his life but for his work. Indeed, labor itself becomes an object which he can obtain only with the greatest effort and with the most irregular interruptions. So much does the appropriation of the object appear as estrangement that the more objects the worker produces the less he can possess and the more he falls under the sway of his product, capital.

All these consequences are implied in the statement that the worker is related to the *product of his labor* as to an alien object. For on this premise it is clear that the more the worker spends himself, the more powerful becomes the alien world of objects which he creates over and against himself, the poorer he himself – his inner world – becomes, the less belongs to him as his own. It is the same in religion. The more man puts into God, the less he retains in himself. The worker puts his life into the object; but now his life no longer belongs to him but to the object. Hence, the greater this activity, the more the worker lacks objects. Whatever the product of his labor is, he is not. Therefore, the greater this product, the less is he himself. The *alienation* of the worker in his product means not only that his labor becomes an object, an *external* existence, but that it exists *outside him*, independently, as something alien to him, and that it becomes a power on its own confronting him. It means that the life which he has conferred on the object confronts him as something hostile and alien.

||XXIII| Let us now look more closely at the *objectification*, at the production of the worker; and in it at the *estrangement*, the *loss* of the object, of his product.

The worker can create nothing without *nature*, without the *sensuous external world*. It is the material on which his labor is realized, in which it is active, from which, and by means of which it produces.

But just as nature provides labor with [the] *means of life* in the sense that labor cannot *live* without objects on which to operate, on the other hand, it also provides the *means of life* in the more restricted sense, i.e., the means for the physical subsistence of the *worker* himself.

Thus the more the worker by his labor *appropriates* the external world, sensuous nature, the more he deprives himself of *means of life* in two respects: first, in that the sensuous external world more and more ceases to be an object belonging to his labor – to be his labor's *means of life*; and, second, in that it more and more ceases to be *means of life* in the immediate sense, means for the physical subsistence of the worker.

In both respects, therefore, the worker becomes a servant of his object, first, in that he receives an *object of labor*, i.e., in that he receives *work*, and, secondly, in that he receives *means of subsistence*. This enables him to exist, first as a *worker*; and second, as a *physical subject*. The height of this servitude is that it is only as a *worker* that he can maintain himself as a *physical subject* and that it is only as a *physical subject* that he is a worker.

(According to the economic laws the estrangement of the worker in his object is expressed thus: the more the worker produces, the less he has to consume; the more values he creates, the more valueless, the more unworthy he becomes; the better formed his product, the more deformed becomes the worker; the more civilized his object, the more barbarous becomes the worker; the

more powerful labor becomes, the more powerless becomes the worker; the more ingenious labor becomes, the less ingenious becomes the worker and the more he becomes nature's servant.)

*Political economy conceals the estrangement inherent in the nature of labor by not considering the **direct** relationship between the **worker** (labor) and production.* It is true that labor produces for the rich wonderful things – but for the worker it produces privation. It produces palaces – but for the worker, hovels. It produces beauty – but for the worker, deformity. It replaces labor by machines, but it throws one section of the workers back into barbarous types of labor and it turns the other section into a machine. It produces intelligence – but for the worker, stupidity, cretinism.

*The direct relationship of labor to its products is the relationship of the worker to the objects of his production.* The relationship of the man of means to the objects of production and to production itself is only a *consequence* of this first relationship – and confirms it. We shall consider this other aspect later. When we ask, then, what is the essential relationship of labor we are asking about the relationship of the *worker* to production.

Till now we have been considering the estrangement, the alienation of the worker only in one of its aspects, i.e., the worker's relationship to the products of his labor. But the estrangement is manifested not only in the result but in the act of production, within the producing activity, itself. How could the worker come to face the product of his activity as a stranger, were it not that in the very act of production he was estranging himself from himself? The product is after all but the summary of the activity, of production. If then the product of labor is alienation, production itself must be active alienation, the alienation of activity, the activity of alienation. In the estrangement of the object of labor is merely summarized the estrangement, the alienation, in the activity of labor itself.

What, then, constitutes the alienation of labor?

First, the fact that labor is *external* to the worker, i.e., it does not belong to his intrinsic nature; that in his work, therefore, he does not affirm himself but denies himself, does not feel content but unhappy, does not develop freely his physical and mental energy but mortifies his body and ruins his mind. The worker therefore only feels himself outside his work, and in his work feels outside himself. He feels at home when he is not working, and when he is working he does not feel at home. His labor is therefore not voluntary, but coerced; it is *forced labor*. It is therefore not the satisfaction of a need; it is merely a *means* to satisfy needs external to it. Its alien character emerges clearly in the fact that as soon as no physical or other compulsion exists, labor is shunned like the plague. External labor, labor in which man alienates himself, is a labor of self-sacrifice, of mortification. Lastly, the external character of labor for the worker appears in the fact that it is not his own, but someone else's, that it does not belong to him, that in it he belongs, not to himself, but to another. Just as in religion the spontaneous activity of the human imagination, of the human brain and the human heart, operates on the individual independently of him – that is, operates as an alien, divine or diabolical activity – so is the worker's activity not his spontaneous activity. It belongs to another; it is the loss of his self.

As a result, therefore, man (the worker) only feels himself freely active in his animal functions – eating, drinking, procreating, or at most in his dwelling and in dressing-up, etc.; and in his human functions he no longer feels himself to be anything but an animal. What is animal becomes human and what is human becomes animal.

Certainly eating, drinking, procreating, etc., are also genuinely human functions. But taken abstractly, separated from the sphere of all other human activity and turned into sole and ultimate ends, they are animal functions.

We have considered the act of estranging practical human activity, labor, in two of its aspects. (1) The relation of the worker to the *product of labor* as an alien object exercising power over him. This relation is at the same time the relation to the sensuous external world, to the objects of

nature, as an alien world inimically opposed to him. (2) The relation of labor to the *act of production* within the *labor* process. This relation is the relation of the worker to his own activity as an alien activity not belonging to him; it is activity as suffering, strength as weakness, begetting as emasculating, the worker's *own* physical and mental energy, his personal life – for what is life but activity? – as an activity which is turned against him, independent of him and not belonging to him. Here we have *self-estrangement*, as previously we had the estrangement of the *thing*.

||XXIV| We have still a third aspect of *estranged labor* to deduce from the two already considered.

Man is a species-being,<sup>20</sup> not only because in practice and in theory he adopts the species (his own as well as those of other things) as his object, but – and this is only another way of expressing it – also because he treats himself as the actual, living species; because he treats himself as a *universal* and therefore a free being.

The life of the species, both in man and in animals, consists physically in the fact that man (like the animal) lives on organic nature; and the more universal man (or the animal) is, the more universal is the sphere of inorganic nature on which he lives. Just as plants, animals, stones, air, light, etc., constitute theoretically a part of human consciousness, partly as objects of natural science, partly as objects of art – his spiritual inorganic nature, spiritual nourishment which he must first prepare to make palatable and digestible – so also in the realm of practice they constitute a part of human life and human activity. Physically man lives only on these products of nature, whether they appear in the form of food, heating, clothes, a dwelling, etc. The universality of man appears in practice precisely in the universality which makes all nature his *inorganic* body – both inasmuch as nature is (1) his direct means of life, and (2) the material, the object, and the instrument of his life activity. Nature is man's *inorganic body* – nature, that is, insofar as it is not itself human body. Man *lives* on nature – means that nature is his *body*, with which he must remain in continuous interchange if he is not to die. That man's physical and spiritual life is linked to nature means simply that nature is linked to itself, for man is a part of nature.

In estranging from man (1) nature, and (2) himself, his own active functions, his life activity, estranged labor estranges the *species* from man. It changes for him the *life of the species* into a means of individual life. First it estranges the life of the species and individual life, and secondly it makes individual life in its abstract form the purpose of the life of the species, likewise in its abstract and estranged form.

For labor, *life activity*, *productive life* itself, appears to man in the first place merely as a *means* of satisfying a need – the need to maintain physical existence. Yet the productive life is the life of the species. It is life-engendering life. The whole character of a species, its species-character, is contained in the character of its life activity; and free, conscious activity is man's species-character. Life itself appears only as a *means to life*.

The animal is immediately one with its life activity. It does not distinguish itself from it. It is *its life activity*. Man makes his life activity itself the object of his will and of his consciousness. He has conscious life activity. It is not a determination with which he directly merges. Conscious life activity distinguishes man immediately from animal life activity. It is just because of this that he is a species-being. Or it is only because he is a species-being that he is a conscious being, i.e., that his own life is an object for him. Only because of that is his activity free activity. Estranged labor reverses the relationship, so that it is just because man is a conscious being that he makes his life activity, his *essential being*, a mere means to his *existence*.

In creating a *world of objects* by his personal activity, in his *work upon* inorganic nature, man proves himself a conscious species-being, i.e., as a being that treats the species as his own essential being, or that treats itself as a species-being. Admittedly animals also produce. They build themselves nests, dwellings, like the bees, beavers, ants, etc. But an animal only produces

what it immediately needs for itself or its young. It produces one-sidedly, whilst man produces universally. It produces only under the dominion of immediate physical need, whilst man produces even when he is free from physical need and only truly produces in freedom therefrom. An animal produces only itself, whilst man reproduces the whole of nature. An animal's product belongs immediately to its physical body, whilst man freely confronts his product. An animal forms only in accordance with the standard and the need of the species to which it belongs, whilst man knows how to produce in accordance with the standard of every species, and knows how to apply everywhere the inherent standard to the object. Man therefore also forms objects in accordance with the laws of beauty.

It is just in his work upon the objective world, therefore, that man really proves himself to be a *species-being*. This production is his active species-life. Through this production, nature appears as *his* work and his reality. The object of labor is, therefore, the *objectification of man's species-life*: for he duplicates himself not only, as in consciousness, intellectually, but also actively, in reality, and therefore he sees himself in a world that he has created. In tearing away from man the object of his production, therefore, estranged labor tears from him his *species-life*, his real objectivity as a member of the species and transforms his advantage over animals into the disadvantage that his inorganic body, nature, is taken from him.

Similarly, in degrading spontaneous, free activity to a means, estranged labor makes man's species-life a means to his physical existence.

The consciousness which man has of his species is thus transformed by estrangement in such a way that species [-life] becomes for him a means.

Estranged labor turns thus:

(3) *Man's species-being*, both nature and his spiritual species-property, into a being *alien* to him, into a *means* of his *individual existence*. It estranges from man his own body, as well as external nature and his spiritual aspect, his *human aspect*.

(4) An immediate consequence of the fact that man is estranged from the product of his labor, from his life activity, from his species-being, is the *estrangement of man from man*. When man confronts himself, he confronts the *other* man. What applies to a man's relation to his work, to the product of his labor and to himself, also holds of a man's relation to the other man, and to the other man's labor and object of labor.

In fact, the proposition that man's species-nature is estranged from him means that one man is estranged from the other, as each of them is from man's essential nature.

The estrangement of man, and in fact every relationship in which man [stands] to himself, is realized and expressed only in the relationship in which a man stands to other men.

Hence within the relationship of estranged labor each man views the other in accordance with the standard and the relationship in which he finds himself as a worker.

||XXV| We took our departure from a fact of political economy – the estrangement of the worker and his production. We have formulated this fact in conceptual terms as *estranged, alienated* labor. We have analyzed this concept – hence analyzing merely a fact of political economy.

Let us now see, further, how the concept of estranged, alienated labor must express and present itself in real life.

If the product of labor is alien to me, if it confronts me as an alien power, to whom, then, does it belong?

To a being *other* than myself.

Who is this being?

The *gods*? To be sure, in the earliest times the principal production (for example, the building of temples, etc., in Egypt, India and Mexico) appears to be in the service of the gods, and the

product belongs to the gods. However, the gods on their own were never the lords of labor. No more was *nature*. And what a contradiction it would be if, the more man subjugated nature by his labor and the more the miracles of the gods were rendered superfluous by the miracles of industry, the more man were to renounce the joy of production and the enjoyment of the product to please these powers.

The *alien* being, to whom labor and the product of labor belongs, in whose service labor is done and for whose benefit the product of labor is provided, can only be *man* himself.

If the product of labor does not belong to the worker, if it confronts him as an alien power, then this can only be because it belongs to some *other man than the worker*. If the worker's activity is a torment to him, to another it must give *satisfaction* and pleasure. Not the gods, not nature, but only man himself can be this alien power over man.

We must bear in mind the previous proposition that man's relation to himself becomes for him *objective* and *actual* through his relation to the other man. Thus, if the product of his labor, his labor objectified, is for him an *alien, hostile*, powerful object independent of him, then his position towards it is such that someone else is master of this object, someone who is alien, hostile, powerful, and independent of him. If he treats his own activity as an unfree activity, then he treats it as an activity performed in the service, under the dominion, the coercion, and the yoke of another man.

Every self-estrangement of man, from himself and from nature, appears in the relation in which he places himself and nature to men other than and differentiated from himself. For this reason religious self-estrangement necessarily appears in the relationship of the layman to the priest, or again to a mediator, etc., since we are here dealing with the intellectual world. In the real practical world self-estrangement can only become manifest through the real practical relationship to other men. The medium through which estrangement takes place is itself *practical*. Thus through estranged labor man not only creates his relationship to the object and to the act of production as to powers [in the manuscript *Menschen* (men) instead of *Mächte* (powers). – Ed.] that are alien and hostile to him; he also creates the relationship in which other men stand to his production and to his product, and the relationship in which he stands to these other men. Just as he creates his own production as the loss of his reality, as his punishment; his own product as a loss, as a product not belonging to him; so he creates the domination of the person who does not produce over production and over the product. Just as he estranges his own activity from himself, so he confers upon the stranger an activity which is not his own.

We have until now considered this relationship only from the standpoint of the worker and later on we shall be considering it also from the standpoint of the non-worker.

Through *estranged, alienated labor*, then, the worker produces the relationship to this labor of a man alien to labor and standing outside it. The relationship of the worker to labor creates the relationship to it of the capitalist (or whatever one chooses to call the master of labor). *Private property* is thus the product, the result, the necessary consequence, of *alienated labor*, of the external relation of the worker to nature and to himself.

*Private property* thus results by analysis from the concept of *alienated labor*, i.e., of *alienated man*, of estranged labor, of estranged life, of *estranged man*.

True, it is as a result of the *movement of private property* that we have obtained the concept of *alienated labor* (of *alienated life*) in political economy. But on analysis of this concept it becomes clear that though private property appears to be the reason, the cause of alienated labor, it is rather its consequence, just as the gods are *originally* not the cause but the effect of man's intellectual confusion. Later this relationship becomes reciprocal.

Only at the culmination of the development of private property does this, its secret, appear again, namely, that on the one hand it is the *product* of alienated labor, and that on the other it is the *means* by which labor alienates itself, the *realization of this alienation*.

This exposition immediately sheds light on various hitherto unsolved conflicts.

(1) Political economy starts from labor as the real soul of production; yet to labor it gives nothing, and to private property everything. Confronting this contradiction, Proudhon has decided in favor of labor against private property<sup>21</sup>. We understand, however, that this apparent contradiction is the contradiction of *estranged labor* with itself, and that political economy has merely formulated the laws of estranged labor.

We also understand, therefore, that *wages* and *private property* are identical. Indeed, where the product, as the object of labor, pays for labor itself, there the wage is but a necessary consequence of labor's estrangement. Likewise, in the wage of labor, labor does not appear as an end in itself but as the servant of the wage. We shall develop this point later, and meanwhile will only draw some conclusions. ||XXVI|<sup>22</sup>

An enforced *increase of wages* (disregarding all other difficulties, including the fact that it would only be by force, too, that such an increase, being an anomaly, could be maintained) would therefore be nothing but better *payment for the slave*, and would not win either for the worker or for labor their human status and dignity.

Indeed, even the *equality of wages*, as demanded by Proudhon, only transforms the relationship of the present-day worker to his labor into the relationship of all men to labor. Society is then conceived as an abstract capitalist.

Wages are a direct consequence of estranged labor, and estranged labor is the direct cause of private property. The downfall of the one must therefore involve the downfall of the other.

(2) From the relationship of estranged labor to private property it follows further that the emancipation of society from private property, etc., from servitude, is expressed in the *political* form of the *emancipation of the workers*; not that *their* emancipation alone is at stake, but because the emancipation of the workers contains universal human emancipation – and it contains this because the whole of human servitude is involved in the relation of the worker to production, and all relations of servitude are but modifications and consequences of this relation.

Just as we have derived the concept of *private property* from the concept of *estranged, alienated labor* by *analysis*, so we can develop every *category* of political economy with the help of these two factors; and we shall find again in each category, e.g., trade, competition, capital, money only a *particular* and *developed expression* of these first elements.

But before considering this phenomenon, however, let us try to solve two other problems.

(1) To define the general *nature of private property*, as it has arisen as a result of estranged labor, in its relation to *truly human* and *social property*.

(2) We have accepted the *estrangement of labor*, its *alienation*, as a fact, and we have analyzed this fact. How, we now ask, does *man* come to *alienate*, to estrange, his *labor*? How is this estrangement rooted in the nature of human development? We have already gone a long way to the solution of this problem by *transforming* the question of the *origin of private property* into the question of the relation of *alienated labor* to the course of humanity's development. For when one speaks of *private property*, one thinks of dealing with something external to man. When one speaks of labor, one is directly dealing with man himself. This new formulation of the question already contains its solution.

*As to (1): The general nature of private property and its relation to truly human property.*

Alienated labor has resolved itself for us into two components which depend on one another, or which are but different expressions of one and the same relationship. *Appropriation* appears as *estrangement*, as *alienation*; and *alienation* appears as *appropriation*, *estrangement* as *truly becoming a citizen*.<sup>23</sup>

We have considered the one side – *alienated labor* in relation to the *worker* himself, i.e., the *relation of alienated labor to itself*. The product, the necessary outcome of this relationship, as we

have seen, is the *property relation of the non-worker to the worker and to labor*. *Private property*, as the material, summary expression of alienated labor, embraces both relations – the *relation of the worker to work and to the product of his labor and to the non-worker*, and the relation of the *non-worker to the worker and to the product of his labor*.

Having seen that in relation to the worker who *appropriates* nature by means of his labor, this appropriation appears as estrangement, his own spontaneous activity as activity for another and as activity of another, vitality as a sacrifice of life, production of the object as loss of the object to an alien power, to an *alien* person – we shall now consider the relation to the worker, to labor and its object of this person who is *alien* to labor and the worker.

First it has to be noted that everything which appears in the worker as an *activity of alienation, of estrangement*, appears in the non-worker as a *state of alienation, of estrangement*.

Secondly, that the worker's *real, practical attitude* in production and to the product (as a state of mind) appears in the non-worker who confronting him as a *theoretical* attitude.

||XXVII| *Thirdly*, the non-worker does everything against the worker which the worker does against himself; but he does not do against himself what he does against the worker.

Let us look more closely at these three relations. |XXVII|

[First Manuscript breaks off here.]

## Second Manuscript

### Antithesis of Capital and Labor. Landed Property and Capital

[...] ||XL| forms the interest on his capital. The worker is the subjective manifestation of the fact that capital is man wholly lost to himself, just as capital is the objective manifestation of the fact that labor is man lost to himself. But the worker has the misfortune to be a living capital, and therefore an indigent capital, one which loses its interest, and hence its livelihood, every moment it is not working. The value of the worker as capital rises according to demand and supply, and physically too his existence, his life, was and is looked upon as a supply of a commodity like any other. The worker produces capital, capital produces him – hence he produces himself, and man as worker, as a commodity, is the product of this entire cycle. To the man who is nothing more than a worker – and to him as a worker – his human qualities only exist insofar as they exist for capital alien to him. Because man and capital are alien, foreign to each other, however, and thus stand in an indifferent, external and accidental relationship to each other, it is inevitable that this foreignness should also appear as something real. As soon, therefore, as it occurs to capital (whether from necessity or caprice) no longer to be for the worker, he himself is no longer for himself: he has no work, hence no wages, and since he has no existence as a human being but only as a worker, he can go and bury himself, starve to death, etc. The worker exists as a worker only when he exists for himself as capital; and he exists as capital only when some capital exists for him. The existence of capital is his existence, his life; as it determines the tenor of his life in a manner indifferent to him.

Political economy, therefore, does not recognize the unemployed worker, the workingman, insofar as he happens to be outside this labor relationship. The rascal, swindler, beggar, the unemployed, the starving, wretched and criminal workingman – these are *figures* who do not exist *for political economy* but only for other eyes, those of the doctor, the judge, the gravedigger, and bum-bailiff, etc.; such figures are specters outside its domain. For it, therefore, the worker's needs are but the one *need* – to maintain him *whilst he is working* and insofar as may be necessary to prevent the *race of laborers* from [dying] out. The wages of labor have thus exactly the same significance as the *maintenance* and *servicing* of any other productive instrument, or as the *consumption of capital* in general, required for its reproduction with interest, like the oil which is applied to wheels to keep them turning. Wages, therefore, belong to capital's and the capitalist's *necessary costs*, and must not exceed the bounds of this necessity. It was therefore quite logical for the English factory owners, before the Amendment Bill of 1834, to deduct from the wages of the worker the public charity which he was receiving out of the Poor Rate and to consider this to be an integral part of wages.<sup>24</sup>

Production does not simply produce man as a *commodity*, the *human commodity*, man in the role of *commodity*; it produces him in keeping with this role as a *mentally* and physically *dehumanized* being. – Immorality, deformity, and dulling of the workers and the capitalists. – Its product is the *self-conscious and self-acting commodity* ... the *human commodity*.... Great advance of Ricardo, Mill, etc., on Smith and Say, to declare the *existence* of the human being – the greater or lesser human productivity of the commodity – to be *indifferent* and even *harmful*. Not how many workers are maintained by a given capital, but rather how much interest it brings in, the sum-total of the annual *savings*, is said to be the true purpose of production.

It was likewise a great and consistent advance of modern ||XLI| English political economy, that, whilst elevating *labor* to the position of its *sole* principle, it should at the same time expound with complete clarity the *inverse* relation between wages and interest on capital, and the fact that the capitalist could normally *only* gain by pressing down wages, and vice versa. Not the defrauding

of the consumer, but the capitalist and the worker taking advantage of each other, is shown to be the *normal* relationship.

The relations of private property contain latent within them the relation of private property as *labor*, the relation of private property as *capital*, and the *mutual relation* of these two to one another. There is the production of human activity as *labor* – that is, as an activity quite alien to itself, to man and to nature, and therefore to consciousness and the expression of life – the *abstract* existence of man as a mere *workman* who may therefore daily fall from his filled void into the absolute void – into his social, and therefore actual, non-existence. On the other hand, there is the production of the object of human activity as *capital* – in which all the natural and social characteristic of the object is *extinguished*; in which private property has lost its natural and social quality (and therefore every political and social illusion, and is not associated with any *apparently* human relations); in which the *selfsame* capital remains the *same* in the most diverse natural and social manifestations, totally indifferent to its *real* content. This contradiction, driven to the limit, is of necessity the limit, the culmination, and the downfall of the whole private-property relationship.

It is therefore another great achievement of modern English political economy to have declared rent of land to be the difference in the interest yielded by the worst and the best land under cultivation; to have [exposed] the landowner's romantic illusions – his alleged social importance and the identity of his interest with the interest of society, a view still maintained by *Adam Smith* after the Physiocrats; and to [have] anticipated and prepared the movement of the real world which will transform the landowner into an ordinary, prosaic capitalist, and thus simplify and sharpen the contradiction [between capital and labor] and hasten its resolution. *Land* as *land*, and *rent* as *rent*, have lost their *distinction of rank* and become insignificant *capital* and *interest* – or rather, *capital* and *interest* that signify only money.

The *distinction* between capital and land, between profit and rent, and between both and wages, and *industry*, and *agriculture*, and *immovable* and *movable* private property – this distinction is not rooted in the nature of things, but is a *historical* distinction, a *fixed* historical moment in the formation and development of the contradiction between capital and labor. In industry, etc., as opposed to immovable landed property, is only expressed the way in which [industry] came into being and the contradiction to agriculture in which industry developed. This distinction only continues to exist as a *special* sort of work – as an *essential*, *important* and *life-embracing* distinction – so long as industry (town life) develops *over* and *against* landed property (aristocratic feudal life) and itself continues to bear the feudal character of its opposite in the form of monopoly, craft, guild, corporation, etc., within which labor still has a *seemingly social* significance, still the significance of the *real* community, and has not yet reached the stage of *indifference* to its content, of complete being-for-self<sup>25</sup>, i.e., of abstraction from all other being, and hence has not yet become *liberated* capital.

||XLII| But liberated *industry*, industry constituted for itself as such, and *liberated capital*, are the necessary *development* of labor. The power of industry over its opposite is at once revealed in the emergence of *agriculture* as a real industry, while previously it left most of the work to the soil and to the *slave* of the soil, through whom the land cultivated itself. With the transformation of the slave into a *free* worker – i.e., into a *hireling* – the landlord himself is transformed into a captain of industry, into a capitalist – a transformation which takes place at first through the intermediacy of the *tenant farmer*. The *tenant farmer*, however, is the landowner's representative – the landowner's revealed *secret*: it is only through him that the landowner has his *economic* existence – his existence as a private proprietor – for the rent of his land only exists due to the competition between the farmers.

Thus, in the person of the *tenant farmer* the landlord *has* already become in essence a *common* capitalist. And this must come to pass, too, in actual fact: the capitalist engaged in agriculture –

the tenant – must become a landlord, or vice versa. The tenant's *industrial hucksterism* is the *landowner's* industrial hucksterism, for the being of the former postulates the being of the latter.

But mindful of their contrasting origin, of their line of descent, the landowner knows the capitalist as his insolent, liberated, enriched slave of yesterday and sees himself as a *capitalist* who is threatened by him. The capitalist knows the landowner as the idle, cruel, egotistical master of yesterday; he knows that he injures him as a capitalist, but that it is to industry that he owes all his present social significance, his possessions and his pleasures; he sees in him [the landowner] a contradiction to *free* industry and to *free* capital – to capital independent of every natural limitation. This contradiction [between landowner and capitalist] is extremely bitter, and each side tells the truth about the other. One need only read the attacks of immovable on movable property and vice versa to obtain a clear picture of their respective worthlessness. The landowner lays stress on the noble lineage of his property, on feudal souvenirs or reminiscences, the poetry of recollection, on his romantic disposition, on his political importance, etc.; and when he talks economics, it is *only* agriculture that he holds to be productive. At the same time he depicts his adversary as a sly, hawking, carping, deceitful, greedy, mercenary, rebellious, heart- and soulless person who is estranged from the community and freely trades it away, who breeds, nourishes and cherishes competition, and with it pauperism, crime, and the dissolution of all social bonds, an extorting, pimping, servile, smooth, flattering, fleecing, dried-up *rogue* without honor, principles, poetry, substance, or anything else. (Amongst others see the Physiocrat *Bergasse*, whom Camille Desmoulins flays in his journal, *Révolutions de France et de Brabant*<sup>26</sup>; see von Vincke, Lancizolle, Haller, Leo, Kosegarten and also *Sismondi*.)

[See on the other hand the garrulous, old-Hegelian theologian *Funke* who tells, after Herr Leo, with tears in his eyes how a slave had refused, when serfdom was abolished, to cease being the property of the gentry<sup>27</sup>. See also the *patriotic visions of Justus Möser*, which distinguish themselves by the fact that they never for a moment [...] abandon the respectable, petty-bourgeois "home-baked", ordinary, narrow horizon of the philistine, and which nevertheless remain *pure* fancy. This contradiction has given them such an appeal to the German heart. - Note by Marx.]

Movable property, for its part, points to the miracles of industry and progress. It is the child of modern times, whose legitimate, native-born son it is. It pities its adversary as a simpleton, *unenlightened* about his own nature (and in this it is completely right), who wants to replace moral capital and free labor by brute, immoral violence and serfdom. It depicts him as a Don Quixote, who under the guise of *bluntness, respectability, the general interest, and stability*, conceals incapacity for progress, greedy self-indulgence, selfishness, sectional interest, and evil intent. It declares him an artful *monopolist*; it pours cold water on his reminiscences, his poetry, and his romanticism by a historical and sarcastic enumeration of the baseness, cruelty, degradation, prostitution, infamy, anarchy and rebellion, of which romantic castles were the workshops.

||XLIII|| It claims to have obtained political freedom for everybody; to have loosed the chains which fettered civil society; to have linked together different worlds; to have created trade promoting friendship between the peoples; to have created pure morality and a pleasant culture; to have given the people civilized needs in place of their crude wants, and the means of satisfying them. Meanwhile, it claims, the landowner – this idle, parasitic grain-profitteer – raises the price of the people's basic necessities and so forces the capitalist to raise wages without being able to increase productivity, thus impeding [the growth of] the nation's annual income, the accumulation of capital, and therefore the possibility of providing work for the people and wealth for the country, eventually cancelling it, thus producing a general decline – whilst he parasitically exploits *every* advantage of modern civilization without doing the least thing for it, and without even abating in the slightest his feudal prejudices. Finally, let him – for whom the cultivation of the land and the land itself exist only as a source of money, which comes to him as a present – let him just take a look at his *tenant farmer* and say whether he himself is not a *downright, fantastic*,

*sly* scoundrel who in his heart and in actual fact has for a long time belonged to *free* industry and to *lovely* trade, however much he may protest and prattle about historical memories and ethical or political goals. Everything which he can really advance to justify himself is true only of the *cultivator of the land* (the capitalist and the laborers), of whom the *landowner* is rather the *enemy*. Thus he gives evidence against himself. [Movable property claims that] *without* capital landed property is dead, worthless matter; that its civilized victory has discovered and made human labor the source of wealth in place of the dead thing. (See Paul Louis Courier, Saint-Simon, Ganilh, Ricardo, Mill, McCulloch and Destutt de Tracy and Michel Chevalier.)

The *real* course of development (to be inserted at this point) results in the necessary victory of the *capitalist* over the *landowner* – that is to say, of developed over undeveloped, immature private property – just as in general, movement must triumph over immobility; open, self-conscious baseness over hidden, unconscious baseness; *cupidity* over *self-indulgence*; the avowedly restless, adroit self-interest of *enlightenment* over the parochial, worldly-wise, respectable, idle and fantastic *self-interest of superstition*; and *money* over the other forms of private property.

Those states which sense something of the danger attaching to fully developed free industry, to fully developed pure morality and to fully developed philanthropic trade, try, but in vain, to hold in check the capitalization of landed property.

*Landed property* in its distinction from capital is private property – capital – still afflicted with *local* and political prejudices; it is capital which has not yet extricated itself from its entanglement with the world and found the form proper to itself – capital *not yet fully developed*. It must achieve its abstract, that is, its *pure*, expression in the course of its *cosmogony*.

The character of *private property* is expressed by labor, capital, and the relations between these two. The movement through which these constituents have to pass is:

*First. Unmediated or mediated unity of the two.*

Capital and labor are at first still united. Then, though separated and estranged, they reciprocally develop and promote each other as *positive* conditions.

[*Second.*] *The two in opposition*, mutually excluding each other. The worker knows the capitalist as his own non-existence, and vice versa: each tries to rob the other of his existence.

[*Third.*] *Opposition* of each to itself. Capital = stored-up labor = labor. As such it splits into *capital itself* and its *interest*, and this latter again into *interest and profit*. The capitalist is completely sacrificed. He falls into the working class, whilst the worker (but only exceptionally) becomes a capitalist. Labor as a moment of capital – its *costs*. Thus the wages of labor – a sacrifice of capital.

Splitting of labor into *labor itself* and the *wages of labor*. The worker himself a capital, a commodity.

*Clash of mutual contradictions.* [XLIII]

## Third Manuscript<sup>28</sup>

### [Private Property and Labor. Political Economy as a Product of the Movement of Private Property]

[1] Re. p. XXXVI. The *subjective essence* of private property – *private property* as activity for itself,<sup>29</sup> as *subject*, as *person* – is *labor*. It is therefore evident that only the political economy which acknowledged *labor* as its principle – *Adam Smith* – and which therefore no longer looked upon private property as a mere *condition* external to man – that it is this political economy which has to be regarded on the one hand as a product of the real *energy* and the real *movement* of private property (it is a movement of private property become independent for itself in consciousness – the modern industry as *Self*) – as a product of modern *industry* – and on the other hand, as a force which has quickened and glorified the energy and development of *modern industry* and made it a power in the realm of *consciousness*.

To this enlightened political economy, which has discovered – within private property – the *subjective essence* of wealth, the adherents of the Monetary and Mercantile System, who look upon private property *only as an objective* substance confronting men, seem therefore to be *fetishists*, *Catholics*. *Engels* was therefore right to call *Adam Smith* the *Luther of Political Economy* [See *Outlines of a Critique of Political Economy*]. Just as *Luther* recognized *religion - faith* - as the substance of the external *world* and in consequence stood opposed to Catholic paganism – just as he superseded *external* religiosity by making religiosity the *inner* substance of man - just as he negated the priests outside the layman because he transplanted the priest into laymen's hearts, just so with wealth: wealth as something outside man and independent of him, and therefore as something to be maintained and asserted only in an external fashion, is done away with; that is, this *external, mindless objectivity* of wealth is done away with, with private property being incorporated in man himself and with man himself being recognized as its essence. But as a result man is brought within the orbit of private property, just as with *Luther* he is brought within the orbit of religion. Under the semblance of recognizing man, the political economy whose principle is labor rather carries to its logical conclusion the denial of man, since man himself no longer stands in an external relation of tension to the external substance of private property, but has himself become this tense essence of private property. What was previously *being external to oneself* – man's actual externalization – has merely become the act of externalizing – the process of alienating.

This political economy begins by seeming to acknowledge man (his independence, spontaneity, etc.); then, locating private property in man's own being, it can no longer be conditioned by the local, national or other *characteristics of private property* as of *something existing outside itself*. This political economy, consequently, displays a *cosmopolitan*, universal energy which overthrows every restriction and bond so as to establish itself instead as the *sole* politics, the sole universality, the sole limit and sole bond. Hence it must throw aside this *hypocrisy* in the course of its further development and come out in its complete cynicism. And this it does – untroubled by all the apparent contradictions in which it becomes involved as a result of this theory – by developing the idea of *labor* much *more one-sidedly*, and therefore *more sharply* and *more consistently*, as the *sole essence of wealth*; by proving the implications of this theory to be *anti-human* in character, in contrast to the other, original approach. Finally, by dealing the death-blow to rent – that *last, individual, natural* mode of private property and source of wealth existing independently of the movement of labor, that expression of feudal property, an expression which has already become wholly economic in character and therefore incapable of resisting political economy. (The *Ricardo* school.) There is not merely a relative growth in the *cynicism* of political

economy from Smith through Say to Ricardo, Mill, etc., inasmuch as the implications of *industry* appear more developed and more contradictory in the eyes of the last-named; these later economists also advance in a positive sense constantly and consciously further than their predecessors in their estrangement from man. They do so, however, *only* because their science develops more consistently and truthfully. Because they make private property in its active form the subject, thus simultaneously turning man into the essence – and at the same time turning man as non-essentiality into the essence – the contradiction of reality corresponds completely to the contradictory being which they accept as their principle. Far from refuting it, the ruptured ||| world of industry confirms their *self-ruptured* principle. Their principle is, after all, the principle of this rupture.

The Physiocratic doctrine of *Dr. Quesnay* forms the transition from the Mercantile System to Adam Smith. *Physiocracy* represents directly the decomposition of feudal property in *economic* terms, but it therefore just as directly represents its *economic metamorphosis* and restoration, save that now its language is no longer feudal but economic. All wealth is resolved into *land* and *cultivation* (agriculture). Land is not yet *capital*: it is still a *special* mode of its existence, the validity of which is supposed to lie in, and to *derive from*, its natural peculiarity. Yet land is a general natural *element*, whilst the Mercantile System admits the existence of wealth only in the form of *precious metal*. Thus the *object* of wealth – its matter – has straightway obtained the highest degree of universality within the *bounds of nature*, insofar as even as *nature*, it is immediate objective wealth. And land only exists for *man* through labor, through agriculture.

Thus the subjective essence of wealth has already been transferred to labor. But at the same time agriculture is the only *productive labor*. Hence, labor is not yet grasped in its generality and abstraction: it is still bound to a particular *natural element as its matter*, and it is therefore only recognized in a *particular mode of existence determined by nature*. It is therefore still only a *specific, particular* alienation of man, just as its product is likewise conceived nearly [as] a specific form of wealth – due more to nature than to labor itself. The land is here still recognized as a phenomenon of nature independent of man - not yet as capital, i.e., as an aspect of labor itself. Labor appears, rather, as an aspect of the *land*. But since the fetishism of the old external wealth, of wealth existing only as an object, has been reduced to a very simple natural element, and since its essence – even if only partially and in a particular form – has been recognized within its subjective existence, the necessary step forward has been made in revealing the *general nature* of wealth and hence in the raising up of *labor* in its total absoluteness (i.e., its abstraction) as the *principle*. It is argued against physiocracy that *agriculture*, from the economic point of view – that is to say, from the only valid point of view – does not differ from any other industry; and that the *essence* of wealth, therefore, is not a *specific* form of labor bound to a particular element - a particular expression of labor – but labor in general.

Physiocracy denies *particular*, external, merely objective wealth by declaring labor to be the *essence* of wealth. But for physiocracy labor is at first only the *subjective essence* of landed property. (It takes its departure from the type of property which historically appears as the dominant and acknowledged type.) It turns only landed property into *alienated man*. It annuls its feudal character by declaring *industry* (agriculture) as its *essence*. But it disavows the world of industry and acknowledges the feudal system by declaring *agriculture* to be the *only* industry.

It is clear that if the *subjective essence* of industry is now grasped (of industry in opposition to landed property, i.e., of industry constituting itself as industry), this essence includes within itself its opposite. For just as industry incorporates annulled landed property, the *subjective* essence of industry at the same time incorporates the subjective essence of *landed property*.

Just as landed property is the first form of private property, with industry at first confronting it historically merely as a special kind of property – or, rather, as landed property's liberated slave – so this process repeats itself in the scientific analysis of the *subjective* essence of private property, *labor*. Labor appears at first only as *agricultural labor*, but then asserts itself as *labor* in general.

||III| All wealth has become *industrial* wealth, the *wealth* of labor, and *industry* is accomplished labor, just as the *factory system* is the perfected essence of *industry*, that is of labor, and just as *industrial capital* is the accomplished objective form of private property.

We can now see how it is only at this point that private property can complete its dominion over man and become, in its most general form, a world-historical power.

### [Private Property and Communism]

Re p. XXXIX. The antithesis between *lack of property* and *property*, so long as it is not comprehended as the antithesis of *labor* and *capital*, still remains an indifferent antithesis, not grasped in its *active connection*, in its *internal* relation, not yet grasped as a *contradiction*. It can find expression in this *first* form even without the advanced development of private property (as in ancient Rome, Turkey, etc.). It does not yet *appear* as having been established by private property itself. But labor, the subjective essence of private property as exclusion of property, and capital, objective labor as exclusion of labor, constitute *private property* as its developed state of contradiction – hence a dynamic relationship driving towards resolution.

*Re the same page.* The transcendence of self-estrangement follows the same course as self-estrangement. *Private property* is first considered only in its objective aspect – but nevertheless with labor as its essence. Its form of existence is therefore *capital*, which is to be annulled “as such” (Proudhon). Or a *particular form* of labor – labor leveled down, fragmented, and therefore unfree – is conceived as the source of private property’s *perniciousness* and of its existence in estrangement from men. For instance, *Fourier*, who, like the Physiocrats, also conceives *agricultural labor* to be at least the *exemplary* type, whilst *Saint-Simon* declares in contrast that *industrial labor* as such is the essence, and accordingly aspires to the *exclusive* rule of the industrialists and the improvement of the workers’ condition. Finally, *communism* is the *positive* expression of annulled private property – at first as *universal* private property.

By embracing this relation as a *whole*, communism is:

(1) In its first form only a *generalization* and *consummation* of it [of this relation]. As such it appears in a two-fold form: on the one hand, the dominion of *material* property bulks so large that it wants to destroy *everything* which is not capable of being possessed by all as *private property*. It wants to disregard talent, etc., in an *arbitrary* manner. For it the sole purpose of life and existence is direct, physical *possession*. The category of the *worker* is not done away with, but extended to all men. The relationship of private property persists as the relationship of the community to the world of things. Finally, this movement of opposing universal private property to private property finds expression in the brutish form of opposing to *marriage* (certainly a *form of exclusive private property*) the *community of women*, in which a woman becomes a piece of *communal* and *common* property. It may be said that this idea of the *community of women* gives away the *secret* of this as yet completely crude and thoughtless communism.<sup>30</sup> Just as woman passes from marriage to general prostitution, [Prostitution is only a specific expression of the general prostitution of the laborer, and since it is a relationship in which falls not the prostitute alone, but also the one who prostitutes – and the latter’s abomination is still greater – the capitalist, etc., also comes under this head. – Note by Marx]<sup>31</sup> so the entire world of wealth (that is, of man’s objective substance) passes from the relationship of exclusive marriage with the owner of private property to a state of universal prostitution with the community. This type of communism – since it negates the *personality* of man in every sphere – is but the logical expression of private property, which is this negation. General *envy* constituting itself as a power is the disguise in which *greed* re-establishes itself and satisfies itself, only in *another* way. The thought of every piece of private property as such is *at least* turned against *wealthier* private property in the form of envy and the urge to reduce things to a common level, so that this envy and urge even constitute the essence of competition. Crude communism [The manuscript has:

Kommunist. – *Ed.*] is only the culmination of this envy and of this leveling-down proceeding from the *preconceived* minimum. It has a *definite, limited* standard. How little this annulment of private property is really an appropriation is in fact proved by the abstract negation of the entire world of culture and civilization, the regression to the *unnatural* ||IV| simplicity of the *poor* and crude man who has few needs and who has not only failed to go beyond private property, but has not yet even reached it.

The community is only a community of *labor*, and of equality of *wages* paid out by communal capital – by the *community* as the universal capitalist. Both sides of the relationship are raised to an *imagined* universality – *labor* as the category in which every person is placed, and *capital* as the acknowledged universality and power of the community.

In the approach to *woman* as the *spoil* and handmaid of communal lust is expressed the infinite degradation in which man exists for himself, for the secret of this approach has its *unambiguous*, decisive, *plain* and undisguised expression in the relation of *man* to *woman* and in the manner in which the *direct* and *natural* species-relationship is conceived. The direct, natural, and necessary relation of person to person is the *relation of man to woman*. In this *natural* species-relationship man's relation to nature is immediately his relation to man, just as his relation to man is immediately his relation to nature – his own *natural* destination. In this relationship, therefore, is *sensuously manifested*, reduced to an observable *fact*, the extent to which the human essence has become nature to man, or to which nature to him has become the human essence of man. From this relationship one can therefore judge man's whole level of development. From the character of this relationship follows how much *man* as a *species-being*, as *man*, has come to be himself and to comprehend himself; the relation of man to woman is the *most natural* relation of human being to human being. It therefore reveals the extent to which man's *natural* behavior has become *human*, or the extent to which the *human* essence in him has become a *natural* essence – the extent to which his *human nature* has come to be *natural* to him. This relationship also reveals the extent to which man's *need* has become a *human* need; the extent to which, therefore, the *other* person as a person has become for him a need – the extent to which he in his individual existence is at the same time a social being.

The first positive annulment of private property – *crude* communism – is thus merely one *form* in which the vileness of private property, which wants to set itself up as the *positive community system*, comes to the surface.

(2) Communism (a) still political in nature – democratic or despotic; (β) with the abolition of the state, yet still incomplete, and being still affected by private property, i.e., by the estrangement of man. In both forms communism already is aware of being reintegration or return of man to himself, the transcendence of human self-estrangement; but since it has not yet grasped the positive essence of private property, and just as little the *human* nature of need, it remains captive to it and infected by it. It has, indeed, grasped its concept, but not its essence.

(3) *Communism* as the *positive* transcendence of *private property* as *human self-estrangement*, and therefore as the real *appropriation* of the *human* essence by and for man; communism therefore as the complete return of man to himself as a *social* (i.e., human) being – a return accomplished consciously and embracing the entire wealth of previous development. This communism, as fully developed naturalism, equals humanism, and as fully developed humanism equals naturalism; it is the *genuine* resolution of the conflict between man and nature and between man and man – the true resolution of the strife between existence and essence, between objectification and self-confirmation, between freedom and necessity, between the individual and the species. Communism is the riddle of history solved, and it knows itself to be this solution.

||V| The entire movement of history, just as its *actual* act of genesis – the birth act of its empirical existence – is, therefore, for its thinking consciousness the *comprehended* and *known* process of its *becoming*. Whereas the still immature communism seeks an *historical* proof for itself – a proof

in the realm of what already exists – among disconnected historical phenomena opposed to private property, tearing single phases from the historical process and focusing attention on them as proofs of its historical pedigree (a hobby-horse ridden hard especially by Cabet, Villegardelle, etc.). By so doing it simply makes clear that by far the greater part of this process contradicts its own claim, and that, if it has ever existed, precisely its being in the *past* refutes its pretension to *reality*.

It is easy to see that the entire revolutionary movement necessarily finds both its empirical and its theoretical basis in the movement of *private property* – more precisely, in that of the economy.

This *material*, immediately *perceptible* private property is the material perceptible expression of *estranged human* life. Its movement – production and consumption – is the *perceptible* revelation of the movement of all production until now, i.e., the realization or the reality of man. Religion, family, state, law, morality, science, art, etc., are only *particular* modes of production, and fall under its general law. The positive transcendence of *private property* as the appropriation of *human* life, is therefore the positive transcendence of all estrangement – that is to say, the return of man from religion, family, state, etc., to his *human*, i.e., *social*, existence. Religious estrangement as such occurs only in the realm of *consciousness*, of man's inner life, but economic estrangement is that of *real life*; its transcendence therefore embraces both aspects. It is evident that the *initial* stage of the movement amongst the various peoples depends on whether the true *recognized* life of the people manifests itself more in consciousness or in the external world – is more ideal or real. Communism begins from the outset (*Owen*) with atheism; but atheism is at first far from being *communism*; indeed, that atheism is still mostly an abstraction.

The philanthropy of atheism is therefore at first only *philosophical*, abstract philanthropy, and that of communism is at once *real* and directly bent on *action*.

We have seen how on the assumption of positively annulled private property man produces man – himself and the other man; how the object, being the direct manifestation of his individuality, is simultaneously his own existence for the other man, the existence of the other man, and that existence for him. Likewise, however, both the material of labor and man as the subject, are the point of departure as well as the result of the movement (and precisely in this fact, that they must constitute the *point of departure*, lies the historical *necessity* of private property). Thus the *social* character is the general character of the whole movement: *just as* society itself produces *man as man*, so is society *produced* by him. Activity and enjoyment, both in their content and in their *mode of existence*, are *social*: *social* [This word is crossed out in the manuscript. – *Ed.*] activity and *social* enjoyment. The *human* aspect of nature exists only for *social* man; for only then does nature exist for him as a *bond* with *man* – as his existence for the other and the other's existence for him – and as the life-element of human reality. Only then does nature exist as the *foundation* of his own *human* existence. Only here has what is to him his *natural* existence become his *human* existence, and nature become man for him. Thus *society* is the complete unity of man with nature – the true resurrection of nature – the consistent naturalism of man and the consistent humanism of nature.

||VI| Social activity and social enjoyment exist by no means *only* in the form of some *directly* communal activity and directly *communal* enjoyment, although *communal* activity and *communal* enjoyment – i.e., activity and enjoyment which are manifested and directly revealed in *real association* with other men – will occur wherever such a *direct* expression of sociability stems from the true character of the activity's content and is appropriate to the nature of the enjoyment.

But also when I am active *scientifically*, etc. – an activity which I can seldom perform in direct community with others – then my activity is *social*, because I perform it as a *man*. Not only is the material of my activity given to me as a social product (as is even the language in which the thinker is active): my *own* existence *is* social activity, and therefore that which I make of myself, I make of myself for society and with the consciousness of myself as a social being.

My *general* consciousness is only the *theoretical* shape of that of which the *living* shape is the *real* community, the social fabric, although at the present day *general* consciousness is an abstraction from real life and as such confronts it with hostility. The *activity* of my general consciousness, as an activity, is therefore also my *theoretical* existence as a social being.

Above all we must avoid postulating “society” again as an abstraction vis-à-vis the individual. The individual *is the social being*. His manifestations of life – even if they may not appear in the direct form of *communal* manifestations of life carried out in association with others – are therefore an expression and confirmation of *social life*. Man’s individual and species-life are not *different*, however much – and this is inevitable – the mode of existence of the individual is a more *particular* or more *general* mode of the life of the species, or the life of the species is a more *particular* or more *general* individual life.

In his *consciousness of species* man confirms his real *social life* and simply repeats his real existence in thought, just as conversely the being of the species confirms itself in species-consciousness and exists for itself in its generality as a thinking being.

Man, much as he may therefore be a *particular* individual (and it is precisely his particularity which makes him an individual, and a real *individual* social being), is just as much the *totality* – the ideal totality – the subjective existence of imagined and experienced society for itself; just as he exists also in the real world both as awareness and real enjoyment of social existence, and as a totality of human manifestation of life.

Thinking and being are thus certainly *distinct*, but at the same time they are in *unity* with each other.

*Death* seems to be a harsh victory of the species over the *particular* individual and to contradict their unity. But the particular individual is only a *particular species-being*, and as such mortal.

<(4) [In the manuscript: “5”. – *Ed.*] Just as *private property* is only the perceptible expression of the fact that man becomes *objective* for himself and at the same time becomes to himself a strange and inhuman object; just as it expresses the fact that the manifestation of his life is the alienation of his life, that his realization is his loss of reality, is an *alien* reality: so, the positive transcendence of private property – i.e., the *perceptible* appropriation for and by man of the human essence and of human life, of objective man, of human *achievements* – should not be conceived merely in the sense of *immediate*, one-sided *enjoyment*, merely in the sense of *possessing*, of *having*. Man appropriates his total essence in a total manner, that is to say, as a whole man. Each of his *human* relations to the world – seeing, hearing, smelling, tasting, feeling, thinking, observing, experiencing, wanting, acting, loving – in short, all the organs of his individual being, like those organs which are directly social in their form, ||VII|| are in their *objective* orientation, or in their *orientation to the object*, the appropriation of the object, the appropriation of *human reality*. Their orientation to the object is the *manifestation of the human reality*, [For this reason it is just as highly varied as the determinations of human essence and activities. – *Note by Marx.*] it is human *activity* and human *suffering*, for suffering, humanly considered, is a kind of self-enjoyment of man.

Private property has made us so stupid and one-sided that an object is only *ours* when we have it – when it exists for us as capital, or when it is directly possessed, eaten, drunk, worn, inhabited, etc., – in short, when it is *used* by us. Although private property itself again conceives all these direct realizations of possession only as *means of life*, and the life which they serve as means is the *life of private property* – labor and conversion into capital.

In the place of *all* physical and mental senses there has therefore come the sheer estrangement of *all* these senses, the sense of *having*. The human being had to be reduced to this absolute poverty in order that he might yield his inner wealth to the outer world. [On the category of “having”, see Hess, in the Philosophy of the Deed].

The transcendence of private property is therefore the complete *emancipation* of all human *senses* and qualities, but it is this emancipation precisely because these senses and attributes have become, subjectively and objectively, *human*. The eye has become a *human eye*, just as its *object* has become a social, *human* object – an object made by man for man. The *senses* have therefore become directly in their practice *theoreticians*. They relate themselves to the *thing* for the sake of the thing, but the thing itself is an *objective human* relation to itself and to man, [In practice I can relate myself to a thing humanly only if the thing relates itself humanly to the human being. – *Note by Marx.*] and vice versa. Need or enjoyment have consequently lost their *egotistical* nature, and nature has lost its mere *utility* by use becoming *human* use.

In the same way, the senses and enjoyment of other men have become my *own* appropriation. Besides these direct organs, therefore, *social* organs develop in the *form* of society; thus, for instance, activity in direct association with others, etc., has become an organ for *expressing* my own *life*, and a mode of appropriating *human* life.

It is obvious that the *human* eye enjoys things in a way different from the crude, non-human eye; the human *ear* different from the crude ear, etc.

We have seen that man does not lose himself in his object only when the object becomes for him a *human* object or objective man. This is possible only when the object becomes for him a *social* object, he himself for himself a social being, just as society becomes a being for him in this object.

On the one hand, therefore, it is only when the objective world becomes everywhere for man in society the world of man's essential powers – human reality, and for that reason the reality of his *own* essential powers – that all *objects* become for him the *objectification* of himself, become objects which confirm and realize his individuality, become *his* objects: that is, *man himself* becomes the object. The *manner* in which they become *his* depends on the *nature of the objects* and on the nature of the *essential power corresponding to it*; for it is precisely the *determinate nature* of this relationship which shapes the particular, *real* mode of affirmation. To the *eye* an object comes to be other than it is to the *ear*, and the object of the eye *is* another object than the object of the *ear*. The specific character of each essential power is precisely its *specific essence*, and therefore also the specific mode of its objectification, of its *objectively actual*, living *being*. Thus man is affirmed in the objective world not only in the act of thinking, ||VIII|| but with *all* his senses.

On the other hand, let us look at this in its subjective aspect. Just as only music awakens in man the sense of music, and just as the most beautiful music has *no* sense for the unmusical ear – is [no] object for it, because my object can only be the confirmation of one of my essential powers, therefore can only exist for me insofar as my essential power exists for itself as a subjective capacity because the meaning of an object for me goes only so far as *my* sense goes (has only a meaning for a sense corresponding to that object) – for this reason the *senses* of the social man *differ* from those of the non-social man. Only through the objectively unfolded richness of man's essential being is the richness of subjective *human* sensibility (a musical ear, an eye for beauty of form – in short, *senses* capable of human gratification, senses affirming themselves as essential powers of *man*) either cultivated or brought into being. For not only the five senses but also the so-called mental senses, the practical senses (will, love, etc.), in a word, *human* sense, the human nature of the senses, comes to be by virtue of *its* object, by virtue of *humanized* nature. The *forming* of the five senses is a labor of the entire history of the world down to the present. The *sense* caught up in crude practical need has only a *restricted sense*.> For the starving man, it is not the human form of food that exists, but only its abstract existence as food. It could just as well be there in its crudest form, and it would be impossible to say wherein this feeding activity differs from that of *animals*. The care-burdened, poverty-stricken man has no *sense* for the finest play; the dealer in minerals sees only the commercial value but not the beauty and the specific character of the mineral: he has no mineralogical sense. Thus, the objectification of the human

essence, both in its theoretical and practical aspects, is required to make man's *sense human*, as well as to create the *human sense* corresponding to the entire wealth of human and natural substance.

<Just as through the movement of *private property*, of its wealth as well as its misery— of its material and spiritual wealth and misery – the budding society finds at hand all the material for this *development*, so *established* society produces man in this entire richness of his being produces the *rich man profoundly endowed with all the senses* – as its enduring reality.>

We see how subjectivism and objectivism, spiritualism and materialism, activity and suffering, only lose their antithetical character, and – thus their existence as such antitheses only within the framework of society; <we see how the resolution of the *theoretical* antitheses is *only* possible in a *practical* way, by virtue of the practical energy of man. Their resolution is therefore by no means merely a problem of understanding, but a *real* problem of life, which *philosophy* could not solve precisely because it conceived this problem as *merely* a theoretical one.

We see how the history of *industry* and the established *objective* existence of industry are the *open* book of *man's essential powers*, the perceptibly existing human *psychology*. Hitherto this was not conceived in its connection with man's *essential being*, but only in an external relation of utility, because, moving in the realm of estrangement, people could only think of man's general mode of being – religion or history in its abstract–general character as politics, art, literature, etc. – ||XI|| as the reality of man's essential powers and *man's species-activity*. We have before us the *objectified essential powers* of man in the form of *sensuous, alien, useful objects*, in the form of estrangement, displayed in *ordinary material industry* (which can be conceived either as a part of that general movement, or that movement can be conceived as a *particular* part of industry, since all human activity hitherto has been labor – that is, industry – activity estranged from itself).

A *psychology* for which this, the part of history existing in the most perceptible and accessible form, remains a closed book, cannot become a genuine, comprehensive and *real* science.> What indeed are we to think of a science which *airily* abstracts from this large part of human labor and which fails to feel its own incompleteness, while such a wealth of human Endeavour, unfolded before it, means nothing more to it than, perhaps, what can be expressed in one word – “need”, “*vulgar need*”?

The *natural sciences* have developed an enormous activity and have accumulated an ever-growing mass of material. Philosophy, however, has remained just as alien to them as they remain to philosophy. Their momentary unity was only a *chimerical illusion*. The will was there, but the power was lacking. Historiography itself pays regard to natural science only occasionally, as a factor of enlightenment, utility, and of some special great discoveries. But natural science has invaded and transformed human life all the more *practically* through the medium of industry; and has prepared human emancipation, although its immediate effect had to be the furthering of the dehumanization of man. *Industry* is the *actual*, historical relationship of nature, and therefore of natural science, to man. If, therefore, industry is conceived as the *exoteric* revelation of man's *essential powers*, we also gain an understanding of the human essence of nature or the natural essence of man. In consequence, natural science will lose its abstractly material – or rather, its idealistic – tendency, and will become the basis of *human* science, as it has already become – albeit in an estranged form – the basis of actual human life, and to assume *one* basis for life and a different basis for *science* is as a matter of course a lie. <The nature which develops in human history – the genesis of human society – is man's *real* nature; hence nature as it develops through industry, even though in an *estranged* form, is true *anthropological* nature.>

*Sense-perception* (see Feuerbach) must be the basis of all science. Only when it proceeds from sense-perception in the twofold form of *sensuous* consciousness and *sensuous* need – is it *true* science. All history is the history of preparing and developing “man” to become the object of *sensuous* consciousness, and turning the requirements of “man as man” into his needs. History

itself is a *real* part of *natural history* – of nature developing into man. Natural science will in time incorporate into itself the science of man, just as the science of man will incorporate into itself natural science: there will be *one* science.

||X| *Man* is the immediate object of natural science; for immediate, *sensuous nature* for man is, immediately, human sensuousness (the expressions are identical) – presented immediately in the form of the *other* man sensuously present for him. Indeed, his own sensuousness first exists as human sensuousness for himself through the *other* man. But *nature* is the immediate object of the *science of man*: the first – object of man – man – is nature, sensuousness; and the particular human sensuous essential powers can only find their self-understanding in the science of the natural world in general, just as they can find their objective realization only in *natural* objects. The element of thought itself – the element of thought's living expression – *language* – is of a sensuous nature. The *social* reality of nature, and *human* natural science, or the *natural science of man*, are identical terms.

<It will be seen how in place of the *wealth and poverty* of political economy come the *rich human being* and the *rich human need*. The *rich* human being is simultaneously the human being *in need* of a totality of human manifestations of life – the man in whom his own realization exists as an inner necessity, as *need*. Not only *wealth*, but likewise the *poverty* of man – under the assumption of socialism<sup>32</sup> – receives in equal measure a human and therefore social significance. Poverty is the passive bond which causes the human being to experience the need of the greatest wealth – the *other* human being. The dominion of the objective being in me, the sensuous outburst of my life activity, is *passion*, which thus becomes here the *activity* of my being.>

(5) A *being* only considers himself independent when he stands on his own feet; and he only stands on his own feet when he owes his *existence* to himself. A man who lives by the grace of another regards himself as a dependent being. But I live completely by the grace of another if I owe him not only the maintenance of my life, but if he has, moreover, *created* my *life* – if he is the *source* of my life. When it is not of my own creation, my life has necessarily a source of this kind outside of it. The *Creation* is therefore an idea very difficult to dislodge from popular consciousness. The fact that nature and man exist on their own account is *incomprehensible* to it, because it contradicts everything *tangible* in practical life.

The creation of the earth has received a mighty blow from *geognosy* – i.e., from the science which presents the formation of the earth, the development of the earth, as a process, as a self-generation. *Generatio aequivoca* is the only practical refutation of the theory of creation.<sup>33</sup>

Now it is certainly easy to say to the single individual what Aristotle has already said: You have been begotten by your father and your mother; therefore in you the mating of two human beings – a species-act of human beings – has produced the human being. You see, therefore, that even physically man owes his existence to man. Therefore you must not only keep sight of the *one* aspect – the *infinite* progression which leads you further to inquire: Who begot my father? Who his grandfather? etc. You must also hold on to the *circular movement* sensuously perceptible in that progress by which man repeats himself in procreation, *man* thus always remaining the subject. You will reply, however: I grant you this circular movement; now grant me the progress which drives me ever further until I ask: Who begot the first man, and nature as a whole? I can only answer you: Your question is itself a product of abstraction. Ask yourself how you arrived at that question. Ask yourself whether your question is not posed from a standpoint to which I cannot reply, because it is wrongly put. Ask yourself whether that progress as such exists for a reasonable mind. When you ask about the creation of nature and man, you are abstracting, in so doing, from man and nature. You postulate them as *non-existent*, and yet you want me to prove them to you as *existing*. Now I say to you: Give up your abstraction and you will also give up your question. Or if you want to hold on to your abstraction, then be consistent, and if you think of man and nature as *non-existent*, ||XI| then think of yourself as non-existent, for you too are surely nature and man. Don't think, don't ask me, for as soon as you think and ask, your

*abstraction* from the existence of nature and man has no meaning. Or are you such an egotist that you conceive everything as nothing, and yet want yourself to exist?

You can reply: I do not want to postulate the nothingness of nature, etc. I ask you about its *genesis*, just as I ask the anatomist about the formation of bones, etc.

But since for the socialist man *the entire so-called history of the world* is nothing but the creation of man through human labor, nothing but the emergence of nature for man, so he has the visible, irrefutable proof of his *birth* through himself, of his *genesis*. Since the *real existence* of man and nature has become evident in practice, through sense experience, because man has thus become evident for man as the being of nature, and nature for man as the being of man, the question about an *alien* being, about a being above nature and man – a question which implies the admission of the unreality of nature and of man – has become impossible in practice. *Atheism*, as the denial of this unreality, has no longer any meaning, for atheism is a *negation of God*, and postulates *the existence of man* through this negation; but socialism as socialism no longer stands in any need of such a mediation. It proceeds from the *theoretically and practically sensuous consciousness* of man and of nature as the *essence*. Socialism is man's *positive self-consciousness*, no longer mediated through the abolition of religion, just as *real life* is man's positive reality, no longer mediated through the abolition of private property, through *communism*. Communism is the positive mode as the negation of the negation, and is hence the *actual* phase necessary for the next stage of historical development in the process of human emancipation and rehabilitation. *Communism* is the necessary form and the dynamic principle of the immediate future, but communism as such is not the goal of human development, the form of human society. ||XI||<sup>34</sup>

### [Human Requirements and Division of Labor Under the Rule of Private Property and Under Socialism. Division of Labor in Bourgeois Society]

||XIV||<sup>35</sup> (7) We have seen what significance, given socialism, the *wealth* of human needs acquires, and what significance, therefore, both a *new mode of production* and a new *object* of production obtain: a new manifestation of the forces of *human* nature and a new enrichment of *human* nature. Under private property their significance is reversed: every person speculates on creating a *new* need in another, so as to drive him to fresh sacrifice, to place him in a new dependence and to seduce him into a new mode of *enjoyment* and therefore economic ruin. Each tries to establish over the other an *alien* power, so as thereby to find satisfaction of his own selfish need. The increase in the quantity of objects is therefore accompanied by an extension of the realm of the alien powers to which man is subjected, and every new product represents a new *potentiality* of mutual swindling and mutual plundering. Man becomes ever poorer as man, his need for *money* becomes ever greater if he wants to master the hostile power. The power of his *money* declines in inverse proportion to the increase in the volume of production: that is, his neediness grows as the *power* of money increases.

The need for money is therefore the true need produced by the economic system, and it is the only need which the latter produces. The *quantity* of money becomes to an ever greater degree its sole *effective* quality. Just as it reduces everything to its abstract form, so it reduces itself in the course of its own movement to *quantitative* being. *Excess* and *intemperance* come to be its true norm.

Subjectively, this appears partly in the fact that the extension of products and needs becomes a *contriving* and ever-*calculating* subservience to inhuman, sophisticated, unnatural and *imaginary* appetites. Private property does not know how to change crude need into *human* need. Its *idealism* is *fantasy*, *caprice* and *whim*; and no eunuch flatters his despot more basely or uses more despicable means to stimulate his dulled capacity for pleasure in order to sneak a favor for

himself than does the industrial eunuch – the producer – in order to sneak for himself a few pieces of silver, in order to charm the golden birds out of the pockets of his dearly beloved neighbors in Christ. He puts himself at the service of the other's most depraved fancies, plays the pimp between him and his need, excites in him morbid appetites, lies in wait for each of his weaknesses – all so that he can then demand the cash for this service of love. (Every product is a bait with which to seduce away the other's very being, his money; every real and possible need is a weakness which will lead the fly to the glue-pot. General exploitation of communal human nature, just as every imperfection in man, is a bond with heaven – an avenue giving the priest access to his heart; every need is an opportunity to approach one's neighbor under the guise of the utmost amiability and to say to him: Dear friend, I give you what you need, but you know the *conditio sine qua non*; you know the ink in which you have to sign yourself over to me; in providing for your pleasure, I fleece you.)

This estrangement manifests itself in part in that the sophistication of needs and of the means [of their satisfaction] on one side produces a bestial barbarization, a complete, crude, abstract simplicity of need, on the other; or rather in that it merely reproduces itself in its opposite. Even the need for fresh air ceases to be a need for the worker. Man returns to a cave dwelling, which is now, however, contaminated with the pestilential breath of civilization, and which he continues to occupy only *precariously*, it being for him an alien habitation which can be withdrawn from him any day – a place from which, if he does XV not pay, he can be thrown out any day. For this mortuary he has to *pay*. A dwelling in the *light*, which Prometheus in Aeschylus designated as one of the greatest boons, by means of which he made the savage into a human being, ceases to exist for the worker. Light, air, etc. – the simplest *animal* cleanliness – ceases to be a need for man. *Filth*, this stagnation and putrefaction of man – the *sewage* of civilization (speaking quite literally) – comes to be the *element of life* for him. Utter, *unnatural* depravation, putrefied nature, comes to be his *life-element*. None of his senses exist any longer, and not only in its human fashion, but in an *inhuman* fashion, and therefore not even in an animal fashion. The crudest *methods* (and *instruments*) of human labor are coming back: the *treadmill* of the Roman slaves, for instance, is the means of production, the means of existence, of many English workers. It is not only that man has no human needs – even his *animal* needs cease to exist. The Irishman no longer knows any need now but the need to *eat*, and indeed only the need to eat *potatoes* – and *scabby potatoes* at that, the worst kind of potatoes. But in each of their industrial towns England and France have already a *little* Ireland. The savage and the animal have at least the need to hunt, to roam, etc. – the need of companionship. The simplification of the machine, of labor is used to make a worker out of the human being still in the making, the completely immature human being, the *child* – whilst the worker has become a neglected child. The machine accommodates itself to the *weakness* of the human being in order to make the *weak* human being into a machine.

<How the multiplication of needs and of the means [of their satisfaction] breeds the absence of needs and of means is demonstrated by the political economist (and the capitalist: in general it is always *empirical* businessmen we are talking about when we refer to political economists, who are their *scientific* confession and aspect). This he shows:

(1) By reducing the worker's need to the barest and most miserable level of physical subsistence, and by reducing his activity to the most abstract mechanical movement; thus he says: Man has no other need either of activity or of enjoyment. For he call this life, *too*, *human* life and existence.

(2) By *counting* the *most meager* form of life (existence) as the standard, indeed, as the general standard – general because it is applicable to the mass of men. He changes the worker into an insensible being lacking all needs, just as he changes his activity into a pure abstraction from all activity. To him, therefore, every *luxury* of the worker seems to be reprehensible, and everything that goes beyond the most abstract need – be it in the realm of passive enjoyment, or a manifestation of activity – seems to him a luxury. Political economy, this science of *wealth*, is therefore simultaneously the science of renunciation, of want, of *saving* – and it actually reaches

the point where it *saves* man the *need* of either fresh *air* or physical *exercise*. This science of marvelous industry is simultaneously the science of *asceticism*, and its true ideal is the *ascetic* but *extortionate* miser and the *ascetic* but *productive* slave. Its moral ideal is the *worker* who takes part of his wages to the savings-bank, and it has even found ready-made a servile *art* which embodies this pet idea: it has been presented, bathed in sentimentality, on the stage. Thus political economy – despite its worldly and voluptuous appearance – is a true moral science, the most moral of all the sciences. Self-renunciation, the renunciation of life and of all human needs, is its principal thesis. The less you eat, drink and buy books; the less you go to the theater, the dance hall, the public house; the less you think, love, theorize, sing, paint, fence, etc., the more you *save* – the *greater* becomes your treasure which neither moths nor rust will devour – your *capital*. The less you *are*, the less you express your own life, the more you *have*, i.e., the greater is your *alienated* life, the greater is the store of your estranged being. Everything ||XVI|| which the political economist takes from you in life and in humanity, he replaces for you in *money* and in *wealth*; and all the things which you cannot do, your money can do. It can eat and, drink, go to the dance hall and the theater; it can travel, it can appropriate art, learning, the treasures of the past, political power – all this it *can* appropriate for you – it can buy all this: it is true *endowment*. Yet being all this, it *wants* to do nothing but create itself, buy itself; for everything else is after all its servant, and when I have the master I have the servant and do not need his servant. All passions and all activity must therefore be submerged in *avarice*. The worker may only have enough for him to want to live, and may only want to live in order to have that.>

It is true that a controversy now arises in the field of political economy. The one side (Lauderdale, Malthus, etc.) recommends *luxury* and execrates thrift. The other (Say, Ricardo, etc.) recommends thrift and execrates luxury. But the former admits that it wants luxury in order to produce *labor* (i.e., absolute thrift); and the latter admits that it recommends thrift in order to produce *wealth* (i.e., luxury). The Lauderdale-Malthus school has the *romantic* notion that avarice alone ought not to determine the consumption of the rich, and it contradicts its own laws in advancing *extravagance* as a direct means of enrichment. Against it, therefore, the other side very earnestly and circumstantially proves that I do not increase but reduce my *possessions* by being extravagant. The Say-Ricardo school is hypocritical in not admitting that it is precisely whim and caprice which determine production. It forgets the “refined needs”; it forgets that there would be no production without consumption; it forgets that as a result of competition production can only become more extensive and luxurious. It forgets that, according to its views, a thing’s value is determined by use, and that use is determined by fashion. It wishes to see only “useful things” produced, but it forgets that production of too many useful things produces too large a *useless* population. Both sides forget that extravagance and thrift, luxury and privation, wealth and poverty are equal.

And you must not only stint the gratification of your immediate senses, as by stinting yourself on food, etc.: you must also spare yourself all sharing of general interests, all sympathy, all trust, etc., if you want to be economical, if you do not want to be ruined by illusions.

<You must make everything that is yours *saleable*, i.e., useful. If I ask the political economist: Do I obey economic laws if I extract money by offering my body for sale, by surrendering it to another’s lust? (The factory workers in France call the prostitution of their wives and daughters the *n*th working hour, which is literally correct.) – Or am I not acting in keeping with political economy if I sell my friend to the Moroccans? (And the direct sale of men in the form of a trade in conscripts, etc., takes place in all civilized countries.) – Then the political economist replies to me: You do not transgress my laws; but see what Cousin Ethics and Cousin Religion have to say about it. My *political economic* ethics and religion have nothing to reproach you with, but – But whom am I now to believe, political economy or ethics? – The ethics of political economy is *acquisition*, work, thrift, sobriety – but political economy promises to satisfy my needs. – The political economy of ethics is the opulence of a good conscience, of virtue, etc.; but how can I

live virtuously if I do not live? And how can I have a good conscience if I do not know anything? It stems from the very nature of estrangement that each sphere applies to me a different and opposite yardstick – ethics one and political economy another; for each is a specific estrangement of man and > ||XVII|| focuses attention on a particular field of estranged essential activity, and each stands in an estranged relation to the other. Thus M. *Michel Chevalier* reproaches Ricardo with having ignored ethics. But Ricardo is allowing political economy to speak its own language, and if it does not speak ethically, this is not Ricardo's fault. M. Chevalier abstracts from political economy insofar as he moralizes, but he really and necessarily ignores ethics insofar as he practices political economy. The relationship of political economy to ethics, if it is other than an arbitrary, contingent and therefore unfounded and unscientific relationship, if it is not being posited for the sake of *appearance* but is meant to be *essential*, can only be the relationship of the laws of political economy to ethics. If there is no such connection, or if the contrary is rather the case, can Ricardo help it? Moreover, the opposition between political economy and ethics is only an *apparent* opposition and just as much no opposition *as it is* an opposition. All that happens is that political economy expresses moral laws *in its own way*.

<Frugality as the principle of political economy is *most brilliantly* shown in its *theory of population*. There are too *many* people. Even the existence of men is a pure luxury; and if the worker is "*ethical*", he will be *sparing* in procreation. (Mill suggests public acclaim for those who prove themselves continent in their sexual relations, and public rebuke for those who sin against such barrenness of marriage.... Is this not ethics, the teaching of asceticism?) The production of people appears as public misery.>

The meaning which production has in relation to the rich is seen *revealed* in the meaning which it has for the poor. Looking upwards the manifestation is always refined, veiled, ambiguous – outward appearance; downwards, it is rough, straightforward, frank – the real thing. The worker's *crude* need is a far greater source of gain than the *refined* need of the rich. The cellar dwellings in London bring more to those who let them than do the palaces; that is to say, with reference to the landlord they constitute *greater wealth*, and thus (to speak the language of political economy) greater *social* wealth.

Industry speculates on the refinement of needs, it speculates however just as much on their *crudeness*, but on their artificially produced crudeness, whose true enjoyment, therefore, is *self-stupefaction* – this *illusory* satisfaction of need this civilization contained *within* the crude barbarism of need. The English gin shops are therefore the *symbolical* representations of private property. Their *luxury* reveals the true relation of industrial luxury and wealth to man. They are therefore rightly the only Sunday pleasures of the people which the English police treats at least mildly. ||XVIII||

||XVIII||<sup>36</sup> We have already seen how the political economist establishes the unity of labor and capital in a variety of ways: (1) Capital is *accumulated labor*. (2) The purpose of capital within production – partly, reproduction of capital with profit, partly, capital as raw material (material of labor), and partly, as an automatically *working instrument* (the machine is capital directly equated with labor) – is *productive labor*. (3) The worker is a capital. (4) Wages belong to costs of capital. (5) In relation to the worker, labor is the reproduction of his life-capital. (6) In relation to the capitalist, labor is an aspect of his capital's activity.

Finally, (7) the political economist postulates the original unity of capital and labor as the unity of the capitalist and the worker; this is the original state of paradise. The way in which these two aspects, ||XIX|| as two persons, confront each other is for the political economist an *accidental* event, and hence only to be explained by reference to external factors. (See Mill.)

The nations which are still dazzled by the *sensuous* glitter of precious metals, and are therefore still fetish-worshippers of metal money, are not yet fully developed money-nations. Contrast of France and England.

The extent to which the solution of theoretical riddles is the task of practice and effected through practice, the extent to which true practice is the condition of a real and positive theory, is shown, for example, in *fetishism*. The sensuous consciousness of the fetish-worshipper is different from that of the Greek, because his sensuous existence is different. The abstract enmity between sense and spirit is necessary so long as the human feeling for nature, the human sense of nature, and therefore also the *natural* sense of *man*, are not yet produced by man's own labor.

*Equality* is nothing but a translation of the German "Ich = Ich"<sup>37</sup> into the French, i.e., political form. Equality as the *basis* of *communism* is its *political* justification, and it is the same as when the German justifies it by conceiving man as *universal self-consciousness*. Naturally, the transcendence of the estrangement always proceeds from that form of the estrangement which is the *dominant* power: in Germany, *self-consciousness*; in France, *equality*, because it is politics; in England, real, material, *practical* need taking only itself as its standard. It is from this standpoint that Proudhon is to be criticized and appreciated.

If we characterize *communism* itself because of its character as negation of the negation, as the appropriation of the human essence through the intermediary of the negation of private property – as being not yet the *true*, self-originating position but rather a position originating from private property [...] in old-German fashion – in the way of Hegel's phenomenology – [...] finished as a *conquered moment* and [...] one might be satisfied by it, in his consciousness [...] of the human being only by *real* [...] transcendence of his thought now as before [...], since with him therefore the real estrangement of the life of man remains, and remains all the more, the more one is conscious of it as such, hence it [the negation of this estrangement] can be accomplished solely by bringing about communism.

In order to abolish the *idea* of private property, the *idea* of communism is quite sufficient. It takes *actual* communist action to abolish actual private property. History will lead to it; and this movement, *which in theory* we already know to be a self-transcending movement, will constitute in actual fact a very rough and protracted process. But we must regard it as a real advance to have at the outset gained a consciousness of the limited character as well as of the goal of this historical movement – and a consciousness which reaches out beyond it.

When communist *artisans* associate with one another, theory, propaganda, etc., is their first end. But at the same time, as a result of this association, they acquire a new need – the need for society – and what appears as a means becomes an end. In this practical process the most splendid results are to be observed whenever French socialist workers are seen together. Such things as smoking, drinking, eating, etc., are no longer means of contact or means that bring them together. Company, association, and conversation, which again has society as its end, are enough for them; the brotherhood of man is no mere phrase with them, but a fact of life, and the nobility of man shines upon us from their work-hardened bodies.

||XX| <When political economy claims that demand and supply always balance each other, it immediately forgets that according to its own claim (theory of population) the supply of *people* always exceeds the demand, and that, therefore, in the essential result of the whole production process – the existence of man – the disparity between demand and supply gets its most striking expression.

The extent to which money, which appears as a means, constitutes true *power* and the sole *end* – the extent to which in general *the* means which turns me into a being, which gives me possession of the alien objective being, is an *end in itself* ... can be clearly seen from the fact that landed property, wherever land is the source of life, and *horse* and *sword*, wherever these are the *true means of life*, are also acknowledged as the true political powers in life. In the Middle Ages a

social estate is emancipated as soon as it is allowed to carry the *sword*. Amongst nomadic peoples it is the *horse* which makes me a free man and a participant in the life of the community.

We have said above that man is regressing to the *cave dwelling*, etc. – but he is regressing to it in an estranged, malignant form. The savage in his cave – a natural element which freely offers itself for his use and protection – feels himself no more a stranger, or rather feels as much at home as a *fish* in water. But the cellar dwelling of the poor man is a hostile element, "a dwelling which remains an alien power and only gives itself up to him insofar as he gives up to it his own blood and sweat" – a dwelling which he cannot regard as his own hearth – where he might at last exclaim: "Here I am at home" – but where instead he finds himself in *someone else's* house, in the house of a *stranger* who always watches him and throws him out if he does not pay his rent. He is also aware of the contrast in quality between his dwelling and a human dwelling that stands in the *other* world, in the heaven of wealth.

Estrangement is manifested not only in the fact that *my* means of life belong to *someone else*, that my desire is the inaccessible possession of *another*, but also in the fact that everything is itself something *different* from itself – that my activity is *something else* and that, finally (and this applies also to the capitalist), all is under [the sway] of *inhuman* power.

There is a form of inactive, extravagant wealth given over wholly to pleasure, the enjoyer of which on the one hand *behaves* as a mere *ephemeral* individual frantically spending himself to no purpose, and also regards the slave-labor of others (human *sweat and blood*) as the prey of his cupidity. He therefore knows man himself, and hence also his own self, as a sacrificed and futile being. With such wealth contempt of man makes its appearance, partly as arrogance and as squandering of what can give sustenance to a hundred human lives, and partly as the infamous illusion that his own unbridled extravagance and ceaseless, unproductive consumption is the condition of the other's *labor* and therefore of his *subsistence*. He regards the realization of the *essential powers* of man only as the realization of his own excesses, his whims and capricious, bizarre notions. This wealth which, on the other hand, again knows wealth as a mere means, as something that is good for nothing but to be annihilated and which is therefore at once slave and master, at once magnanimous and base, capricious, presumptuous, conceited, refined, cultured and witty – this wealth has not yet experienced *wealth* as an utterly *alien power* over itself: it sees in it, rather, only its own power, and [not] wealth but *enjoyment* [is its final] aim.

This [...] <sup>38</sup> and the glittering illusion about the nature of wealth, blinded by sensuous appearances, is confronted by the *working, sober, prosaic, economical* industrialist who is quite enlightened about the nature of wealth, and who, while providing a wider sphere for the other's self-indulgence and paying fulsome flatteries to him in his products (for his products are just so many base compliments to the appetites of the spendthrift), knows how to appropriate for himself in the only *useful* way the other's waning power. If, therefore, industrial wealth appears at first to be the result of extravagant, fantastic wealth, yet its motion, the motion inherent in it, ousts the latter also in an active way. For the fall in the *rate of interest* is a necessary consequence and result of industrial development. The extravagant rentier's means therefore dwindle day by day in *inverse* proportion to the increasing possibilities and pitfalls of pleasure. Consequently, he must either consume his capital, thus ruining himself, or must become an industrial capitalist.... On the other hand, there is a direct, constant rise in the *rent of land* as a result of the course of industrial development; nevertheless, as we have already seen, there must come a time when landed property, like every other kind of property, is bound to fall within the category of profitably self-reproducing capital <sup>39</sup> – and this in fact results from the same industrial development. Thus the squandering landowner, too, must either consume his capital, and thus be ruined, or himself become the farmer of his own estate – an agricultural industrialist.

The diminution in the interest on money, which Proudhon regards as the annulling of capital and as a tendency to socialize capital, is therefore directly rather only a symptom of the total victory of working capital over squandering wealth – i.e., the transformation of all private property into

industrial capital. It is a total victory of private property over all those of its qualities which are still in *appearance* human, and the complete subjection of the owner of private property to the essence of private property – *labor*. To be sure, the industrial capitalist also takes his pleasures. He does not by any means return to the unnatural simplicity of need; but his pleasure is only a side-issue – recreation – something subordinated to production; at the same time it is a *calculated* and, therefore, itself an *economical* pleasure. For he debits it to his capital's expense account, and what is squandered on his pleasure must therefore amount to no more than will be replaced with profit through the reproduction of capital. Pleasure is therefore subsumed under capital, and the pleasure-taking individual under the capital-accumulating individual, whilst formerly the contrary was the case. The decrease in the interest rate is therefore a symptom of the annulment of capital only inasmuch as it is a symptom of the growing domination of capital – of the estrangement which is growing and therefore hastening to its annulment. This is indeed the only way in which that which exists affirms its opposite.>

The quarrel between the political economists about luxury and thrift is, therefore, only the quarrel between that political economy which has achieved clarity about the nature of wealth, and that political economy which is still afflicted with romantic, anti-industrial memories. Neither side, however, knows how to reduce the subject of the controversy to its simple terms, and neither therefore can make short work of the other. [XXI]

[XXXIV]<sup>40</sup> Moreover, *rent of land* qua rent of land has been overthrown, since, contrary to the argument of the Physiocrats which maintains that the landowner is the only true producer, modern political economy has proved that the landowner as such is rather the only completely unproductive rentier. According to this theory, agriculture is the business of the capitalist, who invests his capital in it provided he can expect the usual profit. The claim of the Physiocrats – that landed property, as the sole productive property, should alone pay state taxes and therefore should alone approve them and participate in the affairs of state – is transformed into the opposite position that the tax on the rent of land is the only tax on unproductive income, and is therefore the only tax not detrimental to national production. It goes without saying that from this point of view also the political privilege of landowners no longer follows from their position as principal tax-payers.

Everything which Proudhon conceives as a movement of labor against capital is only the movement of labor in the determination of capital, of *industrial capital*, against capital not consumed *as* capital, i.e., not consumed industrially. And this movement is proceeding along its triumphant road – the road to the victory of *industrial capital*. It is clear, therefore, that only when *labor* is grasped as the essence of private property, can the economic process as such be analyzed in its real concreteness.

*Society*, as it appears to the political economist, is *civil society*<sup>41</sup> in which every individual is a totality of needs and only [XXXV] exists for the other person, as the other exists for him, insofar as each becomes a means for the other. The political economist reduces everything (just as does politics in its *Rights of Man*) to man, i.e., to the individual whom he strips of all determinateness so as to class him as capitalist or worker.

The *division of labor* is the economic expression of the *social character of labor* within the estrangement. Or, since *labor* is only an expression of human activity within alienation, of the manifestation of life as the alienation of life, the *division of labor*, too, is therefore nothing else but the *estranged, alienated* positing of human activity as a *real activity of the species* or as *activity of man as a species-being*.

As for the *essence of the division of labor* – and of course the division of labor had to be conceived as a major driving force in the production of wealth as soon as *labor* was recognized as

the *essence of private property* – i.e., as for the *estranged and alienated form of human activity as an activity of the species* – the political economists are very vague and self-contradictory about it.

*Adam Smith*: “This *division of labor* [...] is not originally the effect of any human wisdom [...]. It is the necessary, [...] slow and gradual consequence of [...] the propensity to truck, barter, and exchange one thing for another. [...] This propensity” to trade is probably a “necessary consequence of the use of reason and of speech [...]. It is common to all men, and to be found in no other race of animals.” The animal, when it is grown up, is entirely independent. “Man has almost constant occasion for the help of others, and it is in vain for him to expect it from their benevolence only. He will be more likely to prevail if he can appeal to their personal interest, and show them that it is for their own advantage to do for him what he requires of them. [...] We address ourselves, not to their *humanity* but to their *self-love*, and never talk to them of *our own necessities* but of their *advantages*. [...]

“As it is by treaty, by barter, and by purchase that we obtain from one another the greater part of those mutual good offices which we stand in need of, so it is this same *trucking* disposition which originally gives occasion to the *division of labor*. In a tribe of hunters or shepherds a particular person makes bows and arrows, for example, with more readiness and dexterity than any other. He frequently exchanges them for cattle or for venison with his companions; and he finds at last that he can in this manner get more cattle and venison than if he himself went to the field to catch them. From a regard to his own interest, therefore, the making of bows, etc., grows to be his chief business [...]

“The difference of *natural talents* in different men [...] is not [...] so much the *cause* as the *effect* of the division of labor.... Without the disposition to truck [...] and exchange, every man must have procured to himself every necessary and conveniency of life [...] All must have had [...] the *same work* to do, and there could have been no such *difference of employment* as could alone give occasion to any great difference of talents.

“As it is this disposition which forms that difference of talents among men so it is this same disposition which renders that difference useful. Many tribes of animals [...] of the same species derive from nature a much more remarkable distinction of genius, than what, antecedent to custom and education, appears to take place among men. By nature a philosopher is not in talent and in intelligence half so different from a street porter, as a mastiff is from a greyhound, or a greyhound from a spaniel, or this last from a shepherd’s dog. Those different tribes of animals, however, though all of the same species, are of scarce any use to one another. The mastiff cannot add to the advantages of his strength ||XXXVI| by making use of the swiftness of the greyhound, etc. The effects of these different talents or grades of intelligence, for want of the power or disposition to barter and exchange, cannot be brought into a common stock, and do not in the least contribute to the better *accommodation* and *conveniency* of the species. Each animal is still obliged to support and defend itself, separately and independently, and derives no sort of advantage from that variety of talents with which nature has distinguished its fellows. Among men, on the contrary, the most dissimilar geniuses are of use to one another; the *different produces* of their respective talents, by the general disposition to truck, barter, and exchange, being brought, as it were, into a common stock, where every man may purchase whatever part of the produce of other men’s industry he has occasion for. [...]

“As it is the power of *exchanging* that gives occasion to the *division of labor*, so the *extent of this division* must always be limited by the *extent of that power*, or, in other words, by the *extent of the market*. When the market is very small, no person can have any encouragement to dedicate himself entirely to one employment, for want of the power to exchange all that surplus part of the produce of his own labor, which is over and above his own consumption, for such parts of the produce of other men’s labor as he has occasion for ...”

In an *advanced* state of society “every man thus lives by exchanging and becomes in some measure a *merchant*, and the *society itself* grows to be what is properly a *commercial society*.” (See Destutt de Tracy [, *Éléments d’idéologie*, Paris, 1826, pp. 68 and 78]: “Society is a series of reciprocal exchanges; *commerce* contains the whole essence of society.”) ... The accumulation of capitals mounts with the division of labor, and vice versa.”

So much for *Adam Smith*.

“If every family produced all that it consumed, society could keep going although no exchange of any sort took place; *without* being *fundamental*, exchange is indispensable in our advanced state of society. The division of labor is a skillful deployment of man’s powers; it increases society’s production – its power and its pleasures – but it curtails, reduces the ability of every person taken individually. Production cannot take place without exchange.”

Thus J. B. *Say*.

“The powers inherent in man are his intelligence and his physical capacity for work. Those which arise from the condition of society consist of the capacity to *divide up labor* and to *distribute different jobs amongst different people* ... and the *power* to exchange *mutual services* and the products which constitute these means. The motive which impels a man to give his services to another is self- interest – he requires a reward for the services rendered. The right of exclusive private property is indispensable to the establishment of exchange amongst men.” “Exchange and division of labor reciprocally condition each other.”

Thus Skarbek.

*Mill* presents developed exchange – *trade* – as a *consequence of the division of labor*.

“The agency of man can be traced to very simple elements. He can, in fact, do nothing more than produce motion. He can move things towards one another, and he can separate them from one another: ||XXXVII| the properties of matter perform all the rest.” “In the employment of labor and machinery, it is often found that the effects can be increased by skillful distribution, by separating all those operations which have any tendency to impede one another, and by bringing together all those operations which can be made in any way to aid one another. As men in general cannot perform many different operations with the same quickness and dexterity with which they can by practice learn to perform a few, it is always an advantage to limit as much as possible the number of operations imposed upon each. For dividing labor, and distributing the powers of men and machinery, to the greatest advantage, it is in most cases necessary to operate upon a large scale; in other words, to produce the commodities in greater masses. It is this advantage which gives existence to the great manufactories; a few of which, placed in the most convenient situations, frequently supply not one country, but many countries, with as much as they desire of the commodity produced.”

Thus *Mill*.

The whole of modern political economy agrees, however, that division of labor and wealth of production, division of labor and accumulation of capital, mutually determine each other; just as it agrees that only private property which is *at liberty* to follow its own course can produce the most useful and comprehensive division of labor.

*Adam Smith's* argument can be summarized as follows: Division of labor bestows on labor infinite productive capacity. It stems from the *propensity to exchange* and *barter*, a specifically human propensity which is probably not accidental, but is conditioned by the use of reason and speech. The motive of those who engage in exchange is not *humanity* but *egoism*. The diversity of human talents is more the effect than the cause of the division of labor, i.e., of exchange. Besides, it is only the latter which makes such diversity useful. The particular attributes of the different breeds within a species of animal are by nature much more marked than the degrees of difference in human aptitude and activity. But because animals are unable to engage in *exchange*, no individual animal benefits from the difference in the attributes of animals of the same species but of different breeds. Animals are unable to combine the different attributes of their species, and are unable to contribute anything to the *common* advantage and comfort of the species. It is otherwise with *men*, amongst whom the most dissimilar talents and forms of activity are of use to one another, *because* they can bring their *different* products together into a common stock, from which each can purchase. As the division of labor springs from the propensity to *exchange*, so it grows and is limited by the *extent of exchange* – by the *extent of the market*. In advanced conditions, every man is a *merchant*, and society is a *commercial society*.

Say regards *exchange* as accidental and not fundamental. Society could exist without it. It becomes indispensable in the advanced state of society. Yet *production* cannot take place *without* it. Division of labor is a *convenient, useful* means – a skillful deployment of human powers for social wealth; but it reduces the *ability of each person* taken *individually*. The last remark is a step forward on the part of Say.

Skarbek distinguishes the *individual* powers *inherent in man* – intelligence and the physical capacity for work – from the powers *derived* from society – *exchange* and *division of labor*, which mutually condition one another. But the necessary premise of exchange is *private property*. Skarbek here expresses in an objective form what Smith, Say, Ricardo, etc., say when they designate *egoism* and *self-interest* as the basis of exchange, and *buying and selling* as the *essential* and *adequate* form of exchange.

Mill presents *trade* as the consequence of the *division of labor*. With him *human* activity is reduced to *mechanical motion*. Division of labor and use of machinery promote wealth of production. Each person must be entrusted with as small a sphere of operations as possible. Division of labor and use of machinery, in their turn, imply large-scale production of wealth, and hence of products. This is the reason for large manufactories.

||XXXVIII| The examination of *division of labor* and *exchange* is of extreme interest, because these are *perceptibly alienated* expressions of human *activity* and *essential power* as a *species-activity* and -power.

To assert that *division of labor* and *exchange* rest on *private property* is nothing but asserting that *labor* is the essence of private property – an assertion which the political economist cannot prove and which we wish to prove for him. Precisely in the fact that *division of labor* and *exchange* are aspects of private property lies the twofold proof, on the one hand that *human* life required *private property* for its realization, and on the other hand that it now requires the supersession of private property.

*Division of labor* and *exchange* are the two *phenomena* which lead the political economist to boast of the social character of his science, while in the same breath he gives unconscious expression to the contradiction in his science – the motivation of society by unsocial, particular interests.

The factors we have to consider are: Firstly, the *propensity to exchange* – the basis of which is found in egoism – is regarded as the cause or reciprocal effect of the division of labor. Say regards exchange as not *fundamental* to the nature of society. Wealth – production – is explained by division of labor and exchange. The impoverishment of individual activity, and its loss of character as a result of the division of labor, are admitted. Exchange and division of labor are acknowledged as the sources of the great *diversity of human talents* – a diversity which in its turn becomes *useful* as a result of exchange. Skarbek divides man's essential powers of production – or productive powers – into two parts: (1) those which are individual and inherent in him – his intelligence and his special disposition, or capacity, for work; and (2) those *derived* from society and not from the actual individual – division of labor and exchange.

Furthermore, the division of labor is limited by the *market*. Human labor is simple *mechanical motion*: the main work is done by the material properties of the objects. The fewest possible operations must be apportioned to any one individual. Splitting-up of labor and concentration of capital; the insignificance of individual production and the production of wealth in large quantities. Meaning of free private property within the division of labor. [XXXVIII]

### [The Power of Money in Bourgeois Society]

[XL] <sup>42</sup> If man's *feelings*, passions, etc., are not merely anthropological phenomena in the [narrower] [This word cannot be clearly deciphered in the manuscript. – *Ed.*] sense, but truly *ontological*<sup>43</sup> affirmation of being (of nature), and if they are only really affirmed because their *object* exists for them as a *sensual* object, then it is clear that:

1. They have by no means merely one mode of affirmation, but rather that the distinct character of their existence, of their life, is constituted by the distinct mode of their affirmation. In what manner the object exists for them, is the characteristic mode of their *gratification*.
2. Wherever the sensuous affirmation is the direct annulment of the object in its independent form (as in eating, drinking, working up of the object, etc.), this is the affirmation of the object.
3. Insofar as man, and hence also his feeling, etc., is *human*, the affirmation of the object by another is likewise his own gratification.
4. Only through developed industry – i.e., through the medium of private property – does the ontological essence of human passion come into being, in its totality as well as in its humanity; the science of man is therefore itself a product of man's own practical activity.
5. The meaning of private property – apart from its estrangement – is the *existence of essential objects* for man, both as objects of enjoyment and as objects of activity.

By possessing the *property* of buying everything, by possessing the property of appropriating all objects, *money* is thus the *object* of eminent possession. The universality of its *property* is the omnipotence of its being. It is therefore regarded as an omnipotent being. Money is the *procurer* between man's need and the object, between his life and his means of life. But *that which* mediates *my* life for me, also *mediates* the existence of other people for me. For me it is the *other* person.

“What, man! confound it, hands and feet  
 And head and backside, all are yours!  
 And what we take while life is sweet,  
 Is that to be declared not ours?  
 Six stallions, say, I can afford,  
 Is not their strength my property?  
 I tear along, a sporting lord,  
 As if their legs belonged to me.”  
 Goethe: *Faust* (Mephistopheles)

Shakespeare in *Timon of Athens*:

“Gold? Yellow, glittering, precious gold? No, Gods,  
 I am no idle votarist! ... Thus much of this will  
 make black white, foul fair,  
 Wrong right, base noble, old young, coward valiant.  
 ... Why, this  
 Will lug your priests and servants from your sides,  
 Pluck stout men’s pillows from below their heads:  
 This yellow slave  
 Will knit and break religions, bless the accursed;  
 Make the hoar leprosy adored, place thieves  
 And give them title, knee and approbation  
 With senators on the bench: This is it  
 That makes the wappen’d widow wed again;  
 She, whom the spital-house and ulcerous sores  
 Would cast the gorge at, this embalms and spices  
 To the April day again. Come, damned earth,  
 Thou common whore of mankind, that putt’s odds  
 Among the rout of nations.”

And also later:

“O thou sweet king-killer, and dear divorce  
 Twixt natural son and sire! thou bright defiler  
 Of Hymen’s purest bed! thou valiant Mars!  
 Thou ever young, fresh, loved and delicate wooer,  
 Whose blush doth thaw the consecrated snow  
 That lies on Dian’s lap! Thou *visible God!*  
 That solder’s close impossibilities,  
 And makest them kiss! That speak’st with every tongue,  
 ||XLII|| To every purpose! O thou touch of hearts!  
 Think, thy slave man rebels, and by thy virtue  
 Set them into confounding odds, that beasts  
 May have the world in empire!”

Shakespeare excellently depicts the real nature of *money*. To understand him, let us begin, first of all, by expounding the passage from Goethe.

That which is for me through the medium of *money* – that for which I can pay (i.e., which money can buy) – that am *I myself*, the possessor of the money. The extent of the power of money is the extent of my power. Money’s properties are my – the possessor’s – properties and essential powers. Thus, what I *am* and *am capable of* is by no means determined by my individuality. I *am* ugly, but I can buy for myself the *most beautiful* of women. Therefore I am not ugly, for the effect of *ugliness* – its deterrent power – is nullified by money. I, according to my individual characteristics, am *lame*, but money furnishes me with twenty-four feet. Therefore I am not lame. I am bad, dishonest, unscrupulous, stupid; but money is honored, and hence its possessor. Money is the supreme good, therefore its possessor is good. Money, besides, saves me the trouble of being dishonest: I am therefore presumed honest. I am *brainless*, but money is the *real brain* of all things and how then should its possessor be brainless? Besides, he can buy clever people for himself, and is he who has [In the manuscript: “is”. – *Ed.*] power over the clever not more clever than the clever? Do not I, who thanks to money am capable of *all* that the human heart longs for, possess all human capacities? Does not my money, therefore, transform all my incapacities into their contrary?

If *money* is the bond binding me to *human* life, binding society to me, connecting me with nature and man, is not money the bond of all *bonds*? Can it not dissolve and bind all ties? Is it not, therefore, also the universal *agent of separation*? It is the *coin* that really *separates* as well as the real *binding agent* – the [...] [In the manuscript one word cannot be deciphered. – Ed.] *chemical* power of society.

Shakespeare stresses especially two properties of money:

1. It is the visible divinity – the transformation of all human and natural properties into their contraries, the universal confounding and distorting of things: impossibilities are soldered together by it.
2. It is the common whore, the common procurer of people and nations.

The distorting and confounding of all human and natural qualities, the fraternization of impossibilities – the *divine power* of money – lies in its *character* as men's estranged, alienating and self-disposing *species-nature*. Money is the alienated *ability of mankind*.

That which I am unable to do as a *man*, and of which therefore all my individual essential powers are incapable, I am able to do by means of *money*. Money thus turns each of these powers into something which in itself it is not – turns it, that is, into its *contrary*.

If I long for a particular dish or want to take the mail-coach because I am not strong enough to go by foot, money fetches me the dish and the mail-coach: that is, it converts my wishes from something in the realm of imagination, translates them from their meditated, imagined or desired existence into their *sensuous, actual* existence – from imagination to life, from imagined being into real being. In effecting this mediation, [money] is the *truly creative* power.

No doubt the *demand* also exists for him who has no money, but his demand is a mere thing of the imagination without effect or existence for me, for a third party, for the [others], [XLIII] and which therefore remains even for me *unreal* and *objectless*. The difference between effective demand based on money and ineffective demand based on my need, my passion, my wish, etc., is the difference between *being* and *thinking*, between the idea which *exists* within me merely as an idea and the idea which exists as a *real object* outside of me.

If I have no money for travel, I have no *need* – that is, no real and realizable need – to travel. If I have the *vocation* for study but no money for it, I have *no* vocation for study – that is, no *effective*, no *true* vocation. On the other hand, if I have really *no* vocation for study but have the will *and* the money for it, I have an *effective* vocation for it. *Money* as the external, universal *medium* and *faculty* (not springing from man as man or from human society as society) for turning an *image into reality* and *reality into a mere image*, transforms the *real essential powers of man and nature* into what are merely abstract notions and therefore *imperfections* and tormenting chimeras, just as it transforms *real imperfections and chimeras* – essential powers which are really impotent, which exist only in the imagination of the individual – into *real powers* and *faculties*. In the light of this characteristic alone, money is thus the general distorting of *individualities* which turns them into their opposite and confers contradictory attributes upon their attributes.

Money, then, appears as this *distorting* power both against the individual and against the bonds of society, etc., which claim to be *entities* in themselves. It transforms fidelity into infidelity, love into hate, hate into love, virtue into vice, vice into virtue, servant into master, master into servant, idiocy into intelligence, and intelligence into idiocy.

Since money, as the existing and active concept of value, confounds and confuses all things, it is the general *confounding* and *confusing* of all things – the world upside-down – the confounding and confusing of all natural and human qualities.

He who can buy bravery is brave, though he be a coward. As money is not exchanged for any one specific quality, for any one specific thing, or for any particular human essential power, but for

the entire objective world of man and nature, from the standpoint of its possessor it therefore serves to exchange every quality for every other, even contradictory, quality and object: it is the fraternization of impossibilities. It makes contradictions embrace.

Assume *man* to be *man* and his relationship to the world to be a human one: then you can exchange love only for love, trust for trust, etc. If you want to enjoy art, you must be an artistically cultivated person; if you want to exercise influence over other people, you must be a person with a stimulating and encouraging effect on other people. Every one of your relations to man and to nature must be a *specific expression*, corresponding to the object of your will, of your *real individual* life. If you love without evoking love in return – that is, if your loving as loving does not produce reciprocal love; if through a *living expression* of yourself as a loving person you do not make yourself a *beloved one*, then your love is impotent – a misfortune. [XLIII]

## [Critique of the Hegelian Dialectic and Philosophy as a Whole]

||XI| (6) This is perhaps the place at which, by way of explanation and justification, we might offer some considerations in regard to the Hegelian dialectic generally and especially its exposition in the *Phänomenologie* and *Logik* and also, lastly, the relation [to it] of the modern critical movement.<sup>44</sup>

So powerful was modern German criticism's preoccupation with the past – so completely was its development entangled with the subject-matter – that here prevailed a completely uncritical attitude to the method of criticizing, together with a complete lack of awareness about the *apparently formal*, but really *vital* question: how do we now stand as regards the Hegelian *dialectic*? This lack of awareness about the relationship of modern criticism to the Hegelian philosophy as a whole and especially to the Hegelian dialectic has been so great that critics like *Strauss* and *Bruno Bauer* still remain within the confines of the Hegelian logic; the former completely so and the latter at least implicitly so in his *Synoptiker* (where, in opposition to *Strauss*, he replaces the substance of “abstract nature” by the “self-consciousness” of abstract man), and even in *Das entdeckte Christenthum*. Thus in *Das entdeckte Christenthum*, for example, you get:

“As though in positing the world, self-consciousness does not posit that which is different [from itself] and in what it is creating it does not create itself, since it in turn annuls the difference between what it has created and itself, since it itself has being only in creating and in the movement – as though its purpose were not this movement?” etc.; or again: “They” (the French materialists) “have not yet been able to see that it is only as the movement of self-consciousness that the movement of the universe has actually come to be for itself, and achieved unity with itself.” [Pp. 113, 114-15.]

Such expressions do not even show any verbal divergence from the Hegelian approach, but on the contrary repeat it word for word.

||XII| How little consciousness there was in relation to the Hegelian dialectic during the act of criticism (*Bauer*, the *Synoptiker*), and how little this consciousness came into being even after the act of material criticism, is proved by *Bauer* when, in his *Die gute Sache der Freiheit*, he dismisses the brash question put by Herr Gruppe – “What about logic now?” – by referring him to future critics.<sup>45</sup>

But even now – now that *Feuerbach* both in his *Thesen* in the *Anekdoten* and, in detail, in the *Philosophie der Zukunft* has in principle overthrown the old dialectic and philosophy; now that that school of criticism, on the other hand, which was incapable of accomplishing this, has all the same seen it accomplished and has proclaimed itself pure, resolute, absolute criticism that has come into the clear with itself; now that this criticism, in its spiritual pride, has reduced the whole process of history to the relation between the rest of the world and itself (the rest of the world, in contrast to itself, falling under the category of “the masses”) and dissolved all dogmatic antitheses into the *single* dogmatic antithesis of its own cleverness and the stupidity of the world – the antithesis of the critical Christ and Mankind, the “*rabble*”; now that daily and hourly it has demonstrated its own excellence against the dullness of the masses; now, finally, that it has proclaimed the critical *Last Judgment* in the shape of an announcement that the day is approaching when the whole of decadent humanity will assemble before it and be sorted by it into groups, each particular mob receiving its *testimonium paupertatis*; now that it has made known in print its superiority to human feelings as well as its superiority to the world, over which it sits enthroned in sublime solitude, only letting fall from time to time from its sarcastic lips the ringing laughter of the Olympian Gods – even now, after all these delightful antics of idealism (i.e., of Young Hegelianism) expiring in the guise of criticism – even now it has not expressed the

suspicion that the time was ripe for a critical settling of accounts with the mother of Young Hegelianism – the Hegelian dialectic – and even had nothing to say about its critical attitude towards the Feuerbachian dialectic. This shows a completely uncritical attitude to itself.

*Feuerbach* is the only one who has a *serious, critical* attitude to the Hegelian dialectic and who has made genuine discoveries in this field. He is in fact the true conqueror of the old philosophy. The extent of his achievement, and the unpretentious simplicity with which he, Feuerbach, gives it to the world, stand in striking contrast to the opposite attitude (of the others).

Feuerbach's great achievement is:

- (1) The proof that philosophy is nothing else but religion rendered into thought and expounded by thought, i.e., another form and manner of existence of the estrangement of the essence of man; hence equally to be condemned;
- (2) The establishment of *true materialism* and of *real science*, by making the social relationship of "man to man" the basic principle of the theory;
- (3) His opposing to the negation of the negation, which claims to be the absolute positive, the self-supporting positive, positively based on itself.

Feuerbach explains the Hegelian dialectic (and thereby justifies starting out from the positive facts which we know by the senses) as follows:

Hegel sets out from the estrangement of substance (in logic, from the infinite, abstractly universal) – from the absolute and fixed abstraction; which means, put popularly, that he sets out from religion and theology.

*Secondly*, he annuls the infinite, and posits the actual, sensuous, real, finite, particular (philosophy, annulment of religion and theology).

*Thirdly*, he again annuls the positive and restores the abstraction, the infinite – restoration of religion and theology.

Feuerbach thus conceives the negation of the negation *only* as a contradiction of philosophy with itself – as the philosophy which affirms theology (the transcendent, etc.) after having denied it, and which it therefore affirms in opposition to itself.

The positive position or self-affirmation and self-confirmation contained in the negation of the negation is taken to be a position which is not yet sure of itself, which is therefore burdened with its opposite, which is doubtful of itself and therefore in need of proof, and which, therefore, is not a position demonstrating itself by its existence – not an acknowledged ||XIII|| position; hence it is directly and immediately confronted by the position of sense-certainty based on itself. [Feuerbach also defines the negation of the negation, the definite concept, as thinking surpassing itself in thinking and as thinking wanting to be directly awareness, nature, reality. – *Note by Marx*<sup>46</sup>]

But because Hegel has conceived the negation of the negation, from the point of view of the positive relation inherent in it, as the true and only positive, and from the point of view of the negative relation inherent in it as the only true act and spontaneous activity of all being, he has only found the *abstract, logical, speculative* expression for the movement of history, which is not yet the real history of man as a given subject, but only the act of creation, the *history of the origin* of man.

We shall explain both the abstract form of this process and the difference between this process as it is in Hegel in contrast to modern criticism, in contrast to the same process in Feuerbach's *Wesen des Christenthums*, or rather the *critical* form of this in Hegel still uncritical process.

Let us take a look at the Hegelian system. One must begin with Hegel's *Phänomenologie*, the true point of origin and the secret of the Hegelian philosophy.

## **Phenomenology.**

### **A. Self-consciousness.**

**I. Consciousness.** (α) Certainty at the level of sense-experience; or the “this” and *meaning*. (β) *Perception*, or the thing with its properties, and *deception*. (γ) Force and understanding, appearance and the supersensible world.

**II. Self-consciousness.** The truth of certainty of self. (a) Independence and dependence of self-consciousness; mastery and servitude. (b) Freedom of self-consciousness. Stoicism, skepticism, the unhappy consciousness.

**III. Reason.** Reason's certainty and reason's truth. (a) Observation as a process of reason. Observation of nature and of self-consciousness. (b) Realization of rational self-consciousness through its own activity. Pleasure and necessity. The law of the heart and the insanity of self-conceit. Virtue and the course of the world. (c) The individuality which is real in and for itself. The spiritual animal kingdom and the deception or the real fact. Reason as lawgiver. Reason which tests laws.

### **B. Mind.**

**I. True mind, ethics.** **II.** Mind in self-estrangement, culture. **III.** Mind certain of itself, morality.

**C. Religion.** *Natural religion; religion of art; revealed religion.*

### **D. Absolute knowledge.**

Hegel's *Encyklopädie*, beginning as it does with logic, with *pure speculative thought*, and ending with *absolute knowledge* – with the self-conscious, self-comprehending philosophic or absolute (i.e., superhuman) abstract mind – is in its entirety nothing but the *display*, the self-objectification, of the *essence* of the philosophic mind, and the philosophic mind is nothing but the estranged mind of the world thinking within its self-estrangement – i.e., comprehending itself abstractly.

*Logic* – mind's *coin of the realm*, the speculative or *mental value* of man and nature – its essence which has grown totally indifferent to all real determinateness, and hence unreal – is *alienated thinking*, and therefore thinking which abstracts from nature and from real man: *abstract thinking*.

Then: *The externality of this abstract thinking ... nature*, as it is for this abstract thinking. Nature is external to it – its self-loss; and it apprehends nature also in an external fashion, as abstract thought, but as alienated abstract thinking. Finally, *mind*, this thinking returning home to its own point of origin – the thinking which as the anthropological, phenomenological, psychological, ethical, artistic and religious mind is not valid for itself, until ultimately it finds itself, and affirms itself, as *absolute knowledge* and hence absolute, i.e., abstract, mind, thus receiving its conscious embodiment in the mode of existence corresponding to it. For its real mode of existence is *abstraction*.

There is a double error in Hegel.

The **first** emerges most clearly in the *Phänomenologie*, the birth-place of the Hegelian philosophy. When, for instance, wealth, state-power, etc., are understood by Hegel as entities estranged from the human being, this only happens in their form as thoughts ... They are thought-entities, and therefore merely an estrangement of *pure*, i.e., abstract, philosophical thinking. The whole process therefore ends with absolute knowledge. It is precisely abstract thought from which these objects are estranged and which they confront with their presumption of reality. The *philosopher* – who is himself an abstract form of estranged man – takes himself as the *criterion* of the estranged world. The whole *history of the alienation process* [*Entäußerungsgeschichte*] and the whole *process of the retraction* of the alienation is therefore nothing but the *history of the*

production of abstract (i.e., absolute) ||XVII||<sup>47</sup> thought – of logical, speculative thought. The estrangement, [Entfremdung] which therefore forms the real interest of the transcendence [Aufhebung] of this alienation [Entäußerung], is the opposition of *in itself and for itself*, of *consciousness and self-consciousness*, of *object and subject* – that is to say, it is the opposition between abstract thinking and sensuous reality or real sensuousness within thought itself. All other oppositions and movements of these oppositions are but the *semblance*, the *cloak*, the *exoteric* shape of these oppositions which alone matter, and which constitute the *meaning* of these other, profane oppositions. It is not the fact that the human being *objectifies himself inhumanly*, in opposition to himself, but the fact that he *objectifies himself* [selbst sich vergegenständlicht] in *distinction* from and in *opposition* to abstract thinking, that constitutes the posited essence of the estrangement [Entfremdung] and the thing to be superseded [aufzuhebende].

||XVIII|| The appropriation of man's essential powers, which have become objects – indeed, alien objects – is thus in the *first place* only an *appropriation* occurring in *consciousness*, in *pure thought*, i.e., in *abstraction*: it is the appropriation of these objects as *thoughts* and as *movements of thought*. Consequently, despite its thoroughly negative and critical appearance and despite the genuine criticism contained in it, which often anticipates far later development, there is already latent in the *Phänomenologie* as a germ, a potentiality, a secret, the uncritical positivism and the equally uncritical idealism of Hegel's later works – that philosophic dissolution and restoration of the existing empirical world.

In the *second place*: the vindication of the objective world for man – for example, the realization that *sensuous* consciousness is not an *abstractly* sensuous consciousness but a *humanly* sensuous consciousness, that religion, wealth, etc., are but the estranged world of *human* objectification, of *man's* essential powers put to work and that they are therefore but the *path* to the true *human* world – this appropriation or the insight into this process appears in Hegel therefore in this form, that *sense*, *religion*, state power, etc., are *spiritual* entities; for only *mind* is the *true* essence of man, and the true form of mind is thinking mind, theological, speculative mind.

The *human character* of nature and of the nature created by history – man's products – appears in the form that they are *products* of abstract mind and as such, therefore, phases of *mind – thought-entities*. The *Phänomenologie* is, therefore, a hidden, mystifying and still uncertain criticism; but inasmuch as it depicts man's *estrangement*, even though man appears only as mind, there lie concealed in it *all* the elements of criticism, already *prepared* and *elaborated* in a manner often rising far above the Hegelian standpoint. The “unhappy consciousness”, the “honest consciousness”, the struggle of the “noble and base consciousness”, etc., etc. – these separate sections contain, but still in an estranged form, the *critical* elements of whole spheres such as religion, the state, civil life, etc. Just as *entities, objects*, appear as thought-entities, so the *subject* is always *consciousness* or *self-consciousness*; or rather the object appears only as *abstract* consciousness, man only as *self-consciousness*: the distinct forms of estrangement which make their appearance are, therefore, only various forms of consciousness and self-consciousness. Just as *in itself* abstract consciousness (the form in which the object is conceived) is merely a moment of distinction of self-consciousness, what appears as the result of the movement is the identity of self-consciousness with consciousness – absolute knowledge – the movement of abstract thought no longer directed outwards but proceeding now only within its own self: that is to say, the dialectic of pure thought is the result. ||XVIII||

||XXIII||<sup>48</sup> The outstanding achievement of Hegel's *Phänomenologie* and of its final outcome, the dialectic of negativity as the moving and generating principle, is thus first that Hegel conceives the self-creation of man as a process, conceives objectification as loss of the object, as alienation and as transcendence of this alienation; that he thus grasps the essence of *labor* and comprehends objective man – true, because real man – as the outcome of man's *own labor*. The *real, active* orientation of man to himself as a species-being, or his manifestation as a real species-being (i.e.,

as a human being), is only possible if he really brings out all his *species-powers* – something which in turn is only possible through the cooperative action of all of mankind, only as the result of history – and treats these powers as objects: and this, to begin with, is again only possible in the form of estrangement.

We shall now demonstrate in detail Hegel's one-sidedness – and limitations as they are displayed in the final chapter of the *Phänomenologie*, "Absolute Knowledge" – a chapter which contains the condensed spirit of the *Phänomenologie*, the relationship of the *Phänomenologie* to speculative dialectic, and also Hegel's *consciousness* concerning both and their relationship to one another.

Let us provisionally say just this much in advance: Hegel's standpoint is that of modern political economy.<sup>49</sup> He grasps *labor* as the *essence* of man – as man's essence which stands the test: he sees only the positive, not the negative side of labor. Labor is man's *coming-to-be* for himself within *alienation*, or as *alienated* man. The only labor which Hegel knows and recognizes is *abstractly mental* labor. Therefore, that which constitutes the essence of philosophy – the *alienation of man who knows himself*, or *alienated science thinking itself* – Hegel grasps as its essence; and in contradistinction to previous philosophy he is therefore able to combine its separate aspects, and to present his philosophy as *the* philosophy. What the other philosophers did – that they grasped separate phases of nature and of human life as phases of self-consciousness, namely, of abstract self-consciousness – is *known* to Hegel as the *doings* of philosophy. Hence his science is absolute.

Let us now turn to our subject.

"Absolute Knowledge". The last chapter of the "*Phänomenologie*".

The main point is that the *object of consciousness* is nothing else but *self-consciousness*, or that the object is only *objectified self-consciousness* – self-consciousness as object. (Positing of man = self-consciousness).

The issue, therefore, is to surmount the *object of consciousness*. *Objectivity* as such is regarded as an *estranged* human relationship which does not correspond to the *essence of man*, to self-consciousness. The *reappropriation* of the objective essence of man, produced within the orbit of estrangement as something alien, therefore denotes not only the annulment of *estrangement*, but of *objectivity* as well. Man, that is to say, is regarded as a *non-objective, spiritual* being.

The movement of *surmounting the object of consciousness* is now described by Hegel in the following way:

The *object* reveals itself not merely as *returning* into the *self* – this is according to Hegel the *one-sided* way of apprehending this movement, the grasping of only one side. Man is equated with self. The self, however, is only the *abstractly* conceived man – man created by abstraction. Man is selfish. His eye, his ear, etc., are *selfish*. In him every one of his essential powers has the quality of *selfhood*. But it is quite false to say on that account "*self-consciousness* has eyes, ears, essential powers". *Self-consciousness* is rather a quality of human nature, of the human eye, etc.; it is not human nature that is a quality of ||XXIV| self-consciousness.

The self-abstracted entity, fixed for itself, is man as *abstract egoist* – *egoism* raised in its pure abstraction to the level of thought. (We shall return to this point later.)

For Hegel the *human being* – *man* – equals *self-consciousness*. All estrangement of the human being is therefore *nothing* but *estrangement of self-consciousness*. The estrangement of self-consciousness is not regarded as an *expression* – reflected in the realm of knowledge and thought – of the *real* estrangement of the human being. Instead, the *actual* estrangement – that which appears real – is according to its *innermost*, hidden nature (which is only brought to light by philosophy) nothing but the *manifestation* of the estrangement of the real human essence, of *self-consciousness*. The science which comprehends this is therefore called *phenomenology*. All

reappropriation of the estranged objective essence appears therefore, as incorporation into self-consciousness: The man who takes hold of his essential being is *merely* the self-consciousness which takes hold of objective essences. Return of the object into the self is therefore the reappropriation of the object.

Expressed in *all its aspects*, the *surmounting of the object of consciousness* means:

- (1) That the object as such presents itself to consciousness as something vanishing.
- (2) That it is the alienation of self-consciousness which posits thinghood.<sup>50</sup>
- (3) That this alienation has, not merely a *negative* but a *positive* significance
- (4) That it has this meaning not merely *for us* or intrinsically, but *for self-consciousness itself*.
- (5) *For self-consciousness*, the negative of the object, or its annulling of itself, has *positive* significance – or it *knows* this futility of the object – because of the fact that it alienates itself, for in this alienation it posits *itself* as object, or, for the sake of the indivisible unity of *being-for-itself*, posits the object as itself.
- (6) On the other hand, this contains likewise the other moment, that self-consciousness has also just as much superseded this alienation and objectivity and resumed them into itself, being thus *at home* in its other-being *as such*.
- (7) This is the movement of consciousness and this is therefore the totality of its moments.
- (8) Consciousness must similarly be related to the object in the totality of its determinations and have comprehended it in terms of each of them. This totality of its determinations makes the object *intrinsically a spiritual being*; and it becomes so in truth for consciousness through the apprehending of each one of the determinations as *self*, or through what was called above the *spiritual attitude* to them.<sup>51</sup>

As to (1): That the object as such presents itself to consciousness as something vanishing – this is the above-mentioned *return of the object into the self*.

As to (2): The *alienation of self-consciousness* posits *thinghood*. Because man equals self-consciousness, his alienated, objective essence, or *thinghood*, equals *alienated self-consciousness*, and *thinghood* is thus posited through this alienation (*thinghood* being *that* which is an *object for man* and an object for him is really only that which is to him an essential object, therefore his *objective* essence. And since it is not *real man*, nor therefore *nature* – man being *human nature* – who as such is made the subject, but only the abstraction of man – self-consciousness, so *thinghood* cannot be anything but alienated self-consciousness). It is only to be expected that a living, natural being equipped and endowed with objective (i.e., material) essential powers should have *real natural objects* of his essence; and that his self-alienation should lead to the positing of a *real*, objective world, but within the framework of *externality*, and, therefore, an overwhelming world not belonging to his own essential being. There is nothing incomprehensible or mysterious in this. It would be mysterious, rather, if it were otherwise. But it is equally clear that a *self-consciousness* by its alienation can posit only *thinghood*, i.e., only an abstract thing, a thing of abstraction and not a *real* thing.<sup>52</sup> It is ||XXVI|| clear, further, that *thinghood* is therefore utterly without any *independence*, any *essentiality* vis-à-vis self-consciousness; that on the contrary it is a mere creature – something *posited* by self-consciousness. And what is posited, instead of confirming itself, is but confirmation of the act of positing which for a moment fixes its energy as the product, and gives it the *semblance* – but only for a moment – of an independent, real substance.

Whenever real, corporeal *man*, man with his feet firmly on the solid ground, man exhaling and inhaling all the forces of nature, *posits* his real, objective *essential powers* as alien objects by his externalisation, it is not the *act of positing* which is the subject in this process: it is the subjectivity of *objective* essential powers, whose action, therefore, must also be something objective. An objective being acts objectively, and he would not act objectively if the objective

did not reside in the very nature of his being. He only creates or posits objects, because he is posited by objects – because at bottom he is nature. In the act of positing, therefore, this objective being does not fall from his state of “pure activity” into a *creating of the object*; on the contrary, his *objective* product only confirms his *objective* activity, his activity as the activity of an objective, natural being.

Here we see how consistent naturalism or humanism is distinct from both idealism and materialism, and constitutes at the same time the unifying truth of both. We see also how only naturalism is capable of comprehending the action of world history.

<Man is directly a *natural being*. As a natural being and as a living natural being he is on the one hand endowed with *natural powers, vital powers* – he is an *active* natural being. These forces exist in him as tendencies and abilities – as *instincts*. On the other hand, as a natural, corporeal, sensuous objective being he is a *suffering*, conditioned and limited creature, like animals and plants. That is to say, the *objects* of his instincts exist outside him, as *objects* independent of him; yet these objects are *objects* that he *needs* – essential objects, indispensable to the manifestation and confirmation of his essential powers. To say that man is a *corporeal*, living, real, sensuous, objective being full of natural vigor is to say that he has *real, sensuous objects* as the object of his being or of his life, or that he can only *express* his life in real, sensuous objects. *To be* objective, natural and sensuous, and at the same time to have object, nature and sense outside oneself, or oneself to be object, nature and sense for a third party, is one and the same thing.>

*Hunger* is a natural *need*; it therefore needs a *nature* outside itself, an *object* outside itself, in order to satisfy itself, to be stilled. Hunger is an acknowledged need of my body for an *object* existing outside it, indispensable to its integration and to the expression of its essential being. The sun is the *object* of the plant – an indispensable object to it, confirming its life – just as the plant is an object of the sun, being an *expression* of the life-awakening power of the sun, of the sun's *objective* essential power.

A being which does not have its nature outside itself is not a *natural* being, and plays no part in the system of nature. A being which has no object outside itself is not an objective being. A being which is not itself an object for some third being has no being for its *object*; i.e., it is not objectively related. Its being is not objective.

||XXVII| A non-objective being is a *non-being*.

Suppose a being which is neither an object itself, nor has an object. Such a being, in the first place, would be the *unique* being: there would exist no being outside it – it would exist solitary and alone. For as soon as there are objects outside me, as soon as I am not *alone*, I am *another* – *another reality* than the object outside me. For this third object I am thus a *different reality* than myself; that is, I am *its* object. Thus, to suppose a being which is not the object of another being is to presuppose that *no* objective being exists. As soon as I have an object, this object has me for an object. But a *non-objective* being is an unreal, non-sensuous thing – a product of mere thought (i.e., of mere imagination) – an abstraction. To be *sensuous*, that is, to be really existing, means to be an object of sense, to be a *sensuous* object, to have sensuous objects outside oneself – objects of one's sensuousness. To be sensuous is to *suffer*.

Man as an objective, sensuous being is therefore a *suffering* being – and because he feels that he suffers, a *passionate* being. Passion is the essential power of man energetically bent on its object.

<But man is not merely a natural being: he is a *human* natural being. That is to say, he is a being for himself. Therefore he is a *species-being*, and has to confirm and manifest himself as such both in his being and in his knowing. Therefore, *human* objects are not natural objects as they immediately present themselves, and neither is *human sense* as it immediately *is* – as it is objectively – *human* sensibility, human objectivity. Neither nature objectively nor nature subjectively is directly given in a form adequate to the human being.> And as everything natural has to *come into being*, *man* too has his act of origin – *history* – which, however, is for him a

known history, and hence as an act of origin it is a conscious self-transcending act of origin. History is the true natural history of man (on which more later).

Thirdly, because this positing of thinghood is itself only an illusion, an act contradicting the nature of pure activity, it has to be canceled again and thinghood denied.

*Re 3, 4, 5 and 6.* (3) This externalization [*Entäußerung*] of consciousness has not merely a *negative* but a *positive* significance, and (4) it has this meaning not merely *for us* or intrinsically, but for consciousness itself. *For consciousness* the negative of the object, its annulling of itself, has *positive* significance – i.e., consciousness *knows* this nullity of the object – because it alienates *itself*; for, in this alienation it *knows* itself as object, or, for the sake of the indivisible unity of *being-for-itself*, the object as itself. (6) On the other hand, there is also this other moment in the process, that consciousness has also just as much superseded this alienation and objectivity and resumed them into itself, being thus *at home* in its *other-being as such*.

As we have already seen, the appropriation of what is estranged and objective, or the annulling of objectivity in the form of *estrangement* (which has to advance from indifferent strangeness to real, antagonistic estrangement), means likewise or even primarily for Hegel that it is *objectivity* which is to be annulled, because it is not the *determinate* character of the object, but rather its *objective* character that is offensive and constitutes estrangement for self-consciousness. The object is therefore something negative, self-annulling – a *nullity*. This nullity of the object has not only a negative but a *positive* meaning for consciousness, since this nullity of the object is precisely the *self-confirmation* of the non-objectivity, of the XXVIII *abstraction* of itself. *For consciousness itself* the nullity of the object has a positive meaning because it *knows* this nullity, the objective being, as *its self-alienation*; because it knows that it exists only as a result of its own self-alienation....

The way in which consciousness is, and in which something is for it, is *knowing*. Knowing is its sole act. Something therefore comes to be for consciousness insofar as the latter *knows* this *something*. Knowing is its sole objective relation.

It, consciousness, then, knows the nullity of the object (i.e., knows the non-existence of the distinction between the object and itself, the non-existence of the object for it) because it knows the object as its *self-alienation*; that is, it knows itself – knows knowing as object – because the object is only the *semblance* of an object, a piece of mystification, which in its essence, however, is nothing else but knowing itself, which has confronted itself with itself and hence has confronted itself with a *nullity* – a something which has *no* objectivity outside the knowing. Or: knowing knows that in relating itself to an object it is only *outside* itself – that it only externalizes itself; that *it itself* only *appears* to itself as an object – or that that which appears to it as an object is only itself.

On the other hand, says Hegel, there is here at the same time this other moment, that consciousness has just as much annulled and reabsorbed this externalisation and objectivity, being thus *at home* in its *other-being as such*.

In this discussion all the illusions of speculation are brought together.

First of *all*: consciousness, self-consciousness, is *at home* in its *other-being as such*. It is therefore – or if we here abstract from the Hegelian abstraction and put the self-consciousness of man instead of self-consciousness – it is *at home* in its *other being as such*. This implies, for one thing, that consciousness (knowing as knowing, thinking as thinking) pretends to be directly the *other* of itself – to be the world of sense, the real world, life – thought surpassing itself in thought (Feuerbach).<sup>53</sup> This aspect is contained herein, inasmuch as consciousness as mere consciousness takes offence not at estranged objectivity, but at *objectivity as such*.

Secondly, this implies that self-conscious man, insofar as he has recognized and superseded the spiritual world (or his world's spiritual, general mode of being) as self-alienation, nevertheless again confirms it in this alienated shape and passes it off as his true mode of being – re-

establishes it, and pretends to be *at home in his other-being as such*. Thus, for instance, after superseding religion, after recognizing religion to be a product of self-alienation he yet finds confirmation of himself in *religion as religion*. Here is the root of Hegel's *false* positivism, or of his merely *apparent* criticism: this is what Feuerbach designated as the positing, negating and re-establishing of religion or theology – but it has to be expressed in more general terms. Thus reason is at home in unreason as unreason. The man who has recognized that he is leading an alienated life in law, politics, etc., is leading his true human life in this alienated life as such. Self-affirmation, self-confirmation *in contradiction* with itself – in contradiction both with the knowledge of and with the essential being of the object – is thus true *knowledge* and *life*.

There can therefore no longer be any question about an act of accommodation on Hegel's part vis-à-vis religion, the state, etc., since this lie is the lie of his principle.

||XXIX| If I *know* religion as *alienated* human self-consciousness, then what I know in it as religion is not my self-consciousness, but my alienated self-consciousness confirmed in it. I therefore know my self-consciousness that belongs to itself, to its very nature, confirmed not in *religion* but rather in *annihilated* and *superseded* religion.

In Hegel, therefore, the negation of the negation is not the confirmation of the true essence, effected precisely through negation of the pseudo-essence. With him the negation of the negation is the confirmation of the pseudo-essence, or of the self-estranged essence in its denial; or it is the denial of this pseudo-essence as an objective being dwelling outside man and independent of him, and its transformation into the subject.

A peculiar role, therefore, is played by the act of *superseding* in which denial and preservation, i.e., affirmation, are bound together.

Thus, for example, in Hegel's philosophy of law, *civil law* superseded equals *morality*, morality superseded equals the *family*, the family superseded equals *civil society*, civil society superseded equals the *state*, the state superseded equals *world history*. In the *actual world* civil law, morality, the family, civil society, the state, etc., remain in existence, only they have become *moments* – states of the existence and being of man – which have no validity in isolation, but dissolve and engender one another, etc. They have become *moments of motion*.

In their actual existence this *mobile* nature of theirs is hidden. It appears and is made manifest only in thought, in philosophy. Hence my true religious existence is my existence in the *philosophy of religion*; my true political existence is my existence in the *philosophy of law*; my true natural existence, existence in the *philosophy of nature*; my true artistic existence, existence in the *philosophy of art*; my true *human* existence, my *existence* in *philosophy*. Likewise the true existence of religion, the state, nature, art, is the *philosophy* of religion, of nature, of the state and of art. If, however, the philosophy of religion, etc., is for me the sole true existence of religion then, too, it is only as a *philosopher of religion* that I am truly religious, and so I deny *real* religious sentiment and the really *religious* man. But at the same time I *assert* them, in part within my own existence or within the alien existence which I oppose to them – for this *is* only their *philosophic* expression – and in part I assert them in their distinct original shape, since for me they represent merely the *apparent* other-being, allegories, forms of their own true existence (i.e., of my *philosophical* existence) hidden under sensuous disguises.

In just the same way, *quality* superseded equals *quantity*, quantity superseded equals *measure*, measure superseded equals *essence*, essence superseded equals *appearance*, appearance superseded equals *actuality*, actuality superseded equals the *concept*, the concept superseded equals *objectivity*, objectivity superseded equals the *absolute idea*, the absolute idea superseded equals *nature*, nature superseded equals *subjective* mind, subjective mind superseded equals *ethical* objective mind, ethical mind superseded equals *art*, art superseded equals *religion*, religion superseded equals *absolute knowledge*.<sup>54</sup>

On the one hand, this act of superseding is a transcending of a conceptual entity; thus, private property *as a concept* is transcended in the *concept* of morality. And because thought imagines itself to be directly the other of itself, to be *sensuous reality* – and therefore takes its own action for *sensuous, real* action – this superseding in thought, which leaves its object in existence in the real world, believes that it has really overcome it. On the other hand, because the object has now become for it a moment of thought, thought takes it in its reality too to be self-confirmation of itself – of self-consciousness, of abstraction.

||XXX| From the one point of view the entity which Hegel *supersedes* in philosophy is therefore not *real* religion, the *real* state, or *real* nature, but religion itself already as an object of knowledge, i.e., *dogmatics*; the same with *jurisprudence, political science* and *natural science*. From the one point of view, therefore, he stands in opposition both to the *real* thing and to immediate, unphilosophic *science* or the unphilosophic *conceptions* of this thing. He therefore contradicts their conventional conceptions. [The conventional conception of theology, jurisprudence, political science, natural science, etc. – *Ed.*]

On the other hand, the religious, etc., man can find in Hegel his final confirmation.

It is now time to formulate the *positive* aspects of the Hegelian dialectic within the realm of estrangement.

(a) *Supersession* as an objective movement of *retracting* the alienation *into self*. This is the insight, expressed within the estrangement, concerning the *appropriation* of the objective essence through the supersession of its estrangement; it is the estranged insight into the *real objectification* of man, into the real appropriation of his objective essence through the annihilation of the estranged character of the objective world, through the supersession of the objective world in its estranged mode of being. In the same way atheism, being the supersession of God, is the advent of theoretic humanism, and communism, as the supersession of private property, is the vindication of real human life as man's possession and thus the advent of practical humanism, or atheism is humanism mediated with itself through the supersession of religion, whilst communism is humanism mediated with itself through the supersession of private property. Only through the supersession of this mediation – which is itself, however, a necessary premise – does positively self-deriving humanism, *positive* humanism, come into being.

But atheism and communism are no flight, no abstraction, no loss of the objective world created by man – of man's essential powers born to the realm of objectivity; they are not a returning in poverty to unnatural, primitive simplicity. On the contrary, they are but the first real emergence, the actual realization for man of man's essence and of his essence as something real.

Thus, by grasping the *positive* meaning of self-referred negation (although again in estranged fashion) Hegel grasps man's self-estrangement, the alienation of man's essence, man's loss of objectivity and his loss of realness as self-discovery, manifestation of his nature, objectification and realization. <In short, within the sphere of abstraction, Hegel conceives labor as man's act of *self-genesis* – conceives man's relation to himself as an alien being and the manifestation of himself as an alien being to be the emergence of *species-consciousness* and *species-life*.>

(b) However, apart from, or rather in consequence of, the referral already described, this act appears in Hegel:

First as a *merely formal*, because abstract, act, because the human being itself is taken to be only an *abstract, thinking being*, conceived merely as self-consciousness. And,

*Secondly*, because the exposition is *formal* and *abstract*, the supersession of the alienation becomes a confirmation of the alienation; or, for Hegel this movement of *self-genesis* and *self-objectification* in the form of *self-alienation* and *self-estrangement* is the absolute, and hence final, *expression of human life* – of life with itself as its aim, of life at peace with itself, and in unity with its essence.

This movement, in its abstract ||XXXI| form as dialectic, is therefore regarded as *truly human life*, and because it is nevertheless an abstraction – an estrangement of human life – it is regarded as a divine process, but as the *divine process* of man, a process traversed by man's abstract, pure, absolute essence that is distinct from himself.

*Thirdly*, this process must have a bearer, a subject. But the subject only comes into being as a result. This result – the subject knowing itself as absolute self-consciousness – is therefore *God, absolute Spirit, the self-knowing and self-manifesting idea*. Real man and real nature become mere predicates – symbols of this hidden, unreal man and of this unreal nature. Subject and predicate are therefore related to each other in absolute reversal – a *mystical subject-object* or a *subjectivity reaching beyond the object* – the *absolute subject* as a *process*, as *subject alienating* itself and returning from alienation into itself, but at the same time retracting this alienation into itself, and the subject as this process; a pure, *incessant* revolving within itself.

*First. Formal and abstract* conception of man's act of self-creation or self-objectification.

Hegel having posited man as equivalent to self-consciousness, the estranged object – the estranged essential reality of man – is nothing but *consciousness*, the thought of estrangement merely – estrangement's *abstract* and therefore empty and unreal expression, *negation*. The supersession of the alienation is therefore likewise nothing but an abstract, empty supersession of that empty abstraction – the *negation of the negation*. The rich, living, sensuous, concrete activity of self-objectification is therefore reduced to its mere abstraction, *absolute negativity* – an abstraction which is again fixed as such and considered as an independent activity – as sheer activity. Because this so-called negativity is nothing but the *abstract, empty* form of that real living act, its content can in consequence be merely a *formal* content produced by abstraction from all content. As a result therefore one gets general, abstract *forms of abstraction* pertaining to every content and on that account indifferent to, and, consequently, valid for, all content – the thought-forms or logical categories torn from *real* mind and from *real* nature. (We shall unfold the *logical* content of absolute negativity further on.)

Hegel's positive achievement here, in his speculative logic, is that the *definite concepts*, the universal *fixed thought-forms* in their independence *vis-à-vis* nature and mind are a necessary result of the general estrangement of the human being and therefore also of a human thought, and that Hegel has therefore brought these together and presented them as moments of the abstraction-process. For example, superseded being is essence, superseded essence is concept, the concept superseded is ... absolute idea. But what, then, is the absolute idea? It supersedes its own self again, if it does not want to traverse once more from the beginning the whole act of abstraction, and to satisfy itself with being a totality of abstractions or the self-comprehending abstraction. But abstraction comprehending itself as abstraction knows itself to be nothing: it must abandon itself – abandon abstraction – and so it arrives at an entity which is its exact opposite – at *nature*. Thus, the entire logic is the demonstration that abstract thought is nothing in itself; that the absolute idea is nothing for itself; that only *nature* is something.

||XXXII| The absolute idea, the abstract idea, which

“*considered* with regard to its unity with itself is intuiting (Logic § 244), and which (*loc. cit.*) “in its own absolute truth *resolves* to let the moment of its particularity or of initial characterization and other-being, the *immediate idea*, as its reflection, *go forth* freely from itself as nature” (*loc. cit.*),

this whole idea which behaves in such a strange and bizarre way, and which has given the Hegelians such terrible headaches, is from beginning to end nothing else but *abstraction* (i.e., the abstract thinker), which, made wise by experience and enlightened concerning its truth, resolves under various (false and themselves still abstract) conditions to *abandon itself* and to replace its self-absorption, nothingness, generality and indeterminateness by its other-being, the particular, and the determinate; resolves to let *nature*, which it held hidden in itself only as an abstraction, as

a thought-entity, *go forth freely from itself*; that is to say, this idea resolves to forsake abstraction and to have a look at nature *free* of abstraction. The abstract idea, which without mediation becomes *intuiting*, is indeed nothing else but abstract thinking that gives itself up and resolves on *intuition*. This entire transition from logic to natural philosophy is nothing else but the transition – so difficult to effect for the abstract thinker, who therefore describes it in such an adventurous way – from *abstracting* to *intuiting*. The *mystical* feeling which drives the philosopher forward from abstract thinking to intuiting is *boredom* – the longing for content.

(The man estranged from himself is also the thinker estranged from his *essence* – that is, from the natural and human essence. His thoughts are therefore fixed mental forms dwelling outside nature and man. Hegel has locked up all these fixed mental forms together in his logic, interpreting each of them first as negation – that is, as an *alienation* of *human* thought – and then as negation of the negation – that is, as a superseding of this alienation, as a *real* expression of human thought. But as this still takes place within the confines of the estrangement, this negation of the negation is in part the restoring of these fixed forms in their estrangement; in part a stopping at the last act – the act of self-reference in alienation – as the true mode of being of these fixed mental forms; \* –

[\* (This means that what Hegel does is to put in place of these fixed abstractions the act of abstraction which revolves in its own circle. We must therefore give him the credit for having indicated the source of all these inappropriate concepts which originally appertained to particular philosophers; for having brought them together; and for having created the entire compass of abstraction as the object of criticism, instead of some specific abstraction.) (Why Hegel separates thought from the *subject* we shall see later; at this stage it is already clear, however, that when man is not, his characteristic expression cannot be human either, and so neither could thought be grasped as an expression of man as a human and natural subject endowed with eyes, ears, etc., and living in society, in the world, and in nature.) – Note by Marx]

– and in part, to the extent that this abstraction apprehends itself and experiences an infinite weariness with itself, there makes its appearance in Hegel, in the form of the resolution to recognize *nature* as the essential being and to go over to intuition, the abandonment of abstract thought – the abandonment of thought revolving solely within the orbit of thought, of thought *sans* eyes, *sans* teeth, *sans* ears, *sans* everything.)

||XXXIII|| But nature too, taken abstractly, for itself – nature fixed in isolation from man – is *nothing* for man. It goes without saying that the abstract thinker who has committed himself to intuiting, intuiting nature abstractly. Just as nature lay enclosed in the thinker in the form of the absolute idea, in the form of a thought-entity – in a shape which was obscure and enigmatic even to him – so by letting it emerge from himself he has really let emerge only this *abstract nature*, only nature as a *thought-entity* – but now with the significance that it is the other-being of thought, that it is real, intuited nature – nature distinguished from abstract thought. Or, to talk in human language, the abstract thinker learns in his intuition of nature that the entities which he thought to create from nothing, from pure abstraction – the entities he believed he was producing in the divine dialectic as pure products of the labor of thought, for ever shuttling back and forth in itself and never looking outward into reality – are nothing else but *abstractions* from *characteristics of nature*. To him, therefore, the whole of nature merely repeats the logical abstractions in a sensuous, external form. He once more *resolves* nature into these abstractions. Thus, his intuition of nature is only the act of confirming his abstraction from the intuition of nature [~~Let us consider for a moment Hegel's characteristics of nature and the transition from nature to the mind. Nature has resulted as the idea in the form of the other being. Since the id ..~~ ] – is only the conscious repetition by him of the process of creating his abstraction. Thus, for example, time equals negativity referred to itself (Hegel, *Encyclopädie der philosophischen Wissenschaften im Grundrisse*, p. 238). To the superseded becoming as being there corresponds,

in natural form, superseded movement as matter. Light is *reflection-in-itself*, the *natural* form. Body as *moon* and *comet* is the *natural* form of the *antithesis* which according to logic is on the one side the *positive resting on itself* and on the other side the *negative resting on itself*. The earth is the *natural* form of the logical *ground*, as the negative unity of the antithesis, etc.

*Nature as nature* – that is to say, insofar as it is still sensuously distinguished from that secret sense hidden within it – nature isolated, distinguished from these abstractions is *nothing* – a *nothing proving itself to be nothing* – is *devoid of sense*, or has only the sense of being an externality which has to be annulled.

“In the finite-*teleological* position is to be found the correct premise that nature does not contain within itself the absolute purpose.” [§ 245.]

Its purpose is the confirmation of abstraction.

“Nature has shown itself to be the idea in the *form of other-being*. Since the *idea* is in this form the negative of itself or *external to itself*, nature is not just relatively external *vis-à-vis* this idea, but *externality* constitutes the form in which it exists as nature.” [§ 247.]

*Externality* here is not to be understood as the *world of sense* which *manifests itself* and is accessible to the light, to the man endowed with senses. It is to be taken here in the sense of alienation, of a mistake, a defect, which ought not to be. For what is true is still the idea. Nature is only the *form* of the idea's *other-being*. And since abstract thought is the *essence*, that which is external to it is by its essence something merely *external*. The abstract thinker recognizes at the same time that *sensuousness* – *externality* in contrast to thought shuttling back and forth *within itself* – is the essence of nature. But he expresses this contrast in such a way as to make this *externality of nature*, its *contrast* to thought, its *defect*, so that inasmuch as it is distinguished from abstraction, nature is something defective.

||XXXIV| An entity which is defective not merely for me or in my eyes but in itself – intrinsically – has something outside itself which it lacks. That is, its essence is different from it itself. Nature has therefore to supersede itself for the abstract thinker, for it is already posited by him as a potentially *superseded* being.

“For us, mind has *nature* for its *premise*, being nature's *truth* and for that reason its *absolute prius*. In this truth nature *has vanished*, and mind has resulted as the idea arrived at being-for-itself, the *object* of which, as well as the *subject*, is the *concept*. This identity is *absolute negativity*, for whereas in nature the concept has its perfect external objectivity, this its alienation has been superseded, and in this alienation the concept has become identical with itself. But it is this identity therefore, only in being a return out of nature.” [§ 381.]

“As the *abstract* idea, *revelation* is unmediated transition to, the *coming-to-be* of, nature; as the revelation of the mind, which is free, it is the *positing* of nature as the *mind's* world – a positing which, being reflection, is at the same time, a *presupposing* of the world as independently existing nature. Revelation in conception is the creation of nature as the mind's being, in which the mind procures the *affirmation* and the *truth* of its freedom.” “*The absolute is mind*. This is the highest definition of the absolute.” [§ 384.] ||XXXIV||

# Notes

1. The *Economic and Philosophic Manuscripts of 1844* is the first work in which Marx tried to systematically elaborate problems of political economy from the standpoint of his maturing dialectical-materialist and communist views and also to synthesize the results of his critical review of prevailing philosophic and economic theories. Apparently, Marx began to write it in order to clarify the problems for himself. But in the process of working on it he conceived the idea of publishing a work analysing the economic system of bourgeois society in his time and its ideological trends. Towards the end of his stay in Paris, on February 1, 1845, Marx signed a contract with Carl Leske, a Darmstadt publisher, concerning the publication of his work entitled *A Critique of Politics and of Political Economy*. It was to be based on his *Economic and Philosophic Manuscripts of 1844* and perhaps also on his earlier manuscript *Contribution to the Critique of Hegel's Philosophy of Law*. This plan did not materialize in the 1840s because Marx was busy writing other works and, to some extent, because the contract with the publisher was cancelled in September 1846, the latter being afraid to have transactions with such a revolutionary-minded author. However, in the early 1850s Marx returned to the idea of writing a book on economics. Thus, the manuscripts of 1844 are connected with the conception of a plan which led many years later to the writing of *Capital*.

The *Economic and Philosophic Manuscripts* is an unfinished work and in part a rough draft. A considerable part of the text has not been preserved. What remains comprises three manuscripts, each of which has its own pagination (in Roman figures). The first manuscript contains 27 pages, of which pages I-XII and XVII-XXVII are divided by two vertical lines into three columns supplied with headings written in beforehand: "Wages of Labor," "Profit of Capital" (this section has also subheadings supplied by the author) and "Rent of Land." It is difficult to tell the order in which Marx filled these columns. All the three columns on p. VII contain the text relating to the section "Wages of Labor." Pages XIII to XVI are divided into two columns and contain texts of the sections "Wages of Labor" (pp. XIII-XV), "Profit of Capital" (pp. XIII-XVI) and "Rent of Land" (p. XVI). On pages XVII to XXI, only the column headed "Rent of Land" is filled in. From page XXII to page XXVII, on which the first manuscript breaks off, Marx wrote across the three columns disregarding the headings. The text of these pages is published as a separate section entitled by the editors according to its content "Estranged Labor."

Of the second manuscript only the last four pages have survived (pp. XL-XLIII).

The third manuscript contains 41 pages (not counting blank ones) divided into two columns and numbered by Marx himself from I to XLIII (in doing so he omitted two numbers, XXII and XXV). Like the extant part of the second manuscript, the third manuscript has no author's headings; the text has been arranged and supplied with the headings by the editors.

Sometimes Marx departed from the subject matter and interrupted his elucidation of one question to analyze another. Pages XXXIX-XL contain the Preface to the whole work which is given before the text of the first manuscript. The text of the section dealing with the critical analysis of Hegel's dialectic, to which Marx referred in the Preface as the concluding chapter and which was scattered on various pages, is arranged in one section and put at the end in accordance with Marx's indications.

In order to give the reader a better visual idea of the structure of the work, the text reproduces in vertical lines the Roman numbers of the sheets of the manuscripts, and the Arabic numbers of the columns in the first manuscript. The notes indicate where the text has been rearranged. Passages crossed out by Marx with a vertical line are enclosed in pointed brackets; separate words or phrases crossed out by the author are given in footnotes only when they supplement the text. The general title and the headings of the various parts of the manuscripts enclosed in square brackets are supplied by the editors on the basis of the author's formulations. In some places the text has been broken up into paragraphs by the editors. Quotations from the French sources cited by Marx in French or in his own

translation into German, are given in English in both cases and the French texts as quoted by Marx are given in the footnotes. Here and elsewhere Marx's rendering of the quotations or free translation is given in small type but without quotation marks. Emphasis in quotations, belonging, as a rule, to Marx, as well as that of the quoted authors, is indicated everywhere by italics.

The *Economic and Philosophic Manuscripts of 1844* was first published by the Institute of Marxism-Leninism in Moscow in the language of the original: Marx/Engels, *Gesamtausgabe*, Abt. 1, Bd. 3, 1932.

In English this work was first published in 1959 by the Foreign Languages Publishing House (now Progress Publishers), Moscow, translated by Martin Milligan.

**2.** This refers to Bruno Bauer's reviews of books, articles and pamphlets on the Jewish question, including Marx's article on the subject in the *Deutsch-Französische Jahrbücher*, which were published in the monthly *Allgemeine Literatur-Zeitung* (issue No. 1, December 1843, and issue No. IV, March 1844) under the title "Von den neuesten Schriften über die Judenfrage." Most of the expressions quoted are taken from these reviews. The expressions "utopian phrase" and "compact mass" can be found in Bruno Bauer's unsigned article, "Was ist jetzt der Gegenstand der Kritik?" published in the *Allgemeine Literatur-Zeitung*, issue No. VIII, July 1844. A detailed critical appraisal of this monthly was later on given by Marx and Engels in the book *Die heilige Familie, oder Kritik der kritischen Kritik* (see this edition, Vol. 4, *The Holy Family, or Critique of Critical Criticism*).

**3.** Marx apparently refers to Weitling's works: *Die Menschheit, wie sie ist und wie sie sein sollte*, 1838, and *Garantien der Harmonie und Freiheit*, Vivis, 1842.

Moses Hess published three articles in the collection *Ein-und-zwanzig Bogen aus der Schweiz* (Twenty-One Sheets from Switzerland), *Erster Teil (Zürich und Winterthur, 1843)*, issued by Georg Herwegh. These articles, entitled "Sozialismus und Kommunismus," "Philosophie der Tat" and "Die Eine und die ganze Freiheit," were published anonymously. The first two of them had a note – "Written by the author of 'Europäische Triarchie'."

**4.** The term "element" in the Hegelian philosophy means a vital element of thought. It is used to stress that thought is a process, and that therefore elements in a system of thought are also phases in a movement. The term "feeling" (*Empfindung*) denotes relatively low forms of mental life in which no distinction is made between the subjective and objective.

**5.** Shortly after writing this Preface Marx fulfilled his intention in *The Holy Family, or Critique of Critical Criticism*, written in collaboration with Engels (see Karl Marx and Frederick Engels, *Collected Works*, Vol. 4).

**6.** The expression "common humanity" (in the manuscript in French, "simple humanity") was borrowed by Marx from the first volume (Chapter VIII) of Adam Smith's *Wealth of Nations*, which he used in Garnier's French translation (*Recherches sur la nature et les causes de la richesse des nations*, Paris, 1802, t. I, p. 138). All the subsequent references were given by Marx to this publication, the synopsis of which is contained in his Paris Notebooks with excerpts on political economy. This edition is reproduced on the MIA and Marx's citations are linked to the text.

**7.** Marx uses the German term "Nationalökonomie" to denote both the economic system in the sense of science or theory, and the economic system itself.

**8.** Loudon's work was a translation into French of an English manuscript apparently never published in the original. The author did publish in English a short pamphlet - *The Equilibrium of Population and Sustenance Demonstrated*, Leamington, 1836.

**9.** Unlike the quotations from a number of other French writers such as Constantin Pecqueur and Eugène Buret, which Marx gives in French in this work, the excerpts from J. B. Say's book are given in his German translation.

**10.** From this page of the manuscript quotations from Adam Smith's book (in the French translation), which Marx cited so far sometimes in French and sometimes in German, are, as a rule, given in German. In this book the corresponding pages of the English edition are substituted for the French by the editors and Marx's references are given in square brackets (see Note 6).

**11.** The text published in small type here and below is not an exact quotation from Smith but a summary of the corresponding passages from his work. Such passages are subsequently given in small type but without quotation marks.

**12.** The preceding page (VII) of the first manuscript does not contain any text relating to the sections "Profit of Capital" and "Rent of Land" (see Note 1).

**13.** The whole paragraph, including the quotation from Ricardo's book in the French translation by Francisco Solano Constancio: *Des principes de l'économie politique, et de l'impôt*, 2-e éd., Paris, 1835, T. II, pp. 194-95 (see the corresponding English edition *On the Principles of Political Economy, and Taxation*, London, 1817), and from Sismondi's *Nouveaux principes d'économie politique...*, Paris, 1819, T. II., p. 331, is an excerpt from Eugène Buret's book *De la misère des classes laborieuses en Angleterre et en France...* Paris, 1840, T. I, pp. 6-7, note.

**14.** The allusion is to the following passage: "In a perfectly fair lottery, those who draw the prizes ought to gain all that is lost by those who draw the blanks. In a profession where twenty fail for one that succeeds, that one ought to gain all that should have been gained by the unsuccessful twenty." (Smith, *Wealth of Nations*, Vol. 1, Bk. 1, p. 94.)

**15.** See Note 12.

**16.** The Corn Laws – a series of laws in England (the first of which dated back to the 15th century) which imposed high duties on imported corn with the aim of maintaining high prices on it in the home market. In the first third of the 19th century several laws were passed (in 1815, 1822 and so on) changing the conditions of corn imports, and in 1828 a sliding scale was introduced, which raised import duties on corn while lowering prices on the home market and, on the contrary, lowered import duties while raising prices.

In 1838 the Manchester factory owners Cobden and Bright founded the Anti-Corn Law League, which widely exploited the popular discontent at rising corn prices. While agitating for the abolition of the corn duties and demanding complete freedom of trade, the League strove to weaken the economic and political positions of the landed aristocracy and to lower workers' wages.

The struggle between the industrial bourgeoisie and the landed aristocracy over the Corn Laws ended in their repeal in 1846.

**17.** Pages XIII to XV are divided into two columns and not three like the other pages of the first manuscript; they contain no text relating to the section "Rent of Land." On page XVI, which also has two columns, this text is in the first column, while on the following pages it is in the second.

**18.** Marx, still using Hegel's terminology and his approach to the unity of the opposites, counterposes the term "Verwirklichung" (realization) to "Entwirklichung" (loss of realization).

**19.** In this manuscript Marx frequently uses two similar German terms, "*Entäusserung*" and "*Entfremdung*," to express the notion of "alienation." In the present edition the former is generally translated as "alienation," the latter as "estrangement," because in the later economic works (*Theories of Surplus-Value*) Marx himself used the word "alienation" as the English equivalent of the term "*Entäusserung*."

**20.** The term "species-being" (*Gattungswesen*) is derived from Ludwig Feuerbach's philosophy where it is applied to man and mankind as a whole.

**21.** Apparently Marx refers to Proudhon's book *Qu'est-ce que la propriété?*, Paris, 1841.

**22.** This passage shows that Marx here uses the category of wages in a broad sense, as an expression of antagonistic relations between the classes of capitalists and of wage-workers. Under “the wages” he understands “the wage-labor,” the capitalist system as such. This idea was apparently elaborated in detail in that part of the manuscript which is now extant.

**23.** This apparently refers to the conversion of individuals into members of civil society which is considered as the sphere of property, of material relations that determine all other relations. In this case Marx refers to the material relations of society based on private property and the antagonism of different classes.

**24.** The Poor Law Amendment Act of 1834 deprived poor people considered able to work (including children) of any public relief except a place in the workhouse, where they were compelled to work.

**25.** In the manuscript “sein für sich selbst,” which is an expression of Hegel’s term “für sich” (for itself) as opposed to “an sich” (in itself). In the Hegelian philosophy the former means roughly explicit, conscious or defined in contrast to “an sich,” a synonym for immature, implicit or unconscious.

**26.** This refers to *Revolutions de France et de Brabant, par Camille Desmoulins. Second Trimestre, contenant mars, avril et mai, Paris, l’an Tier, 1790*, N. 16, p. 139 sq.; N. 23, p. 425 sq.; N. 26, p. 580 sqq.

**27.** This refers to Georg Ludwig Wilhelm Funke, *Die aus der unbeschränkten Theilbarkeit des Grundeigentums hervorgehenden Nachtheile, Hamburg und Gotha, 1839*, p. 56, in which there is a reference to Heinrich Leo, *Studien und Skizzen zu einer Vaturlehre des Slaates*, Halle, 1833, p. 102.

**28.** The third manuscript is a thick notebook the last few pages of which are blank. The pages are divided into two columns by a vertical line, not for the purpose of dividing the text according to the headings but for purely technical reasons. The text of the first three sections comprises pp. I-XI, XIV-XXI, XXXIV-XXXVIII and was written as a supplement to the missing pages of the second manuscript. Pages XI-XIII, XVII, XVIII, XXIII, XXIV, XXVI, XXXIV contain the text of the concluding chapter dealing with the criticism of Hegel’s dialectic (on some pages it is written alongside the text of other sections). In some places the manuscript contains the author’s remarks testifying to his intention to unite into a single whole various passages of this section separated from each other by the text of other sections. Pages XXIX-XL comprise the draft Preface. Finally, the text on the last pages (XLI-XLIII) is a self-contained essay on the power of money in bourgeois society.

**29.** The manuscript has “als für sich seiende Tätigkeit.” For the meaning of the terms “für sich” and “an sich” in Hegel’s philosophy see Note 25.

**30.** Marx refers to the rise of the primitive, crude equalitarian tendencies among the representatives of utopian communism at the early stages of its development. Among the medieval religious communistic communities, in particular, there was current a notion of the common possession of women as a feature of the future society depicted in the spirit of consumer communism ideals. In 1534-35 the German Anabaptists, who seized power in Münster, tried to introduce polygamy in accordance with this view. Tommaso Campanella, the author of *Civitas Solis* (early 17th century), rejected monogamy in his ideal society. The primitive communistic communities were also characterized by asceticism and a hostile attitude to science and works of art. Some of these primitive equalitarian features, the negative attitude to the arts in particular, were inherited by the communist trends of the first half of the 19th century, for example, by the members of the French secret societies of the 1830s and 1840s (“worker-egalitarians,” “humanitarians,” and so on) comprising the followers of Babeuf (for a characterization of these see Engels, “Progress of Social Reform on the Continent” (Karl Marx and Frederick Engels, *Collected Works*, Volume 3, pp. 396-97)).

**31.** This note is given by Marx on page V of the manuscript where it is separated by a horizontal line from the main text, but according to its meaning it refers to this sentence.

**32.** This part of the manuscript shows clearly the peculiarity of the terminology used by Marx in his works. At the time he had not worked out terms adequately expressing the conceptions of scientific communism he was then evolving and was still under the influence of Feuerbach in that respect. Hence the difference in the use of words in his early and subsequent, mature writings. In the *Economic and Philosophic Manuscripts of 1844* the word “socialism” is used to denote the stage of society at which it has carried out a revolutionary transformation, abolished private property, class antagonisms, alienation and so on. In the same sense Marx used the expression “communism equals humanism.” At that time he understood the term “communism as such” not as the final goal of revolutionary transformation but as the process of this transformation, development leading up to that goal, a lower stage of the process.

**33.** This expression apparently refers to the theory of the English geologist Sir Charles Lyell who, in his three-volume work *The Principles of Geology* (1830-33), proved the evolution of the earth’s crust and refuted the popular theory of cataclysms. Lyell used the term “historical geology” for his theory. The term “geognosy” was introduced by the 18th-century German scientist Abraham Werner, a specialist in mineralogy, and it was used also by Alexander Humboldt.

**34.** This statement is interpreted differently by researchers. Many of them maintain that Marx here meant crude equalitarian communism, such as that propounded by Babeuf and his followers. While recognizing the historic role of that communism, he thought it impossible to ignore its weak points. It seems more justifiable, however, to interpret this passage proceeding from the peculiarity of terms used in the manuscript (see Note 32). Marx here used the term “communism” to mean not the higher phase of classless society (which he at the time denoted as “socialism” or “communism equalling humanism”) but movement (in various forms, including primitive forms of equalitarian communism at the early stage) directed at its achievement, a revolutionary transformation process of transition to it. Marx emphasized that this process should not be considered as an end in itself, but that it is a necessary, though a transitional, stage in attaining the future social system, which will be characterized by new features distinct from those proper to this stage.

**35.** Page XI (in part) and pages XII and XIII are taken up by a text relating to the concluding chapter (see Note 28).

**36.** The greater part of this page as well as part of the preceding page (XVII) comprises a text relating to the concluding chapter (see Note 28).

**37.** Apparently Marx refers to a formula of the German philosopher Johann Fichte, an adherent of subjective idealism.

**38.** A part of this page of the manuscript is ripped off, about three lines are missing. – *Ed.*

**39.** See this work, pp. 20-23. – *Ed.*

**40.** The preceding pages starting from p. XXI, which is partly taken up by a text relating to this section, contain the text of the concluding chapter.

**41.** In some of his early writings Marx already uses the term “*bürgerliche Gesellschaft*” to mean two things: (1) in a broader sense, the economic system of society regardless of the historical stage of its development, the sum total of material relations which determine political institutions and ideology, and (2) in the narrow sense, the material relations of bourgeois society (later on, that society as a whole), of capitalism. Hence, the term has been translated according to its concrete meaning in the context as “civil society” in the first case and “bourgeois society” in the second.

**42.** The two previous pages of the manuscript contain the draft Preface to the whole work, which is published on pages 1-2.

**43.** Ontology – in some philosophic systems a theory about being, about the nature of things.

**44.** Originally the section on the Hegelian dialectic was apparently conceived by Marx as a philosophical digression in the section of the third manuscript which is published under the heading “Private Property and Communism” and was written together with other sections as an addition to separate pages of the second manuscript. Therefore Marx marked the beginning of this section (p. XI in the manuscript) as point 6, considering it to be the continuation of the five points of the preceding section. He marked as point 7 the beginning of the following section, headed “Human Requirements and Division of Labor Under the Rule of Private Property,” on page XIV of the manuscript. However, when dealing with this subject on subsequent pages of his manuscript, Marx decided to collect the whole material into a separate, concluding chapter and mentioned this in his draft Preface. The chapter, like a number of other sections of the manuscript, was not finished. While writing it, Marx made special excerpts from the last chapter (“Absolute Knowledge”) of Hegel’s *Phänomenologie des Geistes*, which are in the same notebook as the third manuscript (these excerpts are not reproduced in this edition).

**45.** The reference is not quite accurate. On page 193 of the work mentioned, Bruno Bauer polemicalises not against the anti-Hegelian Herr Gruppe but against the Right Hegelian Marheineke.

**46.** Marx here refers to Feuerbach’s critical observations on Hegel in §§ 29-30 of his *Grundsätze der Philosophie der Zukunft*.

This note is given at the bottom of page XIII of the third manuscript without any indication what it refers to. The asterisk after the sentence to which it seems to refer is given by the editors.

**47.** Here on page XVII of the third manuscript (part of which comprises a text relating to the section “Human Requirements and Division of Labor Under the Rule of Private Property”) Marx gave the note: “see p. XIII,” which proves that this text is the continuation of the section dealing with the critical analysis of the Hegelian dialectic begun on pp. XI-XII.

**48.** At the end of page XVIII of the third manuscript there is a note by Marx: “continued on p. XXII.” However number XXII was omitted by Marx in paging. The text of the given chapter is continued on the page marked by the author as XXIII, which is also confirmed by his remark on it: “see p. XVIII.”

**49.** Marx apparently refers here not only to the identity of Hegel’s views on labor and some other categories of political economy with those of the English classical economists but also to his profound knowledge of economic writings. In lectures he delivered at Jena University in 1803-04 Hegel cited Adam Smith’s work. In his *Philosophie des Rechts* (§ 189) he mentions Smith, Say and Ricardo and notes the rapid development of economic thought.

**50.** Hegel uses the term “thinghood” (*Dingheit*) in his work *Phänomenologie des Geistes* to denote an abstract, universal, mediating link in the process of cognition; “thinghood” reveals the generality of the specific properties of individual things. The synonym for it is “pure essence” (*das reine Wesen*).

**51.** These eight points of the “surmounting of the object of consciousness,” expressed “in all its aspects,” are copied nearly word for word from §§ 1 and 3 of the last chapter (“Absolute Knowledge”) of Hegel’s *Phänomenologie des Geistes*.

**52.** Number XXV was omitted by Marx in paging the third manuscript.

**53.** Marx refers to § 30 of Feuerbach’s *Grundsätze der Philosophie der Zukunft*, which says: “Hegel is a thinker who *surpasses* himself in thinking.”

**54.** This enumeration gives the major categories of Hegel’s *Encyclopädie der philosophischen Wissenschaften* in the order in which they are examined by Hegel. Similarly, the categories reproduced by Marx above (on p. 65), from “civil law” to “world history,” are given in the order in which they appear in Hegel’s *Philosophie des Rechts*.

# **Preface**

---

Hitherto men have constantly made up for themselves false conceptions about themselves, about what they are and what they ought to be. They have arranged their relationships according to their ideas of God, of normal man, etc. The phantoms of their brains have got out of their hands. They, the creators, have bowed down before their creations. Let us liberate them from the chimeras, the ideas, dogmas, imaginary beings under the yoke of which they are pining away. Let us revolt against the rule of thoughts. Let us teach men, says one, to exchange these imaginations for thoughts which correspond to the essence of man; says the second, to take up a critical attitude to them; says the third, to knock them out of their heads; and -- existing reality will collapse.

These innocent and childlike fancies are the kernel of the modern Young-Hegelian philosophy, which not only is received by the German public with horror and awe, but is announced by our philosophic heroes with the solemn consciousness of its cataclysmic dangerousness and criminal ruthlessness. The first volume of the present publication has the aim of uncloaking these sheep, who take themselves and are taken for wolves; of showing how their bleating merely imitates in a philosophic form the conceptions of the German middle class; how the

boasting of these philosophic commentators only mirrors the wretchedness of the real conditions in Germany. It is its aim to debunk and discredit the philosophic struggle with the shadows of reality, which appeals to the dreamy and muddled German nation.

Once upon a time a valiant fellow had the idea that men were drowned in water only because they were possessed with the idea of gravity. If they were to knock this notion out of their heads, say by stating it to be a superstition, a religious concept, they would be sublimely proof against any danger from water. His whole life long he fought against the illusion of gravity, of whose harmful results all statistic brought him new and manifold evidence. This valiant fellow was the type of the new revolutionary philosophers in Germany.

In the third volume of the *Wigand'sche Vierteljahrsschrift* for 1845 the battle of the Huns, prophetically portrayed by Kaulbach, [\[38\]](#) actually takes place. The spirits of the slain, whose fury is not appeased even in death, raise a hue and cry, which sounds like the thunder of battles and war-cries, the clatter of swords, shields and iron waggons. But it is not a battle over earthly things. The holy war is being waged not over protective tariffs, the constitution, potato blight, [\[38\]](#) banking affairs and railways, but in the name of the most sacred interests of the spirit, in the name of “substance”, “self-consciousness”, “criticism;”, the “unique” and the “true man”. We are attending a council of church fathers. As these church fathers are the last specimens of their kind, and as here, it is to be hoped, the cause of the Most High, alias the Absolute, is being pleaded for the last time, it is worth while taking a verbatim report of the proceedings.

Here, first of all, is *Saint Bruno*, who is easily recognised by his *stick* (“become sensuousness, become a *stick*”, *Wigand*, p. 130).’ His head is crowned with a halo of “pure criticism” and, full of contempt for the world, he wraps himself in his “self-consciousness”. He has ‘, *smashed* religion in its entirety and the state in its manifestations” (p. 138), by violating the concept of “substance” in the name of the most high self-consciousness. The ruins of the church and “debris” of the state lie at his feet, while his glance “strikes clown” the “masses into the dust. He is like God, he has neither father nor mother, he is “his own creation, his own product” (p. 136). In short, he is the “Napoleon” of the spirit, in spirit he is “Napoleon”. His spiritual exercises consist in constantly “examining himself, and in this self-examination he finds the impulse to self-determination” (p. 136); as a result of such wearisome self-recording he has obviously become emaciated. Besides “examining” himself — from time to time he “examines” also, as we shall see, the *Westphälische Dampfboot*.

Opposite him stands *Saint Max*, whose services to the Kingdom of God consist in asserting that he has established and proved — on approximately 600 printed pages [*Der Einzige und sein Eigenthum*] — his identity, that he is not just anyone, not some “Tom, Dick or Harry”, but precisely Saint Max and no other. About his halo and other marks of distinction only one thing can be said: that they are “his object and thereby his property”, that they are “unique” and “incomparable” and that they are “inexpressible” (p. 148).c He is simultaneously the “phrase” and the “owner of the phrase”, simultaneously Sancho Panza and Don Quixote. His ascetic exercises consist of sour thoughts about

thoughtlessness, of considerations throughout many pages about inconsiderateness and of the sanctification of unholiness. Incidentally, there is no need for us to elaborate on his virtues, for concerning all the qualities ascribed to him — even if there were more of them than the names of God among the Muslims — he is in the habit of saying: I am all this and something more, I am the all of this nothing and the nothing of this all. He is favourably distinguished from his gloomy rival in possessing a certain solemn “*light-heartedness*” and from time to time he interrupts his serious ponderings with a “*critical hurrah*”.

These two grand masters of the Holy Inquisition summon the heretic Feuerbach, who has to defend himself against the grave charge of gnosticism. The heretic Feuerbach, “thunders” Saint Bruno, is in possession of *hyle*, substance, and refuses to hand it over lest my infinite self-consciousness be reflected in it. Self-consciousness has to wander like a ghost until it has taken back into itself all things which arise from it and flow into it. It has already swallowed the whole world, except for this *hyle*, substance, which the gnostic Feuerbach keeps under lock and key and refuses to hand over.

Saint Max accuses the gnostic of doubting the dogma revealed by the mouth of Saint Max himself, the dogma that “every goose, every dog, every horse” is “the perfect, or, if one prefers the superlative degree, the most perfect, man”. (*Wigand*, p. 187: “The aforesaid does not lack a tittle of what makes man a man. Indeed, the *same* applies also to every goose, every dog, every, horse.”)

Besides the hearing of these important indictments, sentence is also

pronounced in the case brought by the two saints against Moses Hess and in the case brought by Saint Bruno against the authors of *Die Heilige Familie*. But as these accused have been busying themselves with “worldly affairs” and, therefore, have failed to appear before the Santa Casa, [\[40\]](#) they are sentenced in their absence to eternal banishment from the realm of the spirit for the term of their natural life. Finally, the two grand masters are again starting some strange intrigues among themselves and against each other.

---

## The German Ideology by Marx and Engels

# II Saint Bruno

### 1. “Campaign” Against Feuerbach

Before turning to the solemn discussion which Bauer’s selfconsciousness has with itself and the world, we should reveal one secret. Saint Bruno uttered the battle-cry and kindled the war only because he had to “safeguard” himself and his stale, soured criticism against the ungrateful forgetfulness of the public, only because he had to show that, in the changed conditions of 1845, criticism always remained itself and unchanged. He wrote the second volume of the “good cause and his own cause” [Bruno Bauer’s article “Charakteristik Ludwig Feuerbachs” is here ironically called the second volume of Bauer’s book *Die gute.Sache der Freiheit und meine eigene*

Angelegenheit — The Good Cause of Freedom and My Own Cause]: he stands his ground, he fights *pro aris et focis*. [literally: for altars and hearths, used in the sense of: for house and home — that is, pleading his own cause] In the true theological manner, however, he conceals this aim of his by an appearance of wishing to “characterise” Feuerbach. Poor Bruno was quite forgotten, as was best proved by the polemic between Feuerbach and Stirner, [Feuerbach, “Ueber das ‘Wesen des Christenthums’ in Beziehung auf den ‘Einzigsten und sein Eigenthum’”] which no notice at all was taken of him. For just this reason he seized on this polemic in order to be able to proclaim himself, as the antithesis of the antagonists, their higher unity, the Holy Spirit.

Saint Bruno opens his “campaign” with a burst of artillery fire against Feuerbach, that is to say, with a revised and enlarged reprint of an article which had already appeared in the *Norddeutsche Blätter*. [Bruno Bauer’s article “Ludwig Feuerbach”] Feuerbach is made into a knight of “*substance*” in order that Bauer’s *self-consciousness*” shall stand out in stronger relief. In this trans-substantiation of Feuerbach, which is supposed to be proved by all the writings of the latter, our holy man jumps at once from Feuerbach’s writings on Leibniz and Bayle [The reference is to the following works of Feuerbach: *Geschichte der neuern Philosophie. Darstellung, Entwicklung und Kritik der Leibnitzischen Philosophie* and *Pierre Bayle*] to the *Wesen des Christenthums*, leaving out the article against the “positive philosophers”, [\[41\]](#) in the *Hallische Jahrbücher*. [Ludwig Feuerbach, “Zur Kritik der ‘positiven Philosophie’”] This “oversight” is “in place”. For there Feuerbach revealed the whole wisdom of “selfconsciousness” as against the

positive representatives of “substance”, at a time when Saint Bruno was still indulging in speculation on the immaculate conception.

It is hardly necessary to mention that Saint Bruno still continues to prance about on his old-Hegelian war horse. Listen to the first passage in his latest revelations from the Kingdom of God:

“Hegel combined into one Spinoza’s substance and Fichte’s ego; the unity of both, the combination of these opposing spheres, etc., constitutes the peculiar interest but, at the same time, the weakness of Hegel’s philosophy. [... ] This contradiction in which Hegel’s system was entangled had to be resolved and destroyed. But he could only do this by making it impossible for all time to put the question: what is the relation of *self-consciousness* to the *absolute spirit*.... This was possible in two ways. Either self-consciousness had to be burned again in the flames of substance, i.e., the pure substantiality relation had to be firmly established and maintained, or it had to be shown that personality is the creator of its own attributes and essence, that it belongs to the *concept* of personality *in general* to posit itself” (the “concept” or the personality"?) “as limited, and again to abolish this limitation which it posits by its universal *essence*, for precisely this essence is *only the result of its inner self-distinction* of its activity” (Wigand, pp. 86, 87, 88).

[Bruno Bauer, “Charakteristik Ludwig Feuerbachs”]

In *Die Heilige Familie* (p. 220 ) Hegelian philosophy was represented as a union of Spinoza and Fichte and at the same time the contradiction involved in this was emphasised. The specific peculiarity of Saint Bruno is that, unlike the authors of *Die Heilige Familie*, he does not regard the question of the relation of selfconsciousness to substance as “a point of controversy within Hegelian speculation”, but as a world-

historic, even an absolute question. This is the sole form in which he is capable of expressing the conflicts of the present day. He really believes that the triumph of selfconsciousness over substance has a most essential influence not only on European equilibrium but also on the whole future development of the Oregon problem. As to the extent to which the abolition of the Corn Laws in England depends on it, very little has so far transpired.<sup>[42]</sup>

The abstract and nebulous expression into which a real collision is distorted by Hegel is held by this “critical” mind to be the real collision itself. Bruno accepts the *speculative* contradiction and upholds one part of it against the other. A philosophical *phrase* about a real question is for him the real question itself. Consequently, on the one hand, instead of real people and their real consciousness of their social relations, which apparently confront them as something independent, he has the mere abstract expression: *self-consciousness*, just as, instead of real production, he has the *activity of this self-consciousness, which has become independent*. On the other hand, instead of real nature and the actually existing social relations, he has the philosophical summing-up of all the philosophical categories or names of these relations in the expression: *substance*; for Bruno, along with all philosophers and ideologists, erroneously regards thoughts and ideas — the independent intellectual expression of the existing world — as the basis of this existing world. It is obvious that with these two abstractions, which have become senseless and empty, he can perform all kinds of tricks without knowing anything at all about real people and their relations. (See, in addition, what is said about substance in connection with

Feuerbach and concerning “humane liberalism” and the “holy” in connection with Saint Max.) Hence, he does not forsake the speculative basis in order to solve the contradictions of speculation; he manoeuvres while remaining on that basis, and he himself still stands so much on the specifically Hegelian basis that the relation of “self-consciousness” to the “absolute spirit” still gives him no peace. In short, we are confronted with the *philosophy of self-consciousness* that was announced in the *der Synoptiker*, carried out in *Das entdenckte Christenthum* and which, unfortunately, was long ago anticipated in Hegel’s *Phänomenologie*. This new philosophy of Bauer’s was completely disposed of in *Die Heilige Familie* on page 220 et seq. and on pages 304-07. Here, however, Saint Bruno even contrives to caricature himself by smuggling in “personality”, in order to be able, with *Stirner*, to portray the single individual as “his own product”, and *Stirner* as *Bruno’s product*. This step forward deserves a brief notice.

First of all, let the reader compare this caricature with the original, the explanation given of self-consciousness in *Das entdeckte Christenthum*, page 113, and then let him compare this explanation with its prototype, with Hegel’s *Phänomenologie*, pages 575, 583 and so on. (Both these passages are reproduced in *Die Heilige Familie*, pages 221, 223, 224.) But now let us turn to the caricature! “Personality in general”! “Concept”! “Universal essence”! “To posit itself as limited and again to abolish the limitation”! “Inner self-distinction”! What tremendous “results”! “Personality ‘it general’ is either nonsense “in general” or the abstract concept of personality. Therefore, it is part of the “concept” of the concept of personality to “posit itself as limited”. This limitation,

which belongs to the “concept” of its concept, personality directly afterwards posits “by its universal essence”. And after it has again abolished this limitation, it turns out that “precisely this essence” is “the *result* of its inner self-distinction”. The entire grandiose result of this intricate tautology amounts, therefore, to Hegel’s familiar trick of the self-distinction of man in thought, a self-distinction which the unfortunate Bruno stubbornly proclaims to be the sole activity of “personality in general”. A fairly long time ago it was pointed out to Saint Bruno that there is nothing to be got from a “personality” whose activity is restricted to these, by now trivial, logical leaps. At the same time the passage quoted contains the naive admission that the essence of Bauer’s “personality” is the concept of a concept, the abstraction of an abstraction.

Bruno’s criticism of Feuerbach, insofar as it is new, is restricted to hypocritically representing Stirner’s reproaches against Feuerbach *and Bauer* as Bauer’s reproaches against Feuerbach. Thus, for example, the assertions that the “essence of man is essence in general and something holy”, that “man is the God of man”, that the human species is “the Absolute”, that Feuerbach splits man “into an essential and an inessential ego” (although Bruno always declares that the abstract is the essential and, in his antithesis of criticism and the mass, conceives this split as far more monstrous than Feuerbach does), that a struggle must be waged against the “predicates of God”, etc. On the question of selfish and selfless love, Bruno, polemising with Feuerbach, copies Stirner almost word for word for three pages (pp. 133-35) just as he very clumsily copies Stirner’s phrases: “every man is his own creation”,

“truth is a ghost”, and so on. In addition, in Bruno the “creation” is transformed into a “product”. We shall return to this exploitation of Stirner by Saint Bruno.

Thus, the first thing that we discovered in Saint Bruno was his continual dependence on Hegel. We shall not, of course, dwell further on the remarks he has copied from Hegel, but shall only put together a few more passages which show how firmly he believes in the power of the philosophers and how he shares their illusion that a modified consciousness, a new turn given to the interpretation of existing relations, could overturn the whole hitherto existing world. imbued with this faith, Saint Bruno also has one of his pupils certify — in issue IV of Wigand’s quarterly, p. 327 — that his phrases on personality given above, which were proclaimed by him in issue III, were “world-shattering ideas”. ["Ueber das Recht des Freigesprochenen..."]

Saint Bruno says (*Wigand*, p. 95) [Bruno Bauer, “Charakteristik Ludwig Feuerbachs”]

“Philosophy has never been anything but theology reduced to its most general form and given its most rational expression.”

This passage, aimed against Feuerbach, is copied almost word for word from Feuerbach’s *Philosophie der Zukunft* (p. 2):

“Speculative philosophy is true, consistent, *rational* theology.”

Bruno continues:

“Philosophy, in alliance with religion, has always striven for the

absolute dependence of the individual and has *actually achieved this* by demanding and causing the absorption of the individual life in universal life, of the accident in substance, of man in the absolute spirit.”

As if Bruno’s “philosophy”, “in alliance with” Hegel’s, and his still continuing forbidden association with theology, did not “demand”, if not “cause”, the “absorption of man” in the idea of one of his “accidents”, that of self-consciousness, as “substance"! Moreover, one sees from this whole passage with what joy the church father with his “pulpit eloquence” continues to proclaim his “world-shattering” faith in the mysterious power of the holy theologians and philosophers. Of course, in the interests of the “good cause of freedom and his own cause”. [ironical allusion to Bauer’s book *Die gute Sache der Freiheit und meine eigene Angelegenheit*]

On page 105 our god-fearing man has the insolence to reproach Feuerbach:

“Feuerbach *made* of the individual, of the depersonalised man of Christianity, not a man, not a true” (!) “real” (!! ) “personal” (!!!) “man” (these predicates owe their origin to *Die Heilige Familie* and Stirner), “but an emasculated man, a slave” —

and thereby utters, *inter alia*, the nonsense that he, Saint Bruno, can *make* people by means of the *mind*.

Further on in the same passage he says:

“According to Feuerbach the individual has to subordinate himself

to the species, serve it. The species of which Feuerbach speaks is Hegel's Absolute, and it, too, exists nowhere."

Here, as in all the other passages, Saint Bruno does not deprive himself of the glory of making the actual relations of individuals dependent on the philosophical interpretation of these relations. He has not the slightest inkling of the correlation which exists between the concepts of Hegel's "absolute spirit" and Feuerbach's "species" on the one hand and the existing world on the other.

On page 104 the holy father is mightily shocked by the heresy with which Feuerbach transforms the holy trinity of reason, love and will into something that "is *in* individuals and *over* individuals", as though, in our day, every inclination, every impulse, every need did not assert itself as a force "in the individual and *over* the individual", whenever circumstances hinder their satisfaction. If the holy father Bruno experiences hunger, for example, without the means of appeasing it, then even his stomach will become a force "*in* him and *over* him". Feuerbach's mistake is not that he stated this fact but that in idealistic fashion he endowed it with independence instead of regarding it as the product of a definite and surmountable stage of historical development.

Page 111: "Feuerbach is a slave and his servile nature does not allow him to fulfil the *work* of a *man*, to recognise the essence of religion" (what a fine "work of a man"! )..... He does not perceive the essence of religion because he does not know the *bridge* over which he can make his way to the *source* of religion."

Saint Bruno still seriously believes that religion has its own "essence".

As for the “bridge”, “*over which*” one makes one’s way to the “*source of religion*”, this asses’ bridge [a pun in the original: *Eselsbrücke* — asses’ bridge — an expedient used by dull or lazy people to understand a difficult problem] must certainly be an *aqueduct*. At the same time Saint Bruno establishes himself as a curiously modernised Charon who has been retired owing to the building of the bridge, becoming a *toll-keeper* who demands a *halfpenny* from every person crossing the bridge to the spectral realm of religion.

On page 120 the saint remarks:

“How could Feuerbach exist if there were no *truth* and truth were only a *spectre*” (Stirner, help!) “of which hitherto man has been afraid?”

The “man” who fears the “spectre” of “truth” is no other than the worthy Bruno himself. Ten pages earlier, on p. 110, he had already let out the following world-shattering cry of terror at the sight of the “spectre” of truth:

“Truth which is never of itself encountered as a ready-made object and which develops *itself* and reaches unity only in the unfolding of personality.”

Thus, we have here not only truth, this spectre, transformed into a person which develops itself and reaches unity, but in addition this trick is accomplished in a third personality outside it, after the manner of the tapeworm. Concerning the holy man’s former love affair with truth, when he was still young and the lusts of the flesh still strong in him — see *Die Heilige Familie*, p. 115 et seq.’

How purified of all fleshly lusts and earthly desires our holy man now appears is shown by his vehement polemic against Feuerbach's *sensuousness*. Bruno by no means attacks the highly restricted way in which Feuerbach recognises *sensuousness*. He regards Feuerbach's unsuccessful attempt, since it is an attempt to escape ideology, as — a sin. Of course! Sensuousness is lust of the eye, lust of the flesh and arrogance [cf. 1 John 2:16] — horror and abomination [cf. Ezekiel 11:18] in the eyes of the Lord! Do you not know that to be fleshly minded is death, but to be spiritually minded is life and peace; for to be fleshly, minded is hostility to criticism, and everything of the flesh is of this world. And do you not know that it is written: the works of the flesh are manifest, they are adultery, fornication, uncleanness, obscenity, idolatry, witchcraft, enmity, strife, envy, anger, quarrelsomeness, discord, sinful gangs, hatred, murder, drunkenness, gluttony and the like. [cf. Galatians 5:19-21] I prophesy to you, as I prophesied before, that those who do such works will not inherit the kingdom of criticism; but woe to them for in their thirst for delights they are following the path of Cain and are falling into the error of Balaam, and will perish in a rebellion, like that of Korah. These lewd ones feast shamelessly on your alms, and fatten themselves. They are clouds without water driven by the wind; bare, barren trees, twice dead and uprooted; wild ocean waves frothing their own shame; errant stars condemned to the gloom of darkness for ever. [cf. Jude 11-13] For we have read that in the last days there will be terrible times, people will appear who think much of themselves, lewd vilifiers who love voluptuousness [cf. 2 Timothy 3:1-4] more than criticism, makers of

sinful gangs, in short, slaves of the flesh. Such people are shunned by Saint Bruno, who is spiritually minded and loathes the stained covering of the flesh [cf. Jude 23] and for this reason he condemns Feuerbach, whom he regards as the Korah of the gang, to remain outside together with the dogs, the magicians, the debauched and the assassins. [cf. Revelation 22:15] “Sensuousness” — ugh! Not only does it throw the saintly church father into the most violent convulsions, but it even makes him sing, and on page 121 he chants the “song of the end and the end of the song”. Sensuousness — do you know, unfortunate one, what sensuousness is? Sensuousness is — a “stick” (p. 130). Seized with convulsions, Saint Bruno even wrestles on one occasion with one of his own theses, just as Jacob of blessed memory wrestled with God, with the one difference that God twisted Jacob’s thigh, while our saintly epileptic twists all the limbs and ties of his own thesis, and so, by a number of striking examples, makes clear the identity of subject and object:

“Feuerbach may say what he likes ... all the same he *destroys*” (!)  
 “*man...* for he transforms the *word* man into a mere *phrase* ... for he *does not wholly make*” and *create*” (!) “*man, but* raises the whole of mankind to the Absolute, for *in addition* he declares *not* mankind, *but rather* the senses to be the organ of the Absolute, and stamps the sensuous — the object of the senses, of perception, of sensation — as the Absolute, the indubitable and the immediately certain. Whereby Feuerbach — such is Saint Bruno’s opinion — “can undoubtedly shake layers of the air, but he cannot *smash the phenomena of human essence*, because his *innermost*” (!) “*essence and his vitalising spirit [...]* already destroys the *external*” (!)  
 “sound and makes it empty and jarring” (p. 121).

Saint Bruno himself gives us mysterious but decisive disclosures about the causes of his nonsensical attitude:

“As though my ego does not also possess just this particular *sex, unique, compared with all others*, and these particular, unique sex organs,” (Besides his “unique sex organs”, this noble-minded man also possesses a special “unique sex”!)

This unique sex is explained on page 121 in the sense that:

“sensuousness, like a vampire, sucks all the marrow and blood from the *life* of man; it is the insurmountable barrier against which man has to deal himself a mortal blow”.

But even the saintliest man is not pure! They are all sinners and lack the glory that they should have before “self-consciousness”. Saint Bruno, who in his lonely cell at midnight struggles with “substance”, has his attention drawn by the frivolous writings of the heretic Feuerbach to women and female beauty. Suddenly his sight becomes less keen; his pure self-consciousness is besmirched, and a reprehensible, sensuous fantasy plays about the frightened critic with lascivious images. The spirit is willing but the flesh is weak. [cf. Matthew 26:41] Bruno stumbles, he falls, he forgets that he is the power that “with its strength binds, frees and dominates the world”, [cf. *ibid.* 16:19] he forgets that these products of his imagination are “spirit of his spirit”, he loses all “self-control” and, intoxicated, stammers a dithyramb to female beauty, to its “tenderness, softness, womanliness”, to the “full and rounded limbs” and the “*surging, undulating, seething, rushing and hissing, wave-like structure* of the body” of woman. Innocence, however,

always reveals itself — even where it sins. Who does not know that a “surging, undulating, wave-like structure of the body” is Something that no eye has ever seen, or ear heard? Therefore — hush, sweet soul, the spirit will soon prevail over the rebellious flesh and set an insurmountable “barrier” to the overflowing, seething lusts, “against which” they will soon deal themselves a “mortal blow”.

“Feuerbach” — the saint finally arrives at this through a critical understanding of *Die Heilige Familie* — “is a materialist tempered with and corrupted by humanism, i.e., a materialist who is unable to endure the earth and its being” (Saint Bruno knows the being of the earth as distinct from the earth itself, and knows how one should behave in order to “*endure the being* of the earth”!) “but wants to spiritualism himself and rise into heaven; and at the same time he is a humanist who cannot think and build a spiritual world, but one who is impregnated with materialism”, and so on (p. 123).

Just as for Saint Bruno humanism, according to this, consists in thinking” and in “building a spiritual world”, so materialism consists in the following:

“The materialist recognises only the existing, actual being, *matter*” (as though man with all his attributes, including thought, were not an “*existing, actual being*”), “and recognises it as actively extending and realising *itself* in multiplicity, *nature*” (p. 123).

First, *matter* is an existing, actual being, but only in itself, concealed; only when it “actively extends and realises itself in multiplicity” (an “existing, *actual being*” “realises itself”!!), only then does it become *nature*. First there exists the *concept* of matter, an abstraction, an idea, and this latter realises itself in actual nature. Word for word the

Hegelian theory of the pre-existence of the creative categories. From this point of view it is understandable that Saint Bruno mistakes the philosophical phrases of the materialists concerning matter for the actual kernel and content of their world outlook.

## 2. Saint Bruno's Views on the Struggle Between Feuerbach and Stirner

Having thus admonished Feuerbach with a few weighty words, Saint Bruno takes a look at the struggle between Feuerbach and the unique. The first evidence of his interest in this struggle is a methodical, triple smile.

“The critic pursues his path irresistibly, confident of victory, and victorious. He is slandered — he *smiles*. He is called a heretic — he smiles. The old world starts a crusade against him — he *smiles*.”

Saint Bruno — this is thus established — pursues his path but he does not pursue it like other people, he follows a critical course, he accomplishes this important action with a *smile*.

“He does smile his face into more lines than are in the new map, with the augmentation of the Indies. I know my lady will strike him: if she do, he'll smile and take it for a great art, [Shakespeare, Twelfth Night, Act III, Scene 2. Marx and Engels quote these lines from the German translation by August Wilhelm von Schlegel. But they have substituted the word Kunst (art) for the word Gunst (favour)] — like Shakespeare's Malvolio.

Saint Bruno himself does not lift a finger to refute his two opponents, he knows a better way of ridding himself of them, he leaves them —

*divide et impera* — to their own quarrel. He confronts Stirner with Feuerbach's man (p. 124), and Feuerbach with Stirner's unique (p. 126 et seq.); he knows that they are as incensed against each other as the two Kilkenny cats in Ireland, which so completely devoured each other that finally only their tails remained. [43] And Saint Bruno passes sentence on these tails, declaring that they are "*substance*" and, consequently, condemned to eternal damnation.

In confronting Feuerbach with Stirner he repeats what Hegel said of Spinoza and Fichte, where, as we know, the punctiform ego is represented as one, and moreover the most stable, aspect of substance. However much Bruno formerly raged against egoism, which he even considered the *odor specificus* of the masses, on page 129 he accepts egoism from Stirner — only this should be "not that of Max Stirner", but, of course, that of Bruno Bauer. He brands Stirner's egoism as having the moral defect "that his ego for the support of its egoism requires hypocrisy, deception, external violence". For the rest, he believes (see p. 124) in the critical miracles of Saint Max and sees in the latter's struggle (p. 126) "a real effort to radically destroy substance". Instead of dealing with Stirner's criticism of Bauer's "pure criticism", he asserts on p. 124 that Stirner's criticism could affect him just as little as any other, "because *he himself is the critic*".

Finally Saint Bruno refutes both of them, Saint Max and Feuerbach, applying almost literally to Feuerbach and Stirner the antithesis drawn by Stirner between the critic Bruno Bauer and the dogmatist.

*Wigand*, p. 138: “Feuerbach puts himself in opposition to, and *thereby*” (!) “*stands in opposition to*, the unique. He is a *communist* and wants to be one. The unique is an *egoist* and has to be one; he is the *holy one*, the other the *profane one*, he is the *good one*, the other the *evil one*, he is God, the other is man. Both are *dogmatists*.”

The point is, therefore, that he accuses both of *dogmatism*.

*Der Einzige und sein Eigentum*, p. 194: “The critic is afraid of becoming dogmatic or of putting forward dogmas. Obviously, he would then become the opposite of a critic, a dogmatist; he who as a critic was *good*, would now become evil, or from being *unselfish*” (a Communist) “would become an *egoist*, etc. Not a single dogma! — that is his dogma.”

### **3. Saint Bruno Versus the Authors of *Die Heilige Familie***

Saint Bruno, who has disposed of Feuerbach and Stirner in the manner indicated and who has “cut the unique off from all progress”, now turns against the apparent “consequences of Feuerbach”, the German Communists and, especially, the authors of *Die Heilige Familie*. The expression “real humanism”, which he found in the preface to this polemic treatise, provides the main basis of his hypothesis. He will recall a passage from the Bible:

“And I, brethren, could not speak unto you as unto spiritual, but as unto carnal” (in our case it was just the opposite), “even as unto babes in Christ. I have fed you with milk, and not with meat: for hitherto ye were not able to bear it” (1 Corinthians, 3: 1-2).

The first impression that *Die Heilige Familie* made on the worthy

church father was one of profound distress and serious, respectable sorrow. The one good side of the book is that it

“showed what Feuerbach *had* to become, and the position his philosophy *can* adopt, if it *desires* to fight against criticism” (p. 138),

that, consequently, it combined in an easy-going way “desiring” with “what can be” and “what must be”, but this good side does not outweigh its many distressing sides. Feuerbach’s philosophy, which strangely enough is presupposed here,

“*dare not* and *cannot* understand the critic, *dare not* and *cannot* know and perceive criticism in its development, *dare not* and *cannot* know that, in relation to all that is transcendental, criticism is a constant struggle and victory, a continual destruction and creation, the *sole*” (!) “creative and productive principle. It *dare not* and *cannot* know how the critic has worked, and still works, to posit and to make” (!) “the transcendental forces, which up to now have suppressed mankind and not allowed it to breathe and live, into what they *really are*, the spirit of the spirit, the innermost of the innermost, a native thing” (!) “out of and in the native soil, products and creations of self-consciousness. It *dare not* and *cannot* know that the critic and only the critic has smashed religion in its entirety, and the state in its various manifestations, etc.” (pp. 138,139).

Is this not an exact copy of the ancient Jehovah, who runs after his errant people who found greater delight in the cheerful pagan gods, and cries out:

“Hear me, Israel, and close not your ear, Judah! Am I not the Lord

your God, who led you out of the land of Egypt into the land flowing with milk and honey, and behold, from your earliest youth you have done evil in my sight and angered me with the work of my hands and turned your back unto me and not your face towards me, though I invariably tutored you; and you have brought abominations into my house to defile it, and built the high places of Baal in the valley of the son of Himmon, which I did not command, and it never entered my head that you should do such abominations; and I have sent to you my servant Jeremiah, to whom I did address my word, beginning with the thirteenth year of the reign of King Josiah, son of Amon, unto this day — and for twenty-three years now he has been zealously preaching to you, but ye have not harkened. Therefore says the Lord God: Who has ever heard the like of the virgin of Israel doing such an abomination. For rain water does not disappear so quickly as my people forgets me. O earth, earth, earth, hear the word of the Lord!” [cf. Jeremiah 2:6, 32:22, 30, 33-35, 25:3, 19:3, 18:13, 14, 22:29]

Thus, in a lengthy speech on “to dare” and “to be able”, Saint Bruno asserts that his communist opponents have misunderstood him. The way in which he describes criticism in this recent speech, the way in which he transforms the former forces that suppressed ‘the life of mankind’ into “transcendental forces”, and these transcendental forces into the “spirit of the spirit”, and the way in which he presents “criticism” as the sole branch of production proves that the apparent misconception is nothing but a disagreeable conception. We proved that Bauer’s criticism is beneath all criticism, owing to which we have inevitably become dogmatists. He even in all seriousness reproaches us for our insolent disbelief in his ancient phrases. The whole mythology of independent concepts, with Zeus the Thunderer — self-consciousness — at the head, is paraded here once again to the “jingling

of hackneyed phrases of a whole janissary band of current categories”. (*Literatur-Zeitung*, cf. *Die Heilige Familie*, p. 234). First of all, of course, the myth of the creation of the world, i.e., of the hard “*labour*” of the critic, which is “the sole creative and productive principle, a constant struggle and victory, a continual destruction and creation”, “working” and “having worked”. Indeed, the reverend father even reproaches *Die Heilige Familie* for understanding “criticism” in the same way as he understands it himself in the present rejoinder. After taking back “substance” “into the land of its birth, self-consciousness, the criticising and” (since *Die Heilige Familie* also) “the criticised man, and *discarding* it” (self-consciousness here seems to take the place of an ideological lumber-room), he continues:

“It” (the alleged philosophy of Feuerbach) “dare not know that criticism and the critics, as long as they have existed” (!) “have guided and made history, that even their opponents and all the movements and agitations of the present time are their creation, that it is they alone who hold *power in their hands, because strength is in their consciousness*, and because they derive power *from themselves*, from their deeds, from criticism, from’ their opponents, from their creations; that only by the act of criticism is man freed. and thereby men also, and man is *created*” (!) “and thereby mankind as well”.

Thus, criticism *and* the critics are first of all two wholly different subjects, existing and operating apart from each other. The critic is a subject different from criticism, and criticism is a subject different from the critic. This personified criticism, criticism as a subject, is precisely that “critical criticism” against which *Die Heilige Familie* was

directed. “Criticism and the critics, as long as they have existed, have guided and made history.” It is clear that they could not do so “as long as they” did not “exist”, and it is equally clear that “as long as they have existed” they “made history” in their own fashion. Finally, Saint Bruno goes so far as to “dare and be able” to give us one of the most profound explanations about the state-shattering power of criticism, namely, that “criticism and the critics hold *power in their hands*, because” (a fine “because”!) “*strength is in their consciousness*”, and, secondly, that these great manufacturers of history “hold power in their hands”, because they “derive power from themselves and from criticism” (i.e., again from themselves) — whereby it is still, unfortunately, not proven that it is possible to “derive” anything at all from there, from “themselves”, from “criticism”. On the basis of criticism’s own words, one should at least believe that it must be difficult to “derive” from there anything more than the category of “substance” “discarded” there. Finally, criticism also “derives” “from criticism” “power” for a highly monstrous oracular dictum. For it reveals to us a secret that was hidden [cf. Colossians 1 :26] from our fathers and unknown to our grandfathers, the secret that “only by the act of criticism is man created, and thereby mankind as well” — whereas, up to now, criticism was erroneously regarded as an act of people who existed prior to it owing to quite different acts. Hence it seems that Saint Bruno himself came “into the world, from the world, and to the world” through “criticism”, i.e., by *generatio aequioca* [spontaneous generation]. All this is, perhaps, merely another interpretation of the following passage from the Book of Genesis: And Adam *knew*, i.e., criticised, Eve his wife: and she conceived, [cf. Genesis 4: 1] etc.

Thus we see here the whole familiar critical criticism, which was already sufficiently characterised in *Die Heilige Familie*, confronting us again with all its trickery as though nothing had happened. There is no need to be surprised at this, for the saint himself complains, on page 140, that *Die Heilige Familie* “cuts criticism off from all progress”. With the greatest indignation Saint Bruno reproaches the authors of *Die Heilige Familie* because, by means of a chemical process, they evaporated Bauer’s criticism from its “fluid” state into a *crystalline*” state.

It follows that “institutions of mendicancy”, the “baptismal certificate of adulthood”, the “regions of pathos and thunder-like aspects”, the “Mussulman conceptual affliction” (*Die Heilige Familie*, pp. 2, 3, 4 according to the critical *Literatur-Zeitung*) — all this is nonsense only if it is understood in the “crystalline” manner. And the twenty-eight historical howlers of which criticism was proved guilty in its excursion on “Englische Tagesfragen” [article by Julius Faucher] — are they not errors when looked at from the “fluid” point of view? Does criticism insist that, from the fluid point of view, it prophesied *a priori* the Nauwerck conflict [44] — long after this had taken place before its eyes — and did not construct it *post festum*? Does it still insist that the word *marichal* could mean “*farrier*” from the “crystalline” point of view, but from the “fluid” point of view at any rate must mean marshal”? Or that although in the “crystalline” conception “*un fait physique*” may mean “a physical fact”, the true “fluid” translation should be “a fact of physics”? Or that “*la malveillance de nos bourgeois juste-milieux*” [the

ill will of our middle-of-the-road bourgeois] in the “fluid” state still means “the care-freeness of our good burghers”? Does it insist that, from the “fluid” point of view, “a child that does not, in its turn, become a father or mother is *essentially a daughter*”? That someone can have the task “of representing, as it were, the last tear of grief shed by the past”? That the various concierges, lions, grisettes, marquises, scoundrels and wooden doors in Paris in their “fluid” form are nothing but phases of the mystery “in whose concept in general it belongs to posit itself as limited and again to abolish this limitation which is posted by its universal essence, for precisely this essence is only the result of its inner self-distinction, its activity” [Bruno Bauer, “Charakteristik Ludwig Feuerbachs”]? That critical criticism in the “fluid” sense “pursues its path irresistibly, victorious and confident of victory”, when in dealing with a question it first asserts that it has revealed its “true and general significance” and then admits that it “had neither the will nor the right to go beyond criticism”, and finally admits that “it had still to take one step but that step was impossible because — it was impossible” (*Die Heilige Familie*, p. 184)? That from the “fluid” point of view “the future is still the work” of criticism, although “fate may *decide* as it will” [B. Bauer, “Neueste Schriften Über die Judenfrage”]? That from the fluid point of view criticism achieved nothing superhuman when it “came into contradiction with its *true elements* — a *contradiction* which had already found its *solution* in *these same elements* [ B. Bauer, “Was ist jetzt der Gegenstand der Kritik?”]?

The authors of *Die Heilige Familie* have indeed committed the frivolity

of conceiving these and hundreds of other statements as statements expressing firm, “crystalline” *nonsense* — but the synoptic gospels should be read in a “fluid” way, i.e., according to the sense of their authors. and on no account in a “crystalline” way, e., according to their actual nonsense, in order to arrive at true faith and to admire the harmony of the critical household.

“Engels and Marx, therefore, know only the criticism of the *Literatur-Zeitung*” [Bruno Bauer, “Charakteristik Ludwig Feuerbachs”]

— a deliberate lie, proving how “fluidly” our saint has read a book in which his latest works are depicted merely as the culmination of all the “work he has done”. But the church father lacked the calm to read in a crystalline way, for he fears his opponents as rivals who contest his canonisation and “want to deprive him of his sanctity, in order to make *themselves* sanctified”.

Let us, incidentally, note the fact that, according to Saint Bruno’s present statement, his *Literatur-Zeitung* by no means aimed at founding “social society” or at “representing, as it were, the last tear of grief” shed by German ideology, nor did it aim at putting mind in the sharpest opposition to the mass and developing critical criticism in all its purity, but only — at “depicting the liberalism and radicalism of 1842 and their echoes in their half-heartedness and phrase-mongering”, hence at combating the “echoes” of what has long disappeared. *Tant de bruit pour une omelette!* [Much ado about an omelette! An exclamation which Jacques Vallé, Sieur des Barreaux, is supposed to have made

when a thunderstorm occurred while he was eating an omelette on a fast-day] Incidentally, it is just here that the conception of history peculiar to German theory is again shown in its “purest” light. The year 1842 is held to be the period of the greatest brilliance of German liberalism, because at that time philosophy took part in politics. Liberalism vanishes for the critic with the cessation of the *Deutsche Jahrbücher* and the *Rheinische Zeitung*, the organs of liberal and radical theory. After that, apparently, there remain only the “echoes” — whereas in actual fact only now, when the German bourgeoisie feels a real need for political power, a need produced by economic relations, and is striving to satisfy has liberalism in Germany an actual existence and thereby 1 the chance of some success.

Saint Bruno’s profound distress over *Die Heilige Familie* did not allow him to criticise this work “out of himself, through himself and with himself”. To be able to master his pain he had first to obtain the work in a “fluid” form. He found this fluid form in a confused review, teeming with misunderstandings, in the *Westphälische Dampfboot*, May issue, pp. 206-14 All his quotations are taken from passages quoted in the *Westphälische Dampfboot* and he quotes nothing that is not quoted there.

The language of the saintly critic is likewise determined by the language of the Westphalian critic. In the first place, all the statements from the Foreword which are quoted by the Westphalian (*Dampfboot*, p. 206) are transferred to the *Wigand’sche Vierteljahrsschrift* (pp. 140, 141). This transference forms the chief part of Bauer’s criticism,

according to the old principle already recommended by Hegel:

“To trust common sense and, moreover, in order to keep up with the times and advance with philosophy, to read *reviews* of philosophical works, perhaps even their *prefaces* and introductory paragraphs; for the latter give the general principles on which everything turns, while the former give, along with the historical information, also an appraisal which, because it is an appraisal, even goes beyond that which is appraised This beaten track can be followed in one’s dressing-gown; but the elevated feeling of the eternal, the sacred, the infinite, pursues its path in the vestments of a high priest, a path” which, as we have seen, Saint Bruno also knows how to “pursue” while “striking down” (Hegel, *Phänomenologie*, p. 54).

The *Westphalian* critic, after giving a few quotations from the preface, continues:

“Thus the preface itself leads to the *battlefield* of the book”, etc. (p. 206).

The *saintly* critic, having transferred these quotations into the *Wigand’sche Vierteljahrsschrift*, makes a more subtle distinction and says:

“Such is the *terrain* and the *enemy* which Engels and Marx have created for *battle*.”

From the discussion of the critical proposition: “the worker creates nothing”, the *Westphalian* critic gives only the summarising *conclusion*.

The *saintly* critic actually believes that this is all that was said about the

proposition, copies out the Westphalian quotation on page 141 and rejoices at the discovery that only “assertions” have been put forward in opposition to criticism.

Of the examination of the critical outpourings about love, the *Westphalian* critic on page 209 first writes out the *corpus delicti* in part and then a few disconnected sentences from the refutation, which he desires to use as an authority for his nebulous, sickly-sweet sentimentality.

On pages 141-42 the *saintly* critic copies him out word for word, sentence by sentence, in the same order as his predecessor quotes.

The *Westphalian* critic exclaims over the corpse of Herr Julius Faucher: “Such is the fate of the beautiful on earth!”. [Schiller. *Wallenstein’s Tod*, Act IV, Scene 12]

The *saintly* critic cannot finish his “hard work” without appropriating this exclamation to use irrelevantly on page 142.

The *Westphalian* critic on page 212 gives a would-be summary of the arguments which are aimed against Saint Bruno himself in *Die Heilige Familie*.

The *saintly* critic cheerfully and literally copies out all this stuff together with all the Westphalian exclamations. He has not the slightest idea that *nowhere* in the whole of this polemic discourse does anyone reproach hint for “transforming the problem of political emancipation into that of human emancipation”, for “wanting to kill the Jews”, for

“transforming the Jews into theologians”, for “transforming Hegel into Herr Hinrichs”, etc. Credulously, the saintly critic repeats the *Westphalian* critic’s allegation that in *Die Heilige Familie Marx* volunteers to provide some sort of little scholastic treatise “in reply to Bauer’s *silly self-apotheosis*”. Yet the words “silly self-apotheosis”, which Saint Bruno gives as a *quotation*, are nowhere to be found in the whole of *Die Heilige Familie*, but they do occur with the Westphalian critic. Nor is the little treatise offered as a reply to the “self-apology” of criticism on pages 150-63 of *Die Heilige Familie*, but only in the following section on page 165, in connection with the world-historic question: “Why did Herr Bauer *have to* engage in politics?”

Finally on page 143 Saint Bruno presents *Marx* as an “*amusing comedian*”, here again following his Westphalian model, who resolved the “world-historic drama of critical criticism”, on page 213, into a “*most amusing comedy*”.

Thus one sees how the opponents of critical criticism “dare and can” “*know how the critic has worked, and still works!*”

#### **4. Obituary For “M. Hess”**

“What Engels and Marx could *not yet* do, M. Hess has accomplished.”

Such is the great, divine transition which — owing to the relative “can” and “cannot” be done of the evangelists — has taken so firm a hold of the holy man’s fingers that it has to find a place, relevantly or irrelevantly, in every article of the church father.

“What Engels and Marx could not yet do, M. Hess has accomplished.” But what is this “what” that “Engels and Marx could not yet do”? Nothing more nor less, indeed, than — to criticise Stirner. And why was it that Engels and Marx “could *not yet*” criticise Stirner? For the sufficient reason that — Stirner’s book *had not yet appeared* when they wrote *Die Heilige Familie*.

This speculative trick — of joining together everything and bringing the most diverse things into an apparent causal relation — has truly taken possession not only of the head of our saint but also of his fingers. With him it has become devoid of any contents and degenerates into a burlesque manner of uttering tautologies with an important mien. For example, already in the *Allgemeine Literatur-Zeitung* (1, 5) we read:

“The difference between my work and the pages which, for example, a Philippson covers with writing” (that is, the *empty* pages on which, “for example, a Philippson” writes) “must, *therefore, be so constituted as in fact it is*”!!! [Bauer, “Neueste Schriften über die Judenfrage”]

“M. Hess”, for whose writings Engels and Marx take absolutely no responsibility, seems such a strange phenomenon to the saintly critic that he is only capable of copying long excerpts from *Die letzten Philosophen* and passing the judgment that “on some points this criticism has not understood Feuerbach *or also*” (O theology!) “the vessel wishes to rebel against the potter”. Cf. Epistle to the Romans, 9: 20-21. Having once more performed the “hard work” of quoting, our saintly critic finally arrives at the conclusion that Hess copies from

*Hegel*, since he uses the two words “united” and “development”. Saint Bruno, of course, had in a round-about way to try to turn against Feuerbach the proof given in *Die Heilige Familie* of his own complete dependence on Hegel.

“See, that is how Bauer had to end! He fought as best he could against all the Hegelian categories”, with the exception of selfconsciousness — particularly in the glorious struggle of the *Literatur-Zeitung* against Herr Hinrichs. How he fought and conquered them we have already seen. For good measure, let us quote *Wigand*, page 110, where he asserts that

the “true” (1) “*solution*” (2) “*of contradictions*” (3) “in nature and history” (4), the “*true unity*” (5) “of separate relations” (6), the “genuine” (7) “basis” (8) “and abyss” (9) “of religion, the truly *infinite*” (10), “irresistible, self-creative” (11) “personality” (12) “has not yet been found”.

These three lines contain not two doubtful Hegelian categories, as in the case of Hess, but a round dozen of “true, infinite, irresistible” Hegelian categories which reveal themselves as such by ‘,the true unity of separate relations’ — “see, that is how Bauer had to end"! And if the holy man thinks that in Hess he has discovered a Christian believer, not because Hess “hopes” — as Bruno says — but because he does not hope and because he talks of the “resurrection”, then our great church father enables us, on the basis of this same page 1 10, to demonstrate his very pronounced *Judaism*. He declares there

“that the *true, living man in the flesh has not yet been born*”!!! (a

new elucidation about the determination of the “unique sex”) “and the mongrel produced” (*Bruno Bauer?!?*) “is not yet a le to master all *dogmatic formulas*”, etc.

That is to say, the *Messiah* is not yet born, the *son of man* has first to come into the world and this world, being the world of the Old Testament, is still under the rod of the *law*, of “dogmatic formulas”.

Just as Saint Bruno, as shown above, made use of “Engels and Marx” for a transition to Hess, so now the latter serves him to bring Feuerbach finally into causal connection with his excursions on Stirner, *Die heilige Familie* and *Die letzten Philosophen*.

“See, that is how Feuerba.ch had to end!” “Philosophy had to end piously”, etc. (*Wigand*, p. 145.)

The true causal connection, however, is that this exclamation is an imitation of a passage from Hess’ *Die letzten Philosophen* aimed against Bauer, among others (Preface, p. 4):

“Thus, [...] and in no other way had the last offspring of the Christian ascetics to take farewell of the world.”

Saint Bruno ends his speech for the prosecution against Feuerbach and his alleged accomplices with the reproach to Feuerbach that all he can do is to “trumpet”, to “blow blasts on a trumpet”, whereas Monsieur B. Bauer or Madame la critique, the “mongrel produced”, to say nothing of the continual “destruction”, “*drives forth in his triumphal chariot and gathers new triumphs*” (p. 125), “hurls down from the throne” (p. 119), “slays” (p. 111), “strikes down like thunder” (p. 115), “destroys once

and for all” (p. 120), “shatters” (p. 121), allows nature merely to “vegetate” (p. 120), builds “stricter” (!) “prisons” (p. 104) and, finally, with “crushing” pulpit eloquence expatiates, on p. 105, in a brisk, pious, cheerful and free [“Brisk, pious, cheerful and free” (“frisch, fromm, fröhlich und frei”) — the initial words of a students’ saying, which were turned by Ludwig Jahn into the motto of the sport movement he initiated] fashion on the “stably-strongly-firmly-existing”, hurling “rock-like matter and rocks” at Feuerbach’s head (p. 110) and, in conclusion, by a side thrust vanquishes Saint Max as well, by adding “the most abstract abstractness” and “the hardest hardness” (on p. 124) to “critical criticism”, “social society” and “rock-like matter and rocks”.

All this Saint Bruno accomplished “through himself, in himself and with himself”, because he is “He himself”; indeed, he is “himself always the greatest and can always be the greatest” (*is* and *can be*!) “through himself, in himself and with himself” (p. 136). That’s that.

Saint Bruno would undoubtedly be dangerous to the female sex, for he is an “irresistible personality”, if “in the same measure on the other hand” he did not fear “sensuousness as the barrier against which man has to deal himself a mortal *blow*”. Therefore, “through himself, in himself and with himself” he will hardly pluck any flowers but rather allow them to wither in infinite longing and hysterical yearning for the “irresistible personality”, who “possesses this unique sex and these unique, particular sex organs”.

[The following passage is crossed out in the manuscript:]

## 5. Saint Bruno in His “Triumphal Chariot”

Before leaving our church father “victorious and confident of victory”, let us for a moment mingle with the gaping crowd that comes up running just as eagerly when he “drives forth in his triumphal chariot and gathers new triumphs” as when General Tom Thumb with his four ponies provides a diversion. It is not surprising that we hear the humming of street-songs, for to be welcomed with street-songs “belongs after all to the concept” of triumph “in general”.

[On Competition](#)

The German ideology was never published in Marx or Engels lifetime. When the manuscript was discovered, tattered and worn down, the full book was published by the Institute of Marxism in the USSR. Since its publication, the first chapter received enormous popularity as an excellent overview of the materialist conception of history, while at the same time, the second and third chapter received unanimous notoriety for being drastically less helpful to all but the most dedicated scholars of Marxism.

While Chapters 2 & 3 are easy to neglect, there are portions of material where Marx and Engels were explaining their theory instead of critiquing others. The only criteria used for selecting material for this collection was simply that information where Marx and Engels explained their own theories.

If you would like to read their critique of Saint Max and Saint Bruno then read the full book; about a quarter of Chapters 2 & 3 are dedicated solely to a critique. Nearly the entire remainder of the book is a repetition of Saint Max and Saint Bruno's writings, very meticulously and thoroughly reproduced.

Paragraphs have been introduced to the selected passages for easier reading, and section headers have been inserted. Information abstracted by [Brian Basgen](#), 2000.

---

# Idealism

---

" *Hierarchy is the domination of thought* , the domination of the spirit.... Hierarchy is the *supreme domination of spirit* ."

In the foregoing presentation Jacques le bonhomme conceives history merely as the product of abstract thoughts — or, rather, of his notions of abstract thoughts — as governed by these notions, which, in the final analysis, are all resolved into the "holy". This domination of the "holy", of thought, of the Hegelian [absolute idea](#) over the incurable world he further betrays as a historical relation existing at the present time, as the domination of the holy ones, the ideologies, over the vulgar world — as a *hierarchy*. In this hierarchy, what previously appeared *consecutively* exists *side-by-side*, so that one of the two co-existing forms of development rules over the other...

The outcome, of course, is bound to be that the domination which the "world of thoughts" exercises from the outset in history is at the end of the latter also presented as the real, actually existing domination of the thinkers — and, as we shall see, in the final analysis, as the domination of the speculative philosophers — over the world of things, so that Saint Max has only to fight against thoughts and ideas of the ideologies

and to overcome them, in order to make himself "possessor of the world of things in the world of thoughts".

p. 186 [MECW p. 172]

As for the actual hierarchy of the Middle Ages, we shall merely note here that it did not exist for the people, for the great mass of human beings. For the great mass only feudalism existed, and hierarchy only existed insofar as it was itself either feudal or anti-feudal (within the framework of feudalism). Feudalism itself had entirely empirical relations as its basis. Hierarchy and struggle against feudalism (the struggle of the ideologies of a class against the class itself) are only the ideological expression of feudalism and of the struggles developing within feudalism itself — which include also the struggles of the feudally organized nations among themselves. Hierarchy is the ideal form of feudalism; feudalism is a political form of the medieval relations of production and intercourse. Consequently, the struggle of feudalism against hierarchy can only be explained by elucidating these practical material relations. This elucidation of itself puts an end to the previous conception of history which took the illusions of the Middle Ages on trust, in particular those illusions which the Emperor and the Pope brought to bear in their struggle against each other.

p. 190 [MECW p. 176]

We now come to present-day hierarchy, to the domination of the idea in ordinary life.... Since the middle class demand love for *their* kingdom, their regime, they want, according to Jacques le bonhomme, to "establish the kingdom of love on earth". (p. 98) Since they demand

respect for their domination and for the conditions in which it is exercised, and therefore want to usurp domination over respect, they demand, according to this worthy man [Jacques le bonhomme], the domination of *respect* as such, their attitude towards respect is the same as towards the holy spirit dwelling within them. (p. 95) Jacques le bonhomme, with his faith that can move mountains, takes as the actual, earthly basis of the bourgeois world the distorted form in which the sanctimonious and hypocritical ideology of the bourgeoisie voices their particular interests as universal interests. Why this ideological delusion assumes precisely this form for our Saint, we shall see in connection with "political liberalism".

p. 193-4 [MECW p. 176]

---

## On Religion

In religion people make their empirical world into an entity that is only conceived, imagined, that confronts them as something foreign. This again is by no means to be explained from other concepts, from "self-consciousness" and similar nonsense, but from the entire hitherto existing mode of production and intercourse, which is just as independent of the pure concept as the invention of the self-acting mule and the use of railways are independent of Hegelian philosophy. If he wants to speak of an "essence" of religion, i.e., of a material basis of this inessentiality, then he should look for it neither in the "essence of man", nor in the predicate of God, but in the material world which each stage of religious development finds in existence.

The only reason why Christianity wanted to free us from the domination of the flesh and "desires as a driving force" was because it regarded our flesh, our desires as something foreign to us; it wanted to free us from determination by nature only because it regarded our own nature as not belonging to us.

For if I myself am not nature, if my natural desires, my whole natural character, do not belong to myself — and this is the doctrine of Christianity — then all determination by nature — whether due to my own natural character or to what is known as external nature — seems to me a determination by something foreign, a fetter, compulsion used against me, *heteronomy as opposed to autonomy of the spirit* .

Incidentally, Christianity has indeed never succeeded in freeing us from the domination of desires.

---

## Consciousness throughout history

[In ancient times] the ideas and thoughts of people were, of course, ideas and thoughts about themselves and their relationships, their consciousness of *themselves* and of people *in general* — for it was the consciousness not merely of a single individual but of the individual in his interconnection with the whole of society and about the whole of the

society in which they live.

The conditions, independent of them, in which they produce their life, the necessary forms of intercourse connected herewith, and the personal and social relations thereby given, had to take the form — insofar as they were expressed in thoughts — of ideal conditions and necessary relations, i.e., they had to be expressed in consciousness as determinations arising from the concept of man *as such* , from human essence, from the nature of man, from man *as such* . What people were, what their relations were, appeared in consciousness as ideas of man *as such* , of his modes of existence or of his immediate conceptual determinations.

So, after the ideologists had assumed that ideas and thoughts had dominated history up to now, that the history of these ideas and thoughts constitutes all history up to now, after they had imagined that real conditions had conformed to man *as such* and his ideal conditions, i.e., to conceptual determinations, after they had made the history of people's consciousness of themselves the basis of their actual history, after all this, nothing was easier than to call the history of consciousness, of ideas, of the holy, of established concepts — the history of "man" and to put it in the place of real history.

p. 198 [MECW p. 183]

---

## An idealist conception of Humans

Sancho raises the important question:

"But how to curb the inhuman being who dwells in each individual? How can one manage not to set free the inhuman being along with the human being?... At the side of the human being there's always the inhuman being, that egoist, the individual. State, society, mankind cannot master this devil."

In the form in which Sancho understands it, the question again becomes sheer nonsense. He imagines that people up to now have always formed a concept of man, and then won freedom for themselves to the extent that was necessary to realize this concept; that the measure of freedom that they achieved was determined each time by their idea of the ideal of man at the time; it was thus unavoidable that in each individual there remained a residue which did not correspond to this ideal and, hence, since it was "inhuman", was either not set free or only freed *malgre eux*.

In reality, of course, what happened was that people won freedom for themselves each time to the extent that was dictated and permitted not by their ideal of man, but by the existing productive forces. All emancipation carried through hitherto has been based, however, on unrestricted productive forces. The production which these productive forces could provide was insufficient for the whole of society and made development possible only if some persons satisfied their needs at the expense of others, and therefore some — the minority — obtained the monopoly of development, while others — the majority — owing to the constant struggle to satisfy their most essential needs, were for the time being (i.e., until the creation of new revolutionary productive forces)

excluded from any development.

Thus, society has hitherto always developed within the framework of a contradiction — in antiquity the contradiction between freemen and slaves, in the Middle Ages that between nobility and serfs, in modern times that between the bourgeoisie and the proletariat. This explains, on the one hand, the abnormal, "inhuman" way in which the oppressed class satisfies its needs, and, on the other hand, the narrow limits within which intercourse, and with it the whole ruling class, develops. And this restricted character of development consists not only in the exclusion of one class from development, but also in the narrowmindedness of the excluding class, and the "inhuman" is to be found also within the ruling class.

This so-called "inhuman" is just as much a product of present-day relations as the "human" is; it is their native aspect, the rebellion — which is not based on any new revolutionary productive force — against the prevailing relations brought about by the existing productive forces, and against the way of satisfying needs that correspond to these relations. The positive expression "human" corresponds to the definite relations *predominate* at a certain stage of production in the way of satisfying needs determined by them, just as the negative expression "inhuman" corresponds to the attempt to negate these predominate relations in the way of satisfying needs prevailing under them without changing the existing mode of production, an attempt that this stage of production daily engenders afresh.

## On Language & Idealism

One of the most difficult tasks confronting philosophers is to descend from the world of thought to the actual world. *Language* is the immediate actuality of thought. Just as philosophers have given thought an independent existence, so they were bound to make language into an independent realm. This is a secret of philosophical language, in which thoughts in the form of words have their own content. The problem of descending from the world of thoughts to the actual world is turned into the problem of descending from language to life.

We have shown [in Chapter 1] that thoughts and ideas acquire an independent existence in consequence of the personal circumstances and relations of individuals acquiring independent existence. We have shown that exclusive, systematic occupation with these thoughts on the part of ideologists and philosophers, and hence the systemization of these thoughts, is a consequence of division of labour, and that, in particular, German philosophy is a consequence of German petty-bourgeois conditions. The philosophers have only to dissolve their language into the ordinary language, from which it is abstracted, in order to recognize it as the distorted language of the actual world and to realize that neither thoughts nor language in themselves form a realm of their own, that they are only *manifestations* of actual life.

p. 472-3 MECW p. 446

We have seen that the whole problem of the transition from thought to

reality, hence from language to life, exists only in philosophical illusion, i.e., it is justified only for philosophical consciousness, which cannot possibly be clear about the nature and origin of its apparent separation from life. This great problem, insofar as it at all entered the minds of our ideologists, was bound, of course, to result of finely in one of these knights-errant setting out in search of a word which, as a *word* , formed the transition in question, which, as a word, ceases to be simply a word, and which, as a word, in a mysterious super linguistic manner, points from within the language to the actual object it denotes; which, in short, plays among words the same role as the Redeeming God-Man plays among people in Christian fantasy. The emptiest, shallowest brain among the philosophers had to "end" philosophy by proclaiming his lack of thought to be the end of philosophy and thus the triumphant entry into "corporal" life. His philosophizing mental vacuity was already in itself the end of philosophy just as his unspeakable language was the end of all language.

p. 475 [MECW p. 449]

---

# Individuality

---

*Critique: "humans create themselves out of nothing"*

Far from it being true that "out of nothing" I make myself, for example, a "[public] speaker", the nothing which forms the basis here is a very manifold something, the real individual, his speech organs, a definite stage of physical development, an existing language and dialects, ears capable of hearing and a human environment from which it is possible to hear something, etc., etc. therefore, in the development of a property something is created by something out of something, and by no means comes, as in Hegel's Logic, from nothing, through nothing to nothing. [Th. I. Abt. 2 of Hegel]

p. 162 [MECW p. 150]

---

## **Individualism in a class perspective**

When the narrow-minded bourgeois says to the Communists: by abolishing property, i.e., my existence as a capitalist, as a landed proprietor, as a factory owner, and your existence as workers, you abolished my individuality and your own; by making it impossible for me to exploit you, the workers, to rake in my profit, interest or rent, you make it impossible for me to exist as an individual.

When, therefore, the bourgeois tells the Communists: by abolishing my existence *as the bourgeois*, you abolish my existence *as an individual*; when thus he identifies himself as a bourgeois with himself as an individual, one must, at least, recognize his frankness and

shamelessness. For the bourgeois it is actually the case, he believes himself to be an individual only in so far as he is a bourgeois.

But when the theoreticians of the bourgeoisie come forward and give a general expression to this assertion, when they equate the bourgeois's property with individuality in theory as well and want to give a logical justification for this equation, then this nonsense begins to become solemn and holy.

p. 246 [MECW p. 229]

---

## The relation of individual interests to class interests

[Sancho asks:] How is it that personal interests always develop, against the will of individuals, into class interests, into common interests which acquire independent existence in relation to the individual persons, and in their independence assume the form of *general* interests? How is it that as such they come into contradiction with the actual individuals and in this contradiction, by which they are defined as *general* interests, they can be conceived by consciousness as *ideal* and even as religious, holy interests? How is it that in this process of private interests acquiring independent existence as class interests the personal behavior of the individual is bound to be objectified [sich versachlichen], estranged [sich entfremden], and at the same time exists as a power independent of him and without him, created by intercourse, and is transformed into social relations, into a series of powers which determined and subordinate the individual, in which, therefore, appear

in the imagination as "holy" powers?

Had Sancho understood the fact that within the framework of definite *modes of production* , which, of course, are not dependent on the will, alien practical forces, which are independent not only of isolated individuals but even of all of them together, always come to stand above people — then he could be fairly indifferent as to whether this fact is preserved in the religious form or distorted in the fancy of the egoist, above whom everything is placed in imagination, in such a way that he places nothing above himself. Sancho would then have descended from the realm of speculation into the realm of reality, from what people fancy to what they actually are, from what they imagine to how they act and are bound to act in definite circumstances. What seems to him a product of *thought* , he would have understood to be a product of *life* . He would not then have arrived at the absurdity worthy of him — of explaining the division between personal and general interests by saying that people imagine this division *also* in a religious way and *seem* to themselves to be such and such, which is, however, only another word for "imagining".

Incidentally, even in the banal, petty-bourgeois German form in which Sancho perceives contradiction of personal and general interests, he should realize that individuals have always started out from themselves, and could not do otherwise, and that therefore the two aspects he noted are aspects of the personal development of individuals; both are equally engendered by the empirical conditions under which the individuals live, both are only expressions of *one and the same* personal

development of people and are therefore only in *seeming* contradiction to each other.

p. 262-3 [MECW p. 245]

## The role of will in the desires of an individual

Whether a desire becomes fixed or not, i.e., whether it obtains exclusive [power over us] — which, however, does [not] exclude [further progress] — depends on whether material circumstances, "bad" mundane conditions permit the normal satisfaction of this desire and, on the other hand, the development of a totality of desires. This latter depends, in turn, on whether we live in circumstances that allow all-round activity and thereby the full development of all our potentialities. On the actual conditions, and the possibility of development they give each individual, depends also whether thoughts become fixed or not — just as, for example, the fixed ideas of the German philosophers, these "victims of society", *qui nous font pitie* [for whom we feel pity], are inseparable from the German conditions.

An avaricious person is not an owner, but a servant, and he can do nothing for his own sake without at the same time doing it for the sake of his master."

No one can do anything without at the same time doing it for the sake of one or other of his needs and for the sake of the organ of this need — for Stirner this means that this need and its organ are made into a master over him, just as earlier he made the *means* for satisfying a need into a

master over him. Stirner cannot eat without at the same time eating for the sake of his stomach. If the worldly conditions prevent him from satisfying his stomach, then his stomach becomes a master over him, the desire to eat becomes a fixed desire, and the thought of eating becomes a fixed idea — which at the same time gives him an example of the influence of world conditions and fixing his desires and ideas. Sancho's "revolt" against the fixation of desires and thoughts is thus reduced to an impotent moral injunction about self-control and provides new evidence that he merely gives an ideologically high sounding expression to the most trivial sentiments of the petty-bourgeois.

[The following two paragraphs are crossed out in the manuscript (brackets are used for words that were illegible)]:

Since they attack the material basis on which the hitherto inevitable fixedness of desires and ideas depended, the Communists are the only people through whose historical activity the liquefaction of the fixed desires and ideas is in fact brought about and ceases to be an impotent moral injunction, as it was up to now with all moralists "down to" Stirner. Communist organization has a twofold effect on the desires produced in the individual by present-day relations; some of these desires — namely desires which exist under all relations, and only change their form and direction under different social relations — are merely altered by the Communist social system, for they are given the opportunity to develop normally; but others — namely those originating solely in a particular society, under particular conditions of [production] and intercourse — are totally deprived of their conditions of existence.

Which [of the desires] will be merely changed and [which eliminated] in a Communist [society] can [only occur in a practical] way, by [changing the real], actual [conditions of production and intercourse.]

A desire is already by its mere existence something "fixed", and it can occur only to St. Max and his like not to allow his sex instinct, for instance, to become "fixed"; it is that already and will cease to be fixed only as a result of castration or impotence. Each need, which forms the basis of a "desire", is likewise something "fixed", and try as he may St. Max cannot abolish this "fixedness" and for example contrive to free himself from the necessity of eating within "fixed" periods of time. The Communists have no intention of abolishing the fixedness of their desires and needs, an intention which Stirner, immersed in his world of fancy, ascribes to them and all other men; they only strive to achieve an organization of production and intercourse which will make possible the normal satisfaction of all needs, i.e., a satisfaction which is limited only by the needs themselves.

p. 272-3 [MECW p 255]

---

## **Individuality in thought and desire**

It depends not on *consciousness* , but on *being* ; not on thought, but on life; it depends on the individual's empirical development and manifestation of life, which in turn depends on the conditions existing in the world.

If the circumstances in which the individual lives allow him only the [one]-sided development of one quality at the expense of all the rest, [if] they give him the material and time to develop only that one quality, then this individual achieves only a one-sided, crippled development. No moral preaching avails here. And the manner in which this one, preeminently favored quality develops depends again, on the one hand, on the material available for its development and, on the other hand, on the degree and manner in which the other qualities are suppressed.

Precisely because thought, for example, is the thought of a particular, definite individual, it remains *his* definite thought, determined by his individuality in the conditions in which he lives. The thinking individual therefore has no need to resort to prolonged reflection about thought as such in order to declare that his thought is his own thought, his property; from the outset it is his own, peculiarly determined thought and it was precisely his peculiarity which [in the case of St.] Sancho [was found to be] the "opposite" of this, the peculiarity which is peculiar "*as such*".

In the case of an individual, for example, whose life embraces a wide circle of varied activities and practical relations to the world, and who, therefore, lives a many-sided life, thought has the same character of universality as every other manifestation of his life. Consequently, it neither becomes fixed in the form of abstract thought nor does it need complicated tricks of reflection when the individual passes from thought to some other manifestation of life. From the outset it is always a factor in the total life of the individual, one which disappears and is

reproduced as *required* .

In the case of a parochial Berlin schoolmaster or author, however, whose activity is restricted to arduous work on the one hand and the pleasure of thought on the other, whose world extends from [the small confines of their city], whose relations to this world are reduced to a minimum by his pitiful position in life, when such an individual experiences the need to think, it is indeed inevitable that his thought becomes just as abstract as he himself and his life, and that thought confronts him, who is quite incapable of resistance, in the form of a fixed power, whose activity offers the individual the possibility of a momentary escape from his "bad world", of a momentary pleasure.

In the case of such an individual the few remaining desires, which arise not so much from intercourse with a world as from the constitution of the human body, expressed themselves only through *repercussion* , i.e., they assume their narrow development the same one-sided and crude character as does his thought, they appear only along intervals, stimulated by the excessive development of the predominant desire (fortified by immediate physical causes, e.g., [stomach] spasm) and are manifested turbulently and forcibly, with the most brutal suppression of the ordinary, [natural] desire [— this leads to further] domination over [thought.] As a matter of course, the schoolmaster's [thinking reflects on and speculates about] is empirical [fact in a school] masterly fashion.

p. 280-1 [MECW p. 262]

## Needs being the vocation of all human beings

For St. Sancho vocation has a double form; firstly as a vocation which others choose for me — examples of which we have already had above in the case of newspapers that are full of politics and the prisons that our Saint mistook for houses of moral correction. Afterward vocation appears also as a vocation in which the individual himself believes.

If the ego is divorced from all its empirical conditions of life, it's activity, the conditions of its existence, if it is separated from the world that forms its basis and from its own body, then, of course, it has no other vocation and no other designation than that of representing the human being of the logical proposition and to assist St. Sancho in arriving at the equations given above.

In the real world, on the other hand, where individuals have needs, they thereby already have a *vocation* and *task* ; and at the outset it is still immaterial whether they make this their vocation in their imagination as well. It is clear, however, that because the individuals possess consciousness they form an idea of this vocation which their empirical existence has given them and, thus, furnish St. Sancho with the opportunity of seizing on the word vocation, that is, on the mental expression of their actual conditions of life, and of leading out of account these conditions of life themselves.

The proletarian, for example, who like every human being has the vocation of satisfying his needs and who is not in a position to satisfy even the needs that he has in common with all human beings, the

proletarian whom the necessity to work a 14 hour day debases to the level of the beast of burden, whom competition degrades to a mere thing, an article of trade, who from his position as a mere productive force, the sole position left to him, is squeezed out by other, more powerful productive forces — this proletarian is, if only for these reasons, confronted with the real task of revolutionizing his conditions. He can, of course, imagine this to be his "vocation", he can also, if he likes to engage in propaganda, express his "vocation" by saying that to do this or that is the human vocation of the proletarian, the more so since his position does not even allow him to satisfy the needs arising directly from his human nature. St. Sancho does not concern himself with the reality underlining this idea, with the practical name of this proletarian — he clings to the word "vocation" and declares it to be the holy, and the proletarian to be a servant of the holy — the easiest way of considering himself superior and "proceeding further".

Particularly in the relations that have existed hitherto, when one class always ruled, when the conditions of life of an individual always coincided with the conditions of life of a class, when, therefore, the practical task of each newly emerging class was bound to appear to each of its members as a *universal* task, and when each class could actually overthrow its predecessor only by liberating the individuals of *all* classes from certain chains which had hitherto fettered them — under these circumstances it was essential that the task of the individual members of a class striving for domination should be described as a universal human task.

Incidentally, when for example the bourgeois tells the proletarian that his, the proletarian's, human task is to work 14 hours a day, the proletarian is quite justified in replying in the same language that, on the contrary, his task is to overthrow the entire bourgeois system.

p. 305-7 [MECW p. 288]

"Vocation, designation, task, ideal" are either:

1. The idea of the revolutionary tasks laid down for an oppressed class by the material conditions; or
2. Mere idealistic paraphrases, or also the conscious expression of the individuals' modes of activity which owing to the division of labour have assumed independent existence as various professions; or
3. The conscious expression of the necessity which at every moment confronts individuals, classes and nations to assert their position through some quite definite activity; or
4. The conditions of existence of the ruling class (as determined by the preceding development of production), ideally expressed in law, morality, etc., to which [conditions] the ideologists of that class more or less consciously gave a sort of theoretical independence; they can be conceived by separate individuals of that class as vocation, etc., and are held up as a standard of life to the individuals of the oppressed class, partly as an intelligent or recognition of

domination, partly as the moral means for this domination. It is to be noted here, as in general with ideologists, that they inevitably put a thing upside-down and regard their ideology both as the creative force and as the aim of all social relations, whereas it is only an expression and symptom of these relations.

p. 444 [MECW p. 419]

---

## **The role of individual will in the foundation of the state**

In actual history, those theoreticians who regarded *might* as the basis of right were in direct contradiction to those who looked on *will* as the basis of right... If power is taken as the basis of right, as Hobbes, etc., do, then right, law, etc., are merely the symptom, the expression of *other* relations upon which state power rests.

The material life of individuals, which by no means depends merely on their "will", their mode of production and form of intercourse, which mutually determined each other — this is the real basis of the state and remained so at all the stages at which division of labor and private property are still necessary, quite independently of the *will* of individuals. These actual relations are in no way created by the state power; on the contrary they are the power creating it.

The individuals who rule in these conditions — leaving aside the fact that their power must assume the form of the *state* — have to give their

will, which is determined by these definite conditions, a universal expression as the will of the state, as law, an expression whose content is always determined by the relations of this class, as the civil and criminal law demonstrates in the clearest possible way. Just as the weight of their bodies does not depend on their idealistic will or on their arbitrary decision, so also the fact that they enforce their own will in the form of law, and at the same time to make it independent of the personal arbitrariness of each individual among them, does not depend on their idealistic will.

Their personal rule must at the same time assume the form of average rule. Their personal power is based on conditions of life which as they develop are common to many individuals, and the continuance of which they, as ruling individuals, have to maintain against others and, at the same time, to maintain that they are holding good for everybody. The expression of this will, which is determined by their common interests, is the law.

It is precisely because individuals who are independent of one another assert themselves and their own will, and because on this basis their attitude to one another is bound to be egoistical, that self-denial is made necessary in law and right, self-denial in the exceptional case, in self-assertion of their interests in the average case (which, therefore, not *they*, but only the "egoist in agreement with himself" regards as self-denial). The same applies to the classes which are ruled, whose will plays just as small a part in determining the existence of law and the state.

For example, so long as the productive forces are still insufficiently developed to make competition superfluous, and therefore would give rise to competition over and over again, for so long the classes which are ruled would be wanting to be impossible if they had the "will" to abolish competition and with it the state and the law. Incidentally, too, it is only in the imagination of the ideologists that this "will" arises before relations have developed far enough to make the emergence of such a will possible. After relations have developed sufficiently to produce it, the ideologist is able to imagine this will as being purely arbitrary and therefore as conceivable at all times and under all circumstances.

Like right, so crime, i.e., the struggle of the isolated individual against the predominant relations, is not the result of pure arbitrariness. On the contrary, it depends on the same conditions as that domination. The same visionaries who see in right and law the domination of some independently existing general will see in crime the mere violation of right and along. Hence the state does not exist owing to the dominant will, but the state, which arises from the material mode of life of individuals, has also the form of a dominant will. If the latter loses its domination, it means that not only the will has changed but also the material existence and life of individuals, and only for that reason has their will changed. It is possible for rights and laws to be "inherited", but in that case they are no longer dominant, but nominal, of which striking examples are furnished by the history of ancient Roman law and English law.

We saw earlier how a theory and history of pure thought could arise among philosophers owing to the separation of ideas from the individuals and empirical relations which serve as the basis of these ideas. In the same way, here too one can separate right from its real basis, whereby one obtains a "dominant will" which in different eras undergoes various modifications and has its own, independent history in its creations, the laws. On this account, political and civil history becomes ideologically merged in a history of the domination of successive laws.... The most superficial examination of legislation, e.g., for laws and all countries, shows how far the rulers got when they imagined that they could achieve something by means of their "dominant will" alone, i.e., simply by exercising their will.

p. 348-50 [MECW p. 329]

---

## **Individuals and their relationships**

Even that which constitutes the advantage of an individual as such over other individuals, is in our day at the same time a product of society and in its realization is bound to assert itself as privilege, as we have already shown Sancho in connection [with competition](#). Further, the individual as such, regarded by himself, is subordinated to division of labour, which makes him one-sided, cripples and determines him.

Individuals have always and in all circumstances "proceeded *from themselves*", but since they were not *unique* in the sense of not needing any connections with one another, and since their *needs*, consequently

their nature, and the method of satisfying their needs, connected them with one another (relations between the sexes, exchange, division of labour), they *had to* enter into relations with one another. Moreover, since they entered into intercourse with one another not as pure egos, but as individuals at a definite stage of development of their productive forces and requirements, and since this intercourse, in its turn, determined production and needs, it was, therefore, precisely the personal, individual behavior of individuals, their behavior to one another as individuals, that created the existing relations and daily reproduces them anew. They entered into intercourse with one another as what they were, they proceeded "from themselves", as they were, irrespective of their "outlook on life".

This "outlook on life" — even the warped one of the [idealist] philosophers — could, of course, only be determined by their actual life. Hence it certainly follows that the development of an individual is determined by the development of all the others with whom he is directly or indirectly associative, and that the different generations of individuals entering into relations with one another are connected with one another, that the physical existence of the latter generations is determined by that of their predecessors, and that these later generations inherit the productive forces and forms of intercourse accumulated by their predecessors, their own mutual relations being determined thereby. In short, it is clear that development takes place and that the history of the single individual cannot possibly be separated from the history of preceding or contemporary individuals, but is determined by this history.

The transformation of the individual relationship into its opposite, a purely material relationship, the distinction of individuality and fortuity by the individuals themselves is a historical process, as we have already shown ([Chapter 1, Part IV, § 6](#)), and at different stages of development it assumes different, ever sharper and more universal forms.

In the present epoch, the domination of material relations over individuals, and the suppression of individuality by fortuitous circumstances, has assumed its sharpest and most universal form, thereby setting existing individuals a very definite task. It has set them the task of replacing the domination of circumstances and a chance over individuals by the domination of individuals over chance and circumstances. It has not, as Sancho imagines, put forward the demand that "I should develop myself", which up to now every individual has done without Sancho's good advice; it has on the contrary called for liberation from a quite definite mode of development. This task, dictated by present-day relations, coincides with the task of organizing society in the Communist way.

We have already shown above that the abolition of a state of affairs in which relations become independent of individuals, in which individuality is subservient to chance and the personal relations of individuals are subordinated to general class relations, etc. — that the abolition of this state of affairs is determined in the final analysis by the abolition of division of labour. We also shown that the abolition of division of labour is determined by the development of intercourse and productive forces to such a degree of universality that private property

and division of labour becomes fetters on them. We have further shown that private property can be abolished only on condition of an all-around development of individuals, precisely because the existing form of intercourse and the existing productive forces are all embracing and only individuals that are developing in an all-around fashion can appropriate them, i.e., can turn them into free manifestations of their lives. We have shown that at the present time individuals *must* abolish private property, because the productive forces and forms of intercourse have developed so far that, under the domination of private property, they have become destructive forces, and because the contradiction between the classes has reached its extreme limit. Finally, we have shown that the abolition of private property in the division of labour is itself the association of individuals on the basis created by modern productive forces and world's intercourse. [See Chapter One]

Within Communist society, the only society in which the genuine and free development of individuals ceases to be a mere phrase, this development is determined precisely by the connection of individuals, a connection which consists partly in the economic prerequisites and partly in the necessary solidarity of the free development of all, and finally, in the universal character of the activity of individuals on the basis of the existing productive forces. We are, therefore, here concerned with individuals at a definite historical stage of development and by no means merely with individuals chosen at random, even disregarding the indispensable Communist revolution, which itself is a general condition for their free development. The individuals' consciousness of their mutual relations will, of course, likewise be

completely changed, and, therefore, will no more be the "principal of love" or *devoument* than it will be egoism.

# Miscellaneous

---

## The Family

[In the family] entirely empirical relations dominate. The attitude of the bourgeois to the institutions of his regime is like that of the Jew to the law; he evades them whenever it is possible to do so in each individual case, but he wants everyone else to observe them. If the entire bourgeoisie, in a mass and at one time, were to evade bourgeois institutions, it would cease to be bourgeois — a conduct which, of course, never occurs to the bourgeois and by no means depends on their willing or running [i.e., it is dictated by historical conditions]. The dissolute bourgeois evades marriage and secretly commits adultery; the merchant evades the institution of property by depriving others of property by speculation, bankruptcy, etc.; the young bourgeois makes himself independent of his family, if he can by in fact abolishing the

family as far as he is concerned.

But marriage, property, the family remain untouched in theory, because they are the practical basis on which the bourgeoisie has directed its domination, and because in their bourgeois form they are the conditions which make the bourgeois a bourgeois, just as the constantly evaded law makes the religious Jew a religious Jew. This attitude of the bourgeois to the conditions of his existence acquires one of its universal forms in bourgeois mentality. One cannot speak at all of the family " *as such* ". Historically the bourgeois gives the family the character of the bourgeois family, in which boredom and money are the binding link, in which also includes the bourgeois dissolution of the family, which does not prevent the family itself from always continuing to exist. It's dirty existence as its counterpart in the holy concept of it in official phraseology and universal hypocrisy.

Where the family is *actually* abolished, as with the proletariat, just the opposite of what "Stirner" thinks takes place. Then the concept of the family does not exist at all, but here and there family affection based on extremely real relations is certainly to be found.

In the 18th-century the concept of the [feudal] family was abolished by the philosophers, because the actual family was already in the process of dissolution at the highest pinnacles of civilization. The internal family bond, the separate components constituting the concept of the family were dissolved, for example, obedience, piety, fidelity in marriage, etc.; but the real body the family, the property relation, the exclusive attitude in relation to their families, forced cohabitation —

relations determined by the existence of children, the structure of modern towns, the formation of capital, etc. — all these were preserved, along with numerous violations, because the existence of the family is made necessary by its connection with the mode of production, which exists independently of the will of bourgeois society.

That it was impossible to do without it was demonstrated in the most striking way during the French Revolution, when for a moment the family was as good as legally abolished. The family continues to exist even in the 19th-century, only the process of its dissolution has become more general, not on account of the concept, but because of the higher development of industry and competition; the family still exists although its dissolution was long ago proclaimed by French and English Socialists and this has at last penetrated also to the German church fathers, by way of French novels. [\[A\]](#)

p. 194-5 [MECW p. 180]

[\[A\]](#) The sarcasm of Marx and Engels may not be retained in this shortened form; this statement is saracastic. Marx and Engels are explaining that ideas and novels alone cannot change the fact; only *real* changes in the relations of production, i.e. only through the establishment of communism, will the family *actually* be abolished.

---

## Consciousness changing with the development of society

The more the normal form of intercourse of society, and with it the

conditions of the ruling class, develop their contradiction to the advanced productive forces, and the greater the consequent discord within the ruling class itself as well as between it and the class ruled by it, the more fictitious, of course, becomes the consciousness which originally corresponded to this form of intercourse (i.e., it ceases to be the consciousness corresponding to this form of intercourse), and the more do the old traditional ideas of these relations of intercourse, in which actual private interests, etc., etc., are expressed as universal interests, descend to the level of mere idealizing phrases, conscious illusion, deliberate hypocrisy. But the more their falsity is exposed by life, and the less meaning they have to consciousness itself, the more resolutely are they asserted, the more hypocritical, moral and holy becomes the language of this normal society.

p. 310 [MECW p. 293]

---

## Freeing labor

The *modern* state, the rule of the bourgeoisie, is based on *freedom of labour* .... Freedom of Labour is free competition of the workers among themselves.... Labor *is free* in all civilized countries; it is not a matter of freeing labor but of abolishing it.

p. 220-221 [MECW p. 205]

Free activity for the Communists is the creative manifestation of life arising from the free development of all abilities of the whole person.

## Communists on selfishness and selflessness

Communists do not oppose egoism to selflessness or selflessness to egoism, nor do they express this contradiction theoretically either in its sentimental or in its highflown ideological form; they rather demonstrate its material source, with which it disappears of itself. The Communists do not preach *morality* at all.

They do not put to people the moral demand: love one another, do not be egoists, etc.; on the contrary, they are very well aware that egoism, just as much selflessness, *is* in definite circumstances a necessary form of the self-assertion of individuals. Hence, the Communists by no means want to do away with the "private individual" for the sake of the "general", selfless man. That is a statement of the imagination.

Communist theoreticians, the only Communists who have time to devote to the study of history, are distinguished precisely by the fact that they alone have *discovered* that throughout history the "general interest" is created by individuals who are defined as "private persons". They know that this contradiction is only a *seeming* one because one side of it, what is called the "general interest", is constantly being produced by the other side, private interest, and in relation to the latter is by no means an independent force with an independent history — so that this contradiction is in practice constantly destroyed and reproduced. Hence it is not a question of the Hegelian "negative unity"

of two sides of the contradiction, but of the materially determined destruction of the preceding materially determined mode of life of individuals, with the disappearance of which this contradiction together with its unity also disappears.

p. 264-5 [MECW p. 247]

---

## **Alienation due to private property**

Private property alienates the individuality not only of people but also of things. Land has nothing to do with rent of land, the machine has nothing to do with profit. For the landed proprietor, land has the significance only of rent of land; he leases his plots of land and receives rent; this is a feature which land can lose without losing a single one of its inherent features, without, for example, losing any part of its fertility; it is a feature the extent and even the existence of which depends on social relations which are created and destroyed without the assistance of individual landed proprietors. It is the same with machines. How little connection there is between money, the most general form of property, and personal peculiarity, how much they are directly opposed to each other was already known to Shakespeare better than to our theorizing petty-bourgeois:

Thus much of this will make black, white; foul, fair;  
 Wrong, right; base, noble; old, young; coward, valiant.  
 This yellow slave...  
 Will make the hoar leprosy adored...

This it is  
That makes the wappened widow wed again;  
She, whom the spittle-house and ulcerous sores  
Would cast the gorge at, this embalms and spices  
To th' April day again...

Thou visible god,  
That solder'st close impossibilities,  
And makest them kiss!

[William Shakespeare, *Timon of Athens* , Act IV, Scene III.]

In a word, rent of land, profit, etc., these forms of existence of private property, are *social relations* corresponding to a definite stage of production, and they are "individual" only so long as they have not become fetters on the existing productive forces.

p. 247-8 [MECW p. 231]

---

## **The relation of the bourgeois to the capitalist state**

With the development and accumulation of bourgeois property, i.e., with the development of commerce and industry, individuals grew richer and richer while the state fell ever more deeply into debt.

It is therefore obvious that as soon as the bourgeoisie has accumulated money, the state has to beg from the bourgeoisie and in the end it is actually bought up by the latter. This takes place in the period in which the bourgeoisie is still confronted by another class, and consequently the state can retain some appearance of independence in relation to both

of them. Even after the state has been bought up [by special trusts, interest groups, lobbying, bribes, etc.], it still needs money and, therefore, continues to be dependent on the bourgeoisie; nevertheless, when the interests of the bourgeoisie demanded, the state can have had its disposal more funds than states which are less developed and, therefore, less burdened with debts.

p. 382 [MECW p. 361]

---

## On Competition

Those relations brought about by competition: the abolition of local narrowness, the establishment of means of communication, highly developed division of Labour, world intercourse, the proletariat, machinery, the relation between supply and demand, etc. \*

As for the proletarians, they — at any rate in the modern form — first arose out of competition; they have already repeatedly set up collected enterprises which, however, always perish because they were unable to compete with the "contending" private bankers, butchers, etc., and because for proletarians — owing to the frequent opposition of interests among them arising out of the division of labour — no other "agreement" is possible than a political one directed against the whole present system. Where the development of competition enables the proletarians to "come to an understanding", they reach an understanding not about public bakeries but about quite different matters [,i.e. the overthrow of the bourgeois system for a proletarian one.].

---

## Personal Competition

Incidentally, competition certainly began as a "competition of persons" possessing "personal means". The liberation of the feudal serfs, the first condition of competition, and the first accumulation of "things" were purely "personal" acts.

If one person, thanks to good food, careful education and physical exercise, has acquired well-developed bodily powers and skill, while another, owing to inadequate and unhealthy food and consequent poor digestion, and as the result of neglect in childhood and overexertion, has never been able to acquire the "things" necessary for developing his muscles — not to mention acquiring mastery over them — within the "personal power" of the first in relation to the second is a purely material one. It was not "through personal power" that he gained the "means that were lacking"; on the contrary, he owes his "personal power" to the material means already existing.

Incidentally, the transformation of personal means into material means and of material means into personal means is only an aspect of competition and quite inseparable from it. The demand that competition should be conducted not with material means but with personal means amounts to the moral postulate that competition and the relations on which it depends *should* have consequences other than those inevitably

arising from them.

p. 397-8 [MECW p. 374]

## The monetary crisis

The power of money, the fact that the universal means of exchange becomes independent in relation both to society and to individuals, reveals most clearly that the relations of production and intercourse as a whole assume an independent existence....

The material power of money, which is strikingly revealed in monetary crisis and which, in the form of a prominent scarcity of money, oppresses the petty-bourgeois who is "inclined to make purchases", is likewise a highly unpleasant fact for that egoist [a reference to Sancho] in agreement with himself. He gets rid of the difficulty by reversing the ordinary idea of the petty-bourgeois, thus making it appear that the attitude of individuals to the power of money is something that depends solely on their personal willing or running. This fortunate turn of thought then gives him the chance of reading a moral lecture, buttressed by synonymy, etymology and vowel mutation, to the astounded petty-bourgeois already disheartening by lack of money, and thus debarring in advance all inconvenient questions about the causes of the pecuniary embarrassment.

The monetary crisis consist primarily in the fact that all "wealth" [vermogen] suddenly becomes depreciated in relation to the means of

exchange and loses its "power" [vermogen] over money. A crisis is in existence precisely when one can no longer pay with one's "wealth"[vermogen], but *must* pay with money. And this again does not happen because of a shortage of money, as is imagined by the petty-bourgeois who judges the crisis by his personal difficulties, but because the specific difference becomes fixed between money and as the *universal* commodity, the "marketable property and property in circulation", and all the other, *particular* commodities, which suddenly ceased to be marketable property.

# Capital

*A Critique of Political Economy*

## Volume I

### Book One: The Process of Production of Capital

First published: in German in 1867, English edition first published in 1887;

Source: First English edition of 1887 (4th German edition changes included as indicated) with some modernisation of spelling;

Publisher: Progress Publishers, Moscow, USSR;

Translated: Samuel Moore and Edward Aveling, edited by Frederick Engels;

Transcribed: Zodiac, Hinrich Kuhls, Allan Thurrott, Bill McDorman, Bert Schultz and Martha Gimenez (1995-1996);

Proofed: by Andy Blunden and Chris Clayton (2008), Mark Harris (2010), Dave Allinson (2015).

## Preface to the First German Edition (Marx, 1867)

The work, the first volume of which I now submit to the public, forms the continuation of my *Zur Kritik der Politischen Oekonomie* (*A Contribution to the Criticism of Political Economy*) published in 1859. The long pause between the first part and the continuation is due to an illness of many years' duration that again and again interrupted my work.

The substance of that earlier work is summarised in the first three chapters of this volume. This is done not merely for the sake of connexion and completeness. The presentation of the subject matter is improved. As far as circumstances in any way permit, many points only hinted at in the earlier book are here worked out more fully, whilst, conversely, points worked out fully there are only touched upon in this volume. The sections on the history of the theories of value and of money are now, of course, left out altogether. The reader of the earlier work will find, however, in the notes to the first chapter additional sources of reference relative to the history of those theories.

Every beginning is difficult, holds in all sciences. To understand the first chapter, especially the section that contains the analysis of commodities, will, therefore, present the greatest difficulty. That which concerns more especially the analysis of the substance of value and the magnitude of value, I have, as much as it was possible, popularised.<sup>1</sup> The value-form, whose fully developed shape is the money-form, is very elementary and simple. Nevertheless, the human mind has for more than 2,000 years sought in vain to get to the bottom of it all, whilst on the other hand, to the successful analysis of much more composite and complex forms, there has been at least an approximation. Why? Because the body, as an organic whole, is more easy of study than are the cells of that body. In the analysis of economic forms, moreover, neither microscopes nor chemical reagents are of use. The force of abstraction must replace both. But in bourgeois society, the commodity-form of the product of labour – or value-form of the commodity – is the economic cell-form. To the superficial observer, the analysis of these forms seems to turn upon minutiae. It does in fact deal with minutiae, but they are of the same order as those dealt with in microscopic anatomy.

With the exception of the section on value-form, therefore, this volume cannot stand accused on the score of difficulty. I presuppose, of course, a reader who is willing to learn something new and therefore to think for himself.

The physicist either observes physical phenomena where they occur in their most typical form and most free from disturbing influence, or, wherever possible, he makes experiments under conditions that assure the occurrence of the phenomenon in its normality. In this work I have to examine the capitalist mode of production, and the conditions of production and exchange corresponding to that mode. Up to the present time, their classic ground is England. That is the reason why England is used as the chief illustration in the development of my theoretical ideas. If, however, the German reader shrugs his shoulders at the condition of the English industrial and agricultural labourers, or in optimistic fashion comforts himself with the thought that in Germany things are not nearly so bad; I must plainly tell him, "*De te fabula narratur!*" [It is of you that the story is told. – Horace]

Intrinsically, it is not a question of the higher or lower degree of development of the social antagonisms that result from the natural laws of capitalist production. It is a question of these laws themselves, of these tendencies working with iron necessity towards inevitable results. The

country that is more developed industrially only shows, to the less developed, the image of its own future.

But apart from this. Where capitalist production is fully naturalised among the Germans (for instance, in the factories proper) the condition of things is much worse than in England, because the counterpoise of the Factory Acts is wanting. In all other spheres, we, like all the rest of Continental Western Europe, suffer not only from the development of capitalist production, but also from the incompleteness of that development. Alongside the modern evils, a whole series of inherited evils oppress us, arising from the passive survival of antiquated modes of production, with their inevitable train of social and political anachronisms. We suffer not only from the living, but from the dead. *Le mort saisit le vif!* [The dead holds the living in his grasp. – formula of French common law]

The social statistics of Germany and the rest of Continental Western Europe are, in comparison with those of England, wretchedly compiled. But they raise the veil just enough to let us catch a glimpse of the Medusa head behind it. We should be appalled at the state of things at home, if, as in England, our governments and parliaments appointed periodically commissions of inquiry into economic conditions; if these commissions were armed with the same plenary powers to get at the truth; if it was possible to find for this purpose men as competent, as free from partisanship and respect of persons as are the English factory-inspectors, her medical reporters on public health, her commissioners of inquiry into the exploitation of women and children, into housing and food. Perseus wore a magic cap down over his eyes and ears as a make-believe that there are no monsters.

Let us not deceive ourselves on this. As in the 18th century, the American war of independence sounded the tocsin for the European middle class, so that in the 19th century, the American Civil War sounded it for the European working class. In England the process of social disintegration is palpable. When it has reached a certain point, it must react on the Continent. There it will take a form more brutal or more humane, according to the degree of development of the working class itself. Apart from higher motives, therefore, their own most important interests dictate to the classes that are for the nonce the ruling ones, the removal of all legally removable hindrances to the free development of the working class. For this reason, as well as others, I have given so large a space in this volume to the history, the details, and the results of English factory legislation. One nation can and should learn from others. And even when a society has got upon the right track for the discovery of the natural laws of its movement – and it is the ultimate aim of this work, to lay bare the economic law of motion of modern society – it can neither clear by bold leaps, nor remove by legal enactments, the obstacles offered by the successive phases of its normal development. But it can shorten and lessen the birth-pangs.

To prevent possible misunderstanding, a word. I paint the capitalist and the landlord in no sense *couleur de rose* [i.e., seen through rose-tinted glasses]. But here individuals are dealt with only in so far as they are the personifications of economic categories, embodiments of particular class-relations and class-interests. My standpoint, from which the evolution of the economic formation of society is viewed as a process of natural history, can less than any other make the individual responsible for relations whose creature he socially remains, however much he may subjectively raise himself above them.

In the domain of Political Economy, free scientific inquiry meets not merely the same enemies as in all other domains. The peculiar nature of the materials it deals with, summons as foes into the field of battle the most violent, mean and malignant passions of the human breast, the Furies of private interest. The English Established Church, e.g., will more readily pardon an attack on 38 of its 39 articles than on 1/39 of its income. Now-a-days atheism is *culpa levis* [a relatively slight

sin, c.f. mortal sin], as compared with criticism of existing property relations. Nevertheless, there is an unmistakable advance. I refer, e.g., to the Blue book published within the last few weeks: "Correspondence with Her Majesty's Missions Abroad, regarding Industrial Questions and Trades' Unions." The representatives of the English Crown in foreign countries there declare in so many words that in Germany, in France, to be brief, in all the civilised states of the European Continent, radical change in the existing relations between capital and labour is as evident and inevitable as in England. At the same time, on the other side of the Atlantic Ocean, Mr. Wade, vice-president of the United States, declared in public meetings that, after the abolition of slavery, a radical change of the relations of capital and of property in land is next upon the order of the day. These are signs of the times, not to be hidden by purple mantles or black cassocks. They do not signify that tomorrow a miracle will happen. They show that, within the ruling classes themselves, a foreboding is dawning, that the present society is no solid crystal, but an organism capable of change, and is constantly changing.

The second volume of this book will treat of the process of the circulation of capital (Book II.), and of the varied forms assumed by capital in the course of its development (Book III.), the third and last volume (Book IV.), the history of the theory.

Every opinion based on scientific criticism I welcome. As to prejudices of so-called public opinion, to which I have never made concessions, now as aforetime the maxim of the great Florentine is mine:

"Segui il tuo corso, e lascia dir le genti."

[Follow your own course, and let people talk – paraphrased from Dante]

*Karl Marx*

---

<sup>1</sup> This is the more necessary, as even the section of Ferdinand Lassalle's work against Schulze-Delitzsch, in which he professes to give "the intellectual quintessence" of my explanations on these subjects, contains important mistakes. If Ferdinand Lassalle has borrowed almost literally from my writings, and without any acknowledgement, all the general theoretical propositions in his economic works, e.g., those on the historical character of capital, on the connexion between the conditions of production and the mode of production, &c., &c., even to the terminology created by me, this may perhaps be due to purposes of propaganda. I am here, of course, not speaking of his detailed working out and application of these propositions, with which I have nothing to do.

## Preface to the French Edition (Marx, 1872)

To the citizen Maurice Lachâtre

Dear Citizen,

I applaud your idea of publishing the translation of “Das Kapital” as a serial. In this form the book will be more accessible to the working class, a consideration which to me outweighs everything else.

That is the good side of your suggestion, but here is the reverse of the medal: the method of analysis which I have employed, and which had not previously been applied to economic subjects, makes the reading of the first chapters rather arduous, and it is to be feared that the French public, always impatient to come to a conclusion, eager to know the connexion between general principles and the immediate questions that have aroused their passions, may be disheartened because they will be unable to move on at once.

That is a disadvantage I am powerless to overcome, unless it be by forewarning and forearming those readers who zealously seek the truth. There is no royal road to science, and only those who do not dread the fatiguing climb of its steep paths have a chance of gaining its luminous summits.

Believe me,  
dear citizen,  
Your devoted,

*Karl Marx*

## Afterword to the Second German Edition (1873)

I must start by informing the readers of the first edition about the alterations made in the second edition. One is struck at once by the clearer arrangement of the book. Additional notes are everywhere marked as notes to the second edition. The following are the most important points with regard to the text itself:

In Chapter I, Section 1, the derivation of value from an analysis of the equations by which every exchange-value is expressed has been carried out with greater scientific strictness; likewise the connexion between the substance of value and the determination of the magnitude of value by socially necessary labour-time, which was only alluded to in the first edition, is now expressly emphasised. Chapter I, Section 3 (the Form of Value), has been completely revised, a task which was made necessary by the double exposition in the first edition, if nothing else. – Let me remark, in passing, that that double exposition had been occasioned by my friend, Dr. L Kugelman in Hanover. I was visiting him in the spring of 1867 when the first proof-sheets arrived from Hamburg, and he convinced me that most readers needed a supplementary, more didactic explanation of the form of value. – The last section of the first chapter, “The Fetishism of Commodities, etc.,” has largely been altered. Chapter III, Section I (The Measure of Value), has been carefully revised, because in the first edition this section had been treated negligently, the reader having been referred to the explanation already given in “Zur Kritik der Politischen Oekonomie,” Berlin 1859. Chapter VII, particularly Part 2 [Eng. ed., Chapter IX, Section 2], has been re-written to a great extent.

It would be a waste of time to go into all the partial textual changes, which were often purely stylistic. They occur throughout the book. Nevertheless I find now, on revising the French translation appearing in Paris, that several parts of the German original stand in need of rather thorough remoulding, other parts require rather heavy stylistic editing, and still others painstaking elimination of occasional slips. But there was no time for that. For I had been informed only in the autumn of 1871, when in the midst of other urgent work, that the book was sold out and that the printing of the second edition was to begin in January of 1872.

The appreciation which “Das Kapital” rapidly gained in wide circles of the German working class is the best reward of my labours. Herr Mayer, a Vienna manufacturer, who in economic matters represents the bourgeois point of view, in a pamphlet published during the Franco-German War aptly expounded the idea that the great capacity for theory, which used to be considered a hereditary German possession, had almost completely disappeared amongst the so-called educated classes in Germany, but that amongst its working class, on the contrary, that capacity was celebrating its revival.

To the present moment Political Economy, in Germany, is a foreign science. Gustav von Gulich in his “Historical description of Commerce, Industry,” &c.,<sup>1</sup> especially in the two first volumes published in 1830, has examined at length the historical circumstances that prevented, in Germany, the development of the capitalist mode of production, and consequently the development, in that country, of modern bourgeois society. Thus the soil whence Political Economy springs was wanting. This “science” had to be imported from England and France as a ready-made article; its German professors remained schoolboys. The theoretical expression of a foreign reality was turned, in their hands, into a collection of dogmas, interpreted by them in terms of the petty trading world around them, and therefore misinterpreted. The feeling of scientific impotence, a feeling not wholly to be repressed, and the uneasy consciousness of having

to touch a subject in reality foreign to them, was but imperfectly concealed, either under a parade of literary and historical erudition, or by an admixture of extraneous material, borrowed from the so-called “Kameral” sciences, a medley of smatterings, through whose purgatory the hopeful candidate for the German bureaucracy has to pass.

Since 1848 capitalist production has developed rapidly in Germany, and at the present time it is in the full bloom of speculation and swindling. But fate is still unpropitious to our professional economists. At the time when they were able to deal with Political Economy in a straightforward fashion, modern economic conditions did not actually exist in Germany. And as soon as these conditions did come into existence, they did so under circumstances that no longer allowed of their being really and impartially investigated within the bounds of the bourgeois horizon. In so far as Political Economy remains within that horizon, in so far, i.e., as the capitalist regime is looked upon as the absolutely final form of social production, instead of as a passing historical phase of its evolution, Political Economy can remain a science only so long as the class struggle is latent or manifests itself only in isolated and sporadic phenomena.

Let us take England. Its Political Economy belongs to the period in which the class struggle was as yet undeveloped. Its last great representative, Ricardo, in the end, consciously makes the antagonism of class interests, of wages and profits, of profits and rent, the starting point of his investigations, naively taking this antagonism for a social law of Nature. But by this start the science of bourgeois economy had reached the limits beyond which it could not pass. Already in the lifetime of Ricardo, and in opposition to him, it was met by criticism, in the person of Sismondi.<sup>2</sup>

The succeeding period, from 1820 to 1830, was notable in England for scientific activity in the domain of Political Economy. It was the time as well of the vulgarising and extending of Ricardo’s theory, as of the contest of that theory with the old school. Splendid tournaments were held. What was done then, is little known to the Continent generally, because the polemic is for the most part scattered through articles in reviews, occasional literature and pamphlets. The unprejudiced character of this polemic – although the theory of Ricardo already serves, in exceptional cases, as a weapon of attack upon bourgeois economy – is explained by the circumstances of the time. On the one hand, modern industry itself was only just emerging from the age of childhood, as is shown by the fact that with the crisis of 1825 it for the first time opens the periodic cycle of its modern life. On the other hand, the class struggle between capital and labour is forced into the background, politically by the discord between the governments and the feudal aristocracy gathered around the Holy Alliance on the one hand, and the popular masses, led by the bourgeoisie, on the other; economically by the quarrel between industrial capital and aristocratic landed property - a quarrel that in France was concealed by the opposition between small and large landed property, and that in England broke out openly after the Corn Laws. The literature of Political Economy in England at this time calls to mind the stormy forward movement in France after Dr. Quesnay’s death, but only as a Saint Martin’s summer reminds us of spring. With the year 1830 came the decisive crisis.

In France and in England the bourgeoisie had conquered political power. Thenceforth, the class struggle, practically as well as theoretically, took on more and more outspoken and threatening forms. It sounded the knell of scientific bourgeois economy. It was thenceforth no longer a question, whether this theorem or that was true, but whether it was useful to capital or harmful, expedient or inexpedient, politically dangerous or not. In place of disinterested inquirers, there were hired prize fighters; in place of genuine scientific research, the bad conscience and the evil intent of apologetic. Still, even the obtrusive pamphlets with which the Anti-Corn Law League, led by the manufacturers Cobden and Bright, deluged the world, have a historic interest, if no

scientific one, on account of their polemic against the landed aristocracy. But since then the Free Trade legislation, inaugurated by Sir Robert Peel, has deprived vulgar economy of this its last sting.

The Continental revolution of 1848-9 also had its reaction in England. Men who still claimed some scientific standing and aspired to be something more than mere sophists and sycophants of the ruling classes tried to harmonise the Political Economy of capital with the claims, no longer to be ignored, of the proletariat. Hence a shallow syncretism of which John Stuart Mill is the best representative. It is a declaration of bankruptcy by bourgeois economy, an event on which the great Russian scholar and critic, N. Tschernyschewsky, has thrown the light of a master mind in his "Outlines of Political Economy according to Mill."

In Germany, therefore, the capitalist mode of production came to a head, after its antagonistic character had already, in France and England, shown itself in a fierce strife of classes. And meanwhile, moreover, the German proletariat had attained a much more clear class-consciousness than the German bourgeoisie. Thus, at the very moment when a bourgeois science of Political Economy seemed at last possible in Germany, it had in reality again become impossible.

Under these circumstances its professors fell into two groups. The one set, prudent, practical business folk, flocked to the banner of Bastiat, the most superficial and therefore the most adequate representative of the apologetic of vulgar economy; the other, proud of the professorial dignity of their science, followed John Stuart Mill in his attempt to reconcile irreconcilables. Just as in the classical time of bourgeois economy, so also in the time of its decline, the Germans remained mere schoolboys, imitators and followers, petty retailers and hawkers in the service of the great foreign wholesale concern.

The peculiar historical development of German society therefore forbids, in that country, all original work in bourgeois economy; but not the criticism of that economy. So far as such criticism represents a class, it can only represent the class whose vocation in history is the overthrow of the capitalist mode of production and the final abolition of all classes – the proletariat.

The learned and unlearned spokesmen of the German bourgeoisie tried at first to kill "Das Kapital" by silence, as they had managed to do with my earlier writings. As soon as they found that these tactics no longer fitted in with the conditions of the time, they wrote, under pretence of criticising my book, prescriptions "for the tranquillisation of the bourgeois mind." But they found in the workers' press – see, e.g., Joseph Dietzgen's articles in the – antagonists stronger than themselves, to whom (down to this very day) they owe a reply.<sup>3</sup>

An excellent Russian translation of "Das Kapital" appeared in the spring of 1872. The edition of 3,000 copies is already nearly exhausted. As early as 1871, N. Sieber, Professor of Political Economy in the University of Kiev, in his work "David Ricardo's Theory of Value and of Capital," referred to my theory of value, of money and of capital, as in its fundamentals a necessary sequel to the teaching of Smith and Ricardo. That which astonishes the Western European in the reading of this excellent work, is the author's consistent and firm grasp of the purely theoretical position.

That the method employed in "Das Kapital" has been little understood, is shown by the various conceptions, contradictory one to another, that have been formed of it.

Thus the *Paris Revue Positiviste* reproaches me in that, on the one hand, I treat economics metaphysically, and on the other hand – imagine! – confine myself to the mere critical analysis of actual facts, instead of writing receipts<sup>4</sup> (Comtist ones?) for the cook-shops of the future. In answer to the reproach in re metaphysics, Professor Sieber has it:

“In so far as it deals with actual theory, the method of Marx is the deductive method of the whole English school, a school whose failings and virtues are common to the best theoretic economists.”

M. Block – “Les Théoriciens du Socialisme en Allemagne. Extrait du Journal des Economistes, Juillet et Août 1872” – makes the discovery that my method is analytic and says: “Par cet ouvrage M. Marx se classe parmi les esprits analytiques les plus éminents.” German reviews, of course, shriek out at “Hegelian sophistics.” The *European Messenger* of St. Petersburg in an article dealing exclusively with the method of “Das Kapital” (May number, 1872, pp. 427-436), finds my method of inquiry severely realistic, but my method of presentation, unfortunately, German-dialectical. It says:

“At first sight, if the judgment is based on the external form of the presentation of the subject, Marx is the most ideal of ideal philosophers, always in the German, i.e., the bad sense of the word. But in point of fact he is infinitely more realistic than all his forerunners in the work of economic criticism. He can in no sense be called an idealist.”

I cannot answer the writer better than by aid of a few extracts from his own criticism, which may interest some of my readers to whom the Russian original is inaccessible.

After a quotation from the preface to my “Criticism of Political Economy,” Berlin, 1859, pp. IV-VII, where I discuss the materialistic basis of my method, the writer goes on:

“The one thing which is of moment to Marx, is to find the law of the phenomena with whose investigation he is concerned; and not only is that law of moment to him, which governs these phenomena, in so far as they have a definite form and mutual connexion within a given historical period. Of still greater moment to him is the law of their variation, of their development, i.e., of their transition from one form into another, from one series of connexions into a different one. This law once discovered, he investigates in detail the effects in which it manifests itself in social life. Consequently, Marx only troubles himself about one thing: to show, by rigid scientific investigation, the necessity of successive determinate orders of social conditions, and to establish, as impartially as possible, the facts that serve him for fundamental starting-points. For this it is quite enough, if he proves, at the same time, both the necessity of the present order of things, and the necessity of another order into which the first must inevitably pass over; and this all the same, whether men believe or do not believe it, whether they are conscious or unconscious of it. Marx treats the social movement as a process of natural history, governed by laws not only independent of human will, consciousness and intelligence, but rather, on the contrary, determining that will, consciousness and intelligence. ... If in the history of civilisation the conscious element plays a part so subordinate, then it is self-evident that a critical inquiry whose subject-matter is civilisation, can, less than anything else, have for its basis any form of, or any result of, consciousness. That is to say, that not the idea, but the material phenomenon alone can serve as its starting-point. Such an inquiry will confine itself to the confrontation and the comparison of a fact, not with ideas, but with another fact. For this inquiry, the one thing of moment is, that both facts be investigated as accurately as possible, and that they actually form, each with respect to the other, different momenta of an evolution; but most important of all is the rigid analysis of the series of successions, of the sequences and concatenations in which the different stages of such an evolution present

themselves. But it will be said, the general laws of economic life are one and the same, no matter whether they are applied to the present or the past. This Marx directly denies. According to him, such abstract laws do not exist. On the contrary, in his opinion every historical period has laws of its own. ... As soon as society has outlived a given period of development, and is passing over from one given stage to another, it begins to be subject also to other laws. In a word, economic life offers us a phenomenon analogous to the history of evolution in other branches of biology. The old economists misunderstood the nature of economic laws when they likened them to the laws of physics and chemistry. A more thorough analysis of phenomena shows that social organisms differ among themselves as fundamentally as plants or animals. Nay, one and the same phenomenon falls under quite different laws in consequence of the different structure of those organisms as a whole, of the variations of their individual organs, of the different conditions in which those organs function, &c. Marx, e.g., denies that the law of population is the same at all times and in all places. He asserts, on the contrary, that every stage of development has its own law of population. ... With the varying degree of development of productive power, social conditions and the laws governing them vary too. Whilst Marx sets himself the task of following and explaining from this point of view the economic system established by the sway of capital, he is only formulating, in a strictly scientific manner, the aim that every accurate investigation into economic life must have. The scientific value of such an inquiry lies in the disclosing of the special laws that regulate the origin, existence, development, death of a given social organism and its replacement by another and higher one. And it is this value that, in point of fact, Marx's book has."

Whilst the writer pictures what he takes to be actually my method, in this striking and [as far as concerns my own application of it] generous way, what else is he picturing but the dialectic method?

Of course the method of presentation must differ in form from that of inquiry. The latter has to appropriate the material in detail, to analyse its different forms of development, to trace out their inner connexion. Only after this work is done, can the actual movement be adequately described. If this is done successfully, if the life of the subject-matter is ideally reflected as in a mirror, then it may appear as if we had before us a mere a priori construction.

My dialectic method is not only different from the Hegelian, but is its direct opposite. To Hegel, the life process of the human brain, i.e., the process of thinking, which, under the name of "the Idea," he even transforms into an independent subject, is the demiurgos of the real world, and the real world is only the external, phenomenal form of "the Idea." With me, on the contrary, the ideal is nothing else than the material world reflected by the human mind, and translated into forms of thought.

The mystifying side of Hegelian dialectic I criticised nearly thirty years ago, at a time when it was still the fashion. But just as I was working at the first volume of "Das Kapital," it was the good pleasure of the peevish, arrogant, mediocre *Επιγονοί* [Epigones – Büchner, Dühring and others] who now talk large in cultured Germany, to treat Hegel in same way as the brave Moses Mendelssohn in Lessing's time treated Spinoza, i.e., as a "dead dog." I therefore openly avowed myself the pupil of that mighty thinker, and even here and there, in the chapter on the theory of value, coquetted with the modes of expression peculiar to him. The mystification which dialectic suffers in Hegel's hands, by no means prevents him from being the first to present its general

form of working in a comprehensive and conscious manner. With him it is standing on its head. It must be turned right side up again, if you would discover the rational kernel within the mystical shell.

In its mystified form, dialectic became the fashion in Germany, because it seemed to transfigure and to glorify the existing state of things. In its rational form it is a scandal and abomination to bourgeoisdom and its doctrinaire professors, because it includes in its comprehension and affirmative recognition of the existing state of things, at the same time also, the recognition of the negation of that state, of its inevitable breaking up; because it regards every historically developed social form as in fluid movement, and therefore takes into account its transient nature not less than its momentary existence; because it lets nothing impose upon it, and is in its essence critical and revolutionary.

The contradictions inherent in the movement of capitalist society impress themselves upon the practical bourgeois most strikingly in the changes of the periodic cycle, through which modern industry runs, and whose crowning point is the universal crisis. That crisis is once again approaching, although as yet but in its preliminary stage; and by the universality of its theatre and the intensity of its action it will drum dialectics even into the heads of the mushroom-upstarts of the new, holy Prusso-German empire.

<sup>1</sup> Geschichtliche Darstellung des Handels, der Gewerbe und des Ackerbaus, &c.. von Gustav von Gülich. 5 vols., Jena. 1830-45.

<sup>2</sup> See my work “Zur Kritik, &c.,” p. 39.

<sup>3</sup> The mealy-mouthed babblers of German vulgar economy fell foul of the style of my book. No one can feel the literary shortcomings in “Das Kapital” more strongly than I myself. Yet I will for the benefit and the enjoyment of these gentlemen and their public quote in this connexion one English and one Russian notice. The Saturday Review, always hostile to my views, said in its notice of the first edition: “The presentation of the subject invests the driest economic questions with a certain peculiar charm.” The “St. Petersburg Journal” (Sankt-Peterburgskie Vedomosti), in its issue of April 8 (20), 1872, says: “The presentation of the subject, with the exception of one or two exceptionally special parts, is distinguished by its comprehensibility by the general reader, its clearness, and, in spite of the scientific intricacy of the subject, by an unusual liveliness. In this respect the author in no way resembles ... the majority of German scholars who ... write their books in a language so dry and obscure that the heads of ordinary mortals are cracked by it.”

<sup>4</sup> Rezepte – translated as “Receipt,” which in the 19th Century, meant “recipe” and Ben Fowkes, for example translates this as “recipe.” [MIA footnote].

## Afterword to the French Edition (1875)

Mr. J. Roy set himself the task of producing a version that would be as exact and even literal as possible, and has scrupulously fulfilled it. But his very scrupulosity has compelled me to modify his text, with a view to rendering it more intelligible to the reader. These alterations, introduced from day to day, as the book was published in parts, were not made with equal care and were bound to result in a lack of harmony in style.

Having once undertaken this work of revision, I was led to apply it also to the basic original text (the second German edition), to simplify some arguments, to complete others, to give additional historical or statistical material, to add critical suggestions, etc. Hence, whatever the literary defects of this French edition may be, it possesses a scientific value independent of the original and should be consulted even by readers familiar with German.

Below I give the passages in the Afterword to the second German edition which treat of the development of Political Economy in Germany and the method employed in the present work.

## Preface to the Third German Edition (1883)

Marx was not destined to get this, the third, edition ready for press himself. The powerful thinker, to whose greatness even his opponents now make obeisance, died on March 14, 1883.

Upon me who in Marx lost the best, the truest friend I had – and had for forty years – the friend to whom I am more indebted than can be expressed in words – upon me now devolved the duty of attending to the publication of this third edition, as well as of the second volume, which Marx had left behind in manuscript. I must now account here to the reader for the way in which I discharged the first part of my duty.

It was Marx's original intention to re-write a great part of the text of Volume I, to formulate many theoretical points more exactly, insert new ones and bring historical and statistical materials up to date. But his ailing condition and the urgent need to do the final editing of Volume II induced him to give up this scheme. Only the most necessary alterations were to be made, only the insertions which the French edition ("Le Capital." Par Karl Marx. Paris, Lachâtre 1873) already contained, were to be put in.

Among the books left by Marx there was a German copy which he himself had corrected here and there and provided with references to the French edition; also a French copy in which he had indicated the exact passages to be used. These alterations and additions are confined, with few exceptions, to the last [Engl. ed.: second last] part of the book: "The Accumulation of Capital." Here the previous text followed the original draft more closely than elsewhere, while the preceding sections had been gone over more thoroughly. The style was therefore more vivacious, more of a single cast, but also more careless, studded with Anglicisms and in parts unclear; there were gaps here and there in the presentation of arguments, some important particulars being merely alluded to.

With regard to the style, Marx had himself thoroughly revised several sub-sections and thereby had indicated to me here, as well as in numerous oral suggestions, the length to which I could go in eliminating English technical terms and other Anglicisms. Marx would in any event have gone over the additions and supplemental texts and have replaced the smooth French with his own terse German; I had to be satisfied, when transferring them, with bringing them into maximum harmony with the original text.

Thus not a single word was changed in this third edition without my firm conviction that the author would have altered it himself. It would never occur to me to introduce into "Das Kapital" the current jargon in which German economists are wont to express themselves – that gibberish in which, for instance, one who for cash has others give him their labour is called a labour-giver (Arbeitgeber) and one whose labour is taken away from him for wages is called a labour-taker (Arbeitnehmer). In French, too, the word "travail" is used in every-day life in the sense of "occupation." But the French would rightly consider any economist crazy should he call the capitalist a *donneur de travail* (a labour-giver) or the worker a *receveur de travail* (a labour-taker).

Nor have I taken the liberty to convert the English coins and moneys, measures and weights used throughout the text to their new-German equivalents. When the first edition appeared there were as many kinds of measures and weights in Germany as there are days in the year. Besides there were two kinds of marks (the Reichsmark existed at the time only in the imagination of Soetbeer, who had invented it in the late thirties), two kinds of gulden and at least three kinds of taler, including one called *neues Zweidrittel*. In the natural sciences the metric system prevailed, in the world market – English measures and weights. Under such circumstances English units of

measure were quite natural for a book which had to take its factual proofs almost exclusively from British industrial relations. The last-named reason is decisive even to-day, especially because the corresponding relations in the world market have hardly changed and English weights and measures almost completely control precisely the key industries, iron and cotton.

In conclusion a few words on Marx's art of quotation, which is so little understood. When they are pure statements of fact or descriptions, the quotations, from the English Blue books, for example, serve of course as simple documentary proof. But this is not so when the theoretical views of other economists are cited. Here the quotation is intended merely to state where, when and by whom an economic idea conceived in the course of development was first clearly enunciated. Here the only consideration is that the economic conception in question must be of some significance to the history of science, that it is the more or less adequate theoretical expression of the economic situation of its time. But whether this conception still possesses any absolute or relative validity from the standpoint of the author or whether it already has become wholly past history is quite immaterial. Hence these quotations are only a running commentary to the text, a commentary borrowed from the history of economic science, and establish the dates and originators of certain of the more important advances in economic theory. And that was a very necessary thing in a science whose historians have so far distinguished themselves only by tendentious ignorance characteristic of careerists. It will now be understandable why Marx, in consonance with the Afterword to the second edition, only in very exceptional cases had occasion to quote German economists.

There is hope that the second volume will appear in the course of 1884.

## Preface to the English Edition (Engels, 1886)

The publication of an English version of "Das Kapital" needs no apology. On the contrary, an explanation might be expected why this English version has been delayed until now, seeing that for some years past the theories advocated in this book have been constantly referred to, attacked and defended, interpreted and misinterpreted, in the periodical press and the current literature of both England and America.

When, soon after the author's death in 1883, it became evident that an English edition of the work was really required, Mr. Samuel Moore, for many years a friend of Marx and of the present writer, and than whom, perhaps, no one is more conversant with the book itself, consented to undertake the translation which the literary executors of Marx were anxious to lay before the public. It was understood that I should compare the MS. with the original work, and suggest such alterations as I might deem advisable. When, by and by, it was found that Mr. Moore's professional occupations prevented him from finishing the translation as quickly as we all desired, we gladly accepted Dr. Aveling's offer to undertake a portion of the work; at the same time Mrs. Aveling, Marx's youngest daughter, offered to check the quotations and to restore the original text of the numerous passages taken from English authors and Blue books and translated by Marx into German. This has been done throughout, with but a few unavoidable exceptions.

The following portions of the book have been translated by Dr. Aveling: (1) Chapters X. (The Working day), and XI. (Rate and Mass of Surplus-Value); (2) Part VI. (Wages, comprising Chapters XIX. to XXII.); (3) from Chapter XXIV., Section 4 (Circumstances that &c.) to the end of the book, comprising the latter part of Chapter XXIV., Chapter XXV., and the whole of Part VIII. (Chapters XXVI. to XXXIII.); (4) the two Author's prefaces. All the rest of the book has been done by Mr. Moore. While, thus, each of the translators is responsible for his share of the work only, I bear a joint responsibility for the whole.

The third German edition, which has been made the basis of our work throughout, was prepared by me, in 1883, with the assistance of notes left by the author, indicating the passages of the second edition to be replaced by designated passages, from the French text published in 1873.<sup>1</sup> The alterations thus effected in the text of the second edition generally coincided with changes prescribed by Marx in a set of MS. instructions for an English translation that was planned, about ten years ago, in America, but abandoned chiefly for want of a fit and proper translator. This MS. was placed at our disposal by our old friend Mr. F. A. Sorge of Hoboken N. J. It designates some further interpolations from the French edition; but, being so many years older than the final instructions for the third edition, I did not consider myself at liberty to make use of it otherwise than sparingly, and chiefly in cases where it helped us over difficulties. In the same way, the French text has been referred to in most of the difficult passages, as an indicator of what the author himself was prepared to sacrifice wherever something of the full import of the original had to be sacrificed in the rendering.

There is, however, one difficulty we could not spare the reader: the use of certain terms in a sense different from what they have, not only in common life, but in ordinary Political Economy. But this was unavoidable. Every new aspect of a science involves a revolution in the technical terms of that science. This is best shown by chemistry, where the whole of the terminology is radically changed about once in twenty years, and where you will hardly find a single organic compound that has not gone through a whole series of different names. Political Economy has generally been content to take, just as they were, the terms of commercial and industrial life, and to operate with

them, entirely failing to see that by so doing, it confined itself within the narrow circle of ideas expressed by those terms. Thus, though perfectly aware that both profits and rent are but subdivisions, fragments of that unpaid part of the product which the labourer has to supply to his employer (its first appropriator, though not its ultimate exclusive owner), yet even classical Political Economy never went beyond the received notions of profits and rents, never examined this unpaid part of the product (called by Marx surplus-product) in its integrity as a whole, and therefore never arrived at a clear comprehension, either of its origin and nature, or of the laws that regulate the subsequent distribution of its value. Similarly all industry, not agricultural or handicraft, is indiscriminately comprised in the term of manufacture, and thereby the distinction is obliterated between two great and essentially different periods of economic history: the period of manufacture proper, based on the division of manual labour, and the period of modern industry based on machinery. It is, however, self-evident that a theory which views modern capitalist production as a mere passing stage in the economic history of mankind, must make use of terms different from those habitual to writers who look upon that form of production as imperishable and final.

A word respecting the author's method of quoting may not be out of place. In the majority of cases, the quotations serve, in the usual way, as documentary evidence in support of assertions made in the text. But in many instances, passages from economic writers are quoted in order to indicate when, where, and by whom a certain proposition was for the first time clearly enunciated. This is done in cases where the proposition quoted is of importance as being a more or less adequate expression of the conditions of social production and exchange prevalent at the time, and quite irrespective of Marx's recognition, or otherwise, of its general validity. These quotations, therefore, supplement the text by a running commentary taken from the history of the science.

Our translation comprises the first book of the work only. But this first book is in a great measure a whole in itself, and has for twenty years ranked as an independent work. The second book, edited in German by me, in 1885, is decidedly incomplete without the third, which cannot be published before the end of 1887. When Book III. has been brought out in the original German, it will then be soon enough to think about preparing an English edition of both.

“Das Kapital” is often called, on the Continent, “the Bible of the working class.” That the conclusions arrived at in this work are daily more and more becoming the fundamental principles of the great working-class movement, not only in Germany and Switzerland, but in France, in Holland and Belgium, in America, and even in Italy and Spain, that everywhere the working class more and more recognises, in these conclusions, the most adequate expression of its condition and of its aspirations, nobody acquainted with that movement will deny. And in England, too, the theories of Marx, even at this moment, exercise a powerful influence upon the socialist movement which is spreading in the ranks of “cultured” people no less than in those of the working class. But that is not all. The time is rapidly approaching when a thorough examination of England's economic position will impose itself as an irresistible national necessity. The working of the industrial system of this country, impossible without a constant and rapid extension of production, and therefore of markets, is coming to a dead stop.

Free Trade has exhausted its resources; even Manchester doubts this its quondam economic gospel.<sup>2</sup> Foreign industry, rapidly developing, stares English production in the face everywhere, not only in protected, but also in neutral markets, and even on this side of the Channel. While the productive power increases in a geometric, the extension of markets proceeds at best in an arithmetic ratio. The decennial cycle of stagnation, prosperity, over-production and crisis, ever recurrent from 1825 to 1867, seems indeed to have run its course; but only to land us in the

slough of despond of a permanent and chronic depression. The sighed for period of prosperity will not come; as often as we seem to perceive its heralding symptoms, so often do they again vanish into air. Meanwhile, each succeeding winter brings up afresh the great question, "what to do with the unemployed"; but while the number of the unemployed keeps swelling from year to year, there is nobody to answer that question; and we can almost calculate the moment when the unemployed losing patience will take their own fate into their own hands. Surely, at such a moment, the voice ought to be heard of a man whose whole theory is the result of a lifelong study of the economic history and condition of England, and whom that study led to the conclusion that, at least in Europe, England is the only country where the inevitable social revolution might be effected entirely by peaceful and legal means. He certainly never forgot to add that he hardly expected the English ruling classes to submit, without a "pro-slavery rebellion," to this peaceful and legal revolution.

---

<sup>1</sup> "Le Capital," par Karl Marx. Traduction de M. J. Roy, entièrement révisée par l'auteur. Paris. Lachâtre. This translation, especially in the latter part of the book, contains considerable alterations in and additions to the text of the second German edition.

<sup>2</sup> At the quarterly meeting of the Manchester Chamber of Commerce, held this afternoon, a warm discussion took place on the subject of Free Trade. A resolution was moved to the effect that "having waited in vain 40 years for other nations to follow the Free Trade example of England, this Chamber thinks the time has now arrived to reconsider that position." The resolution was rejected by a majority of one only, the figures being 21 for, and 22 against. – Evening Standard, Nov. 1, 1886.

## Preface to the Fourth German Edition (Engels, 1890)

The fourth edition required that I should establish in final form, as nearly as possible, both text and footnotes. The following brief explanation will show how I have fulfilled this task.

After again comparing the French edition and Marx's manuscript remarks I have made some further additions to the German text from that translation. They will be found on p. 80 (3rd edition, p. 88) [present edition, pp. 117-18], pp. 458-60 (3rd edition, pp. 509-10) [present edition, pp. 462-65],<sup>1</sup> pp. 547-51 (3rd edition, p. 600) [present edition, pp. 548-51], pp. 591-93 (3rd edition, p. 644) [present edition, 587-89] and p. 596 (3rd edition, p. 648) [present edition, p. 591] in Note 1. I have also followed the example of the French and English editions by putting the long footnote on the miners into the text (3rd edition, pp. 509-15; 4th edition, pp. 461-67) [present edition, pp. 465-71]. Other small alterations are of a purely technical nature.

Further, I have added a few more explanatory notes, especially where changed historical conditions seemed to demand this. All these additional notes are enclosed in square brackets and marked either with my initials or "D. H."<sup>2</sup>

Meanwhile a complete revision of the numerous quotations had been made necessary by the publication of the English edition. For this edition Marx's youngest daughter, Eleanor, undertook to compare all the quotations with their originals, so that those taken from English sources, which constitute the vast majority, are given there not as re-translations from the German but in the original English form. In preparing the fourth edition it was therefore incumbent upon me to consult this text. The comparison revealed various small inaccuracies. Page numbers wrongly indicated, due partly to mistakes in copying from notebooks, and partly to the accumulated misprints of three editions; misplaced quotation or omission marks, which cannot be avoided when a mass of quotations is copied from note-book extracts; here and there some rather unhappy translation of a word; particular passages quoted from the old Paris notebooks of 1843-45, when Marx did not know English and was reading English economists in French translations, so that the double translation yielded a slightly different shade of meaning, e.g., in the case of Steuart, Ure, etc., where the English text had now to be used – and other similar instances of trifling inaccuracy or negligence. But anyone who compares the fourth edition with the previous ones can convince himself that all this laborious process of emendation has not produced the smallest change in the book worth speaking of. There was only one quotation which could not be traced – the one from Richard Jones (4th edition, p. 562, note 47). Marx probably slipped up when writing down the title of the book.<sup>3</sup> All the other quotations retain their cogency in full, or have enhanced it due to their present exact form.

Here, however, I am obliged to revert to an old story.

I know of only one case in which the accuracy of a quotation given by Marx has been called in question. But as the issue dragged beyond his lifetime I cannot well ignore it here.

On March 7, 1872, there appeared in the Berlin Concordia, organ of the German Manufacturers' Association, an anonymous article entitled: "How Karl Marx Quotes." It was here asserted, with an effervescence of moral indignation and unparliamentary language, that the quotation from Gladstone's Budget Speech of April 16, 1863 (in the Inaugural Address of the International Workingmen's Association, 1864, and repeated in "Capital," Vol. I, p. 617, 4th edition; p. 671, 3rd edition) [present edition, p. 610], had been falsified; that not a single word of the sentence:

“this intoxicating augmentation of wealth and power ... is ... entirely confined to classes of property” was to be found in the (semi-official) stenographic report in Hansard. “But this sentence is nowhere to be found in Gladstone’s speech. Exactly the opposite is stated there.” (In bold type): “This sentence, both in form and substance, is a lie inserted by Marx.”

Marx, to whom the number of *Concordia* was sent the following May, answered the anonymous author in the *Volksstaat* of June 1st. As he could not recall which newspaper report he had used for the quotation, he limited himself to citing, first the equivalent quotation from two English publications, and then the report in *The Times*, according to which Gladstone says:

“That is the state of the case as regards the wealth of this country. I must say for one, I should look almost with apprehension and with pain upon this intoxicating augmentation of wealth and power, if it were my belief that it was confined to classes who are in easy circumstances. This takes no cognisance at all of the condition of the labouring population. The augmentation I have described and which is founded, I think, upon accurate returns, is an augmentation entirely confined to classes possessed of property.”

Thus Gladstone says here that he would be sorry if it were so, but it is so: this intoxicating augmentation of wealth and power is entirely confined to classes of property. And as to the semi-official Hansard, Marx goes on to say: “In the version which he afterwards manipulated [zurechtgestümpert], Mr. Gladstone was astute enough to obliterate [wegzupfuschen] this passage, which, coming from an English Chancellor of the Exchequer, was certainly compromising. This, by the way, is a traditional usage in the English parliament and not an invention gotten up by little Lasker against Bebel.”

The anonymous writer gets angrier and angrier. In his answer in *Concordia*, July 4th, he sweeps aside second-hand sources and demurely suggests that it is the “custom” to quote parliamentary speeches from the stenographic report; adding, however, that *The Times* report (which includes the “falsified” sentence) and the Hansard report (which omits it) are “substantially in complete agreement,” while *The Times* report likewise contains “the exact opposite to that notorious passage in the Inaugural Address.” This fellow carefully conceals the fact that *The Times* report explicitly includes that self-same “notorious passage,” alongside of its alleged “opposite.” Despite all this, however, the anonymous one feels that he is stuck fast and that only some new dodge can save him. Thus, whilst his article bristles, as we have just shown, with “impudent mendacity” and is interlarded with such edifying terms of abuse as “bad faith,” “dishonesty,” “lying allegation,” “that spurious quotation,” “impudent mendacity,” “a quotation entirely falsified,” “this falsification,” “simply infamous,” etc., he finds it necessary to divert the issue to another domain and therefore promises “to explain in a second article the meaning which we (the non-mendacious anonymous one) attribute to the content of Gladstone’s words.” As if his particular opinion, of no decisive value as it is, had anything whatever to do with the matter. This second article was printed in *Concordia* on July 11th.

Marx replied again in the *Volksstaat* of August 7th now giving also the reports of the passage in question from the *Morning Star* and the *Morning Advertiser* of April 17, 1863. According to both reports Gladstone said that he would look with apprehension, etc., upon this intoxicating augmentation of wealth and power if he believed it to be confined to “classes in easy circumstances.” But this augmentation was in fact “entirely confined to classes possessed of property.” So these reports too reproduced word for word the sentence alleged to have been “lyingly inserted.” Marx further established once more, by a comparison of *The Times* and the Hansard texts, that this sentence, which three newspaper reports of identical content, appearing independently of one another the next morning, proved to have been really uttered, was missing from the Hansard report, revised according to the familiar “custom,” and that Gladstone, to use

Marx's words, "had afterwards conjured it away." In conclusion Marx stated that he had no time for further intercourse with the anonymous one. The latter also seems to have had enough, at any rate Marx received no further issues of *Concordia*.

With this the matter appeared to be dead and buried. True, once or twice later on there reached us, from persons in touch with the University of Cambridge, mysterious rumours of an unspeakable literary crime which Marx was supposed to have committed in "*Capital*," but despite all investigation nothing more definite could be learned. Then, on November 29, 1883, eight months after Marx's death, there appeared in *The Times* a letter headed Trinity College, Cambridge, and signed Sedley Taylor, in which this little man, who dabbles in the mildest sort of co-operative affairs, seizing upon some chance pretext or other, at last enlightened us, not only concerning those vague Cambridge rumours, but also the anonymous one in *Concordia*.

"What appears extremely singular," says the little man from Trinity College, "is that it was reserved for Professor Brentano (then of the University of Breslau, now of that of Strassburg) to expose... the bad faith which had manifestly dictated the citation made from Mr. Gladstone's speech in the [Inaugural] Address. Herr Karl Marx, who ... attempted to defend the citation, had the hardihood, in the deadly shifts to which Brentano's masterly conduct of the attack speedily reduced him, to assert that Mr. Gladstone had 'manipulated' the report of his speech in *The Times* of April 17, 1863, before it appeared in Hansard, in order to 'obliterate' a passage which 'was certainly compromising' for an English Chancellor of the Exchequer. On Brentano's showing, by a detailed comparison of texts, that the reports of *The Times* and of Hansard agreed in utterly excluding the meaning which craftily isolated quotation had put upon Mr. Gladstone's words, Marx withdrew from further controversy under the plea of 'want of time.'"

So that was at the bottom of the whole business! And thus was the anonymous campaign of Herr Brentano in *Concordia* gloriously reflected in the productively co-operating imagination of Cambridge. Thus he stood, sword in hand, and thus he battled, in his "masterly conduct of the attack," this St. George of the German Manufacturers' Association, whilst the infernal dragon Marx, "in deadly shifts," "speedily" breathed his last at his feet.

All this Ariostian battle scene, however, only serves to conceal the dodges of our St. George. Here there is no longer talk of "lying insertion" or "falsification," but of "craftily isolated quotation." The whole issue was shifted, and St. George and his Cambridge squire very well knew why.

Eleanor Marx replied in the monthly journal *To-day* (February 1884), as *The Times* refused to publish her letter. She once more focussed the debate on the sole question at issue: had Marx "lyingly inserted" that sentence or not? To this Mr. Sedley Taylor answered that "the question whether a particular sentence did or did not occur in Mr. Gladstone's speech" had been, in his opinion, "of very subordinate importance" in the Brentano-Marx controversy, "compared to the issue whether the quotation in dispute was made with the intention of conveying, or of perverting Mr. Gladstone's meaning." He then admits that *The Times* report contains "a verbal contrariety"; but, if the context is rightly interpreted, i.e., in the Gladstonian Liberal sense, it shows what Mr. Gladstone meant to say. (*To-day*, March, 1884.) The most comic point here is that our little Cambridge man now insists upon quoting the speech not from Hansard, as, according to the anonymous Brentano, it is "customary" to do, but from *The Times* report, which the same Brentano had characterised as "necessarily bungling." Naturally so, for in Hansard the vexatious sentence is missing.

Eleanor Marx had no difficulty (in the same issue of *To-day*) in dissolving all this argumentation into thin air. Either Mr. Taylor had read the controversy of 1872, in which case he was now making not only "lying insertions" but also "lying" suppressions; or he had not read it and ought

to remain silent. In either case it was certain that he did not dare to maintain for a moment the accusation of his friend Brentano that Marx had made a “lying” addition. On the contrary, Marx, it now seems, had not lyingly added but suppressed an important sentence. But this same sentence is quoted on page 5 of the Inaugural Address, a few lines before the alleged “lying insertion.” And as to the “contrariety” in Gladstone’s speech, is it not Marx himself, who in “Capital,” p. 618 (3rd edition, p. 672), note 105 [present edition, p. 611, Note 1], refers to “the continual crying contradictions in Gladstone’s Budget speeches of 1863 and 1864”? Only he does not presume à la Mr. Sedley Taylor to resolve them into complacent Liberal sentiments. Eleanor Marx, in concluding her reply, finally sums up as follows:

“Marx has not suppressed anything worth quoting, neither has he ‘lyingly’ added anything. But he has restored, rescued from oblivion, a particular sentence of one of Mr. Gladstone’s speeches, a sentence which had indubitably been pronounced, but which somehow or other had found its way – out of Hansard.”

With that Mr. Sedley Taylor too had had enough, and the result of this whole professorial cobweb, spun out over two decades and two great countries, is that nobody has since dared to cast any other aspersion upon Marx’s literary honesty; whilst Mr. Sedley Taylor, no doubt, will hereafter put as little confidence in the literary war bulletins of Herr Brentano as Herr Brentano will in the papal infallibility of Hansard.

<sup>3</sup> Marx was not mistaken in the title of the book but in the page. He put down 36 instead of 37. (See pp. 560-61 of the present edition.) – Ed.

# **Part 1: Commodities and Money**

## Chapter 1: Commodities

### Section 1: The Two Factors of a Commodity: Use-Value and Value (The Substance of Value and the Magnitude of Value)

The wealth of those societies in which the capitalist mode of production prevails, presents itself as “an immense accumulation of commodities,”<sup>1</sup> its unit being a single commodity. Our investigation must therefore begin with the analysis of a commodity.

A commodity is, in the first place, an object outside us, a thing that by its properties satisfies human wants of some sort or another. The nature of such wants, whether, for instance, they spring from the stomach or from fancy, makes no difference.<sup>2</sup> Neither are we here concerned to know how the object satisfies these wants, whether directly as means of subsistence, or indirectly as means of production.

Every useful thing, as iron, paper, &c., may be looked at from the two points of view of quality and quantity. It is an assemblage of many properties, and may therefore be of use in various ways. To discover the various uses of things is the work of history.<sup>3</sup> So also is the establishment of socially-recognized standards of measure for the quantities of these useful objects. The diversity of these measures has its origin partly in the diverse nature of the objects to be measured, partly in convention.

The utility of a thing makes it a use value.<sup>4</sup> But this utility is not a thing of air. Being limited by the physical properties of the commodity, it has no existence apart from that commodity. A commodity, such as iron, corn, or a diamond, is therefore, so far as it is a material thing, a use value, something useful. This property of a commodity is independent of the amount of labour required to appropriate its useful qualities. When treating of use value, we always assume to be dealing with definite quantities, such as dozens of watches, yards of linen, or tons of iron. The use values of commodities furnish the material for a special study, that of the commercial knowledge of commodities.<sup>5</sup> Use values become a reality only by use or consumption: they also constitute the substance of all wealth, whatever may be the social form of that wealth. In the form of society we are about to consider, they are, in addition, the material depositories of exchange value.

Exchange value, at first sight, presents itself as a quantitative relation, as the proportion in which values in use of one sort are exchanged for those of another sort,<sup>6</sup> a relation constantly changing with time and place. Hence exchange value appears to be something accidental and purely relative, and consequently an intrinsic value, *i.e.*, an exchange value that is inseparably connected with, inherent in commodities, seems a contradiction in terms.<sup>7</sup> Let us consider the matter a little more closely.

A given commodity, *e.g.*, a quarter of wheat is exchanged for x blacking, y silk, or z gold, &c. – in short, for other commodities in the most different proportions. Instead of one exchange value, the wheat has, therefore, a great many. But since x blacking, y silk, or z gold &c., each represents the exchange value of one quarter of wheat, x blacking, y silk, z gold, &c., must, as exchange values, be replaceable by each other, or equal to each other. Therefore, first: the valid exchange values of a given commodity express something equal; secondly, exchange value, generally, is only the mode of expression, the phenomenal form, of something contained in it, yet distinguishable from it.

Let us take two commodities, *e.g.*, corn and iron. The proportions in which they are exchangeable, whatever those proportions may be, can always be represented by an equation in which a given quantity of corn is equated to some quantity of iron: *e.g.*, 1 quarter corn = x cwt. iron. What does this equation tell us? It tells us that in two different things – in 1 quarter of corn and x cwt. of iron, there exists in equal quantities something common to both. The two things must therefore be equal to a third, which in itself is neither the one nor the other. Each of them, so far as it is exchange value, must therefore be reducible to this third.

A simple geometrical illustration will make this clear. In order to calculate and compare the areas of rectilinear figures, we decompose them into triangles. But the area of the triangle itself is expressed by something totally different from its visible figure, namely, by half the product of the base multiplied by the altitude. In the same way the exchange values of commodities must be capable of being expressed in terms of something common to them all, of which thing they represent a greater or less quantity.

This common “something” cannot be either a geometrical, a chemical, or any other natural property of commodities. Such properties claim our attention only in so far as they affect the utility of those commodities, make them use values. But the exchange of commodities is evidently an act characterised by a total abstraction from use value. Then one use value is just as good as another, provided only it be present in sufficient quantity. Or, as old Barbon says,

“one sort of wares are as good as another, if the values be equal. There is no difference or distinction in things of equal value ... An hundred pounds’ worth of lead or iron, is of as great value as one hundred pounds’ worth of silver or gold.”<sup>8</sup>

As use values, commodities are, above all, of different qualities, but as exchange values they are merely different quantities, and consequently do not contain an atom of use value.

If then we leave out of consideration the use value of commodities, they have only one common property left, that of being products of labour. But even the product of labour itself has undergone a change in our hands. If we make abstraction from its use value, we make abstraction at the same time from the material elements and shapes that make the product a use value; we see in it no longer a table, a house, yarn, or any other useful thing. Its existence as a material thing is put out of sight. Neither can it any longer be regarded as the product of the labour of the joiner, the mason, the spinner, or of any other definite kind of productive labour. Along with the useful qualities of the products themselves, we put out of sight both the useful character of the various kinds of labour embodied in them, and the concrete forms of that labour; there is nothing left but what is common to them all; all are reduced to one and the same sort of labour, human labour in the abstract.

Let us now consider the residue of each of these products; it consists of the same unsubstantial reality in each, a mere congelation of homogeneous human labour, of labour power expended without regard to the mode of its expenditure. All that these things now tell us is, that human labour power has been expended in their production, that human labour is embodied in them. When looked at as crystals of this social substance, common to them all, they are – Values.

We have seen that when commodities are exchanged, their exchange value manifests itself as something totally independent of their use value. But if we abstract from their use value, there remains their Value as defined above. Therefore, the common substance that manifests itself in the exchange value of commodities, whenever they are exchanged, is their value. The progress of our investigation will show that exchange value is the only form in which the value of commodities can manifest itself or be expressed. For the present, however, we have to consider the nature of value independently of this, its form.

A use value, or useful article, therefore, has value only because human labour in the abstract has been embodied or materialised in it. How, then, is the magnitude of this value to be measured? Plainly, by the quantity of the value-creating substance, the labour, contained in the article. The quantity of labour, however, is measured by its duration, and labour time in its turn finds its standard in weeks, days, and hours.

Some people might think that if the value of a commodity is determined by the quantity of labour spent on it, the more idle and unskilful the labourer, the more valuable would his commodity be, because more time would be required in its production. The labour, however, that forms the substance of value, is homogeneous human labour, expenditure of one uniform labour power. The total labour power of society, which is embodied in the sum total of the values of all commodities produced by that society, counts here as one homogeneous mass of human labour power, composed though it be of innumerable individual units. Each of these units is the same as any other, so far as it has the character of the average labour power of society, and takes effect as such; that is, so far as it requires for producing a commodity, no more time than is needed on an average, no more than is socially necessary. The labour time socially necessary is that required to produce an article under the normal conditions of production, and with the average degree of skill and intensity prevalent at the time. The introduction of power-looms into England probably reduced by one-half the labour required to weave a given quantity of yarn into cloth. The hand-loom weavers, as a matter of fact, continued to require the same time as before; but for all that, the product of one hour of their labour represented after the change only half an hour's social labour, and consequently fell to one-half its former value.

We see then that that which determines the magnitude of the value of any article is the amount of labour socially necessary, or the labour time socially necessary for its production.<sup>9</sup> Each individual commodity, in this connexion, is to be considered as an average sample of its class.<sup>10</sup> Commodities, therefore, in which equal quantities of labour are embodied, or which can be produced in the same time, have the same value. The value of one commodity is to the value of any other, as the labour time necessary for the production of the one is to that necessary for the production of the other. "As values, all commodities are only definite masses of congealed labour time."<sup>11</sup>

The value of a commodity would therefore remain constant, if the labour time required for its production also remained constant. But the latter changes with every variation in the productiveness of labour. This productiveness is determined by various circumstances, amongst others, by the average amount of skill of the workmen, the state of science, and the degree of its practical application, the social organisation of production, the extent and capabilities of the means of production, and by physical conditions. For example, the same amount of labour in favourable seasons is embodied in 8 bushels of corn, and in unfavourable, only in four. The same labour extracts from rich mines more metal than from poor mines. Diamonds are of very rare occurrence on the earth's surface, and hence their discovery costs, on an average, a great deal of labour time. Consequently much labour is represented in a small compass. Jacob doubts whether gold has ever been paid for at its full value. This applies still more to diamonds. According to Eschwege, the total produce of the Brazilian diamond mines for the eighty years, ending in 1823, had not realised the price of one-and-a-half years' average produce of the sugar and coffee plantations of the same country, although the diamonds cost much more labour, and therefore represented more value. With richer mines, the same quantity of labour would embody itself in more diamonds, and their value would fall. If we could succeed at a small expenditure of labour, in converting carbon into diamonds, their value might fall below that of bricks. In general, the greater the productiveness of labour, the less is the labour time required for the production of an

article, the less is the amount of labour crystallised in that article, and the less is its value; and *vice versâ*, the less the productiveness of labour, the greater is the labour time required for the production of an article, and the greater is its value. The value of a commodity, therefore, varies directly as the quantity, and inversely as the productiveness, of the labour incorporated in it. \*

A thing can be a use value, without having value. This is the case whenever its utility to man is not due to labour. Such are air, virgin soil, natural meadows, &c. A thing can be useful, and the product of human labour, without being a commodity. Whoever directly satisfies his wants with the produce of his own labour, creates, indeed, use values, but not commodities. In order to produce the latter, he must not only produce use values, but use values for others, social use values. (And not only for others, without more. The mediaeval peasant produced quit-rent-corn for his feudal lord and tithe-corn for his parson. But neither the quit-rent-corn nor the tithe-corn became commodities by reason of the fact that they had been produced for others. To become a commodity a product must be transferred to another, whom it will serve as a use value, by means of an exchange.)<sup>12</sup> Lastly nothing can have value, without being an object of utility. If the thing is useless, so is the labour contained in it; the labour does not count as labour, and therefore creates no value.

## Section 2: The Two-fold Character of the Labour Embodied in Commodities

At first sight a commodity presented itself to us as a complex of two things – use value and exchange value. Later on, we saw also that labour, too, possesses the same two-fold nature; for, so far as it finds expression in value, it does not possess the same characteristics that belong to it as a creator of use values. I was the first to point out and to examine critically this two-fold nature of the labour contained in commodities. As this point is the pivot on which a clear comprehension of political economy turns, we must go more into detail.

Let us take two commodities such as a coat and 10 yards of linen, and let the former be double the value of the latter, so that, if 10 yards of linen = W, the coat = 2W.

The coat is a use value that satisfies a particular want. Its existence is the result of a special sort of productive activity, the nature of which is determined by its aim, mode of operation, subject, means, and result. The labour, whose utility is thus represented by the value in use of its product, or which manifests itself by making its product a use value, we call useful labour. In this connection we consider only its useful effect.

As the coat and the linen are two qualitatively different use values, so also are the two forms of labour that produce them, tailoring and weaving. Were these two objects not qualitatively different, not produced respectively by labour of different quality, they could not stand to each other in the relation of commodities. Coats are not exchanged for coats, one use value is not exchanged for another of the same kind.

To all the different varieties of values in use there correspond as many different kinds of useful labour, classified according to the order, genus, species, and variety to which they belong in the social division of labour. This division of labour is a necessary condition for the production of commodities, but it does not follow, conversely, that the production of commodities is a

---

\* The following passage occurred only in the first edition. "Now we know the substance of value. It is labour. We know the measure of its magnitude. It is labour time. The form, which stamps value as exchange-value, remains to be analysed. But before this we need to develop the characteristics we have already found somewhat more fully." Taken from the Penguin edition of "Capital," translated by Ben Fowkes.

necessary condition for the division of labour. In the primitive Indian community there is social division of labour, without production of commodities. Or, to take an example nearer home, in every factory the labour is divided according to a system, but this division is not brought about by the operatives mutually exchanging their individual products. Only such products can become commodities with regard to each other, as result from different kinds of labour, each kind being carried on independently and for the account of private individuals.

To resume, then: In the use value of each commodity there is contained useful labour, *i.e.*, productive activity of a definite kind and exercised with a definite aim. Use values cannot confront each other as commodities, unless the useful labour embodied in them is qualitatively different in each of them. In a community, the produce of which in general takes the form of commodities, *i.e.*, in a community of commodity producers, this qualitative difference between the useful forms of labour that are carried on independently by individual producers, each on their own account, develops into a complex system, a social division of labour.

Anyhow, whether the coat be worn by the tailor or by his customer, in either case it operates as a use value. Nor is the relation between the coat and the labour that produced it altered by the circumstance that tailoring may have become a special trade, an independent branch of the social division of labour. Wherever the want of clothing forced them to it, the human race made clothes for thousands of years, without a single man becoming a tailor. But coats and linen, like every other element of material wealth that is not the spontaneous produce of Nature, must invariably owe their existence to a special productive activity, exercised with a definite aim, an activity that appropriates particular nature-given materials to particular human wants. So far therefore as labour is a creator of use value, is useful labour, it is a necessary condition, independent of all forms of society, for the existence of the human race; it is an eternal nature-imposed necessity, without which there can be no material exchanges between man and Nature, and therefore no life.

The use values, coat, linen, &c., *i.e.*, the bodies of commodities, are combinations of two elements – matter and labour. If we take away the useful labour expended upon them, a material substratum is always left, which is furnished by Nature without the help of man. The latter can work only as Nature does, that is by changing the form of matter.<sup>13</sup> Nay more, in this work of changing the form he is constantly helped by natural forces. We see, then, that labour is not the only source of material wealth, of use values produced by labour. As William Petty puts it, labour is its father and the earth its mother.

Let us now pass from the commodity considered as a use value to the value of commodities.

By our assumption, the coat is worth twice as much as the linen. But this is a mere quantitative difference, which for the present does not concern us. We bear in mind, however, that if the value of the coat is double that of 10 yds of linen, 20 yds of linen must have the same value as one coat. So far as they are values, the coat and the linen are things of a like substance, objective expressions of essentially identical labour. But tailoring and weaving are, qualitatively, different kinds of labour. There are, however, states of society in which one and the same man does tailoring and weaving alternately, in which case these two forms of labour are mere modifications of the labour of the same individual, and not special and fixed functions of different persons, just as the coat which our tailor makes one day, and the trousers which he makes another day, imply only a variation in the labour of one and the same individual. Moreover, we see at a glance that, in our capitalist society, a given portion of human labour is, in accordance with the varying demand, at one time supplied in the form of tailoring, at another in the form of weaving. This change may possibly not take place without friction, but take place it must.

Productive activity, if we leave out of sight its special form, *viz.*, the useful character of the labour, is nothing but the expenditure of human labour power. Tailoring and weaving, though

qualitatively different productive activities, are each a productive expenditure of human brains, nerves, and muscles, and in this sense are human labour. They are but two different modes of expending human labour power. Of course, this labour power, which remains the same under all its modifications, must have attained a certain pitch of development before it can be expended in a multiplicity of modes. But the value of a commodity represents human labour in the abstract, the expenditure of human labour in general. And just as in society, a general or a banker plays a great part, but mere man, on the other hand, a very shabby part,<sup>14</sup> so here with mere human labour. It is the expenditure of simple labour power, *i.e.*, of the labour power which, on an average, apart from any special development, exists in the organism of every ordinary individual. Simple average labour, it is true, varies in character in different countries and at different times, but in a particular society it is given. Skilled labour counts only as simple labour intensified, or rather, as multiplied simple labour, a given quantity of skilled being considered equal to a greater quantity of simple labour. Experience shows that this reduction is constantly being made. A commodity may be the product of the most skilled labour, but its value, by equating it to the product of simple unskilled labour, represents a definite quantity of the latter labour alone.<sup>15</sup> The different proportions in which different sorts of labour are reduced to unskilled labour as their standard, are established by a social process that goes on behind the backs of the producers, and, consequently, appear to be fixed by custom. For simplicity's sake we shall henceforth account every kind of labour to be unskilled, simple labour; by this we do no more than save ourselves the trouble of making the reduction.

Just as, therefore, in viewing the coat and linen as values, we abstract from their different use values, so it is with the labour represented by those values: we disregard the difference between its useful forms, weaving and tailoring. As the use values, coat and linen, are combinations of special productive activities with cloth and yarn, while the values, coat and linen, are, on the other hand, mere homogeneous congelations of undifferentiated labour, so the labour embodied in these latter values does not count by virtue of its productive relation to cloth and yarn, but only as being expenditure of human labour power. Tailoring and weaving are necessary factors in the creation of the use values, coat and linen, precisely because these two kinds of labour are of different qualities; but only in so far as abstraction is made from their special qualities, only in so far as both possess the same quality of being human labour, do tailoring and weaving form the substance of the values of the same articles.

Coats and linen, however, are not merely values, but values of definite magnitude, and according to our assumption, the coat is worth twice as much as the ten yards of linen. Whence this difference in their values? It is owing to the fact that the linen contains only half as much labour as the coat, and consequently, that in the production of the latter, labour power must have been expended during twice the time necessary for the production of the former.

While, therefore, with reference to use value, the labour contained in a commodity counts only qualitatively, with reference to value it counts only quantitatively, and must first be reduced to human labour pure and simple. In the former case, it is a question of How and What, in the latter of How much? How long a time? Since the magnitude of the value of a commodity represents only the quantity of labour embodied in it, it follows that all commodities, when taken in certain proportions, must be equal in value.

If the productive power of all the different sorts of useful labour required for the production of a coat remains unchanged, the sum of the values of the coats produced increases with their number. If one coat represents  $x$  days' labour, two coats represent  $2x$  days' labour, and so on. But assume that the duration of the labour necessary for the production of a coat becomes doubled or halved. In the first case one coat is worth as much as two coats were before; in the second case, two coats

are only worth as much as one was before, although in both cases one coat renders the same service as before, and the useful labour embodied in it remains of the same quality. But the quantity of labour spent on its production has altered.

An increase in the quantity of use values is an increase of material wealth. With two coats two men can be clothed, with one coat only one man. Nevertheless, an increased quantity of material wealth may correspond to a simultaneous fall in the magnitude of its value. This antagonistic movement has its origin in the two-fold character of labour. Productive power has reference, of course, only to labour of some useful concrete form, the efficacy of any special productive activity during a given time being dependent on its productiveness. Useful labour becomes, therefore, a more or less abundant source of products, in proportion to the rise or fall of its productiveness. On the other hand, no change in this productiveness affects the labour represented by value. Since productive power is an attribute of the concrete useful forms of labour, of course it can no longer have any bearing on that labour, so soon as we make abstraction from those concrete useful forms. However then productive power may vary, the same labour, exercised during equal periods of time, always yields equal amounts of value. But it will yield, during equal periods of time, different quantities of values in use; more, if the productive power rise, fewer, if it fall. The same change in productive power, which increases the fruitfulness of labour, and, in consequence, the quantity of use values produced by that labour, will diminish the total value of this increased quantity of use values, provided such change shorten the total labour time necessary for their production; and *vice versa*.

On the one hand all labour is, speaking physiologically, an expenditure of human labour power, and in its character of identical abstract human labour, it creates and forms the value of commodities. On the other hand, all labour is the expenditure of human labour power in a special form and with a definite aim, and in this, its character of concrete useful labour, it produces use values.<sup>16</sup>

### Section 3: The Form of Value or Exchange-Value

Commodities come into the world in the shape of use values, articles, or goods, such as iron, linen, corn, &c. This is their plain, homely, bodily form. They are, however, commodities, only because they are something two-fold, both objects of utility, and, at the same time, depositories of value. They manifest themselves therefore as commodities, or have the form of commodities, only in so far as they have two forms, a physical or natural form, and a value form.

The reality of the value of commodities differs in this respect from Dame Quickly, that we don't know "where to have it." The value of commodities is the very opposite of the coarse materiality of their substance, not an atom of matter enters into its composition. Turn and examine a single commodity, by itself, as we will, yet in so far as it remains an object of value, it seems impossible to grasp it. If, however, we bear in mind that the value of commodities has a purely social reality, and that they acquire this reality only in so far as they are expressions or embodiments of one identical social substance, viz., human labour, it follows as a matter of course, that value can only manifest itself in the social relation of commodity to commodity. In fact we started from exchange value, or the exchange relation of commodities, in order to get at the value that lies hidden behind it. We must now return to this form under which value first appeared to us.

Every one knows, if he knows nothing else, that commodities have a value form common to them all, and presenting a marked contrast with the varied bodily forms of their use values. I mean their money form. Here, however, a task is set us, the performance of which has never yet even been attempted by *bourgeois* economy, the task of tracing the genesis of this money form, of

developing the expression of value implied in the value relation of commodities, from its simplest, almost imperceptible outline, to the dazzling money-form. By doing this we shall, at the same time, solve the riddle presented by money.

The simplest value-relation is evidently that of one commodity to some one other commodity of a different kind. Hence the relation between the values of two commodities supplies us with the simplest expression of the value of a single commodity.

## A. Elementary or Accidental Form Of Value

$x$  commodity A =  $y$  commodity B, or

$x$  commodity A is worth  $y$  commodity B.

20 yards of linen = 1 coat, or

20 Yards of linen are worth 1 coat.

### 1. The two poles of the expression of value. Relative form and Equivalent form

The whole mystery of the form of value lies hidden in this elementary form. Its analysis, therefore, is our real difficulty.

Here two different kinds of commodities (in our example the linen and the coat), evidently play two different parts. The linen expresses its value in the coat; the coat serves as the material in which that value is expressed. The former plays an active, the latter a passive, part. The value of the linen is represented as relative value, or appears in relative form. The coat officiates as equivalent, or appears in equivalent form.

The relative form and the equivalent form are two intimately connected, mutually dependent and inseparable elements of the expression of value; but, at the same time, are mutually exclusive, antagonistic extremes – *i.e.*, poles of the same expression. They are allotted respectively to the two different commodities brought into relation by that expression. It is not possible to express the value of linen in linen. 20 yards of linen = 20 yards of linen is no expression of value. On the contrary, such an equation merely says that 20 yards of linen are nothing else than 20 yards of linen, a definite quantity of the use value linen. The value of the linen can therefore be expressed only relatively – *i.e.*, in some other commodity. The relative form of the value of the linen presupposes, therefore, the presence of some other commodity – here the coat – under the form of an equivalent. On the other hand, the commodity that figures as the equivalent cannot at the same time assume the relative form. That second commodity is not the one whose value is expressed. Its function is merely to serve as the material in which the value of the first commodity is expressed.

No doubt, the expression 20 yards of linen = 1 coat, or 20 yards of linen are worth 1 coat, implies the opposite relation. 1 coat = 20 yards of linen, or 1 coat is worth 20 yards of linen. But, in that case, I must reverse the equation, in order to express the value of the coat relatively; and so soon as I do that the linen becomes the equivalent instead of the coat. A single commodity cannot, therefore, simultaneously assume, in the same expression of value, both forms. The very polarity of these forms makes them mutually exclusive.

Whether, then, a commodity assumes the relative form, or the opposite equivalent form, depends entirely upon its accidental position in the expression of value – that is, upon whether it is the commodity whose value is being expressed or the commodity in which value is being expressed.

### 2. The Relative Form of value

(a.) The nature and import of this form

In order to discover how the elementary expression of the value of a commodity lies hidden in the value relation of two commodities, we must, in the first place, consider the latter entirely apart from its quantitative aspect. The usual mode of procedure is generally the reverse, and in the value relation nothing is seen but the proportion between definite quantities of two different sorts of commodities that are considered equal to each other. It is apt to be forgotten that the magnitudes of different things can be compared quantitatively, only when those magnitudes are expressed in terms of the same unit. It is only as expressions of such a unit that they are of the same denomination, and therefore commensurable.<sup>17</sup>

Whether 20 yards of linen = 1 coat or = 20 coats or = x coats – that is, whether a given quantity of linen is worth few or many coats, every such statement implies that the linen and coats, as magnitudes of value, are expressions of the same unit, things of the same kind. Linen = coat is the basis of the equation.

But the two commodities whose identity of quality is thus assumed, do not play the same part. It is only the value of the linen that is expressed. And how? By its reference to the coat as its equivalent, as something that can be exchanged for it. In this relation the coat is the mode of existence of value, is value embodied, for only as such is it the same as the linen. On the other hand, the linen's own value comes to the front, receives independent expression, for it is only as being value that it is comparable with the coat as a thing of equal value, or exchangeable with the coat. To borrow an illustration from chemistry, butyric acid is a different substance from propyl formate. Yet both are made up of the same chemical substances, carbon (C), hydrogen (H), and oxygen (O), and that, too, in like proportions – namely,  $C_4H_8O_2$ . If now we equate butyric acid to propyl formate, then, in the first place, propyl formate would be, in this relation, merely a form of existence of  $C_4H_8O_2$ ; and in the second place, we should be stating that butyric acid also consists of  $C_4H_8O_2$ . Therefore, by thus equating the two substances, expression would be given to their chemical composition, while their different physical forms would be neglected.

If we say that, as values, commodities are mere congelations of human labour, we reduce them by our analysis, it is true, to the abstraction, value; but we ascribe to this value no form apart from their bodily form. It is otherwise in the value relation of one commodity to another. Here, the one stands forth in its character of value by reason of its relation to the other.

By making the coat the equivalent of the linen, we equate the labour embodied in the former to that in the latter. Now, it is true that the tailoring, which makes the coat, is concrete labour of a different sort from the weaving which makes the linen. But the act of equating it to the weaving, reduces the tailoring to that which is really equal in the two kinds of labour, to their common character of human labour. In this roundabout way, then, the fact is expressed, that weaving also, in so far as it weaves value, has nothing to distinguish it from tailoring, and, consequently, is abstract human labour. It is the expression of equivalence between different sorts of commodities that alone brings into relief the specific character of value-creating labour, and this it does by actually reducing the different varieties of labour embodied in the different kinds of commodities to their common quality of human labour in the abstract.<sup>18</sup>

There is, however, something else required beyond the expression of the specific character of the labour of which the value of the linen consists. Human labour power in motion, or human labour, creates value, but is not itself value. It becomes value only in its congealed state, when embodied in the form of some object. In order to express the value of the linen as a congelation of human labour, that value must be expressed as having objective existence, as being a something materially different from the linen itself, and yet a something common to the linen and all other commodities. The problem is already solved.

When occupying the position of equivalent in the equation of value, the coat ranks qualitatively as the equal of the linen, as something of the same kind, because it is value. In this position it is a thing in which we see nothing but value, or whose palpable bodily form represents value. Yet the coat itself, the body of the commodity, coat, is a mere use value. A coat as such no more tells us it is value, than does the first piece of linen we take hold of. This shows that when placed in value-relation to the linen, the coat signifies more than when out of that relation, just as many a man strutting about in a gorgeous uniform counts for more than when in mufti.

In the production of the coat, human labour power, in the shape of tailoring, must have been actually expended. Human labour is therefore accumulated in it. In this aspect the coat is a depository of value, but though worn to a thread, it does not let this fact show through. And as equivalent of the linen in the value equation, it exists under this aspect alone, counts therefore as embodied value, as a body that is value. A, for instance, cannot be “your majesty” to B, unless at the same time majesty in B’s eyes assumes the bodily form of A, and, what is more, with every new father of the people, changes its features, hair, and many other things besides.

Hence, in the value equation, in which the coat is the equivalent of the linen, the coat officiates as the form of value. The value of the commodity linen is expressed by the bodily form of the commodity coat, the value of one by the use value of the other. As a use value, the linen is something palpably different from the coat; as value, it is the same as the coat, and now has the appearance of a coat. Thus the linen acquires a value form different from its physical form. The fact that it is value, is made manifest by its equality with the coat, just as the sheep’s nature of a Christian is shown in his resemblance to the Lamb of God.

We see, then, all that our analysis of the value of commodities has already told us, is told us by the linen itself, so soon as it comes into communication with another commodity, the coat. Only it betrays its thoughts in that language with which alone it is familiar, the language of commodities. In order to tell us that its own value is created by labour in its abstract character of human labour, it says that the coat, in so far as it is worth as much as the linen, and therefore is value, consists of the same labour as the linen. In order to inform us that its sublime reality as value is not the same as its buckram body, it says that value has the appearance of a coat, and consequently that so far as the linen is value, it and the coat are as like as two peas. We may here remark, that the language of commodities has, besides Hebrew, many other more or less correct dialects. The German “Wertsein,” to be worth, for instance, expresses in a less striking manner than the Romance verbs “valere,” “valer,” “valoir,” that the equating of commodity B to commodity A, is commodity A’s own mode of expressing its value. *Paris vaut bien une messe*. [Paris is certainly worth a mass]

By means, therefore, of the value-relation expressed in our equation, the bodily form of commodity B becomes the value form of commodity A, or the body of commodity B acts as a mirror to the value of commodity A.<sup>19</sup> By putting itself in relation with commodity B, as value *in propria personâ*, as the matter of which human labour is made up, the commodity A converts the value in use, B, into the substance in which to express its, A’s, own value. The value of A, thus expressed in the use value of B, has taken the form of relative value.

#### (b.) Quantitative determination of Relative value

Every commodity, whose value it is intended to express, is a useful object of given quantity, as 15 bushels of corn, or 100 lbs of coffee. And a given quantity of any commodity contains a definite quantity of human labour. The value form must therefore not only express value generally, but also value in definite quantity. Therefore, in the value relation of commodity A to commodity B, of the linen to the coat, not only is the latter, as value in general, made the equal in quality of the

linen, but a definite quantity of coat (1 coat) is made the equivalent of a definite quantity (20 yards) of linen.

The equation, 20 yards of linen = 1 coat, or 20 yards of linen are worth one coat, implies that the same quantity of value substance (congealed labour) is embodied in both; that the two commodities have each cost the same amount of labour of the same quantity of labour time. But the labour time necessary for the production of 20 yards of linen or 1 coat varies with every change in the productiveness of weaving or tailoring. We have now to consider the influence of such changes on the quantitative aspect of the relative expression of value.

I. Let the value of the linen vary,<sup>20</sup> that of the coat remaining constant. If, say in consequence of the exhaustion of flax-growing soil, the labour time necessary for the production of the linen be doubled, the value of the linen will also be doubled. Instead of the equation, 20 yards of linen = 1 coat, we should have 20 yards of linen = 2 coats, since 1 coat would now contain only half the labour time embodied in 20 yards of linen. If, on the other hand, in consequence, say, of improved looms, this labour time be reduced by one-half, the value of the linen would fall by one-half. Consequently, we should have 20 yards of linen =  $\frac{1}{2}$  coat. The relative value of commodity A, *i.e.*, its value expressed in commodity B, rises and falls directly as the value of A, the value of B being supposed constant.

II. Let the value of the linen remain constant, while the value of the coat varies. If, under these circumstances, in consequence, for instance, of a poor crop of wool, the labour time necessary for the production of a coat becomes doubled, we have instead of 20 yards of linen = 1 coat, 20 yards of linen =  $\frac{1}{2}$  coat. If, on the other hand, the value of the coat sinks by one-half, then 20 yards of linen = 2 coats. Hence, if the value of commodity A remain constant, its relative value expressed in commodity B rises and falls inversely as the value of B.

If we compare the different cases in I and II, we see that the same change of magnitude in relative value may arise from totally opposite causes. Thus, the equation, 20 yards of linen = 1 coat, becomes 20 yards of linen = 2 coats, either, because the value of the linen has doubled, or because the value of the coat has fallen by one-half; and it becomes 20 yards of linen =  $\frac{1}{2}$  coat, either, because the value of the linen has fallen by one-half, or because the value of the coat has doubled.

III. Let the quantities of labour time respectively necessary for the production of the linen and the coat vary simultaneously in the same direction and in the same proportion. In this case 20 yards of linen continue equal to 1 coat, however much their values may have altered. Their change of value is seen as soon as they are compared with a third commodity, whose value has remained constant. If the values of all commodities rose or fell simultaneously, and in the same proportion, their relative values would remain unaltered. Their real change of value would appear from the diminished or increased quantity of commodities produced in a given time.

IV. The labour time respectively necessary for the production of the linen and the coat, and therefore the value of these commodities may simultaneously vary in the same direction, but at unequal rates or in opposite directions, or in other ways. The effect of all these possible different variations, on the relative value of a commodity, may be deduced from the results of I, II, and III.

Thus real changes in the magnitude of value are neither unequivocally nor exhaustively reflected in their relative expression, that is, in the equation expressing the magnitude of relative value. The relative value of a commodity may vary, although its value remains constant. Its relative value may remain constant, although its value varies; and finally, simultaneous variations in the

magnitude of value and in that of its relative expression by no means necessarily correspond in amount.<sup>21</sup>

### 3. The Equivalent form of value

We have seen that commodity A (the linen), by expressing its value in the use value of a commodity differing in kind (the coat), at the same time impresses upon the latter a specific form of value, namely that of the equivalent. The commodity linen manifests its quality of having a value by the fact that the coat, without having assumed a value form different from its bodily form, is equated to the linen. The fact that the latter therefore has a value is expressed by saying that the coat is directly exchangeable with it. Therefore, when we say that a commodity is in the equivalent form, we express the fact that it is directly exchangeable with other commodities.

When one commodity, such as a coat, serves as the equivalent of another, such as linen, and coats consequently acquire the characteristic property of being directly exchangeable with linen, we are far from knowing in what proportion the two are exchangeable. The value of the linen being given in magnitude, that proportion depends on the value of the coat. Whether the coat serves as the equivalent and the linen as relative value, or the linen as the equivalent and the coat as relative value, the magnitude of the coat's value is determined, independently of its value form, by the labour time necessary for its production. But whenever the coat assumes in the equation of value, the position of equivalent, its value acquires no quantitative expression; on the contrary, the commodity coat now figures only as a definite quantity of some article.

For instance, 40 yards of linen are worth – what? 2 coats. Because the commodity coat here plays the part of equivalent, because the use-value coat, as opposed to the linen, figures as an embodiment of value, therefore a definite number of coats suffices to express the definite quantity of value in the linen. Two coats may therefore express the quantity of value of 40 yards of linen, but they can never express the quantity of their own value. A superficial observation of this fact, namely, that in the equation of value, the equivalent figures exclusively as a simple quantity of some article, of some use value, has misled Bailey, as also many others, both before and after him, into seeing, in the expression of value, merely a quantitative relation. The truth being, that when a commodity acts as equivalent, no quantitative determination of its value is expressed.

The first peculiarity that strikes us, in considering the form of the equivalent, is this: use value becomes the form of manifestation, the phenomenal form of its opposite, value.

The bodily form of the commodity becomes its value form. But, mark well, that this *quid pro quo* exists in the case of any commodity B, only when some other commodity A enters into a value relation with it, and then only within the limits of this relation. Since no commodity can stand in the relation of equivalent to itself, and thus turn its own bodily shape into the expression of its own value, every commodity is compelled to choose some other commodity for its equivalent, and to accept the use value, that is to say, the bodily shape of that other commodity as the form of its own value.

One of the measures that we apply to commodities as material substances, as use values, will serve to illustrate this point. A sugar-loaf being a body, is heavy, and therefore has weight: but we can neither see nor touch this weight. We then take various pieces of iron, whose weight has been determined beforehand. The iron, as iron, is no more the form of manifestation of weight, than is the sugar-loaf. Nevertheless, in order to express the sugar-loaf as so much weight, we put it into a weight-relation with the iron. In this relation, the iron officiates as a body representing nothing but weight. A certain quantity of iron therefore serves as the measure of the weight of the sugar, and represents, in relation to the sugar-loaf, weight embodied, the form of manifestation of weight. This part is played by the iron only within this relation, into which the sugar or any other

body, whose weight has to be determined, enters with the iron. Were they not both heavy, they could not enter into this relation, and the one could therefore not serve as the expression of the weight of the other. When we throw both into the scales, we see in reality, that as weight they are both the same, and that, therefore, when taken in proper proportions, they have the same weight. Just as the substance iron, as a measure of weight, represents in relation to the sugar-loaf weight alone, so, in our expression of value, the material object, coat, in relation to the linen, represents value alone.

Here, however, the analogy ceases. The iron, in the expression of the weight of the sugar-loaf, represents a natural property common to both bodies, namely their weight; but the coat, in the expression of value of the linen, represents a non-natural property of both, something purely social, namely, their value.

Since the relative form of value of a commodity – the linen, for example – expresses the value of that commodity, as being something wholly different from its substance and properties, as being, for instance, coat-like, we see that this expression itself indicates that some social relation lies at the bottom of it. With the equivalent form it is just the contrary. The very essence of this form is that the material commodity itself – the coat – just as it is, expresses value, and is endowed with the form of value by Nature itself. Of course this holds good only so long as the value relation exists, in which the coat stands in the position of equivalent to the linen.<sup>22</sup> Since, however, the properties of a thing are not the result of its relations to other things, but only manifest themselves in such relations, the coat seems to be endowed with its equivalent form, its property of being directly exchangeable, just as much by Nature as it is endowed with the property of being heavy, or the capacity to keep us warm. Hence the enigmatical character of the equivalent form which escapes the notice of the bourgeois political economist, until this form, completely developed, confronts him in the shape of money. He then seeks to explain away the mystical character of gold and silver, by substituting for them less dazzling commodities, and by reciting, with ever renewed satisfaction, the catalogue of all possible commodities which at one time or another have played the part of equivalent. He has not the least suspicion that the most simple expression of value, such as 20 yds of linen = 1 coat, already propounds the riddle of the equivalent form for our solution.

The body of the commodity that serves as the equivalent, figures as the materialisation of human labour in the abstract, and is at the same time the product of some specifically useful concrete labour. This concrete labour becomes, therefore, the medium for expressing abstract human labour. If on the one hand the coat ranks as nothing but the embodiment of abstract human labour, so, on the other hand, the tailoring which is actually embodied in it, counts as nothing but the form under which that abstract labour is realised. In the expression of value of the linen, the utility of the tailoring consists, not in making clothes, but in making an object, which we at once recognise to be Value, and therefore to be a congelation of labour, but of labour indistinguishable from that realised in the value of the linen. In order to act as such a mirror of value, the labour of tailoring must reflect nothing besides its own abstract quality of being human labour generally.

In tailoring, as well as in weaving, human labour power is expended. Both, therefore, possess the general property of being human labour, and may, therefore, in certain cases, such as in the production of value, have to be considered under this aspect alone. There is nothing mysterious in this. But in the expression of value there is a complete turn of the tables. For instance, how is the fact to be expressed that weaving creates the value of the linen, not by virtue of being weaving, as such, but by reason of its general property of being human labour? Simply by opposing to weaving that other particular form of concrete labour (in this instance tailoring), which produces the equivalent of the product of weaving. Just as the coat in its bodily form became a direct

expression of value, so now does tailoring, a concrete form of labour, appear as the direct and palpable embodiment of human labour generally.

Hence, the second peculiarity of the equivalent form is, that concrete labour becomes the form under which its opposite, abstract human labour, manifests itself.

But because this concrete labour, tailoring in our case, ranks as, and is directly identified with, undifferentiated human labour, it also ranks as identical with any other sort of labour, and therefore with that embodied in the linen. Consequently, although, like all other commodity-producing labour, it is the labour of private individuals, yet, at the same time, it ranks as labour directly social in its character. This is the reason why it results in a product directly exchangeable with other commodities. We have then a third peculiarity of the equivalent form, namely, that the labour of private individuals takes the form of its opposite, labour directly social in its form.

The two latter peculiarities of the equivalent form will become more intelligible if we go back to the great thinker who was the first to analyse so many forms, whether of thought, society, or Nature, and amongst them also the form of value. I mean Aristotle.

In the first place, he clearly enunciates that the money form of commodities is only the further development of the simple form of value – *i.e.*, of the expression of the value of one commodity in some other commodity taken at random; for he says:

5 beds = 1 house (χλιναι πεντε αντι οιχιας)

is not to be distinguished from

5 beds = so much money. (χλιναι πεντε αντι ... οσον αι πεντε χλιναι)

He further sees that the value relation which gives rise to this expression makes it necessary that the house should qualitatively be made the equal of the bed, and that, without such an equalisation, these two clearly different things could not be compared with each other as commensurable quantities. “Exchange,” he says, “cannot take place without equality, and equality not without commensurability”. (ουτ ισοτης μη ουσης συμμετριας). Here, however, he comes to a stop, and gives up the further analysis of the form of value. “It is, however, in reality, impossible (τη μεν ουν αληθεια αδυνατον), that such unlike things can be commensurable” – *i.e.*, qualitatively equal. Such an equalisation can only be something foreign to their real nature, consequently only “a makeshift for practical purposes.”

Aristotle therefore, himself, tells us what barred the way to his further analysis; it was the absence of any concept of value. What is that equal something, that common substance, which admits of the value of the beds being expressed by a house? Such a thing, in truth, cannot exist, says Aristotle. And why not? Compared with the beds, the house does represent something equal to them, in so far as it represents what is really equal, both in the beds and the house. And that is – human labour.

There was, however, an important fact which prevented Aristotle from seeing that, to attribute value to commodities, is merely a mode of expressing all labour as equal human labour, and consequently as labour of equal quality. Greek society was founded upon slavery, and had, therefore, for its natural basis, the inequality of men and of their labour powers. The secret of the expression of value, namely, that all kinds of labour are equal and equivalent, because, and so far as they are human labour in general, cannot be deciphered, until the notion of human equality has already acquired the fixity of a popular prejudice. This, however, is possible only in a society in which the great mass of the produce of labour takes the form of commodities, in which, consequently, the dominant relation between man and man, is that of owners of commodities. The brilliancy of Aristotle’s genius is shown by this alone, that he discovered, in the expression of the

value of commodities, a relation of equality. The peculiar conditions of the society in which he lived, alone prevented him from discovering what, “in truth,” was at the bottom of this equality.

#### **4. The Elementary Form of value considered as a whole**

The elementary form of value of a commodity is contained in the equation, expressing its value relation to another commodity of a different kind, or in its exchange relation to the same. The value of commodity A, is qualitatively expressed, by the fact that commodity B is directly exchangeable with it. Its value is quantitatively expressed by the fact, that a definite quantity of B is exchangeable with a definite quantity of A. In other words, the value of a commodity obtains independent and definite expression, by taking the form of exchange value. When, at the beginning of this chapter, we said, in common parlance, that a commodity is both a use value and an exchange value, we were, accurately speaking, wrong. A commodity is a use value or object of utility, and a value. It manifests itself as this two-fold thing, that it is, as soon as its value assumes an independent form – viz., the form of exchange value. It never assumes this form when isolated, but only when placed in a value or exchange relation with another commodity of a different kind. When once we know this, such a mode of expression does no harm; it simply serves as an abbreviation.

Our analysis has shown, that the form or expression of the value of a commodity originates in the nature of value, and not that value and its magnitude originate in the mode of their expression as exchange value. This, however, is the delusion as well of the mercantilists and their recent revivers, Ferrier, Ganihl,<sup>23</sup> and others, as also of their antipodes, the modern bagmen of Free-trade, such as Bastiat. The mercantilists lay special stress on the qualitative aspect of the expression of value, and consequently on the equivalent form of commodities, which attains its full perfection in money. The modern hawkers of Free-trade, who must get rid of their article at any price, on the other hand, lay most stress on the quantitative aspect of the relative form of value. For them there consequently exists neither value, nor magnitude of value, anywhere except in its expression by means of the exchange relation of commodities, that is, in the daily list of prices current. Macleod, who has taken upon himself to dress up the confused ideas of Lombard Street in the most learned finery, is a successful cross between the superstitious mercantilists, and the enlightened Free-trade bagmen.

A close scrutiny of the expression of the value of A in terms of B, contained in the equation expressing the value relation of A to B, has shown us that, within that relation, the bodily form of A figures only as a use value, the bodily form of B only as the form or aspect of value. The opposition or contrast existing internally in each commodity between use value and value, is, therefore, made evident externally by two commodities being placed in such relation to each other, that the commodity whose value it is sought to express, figures directly as a mere use value, while the commodity in which that value is to be expressed, figures directly as mere exchange value. Hence the elementary form of value of a commodity is the elementary form in which the contrast contained in that commodity, between use value and value, becomes apparent.

Every product of labour is, in all states of society, a use value; but it is only at a definite historical epoch in a society's development that such a product becomes a commodity, viz., at the epoch when the labour spent on the production of a useful article becomes expressed as one of the objective qualities of that article, *i.e.*, as its value. It therefore follows that the elementary value form is also the primitive form under which a product of labour appears historically as a commodity, and that the gradual transformation of such products into commodities, proceeds *pari passu* with the development of the value form.

We perceive, at first sight, the deficiencies of the elementary form of value: it is a mere germ, which must undergo a series of metamorphoses before it can ripen into the price form.

The expression of the value of commodity A in terms of any other commodity B, merely distinguishes the value from the use value of A, and therefore places A merely in a relation of exchange with a single different commodity, B; but it is still far from expressing A's qualitative equality, and quantitative proportionality, to all commodities. To the elementary relative value form of a commodity, there corresponds the single equivalent form of one other commodity. Thus, in the relative expression of value of the linen, the coat assumes the form of equivalent, or of being directly exchangeable, only in relation to a single commodity, the linen.

Nevertheless, the elementary form of value passes by an easy transition into a more complete form. It is true that by means of the elementary form, the value of a commodity A, becomes expressed in terms of one, and only one, other commodity. But that one may be a commodity of any kind, coat, iron, corn, or anything else. Therefore, according as A is placed in relation with one or the other, we get for one and the same commodity, different elementary expressions of value.<sup>24</sup> The number of such possible expressions is limited only by the number of the different kinds of commodities distinct from it. The isolated expression of A's value, is therefore convertible into a series, prolonged to any length, of the different elementary expressions of that value.

## B. Total or Expanded Form of value

z Com. A = u Com. B or = v Com. C or = w Com. D or = Com. E or = &c.  
 (20 yards of linen = 1 coat or = 10 lbs tea or = 40 lbs. coffee or  
 = 1 quarter corn or = 2 ounces gold or = ½ ton iron or = &c.)

### 1. The Expanded Relative form of value

The value of a single commodity, the linen, for example, is now expressed in terms of numberless other elements of the world of commodities. Every other commodity now becomes a mirror of the linen's value.<sup>25</sup> It is thus, that for the first time, this value shows itself in its true light as a congelation of undifferentiated human labour. For the labour that creates it, now stands expressly revealed, as labour that ranks equally with every other sort of human labour, no matter what its form, whether tailoring, ploughing, mining, &c., and no matter, therefore, whether it is realised in coats, corn, iron, or gold. The linen, by virtue of the form of its value, now stands in a social relation, no longer with only one other kind of commodity, but with the whole world of commodities. As a commodity, it is a citizen of that world. At the same time, the interminable series of value equations implies, that as regards the value of a commodity, it is a matter of indifference under what particular form, or kind, of use value it appears.

In the first form, 20 yds of linen = 1 coat, it might, for ought that otherwise appears, be pure accident, that these two commodities are exchangeable in definite quantities. In the second form, on the contrary, we perceive at once the background that determines, and is essentially different from, this accidental appearance. The value of the linen remains unaltered in magnitude, whether expressed in coats, coffee, or iron, or in numberless different commodities, the property of as many different owners. The accidental relation between two individual commodity-owners disappears. It becomes plain, that it is not the exchange of commodities which regulates the magnitude of their value; but, on the contrary, that it is the magnitude of their value which controls their exchange proportions.

## 2. The particular Equivalent form

Each commodity, such as, coat, tea, corn, iron, &c., figures in the expression of value of the linen, as an equivalent, and, consequently, as a thing that is value. The bodily form of each of these commodities figures now as a particular equivalent form, one out of many. In the same way the manifold concrete useful kinds of labour, embodied in these different commodities, rank now as so many different forms of the realisation, or manifestation, of undifferentiated human labour.

## 3. Defects of the Total or Expanded form of value

In the first place, the relative expression of value is incomplete because the series representing it is interminable. The chain of which each equation of value is a link, is liable at any moment to be lengthened by each new kind of commodity that comes into existence and furnishes the material for a fresh expression of value. In the second place, it is a many-coloured mosaic of disparate and independent expressions of value. And lastly, if, as must be the case, the relative value of each commodity in turn, becomes expressed in this expanded form, we get for each of them a relative value form, different in every case, and consisting of an interminable series of expressions of value. The defects of the expanded relative value form are reflected in the corresponding equivalent form. Since the bodily form of each single commodity is one particular equivalent form amongst numberless others, we have, on the whole, nothing but fragmentary equivalent forms, each excluding the others. In the same way, also, the special, concrete, useful kind of labour embodied in each particular equivalent, is presented only as a particular kind of labour, and therefore not as an exhaustive representative of human labour generally. The latter, indeed, gains adequate manifestation in the totality of its manifold, particular, concrete forms. But, in that case, its expression in an infinite series is ever incomplete and deficient in unity.

The expanded relative value form is, however, nothing but the sum of the elementary relative expressions or equations of the first kind, such as:

20 yards of linen = 1 coat  
20 yards of linen = 10 lbs of tea, etc.

Each of these implies the corresponding inverted equation,

1 coat = 20 yards of linen  
10 lbs of tea = 20 yards of linen, etc.

In fact, when a person exchanges his linen for many other commodities, and thus expresses its value in a series of other commodities, it necessarily follows, that the various owners of the latter exchange them for the linen, and consequently express the value of their various commodities in one and the same third commodity, the linen. If then, we reverse the series, 20 yards of linen = 1 coat or = 10 lbs of tea, etc., that is to say, if we give expression to the converse relation already implied in the series, we get,

### C. The General Form of Value

|    |                   |   |                     |
|----|-------------------|---|---------------------|
| 1  | coat              | } | = 20 yards of linen |
| 10 | lbs of tea        |   |                     |
| 40 | lbs of coffee     |   |                     |
| 1  | quarter of corn   |   |                     |
| 2  | ounces of gold    |   |                     |
| ½  | a ton of iron     |   |                     |
| x  | Commodity A, etc. |   |                     |

## 1. The altered character of the form of value

All commodities now express their value (1) in an elementary form, because in a single commodity; (2) with unity, because in one and the same commodity. This form of value is elementary and the same for all, therefore general.

The forms A and B were fit only to express the value of a commodity as something distinct from its use value or material form.

The first form, A, furnishes such equations as the following: – 1 coat = 20 yards of linen, 10 lbs of tea =  $\frac{1}{2}$  a ton of iron. The value of the coat is equated to linen, that of the tea to iron. But to be equated to linen, and again to iron, is to be as different as are linen and iron. This form, it is plain, occurs practically only in the first beginning, when the products of labour are converted into commodities by accidental and occasional exchanges.

The second form, B, distinguishes, in a more adequate manner than the first, the value of a commodity from its use value, for the value of the coat is there placed in contrast under all possible shapes with the bodily form of the coat; it is equated to linen, to iron, to tea, in short, to everything else, only not to itself, the coat. On the other hand, any general expression of value common to all is directly excluded; for, in the equation of value of each commodity, all other commodities now appear only under the form of equivalents. The expanded form of value comes into actual existence for the first time so soon as a particular product of labour, such as cattle, is no longer exceptionally, but habitually, exchanged for various other commodities.

The third and lastly developed form expresses the values of the whole world of commodities in terms of a single commodity set apart for the purpose, namely, the linen, and thus represents to us their values by means of their equality with linen. The value of every commodity is now, by being equated to linen, not only differentiated from its own use value, but from all other use values generally, and is, by that very fact, expressed as that which is common to all commodities. By this form, commodities are, for the first time, effectively brought into relation with one another as values, or made to appear as exchange values.

The two earlier forms either express the value of each commodity in terms of a single commodity of a different kind, or in a series of many such commodities. In both cases, it is, so to say, the special business of each single commodity to find an expression for its value, and this it does without the help of the others. These others, with respect to the former, play the passive parts of equivalents. The general form of value, C, results from the joint action of the whole world of commodities, and from that alone. A commodity can acquire a general expression of its value only by all other commodities, simultaneously with it, expressing their values in the same equivalent; and every new commodity must follow suit. It thus becomes evident that since the existence of commodities as values is purely social, this social existence can be expressed by the totality of their social relations alone, and consequently that the form of their value must be a socially recognised form.

All commodities being equated to linen now appear not only as qualitatively equal as values generally, but also as values whose magnitudes are capable of comparison. By expressing the magnitudes of their values in one and the same material, the linen, those magnitudes are also compared with each other. For instance, 10 lbs of tea = 20 yards of linen, and 40 lbs of coffee = 20 yards of linen. Therefore, 10 lbs of tea = 40 lbs of coffee. In other words, there is contained in 1 lb of coffee only one-fourth as much substance of value – labour – as is contained in 1 lb of tea.

The general form of relative value, embracing the whole world of commodities, converts the single commodity that is excluded from the rest, and made to play the part of equivalent – here the linen – into the universal equivalent. The bodily form of the linen is now the form assumed in

common by the values of all commodities; it therefore becomes directly exchangeable with all and every of them. The substance linen becomes the visible incarnation, the social chrysalis state of every kind of human labour. Weaving, which is the labour of certain private individuals producing a particular article, linen, acquires in consequence a social character, the character of equality with all other kinds of labour. The innumerable equations of which the general form of value is composed, equate in turn the labour embodied in the linen to that embodied in every other commodity, and they thus convert weaving into the general form of manifestation of undifferentiated human labour. In this manner the labour realised in the values of commodities is presented not only under its negative aspect, under which abstraction is made from every concrete form and useful property of actual work, but its own positive nature is made to reveal itself expressly. The general value form is the reduction of all kinds of actual labour to their common character of being human labour generally, of being the expenditure of human labour power.

The general value form, which represents all products of labour as mere congelations of undifferentiated human labour, shows by its very structure that it is the social resumé of the world of commodities. That form consequently makes it indisputably evident that in the world of commodities the character possessed by all labour of being *human* labour constitutes its specific social character.

## **2. The Interdependent Development of the Relative Form of Value, and of the Equivalent Form**

The degree of development of the relative form of value corresponds to that of the equivalent form. But we must bear in mind that the development of the latter is only the expression and result of the development of the former.

The primary or isolated relative form of value of one commodity converts some other commodity into an isolated equivalent. The expanded form of relative value, which is the expression of the value of one commodity in terms of all other commodities, endows those other commodities with the character of particular equivalents differing in kind. And lastly, a particular kind of commodity acquires the character of universal equivalent, because all other commodities make it the material in which they uniformly express their value.

The antagonism between the relative form of value and the equivalent form, the two poles of the value form, is developed concurrently with that form itself.

The first form, 20 yds of linen = one coat, already contains this antagonism, without as yet fixing it. According as we read this equation forwards or backwards, the parts played by the linen and the coat are different. In the one case the relative value of the linen is expressed in the coat, in the other case the relative value of the coat is expressed in the linen. In this first form of value, therefore, it is difficult to grasp the polar contrast.

Form B shows that only one single commodity at a time can completely expand its relative value, and that it acquires this expanded form only because, and in so far as, all other commodities are, with respect to it, equivalents. Here we cannot reverse the equation, as we can the equation 20 yds of linen = 1 coat, without altering its general character, and converting it from the expanded form of value into the general form of value.

Finally, the form C gives to the world of commodities a general social relative form of value, because, and in so far as, thereby all commodities, with the exception of one, are excluded from the equivalent form. A single commodity, the linen, appears therefore to have acquired the character of direct exchangeability with every other commodity because, and in so far as, this character is denied to every other commodity.<sup>26</sup>

The commodity that figures as universal equivalent, is, on the other hand, excluded from the relative value form. If the linen, or any other commodity serving as universal equivalent, were, at the same time, to share in the relative form of value, it would have to serve as its own equivalent. We should then have 20 yds of linen = 20 yds of linen; this tautology expresses neither value, nor magnitude of value. In order to express the relative value of the universal equivalent, we must rather reverse the form C. This equivalent has no relative form of value in common with other commodities, but its value is relatively expressed by a never ending series of other commodities. Thus, the expanded form of relative value, or form B, now shows itself as the specific form of relative value for the equivalent commodity.

### 3. Transition from the General form of value to the Money form

The universal equivalent form is a form of value in general. It can, therefore, be assumed by any commodity. On the other hand, if a commodity be found to have assumed the universal equivalent form (form C), this is only because and in so far as it has been excluded from the rest of all other commodities as their equivalent, and that by their own act. And from the moment that this exclusion becomes finally restricted to one particular commodity, from that moment only, the general form of relative value of the world of commodities obtains real consistence and general social validity.

The particular commodity, with whose bodily form the equivalent form is thus socially identified, now becomes the money commodity, or serves as money. It becomes the special social function of that commodity, and consequently its social monopoly, to play within the world of commodities the part of the universal equivalent. Amongst the commodities which, in form B, figure as particular equivalents of the linen, and, in form C, express in common their relative values in linen, this foremost place has been attained by one in particular – namely, gold. If, then, in form C we replace the linen by gold, we get,

#### D. The Money-Form

|                   |   |   |                    |
|-------------------|---|---|--------------------|
| 20 yards of linen | = | } | = 2 ounces of gold |
| 1 coat            | = |   |                    |
| 10 lbs of tea     | = |   |                    |
| 40 lbs of coffee  | = |   |                    |
| 1 quarter of corn | = |   |                    |
| 2 ounces of gold  | = |   |                    |
| ½ a ton of iron   | = |   |                    |
| x Commodity A     | = |   |                    |

In passing from form A to form B, and from the latter to form C, the changes are fundamental. On the other hand, there is no difference between forms C and D, except that, in the latter, gold has assumed the equivalent form in the place of linen. Gold is in form D, what linen was in form C – the universal equivalent. The progress consists in this alone, that the character of direct and universal exchangeability – in other words, that the universal equivalent form – has now, by social custom, become finally identified with the substance, gold.

Gold is now money with reference to all other commodities only because it was previously, with reference to them, a simple commodity. Like all other commodities, it was also capable of serving as an equivalent, either as simple equivalent in isolated exchanges, or as particular equivalent by the side of others. Gradually it began to serve, within varying limits, as universal equivalent. So soon as it monopolises this position in the expression of value for the world of commodities, it

becomes the money commodity, and then, and not till then, does form D become distinct from form C, and the general form of value become changed into the money form.

The elementary expression of the relative value of a single commodity, such as linen, in terms of the commodity, such as gold, that plays the part of money, is the price form of that commodity. The price form of the linen is therefore

20 yards of linen = 2 ounces of gold, or, if 2 ounces of gold when  
coined are £2, 20 yards of linen = £2.

The difficulty in forming a concept of the money form, consists in clearly comprehending the universal equivalent form, and as a necessary corollary, the general form of value, form C. The latter is deducible from form B, the expanded form of value, the essential component element of which, we saw, is form A, 20 yards of linen = 1 coat or  $x$  commodity A =  $y$  commodity B. The simple commodity form is therefore the germ of the money form.

## Section 4: The Fetishism of Commodities and the Secret Thereof

A commodity appears, at first sight, a very trivial thing, and easily understood. Its analysis shows that it is, in reality, a very queer thing, abounding in metaphysical subtleties and theological niceties. So far as it is a value in use, there is nothing mysterious about it, whether we consider it from the point of view that by its properties it is capable of satisfying human wants, or from the point that those properties are the product of human labour. It is as clear as noon-day, that man, by his industry, changes the forms of the materials furnished by Nature, in such a way as to make them useful to him. The form of wood, for instance, is altered, by making a table out of it. Yet, for all that, the table continues to be that common, every-day thing, wood. But, so soon as it steps forth as a commodity, it is changed into something transcendent. It not only stands with its feet on the ground, but, in relation to all other commodities, it stands on its head, and evolves out of its wooden brain grotesque ideas, far more wonderful than “table-turning” ever was.<sup>26a</sup>

The mystical character of commodities does not originate, therefore, in their use value. Just as little does it proceed from the nature of the determining factors of value. For, in the first place, however varied the useful kinds of labour, or productive activities, may be, it is a physiological fact, that they are functions of the human organism, and that each such function, whatever may be its nature or form, is essentially the expenditure of human brain, nerves, muscles, &c. Secondly, with regard to that which forms the ground-work for the quantitative determination of value, namely, the duration of that expenditure, or the quantity of labour, it is quite clear that there is a palpable difference between its quantity and quality. In all states of society, the labour time that it costs to produce the means of subsistence, must necessarily be an object of interest to mankind, though not of equal interest in different stages of development.<sup>27</sup> And lastly, from the moment that men in any way work for one another, their labour assumes a social form.

Whence, then, arises the enigmatical character of the product of labour, so soon as it assumes the form of commodities? Clearly from this form itself. The equality of all sorts of human labour is expressed objectively by their products all being equally values; the measure of the expenditure of labour power by the duration of that expenditure, takes the form of the quantity of value of the products of labour; and finally the mutual relations of the producers, within which the social character of their labour affirms itself, take the form of a social relation between the products.

A commodity is therefore a mysterious thing, simply because in it the social character of men’s labour appears to them as an objective character stamped upon the product of that labour; because the relation of the producers to the sum total of their own labour is presented to them as a social

relation, existing not between themselves, but between the products of their labour. This is the reason why the products of labour become commodities, social things whose qualities are at the same time perceptible and imperceptible by the senses. In the same way the light from an object is perceived by us not as the subjective excitation of our optic nerve, but as the objective form of something outside the eye itself. But, in the act of seeing, there is at all events, an actual passage of light from one thing to another, from the external object to the eye. There is a physical relation between physical things. But it is different with commodities. There, the existence of the things *quâ* commodities, and the value relation between the products of labour which stamps them as commodities, have absolutely no connection with their physical properties and with the material relations arising therefrom. There it is a definite social relation between men, that assumes, in their eyes, the fantastic form of a relation between things. In order, therefore, to find an analogy, we must have recourse to the mist-enveloped regions of the religious world. In that world the productions of the human brain appear as independent beings endowed with life, and entering into relation both with one another and the human race. So it is in the world of commodities with the products of men's hands. This I call the Fetishism which attaches itself to the products of labour, so soon as they are produced as commodities, and which is therefore inseparable from the production of commodities.

This Fetishism of commodities has its origin, as the foregoing analysis has already shown, in the peculiar social character of the labour that produces them.

As a general rule, articles of utility become commodities, only because they are products of the labour of private individuals or groups of individuals who carry on their work independently of each other. The sum total of the labour of all these private individuals forms the aggregate labour of society. Since the producers do not come into social contact with each other until they exchange their products, the specific social character of each producer's labour does not show itself except in the act of exchange. In other words, the labour of the individual asserts itself as a part of the labour of society, only by means of the relations which the act of exchange establishes directly between the products, and indirectly, through them, between the producers. To the latter, therefore, the relations connecting the labour of one individual with that of the rest appear, not as direct social relations between individuals at work, but as what they really are, material relations between persons and social relations between things. It is only by being exchanged that the products of labour acquire, as values, one uniform social status, distinct from their varied forms of existence as objects of utility. This division of a product into a useful thing and a value becomes practically important, only when exchange has acquired such an extension that useful articles are produced for the purpose of being exchanged, and their character as values has therefore to be taken into account, beforehand, during production. From this moment the labour of the individual producer acquires socially a two-fold character. On the one hand, it must, as a definite useful kind of labour, satisfy a definite social want, and thus hold its place as part and parcel of the collective labour of all, as a branch of a social division of labour that has sprung up spontaneously. On the other hand, it can satisfy the manifold wants of the individual producer himself, only in so far as the mutual exchangeability of all kinds of useful private labour is an established social fact, and therefore the private useful labour of each producer ranks on an equality with that of all others. The equalisation of the most different kinds of labour can be the result only of an abstraction from their inequalities, or of reducing them to their common denominator, viz. expenditure of human labour power or human labour in the abstract. The two-fold social character of the labour of the individual appears to him, when reflected in his brain, only under those forms which are impressed upon that labour in every-day practice by the exchange of products. In this way, the character that his own labour possesses of being socially

useful takes the form of the condition, that the product must be not only useful, but useful for others, and the social character that his particular labour has of being the equal of all other particular kinds of labour, takes the form that all the physically different articles that are the products of labour, have one common quality, viz., that of having value.

Hence, when we bring the products of our labour into relation with each other as values, it is not because we see in these articles the material receptacles of homogeneous human labour. Quite the contrary: whenever, by an exchange, we equate as values our different products, by that very act, we also equate, as human labour, the different kinds of labour expended upon them. We are not aware of this, nevertheless we do it.<sup>28</sup> Value, therefore, does not stalk about with a label describing what it is. It is value, rather, that converts every product into a social hieroglyphic. Later on, we try to decipher the hieroglyphic, to get behind the secret of our own social products; for to stamp an object of utility as a value, is just as much a social product as language. The recent scientific discovery, that the products of labour, so far as they are values, are but material expressions of the human labour spent in their production, marks, indeed, an epoch in the history of the development of the human race, but, by no means, dissipates the mist through which the social character of labour appears to us to be an objective character of the products themselves. The fact, that in the particular form of production with which we are dealing, viz., the production of commodities, the specific social character of private labour carried on independently, consists in the equality of every kind of that labour, by virtue of its being human labour, which character, therefore, assumes in the product the form of value – this fact appears to the producers, notwithstanding the discovery above referred to, to be just as real and final, as the fact, that, after the discovery by science of the component gases of air, the atmosphere itself remained unaltered.

What, first of all, practically concerns producers when they make an exchange, is the question, how much of some other product they get for their own? in what proportions the products are exchangeable? When these proportions have, by custom, attained a certain stability, they appear to result from the nature of the products, so that, for instance, one ton of iron and two ounces of gold appear as naturally to be of equal value as a pound of gold and a pound of iron in spite of their different physical and chemical qualities appear to be of equal weight. The character of having value, when once impressed upon products, obtains fixity only by reason of their acting and re-acting upon each other as quantities of value. These quantities vary continually, independently of the will, foresight and action of the producers. To them, their own social action takes the form of the action of objects, which rule the producers instead of being ruled by them. It requires a fully developed production of commodities before, from accumulated experience alone, the scientific conviction springs up, that all the different kinds of private labour, which are carried on independently of each other, and yet as spontaneously developed branches of the social division of labour, are continually being reduced to the quantitative proportions in which society requires them. And why? Because, in the midst of all the accidental and ever fluctuating exchange relations between the products, the labour time socially necessary for their production forcibly asserts itself like an over-riding law of Nature. The law of gravity thus asserts itself when a house falls about our ears.<sup>29</sup> The determination of the magnitude of value by labour time is therefore a secret, hidden under the apparent fluctuations in the relative values of commodities. Its discovery, while removing all appearance of mere accidentality from the determination of the magnitude of the values of products, yet in no way alters the mode in which that determination takes place.

Man's reflections on the forms of social life, and consequently, also, his scientific analysis of those forms, take a course directly opposite to that of their actual historical development. He begins, *post festum*, with the results of the process of development ready to hand before him. The

characters that stamp products as commodities, and whose establishment is a necessary preliminary to the circulation of commodities, have already acquired the stability of natural, self-understood forms of social life, before man seeks to decipher, not their historical character, for in his eyes they are immutable, but their meaning. Consequently it was the analysis of the prices of commodities that alone led to the determination of the magnitude of value, and it was the common expression of all commodities in money that alone led to the establishment of their characters as values. It is, however, just this ultimate money form of the world of commodities that actually conceals, instead of disclosing, the social character of private labour, and the social relations between the individual producers. When I state that coats or boots stand in a relation to linen, because it is the universal incarnation of abstract human labour, the absurdity of the statement is self-evident. Nevertheless, when the producers of coats and boots compare those articles with linen, or, what is the same thing, with gold or silver, as the universal equivalent, they express the relation between their own private labour and the collective labour of society in the same absurd form.

The categories of bourgeois economy consist of such like forms. They are forms of thought expressing with social validity the conditions and relations of a definite, historically determined mode of production, viz., the production of commodities. The whole mystery of commodities, all the magic and necromancy that surrounds the products of labour as long as they take the form of commodities, vanishes therefore, so soon as we come to other forms of production.

Since Robinson Crusoe's experiences are a favourite theme with political economists,<sup>30</sup> let us take a look at him on his island. Moderate though he be, yet some few wants he has to satisfy, and must therefore do a little useful work of various sorts, such as making tools and furniture, taming goats, fishing and hunting. Of his prayers and the like we take no account, since they are a source of pleasure to him, and he looks upon them as so much recreation. In spite of the variety of his work, he knows that his labour, whatever its form, is but the activity of one and the same Robinson, and consequently, that it consists of nothing but different modes of human labour. Necessity itself compels him to apportion his time accurately between his different kinds of work. Whether one kind occupies a greater space in his general activity than another, depends on the difficulties, greater or less as the case may be, to be overcome in attaining the useful effect aimed at. This our friend Robinson soon learns by experience, and having rescued a watch, ledger, and pen and ink from the wreck, commences, like a true-born Briton, to keep a set of books. His stock-book contains a list of the objects of utility that belong to him, of the operations necessary for their production; and lastly, of the labour time that definite quantities of those objects have, on an average, cost him. All the relations between Robinson and the objects that form this wealth of his own creation, are here so simple and clear as to be intelligible without exertion, even to Mr. Sedley Taylor. And yet those relations contain all that is essential to the determination of value.

Let us now transport ourselves from Robinson's island bathed in light to the European middle ages shrouded in darkness. Here, instead of the independent man, we find everyone dependent, serfs and lords, vassals and suzerains, laymen and clergy. Personal dependence here characterises the social relations of production just as much as it does the other spheres of life organised on the basis of that production. But for the very reason that personal dependence forms the ground-work of society, there is no necessity for labour and its products to assume a fantastic form different from their reality. They take the shape, in the transactions of society, of services in kind and payments in kind. Here the particular and natural form of labour, and not, as in a society based on production of commodities, its general abstract form is the immediate social form of labour. Compulsory labour is just as properly measured by time, as commodity-producing labour; but every serf knows that what he expends in the service of his lord, is a definite quantity of his own

personal labour power. The tithe to be rendered to the priest is more matter of fact than his blessing. No matter, then, what we may think of the parts played by the different classes of people themselves in this society, the social relations between individuals in the performance of their labour, appear at all events as their own mutual personal relations, and are not disguised under the shape of social relations between the products of labour.

For an example of labour in common or directly associated labour, we have no occasion to go back to that spontaneously developed form which we find on the threshold of the history of all civilised races.<sup>31</sup> We have one close at hand in the patriarchal industries of a peasant family, that produces corn, cattle, yarn, linen, and clothing for home use. These different articles are, as regards the family, so many products of its labour, but as between themselves, they are not commodities. The different kinds of labour, such as tillage, cattle tending, spinning, weaving and making clothes, which result in the various products, are in themselves, and such as they are, direct social functions, because functions of the family, which, just as much as a society based on the production of commodities, possesses a spontaneously developed system of division of labour. The distribution of the work within the family, and the regulation of the labour time of the several members, depend as well upon differences of age and sex as upon natural conditions varying with the seasons. The labour power of each individual, by its very nature, operates in this case merely as a definite portion of the whole labour power of the family, and therefore, the measure of the expenditure of individual labour power by its duration, appears here by its very nature as a social character of their labour.

Let us now picture to ourselves, by way of change, a community of free individuals, carrying on their work with the means of production in common, in which the labour power of all the different individuals is consciously applied as the combined labour power of the community. All the characteristics of Robinson's labour are here repeated, but with this difference, that they are social, instead of individual. Everything produced by him was exclusively the result of his own personal labour, and therefore simply an object of use for himself. The total product of our community is a social product. One portion serves as fresh means of production and remains social. But another portion is consumed by the members as means of subsistence. A distribution of this portion amongst them is consequently necessary. The mode of this distribution will vary with the productive organisation of the community, and the degree of historical development attained by the producers. We will assume, but merely for the sake of a parallel with the production of commodities, that the share of each individual producer in the means of subsistence is determined by his labour time. Labour time would, in that case, play a double part. Its apportionment in accordance with a definite social plan maintains the proper proportion between the different kinds of work to be done and the various wants of the community. On the other hand, it also serves as a measure of the portion of the common labour borne by each individual, and of his share in the part of the total product destined for individual consumption. The social relations of the individual producers, with regard both to their labour and to its products, are in this case perfectly simple and intelligible, and that with regard not only to production but also to distribution.

The religious world is but the reflex of the real world. And for a society based upon the production of commodities, in which the producers in general enter into social relations with one another by treating their products as commodities and values, whereby they reduce their individual private labour to the standard of homogeneous human labour – for such a society, Christianity with its *cultus* of abstract man, more especially in its bourgeois developments, Protestantism, Deism, &c., is the most fitting form of religion. In the ancient Asiatic and other ancient modes of production, we find that the conversion of products into commodities, and

therefore the conversion of men into producers of commodities, holds a subordinate place, which, however, increases in importance as the primitive communities approach nearer and nearer to their dissolution. Trading nations, properly so called, exist in the ancient world only in its interstices, like the gods of Epicurus in the Intermundia, or like Jews in the pores of Polish society. Those ancient social organisms of production are, as compared with bourgeois society, extremely simple and transparent. But they are founded either on the immature development of man individually, who has not yet severed the umbilical cord that unites him with his fellowmen in a primitive tribal community, or upon direct relations of subjection. They can arise and exist only when the development of the productive power of labour has not risen beyond a low stage, and when, therefore, the social relations within the sphere of material life, between man and man, and between man and Nature, are correspondingly narrow. This narrowness is reflected in the ancient worship of Nature, and in the other elements of the popular religions. The religious reflex of the real world can, in any case, only then finally vanish, when the practical relations of everyday life offer to man none but perfectly intelligible and reasonable relations with regard to his fellowmen and to Nature.

The life-process of society, which is based on the process of material production, does not strip off its mystical veil until it is treated as production by freely associated men, and is consciously regulated by them in accordance with a settled plan. This, however, demands for society a certain material ground-work or set of conditions of existence which in their turn are the spontaneous product of a long and painful process of development.

Political Economy has indeed analysed, however incompletely,<sup>32</sup> value and its magnitude, and has discovered what lies beneath these forms. But it has never once asked the question why labour is represented by the value of its product and labour time by the magnitude of that value.<sup>33</sup> These formulæ, which bear it stamped upon them in unmistakable letters that they belong to a state of society, in which the process of production has the mastery over man, instead of being controlled by him, such formulæ appear to the bourgeois intellect to be as much a self-evident necessity imposed by Nature as productive labour itself. Hence forms of social production that preceded the bourgeois form, are treated by the bourgeoisie in much the same way as the Fathers of the Church treated pre-Christian religions.<sup>34</sup>

To what extent some economists are misled by the Fetishism inherent in commodities, or by the objective appearance of the social characteristics of labour, is shown, amongst other ways, by the dull and tedious quarrel over the part played by Nature in the formation of exchange value. Since exchange value is a definite social manner of expressing the amount of labour bestowed upon an object, Nature has no more to do with it, than it has in fixing the course of exchange.

The mode of production in which the product takes the form of a commodity, or is produced directly for exchange, is the most general and most embryonic form of bourgeois production. It therefore makes its appearance at an early date in history, though not in the same predominating and characteristic manner as now-a-days. Hence its Fetish character is comparatively easy to be seen through. But when we come to more concrete forms, even this appearance of simplicity vanishes. Whence arose the illusions of the monetary system? To it gold and silver, when serving as money, did not represent a social relation between producers, but were natural objects with strange social properties. And modern economy, which looks down with such disdain on the monetary system, does not its superstition come out as clear as noon-day, whenever it treats of capital? How long is it since economy discarded the physiocratic illusion, that rents grow out of the soil and not out of society?

But not to anticipate, we will content ourselves with yet another example relating to the commodity form. Could commodities themselves speak, they would say: Our use value may be a

thing that interests men. It is no part of us as objects. What, however, does belong to us as objects, is our value. Our natural intercourse as commodities proves it. In the eyes of each other we are nothing but exchange values. Now listen how those commodities speak through the mouth of the economist.

“Value” – (*i.e.*, exchange value) “is a property of things, riches” – (*i.e.*, use value) “of man. Value, in this sense, necessarily implies exchanges, riches do not.”<sup>35</sup>

“Riches” (use value) “are the attribute of men, value is the attribute of commodities. A man or a community is rich, a pearl or a diamond is valuable...”

A pearl or a diamond is valuable as a pearl or a diamond.<sup>36</sup>

So far no chemist has ever discovered exchange value either in a pearl or a diamond. The economic discoverers of this chemical element, who by-the-by lay special claim to critical acumen, find however that the use value of objects belongs to them independently of their material properties, while their value, on the other hand, forms a part of them as objects. What confirms them in this view, is the peculiar circumstance that the use value of objects is realised without exchange, by means of a direct relation between the objects and man, while, on the other hand, their value is realised only by exchange, that is, by means of a social process. Who fails here to call to mind our good friend, Dogberry, who informs neighbour Seacoal, that, “To be a well-favoured man is the gift of fortune; but reading and writing comes by Nature.”<sup>37</sup>

---

<sup>1</sup> Karl Marx, “Zur Kritik der Politischen Oekonomie.” Berlin, 1859, p. 3.

<sup>2</sup> “Desire implies want, it is the appetite of the mind, and as natural as hunger to the body... The greatest number (of things) have their value from supplying the wants of the mind.” Nicholas Barbon: “A Discourse Concerning Coining the New Money Lighter. In Answer to Mr. Locke’s Considerations, &c.”, London, 1696, pp. 2, 3.

<sup>3</sup> “Things have an intrinsick vertue” (this is Barbon’s special term for value in use) “which in all places have the same vertue; as the loadstone to attract iron” (*l.c.*, p. 6). The property which the magnet possesses of attracting iron, became of use only after by means of that property the polarity of the magnet had been discovered.

<sup>4</sup> “The natural worth of anything consists in its fitness to supply the necessities, or serve the conveniencies of human life.” (John Locke, “Some Considerations on the Consequences of the Lowering of Interest, 1691,” in Works Edit. Lond., 1777, Vol. II., p. 28.) In English writers of the 17th century we frequently find “worth” in the sense of value in use, and “value” in the sense of exchange value. This is quite in accordance with the spirit of a language that likes to use a Teutonic word for the actual thing, and a Romance word for its reflexion.

<sup>5</sup> In bourgeois societies the economic *fictio juris* prevails, that every one, as a buyer, possesses an encyclopedic knowledge of commodities.

<sup>6</sup> “La valeur consiste dans le rapport d’échange qui se trouve entre telle chose et telle autre entre telle mesure d’une production et telle mesure d’une autre.” [“Value consists in the exchange relation between one thing and another, between a given amount of one product and a given amount of another”] (Le Trosne: “De l’Intérêt Social.” Physiocrates, Ed. Daire. Paris, 1846. p. 889.)

<sup>7</sup> “Nothing can have an intrinsick value.” (N. Barbon, *l.c.*, p. 6); or as Butler says – “The value of a thing is just as much as it will bring.”

<sup>8</sup> N. Barbon, *l.c.*, p. 53 and 7.

<sup>9</sup> “The value of them (the necessaries of life), when they are exchanged the one for another, is regulated by the quantity of labour necessarily required, and commonly taken in producing them.”

(“Some Thoughts on the Interest of Money in General, and Particularly in the Publick Funds, &c.” Lond., p. 36) This remarkable anonymous work written in the last century, bears no date. It is clear, however, from internal evidence that it appeared in the reign of George II, about 1739 or 1740.

<sup>10</sup> “Toutes les productions d’un même genre ne forment proprement qu’une masse, dont le prix se détermine en général et sans égard aux circonstances particulières.” [“Properly speaking, all products of the same kind form a single mass, and their price is determined in general and without regard to particular circumstances”] (Le Trosne, l.c., p. 893.)

<sup>11</sup> K. Marx. l.c., p.6

<sup>12</sup> I am inserting the parenthesis because its omission has often given rise to the misunderstanding that every product that is consumed by some one other than its producer is considered in Marx a commodity. [Engels, 4th German Edition]

<sup>13</sup> Tutti i fenomeni dell’universo, sieno essi prodotti della mano dell’uomo, ovvero delle universali leggi della fisica, non ci danno idea di attuale creazione, ma unicamente di una modificazione della materia. Accostare e separare sono gli unici elementi che l’ingegno umano ritrova analizzando l’idea della riproduzione: e tanto e riproduzione di valore (value in use, although Verri in this passage of his controversy with the Physiocrats is not himself quite certain of the kind of value he is speaking of) e di ricchezze se la terra, l’aria e l’acqua ne’ campi si trasmutino in grano, come se colla mano dell’uomo il glutine di un insetto si trasmuti in velluto ovvero alcuni pezzetti di metalio si organizzino a formare una ripetizione.” [“All the phenomena of the universe, whether produced by the hand of man or through the universal laws of physics, are not actual new creations, but merely a modification of matter. Joining together and separating are the only elements which the human mind always finds on analysing the concept of reproduction and it is just the same with the reproduction of value” (value in use, although Verri in this passage of his controversy with the Physiocrats is not himself quite certain of the kind of value he is speaking of) “and of wealth, when earth, air and water in the fields are transformed into corn, or when the hand of man transforms the secretions of an insect into silk, or some pieces of metal are arranged to make the mechanism of a watch.”] – Pietro Verri, “Meditazioni sulla Economia Politica” [first printed in 1773] in Custodi’s edition of the Italian Economists, Parte Moderna, t. XV., p. 22.

<sup>14</sup> Comp. Hegel, “Philosophie des Rechts.” Berlin, 1840. p. 250.

<sup>15</sup> The reader must note that we are not speaking here of the wages or value that the labourer gets for a given labour time, but of the value of the commodity in which that labour time is materialised. Wages is a category that, as yet, has no existence at the present stage of our investigation.

<sup>16</sup> In order to prove that labour alone is that all-sufficient and real measure, by which at all times the value of all commodities can be estimated and compared, Adam Smith says, “Equal quantities of labour must at all times and in all places have the same value for the labourer. In his normal state of health, strength, and activity, and with the average degree of skill that he may possess, he must always give up the same portion of his rest, his freedom, and his happiness.” (“Wealth of Nations,” b. I. ch. V.) On the one hand Adam Smith here (but not everywhere) confuses the determination of value by means of the quantity of labour expended in the production of commodities, with the determination of the values of commodities by means of the value of labour, and seeks in consequence to prove that equal quantities of labour have always the same value. On the other hand he has a presentiment, that labour, so far as it manifests itself in the value of commodities, counts only as expenditure of labour power, but he treats this expenditure as the mere sacrifice of rest, freedom, and happiness, not as at the same time the normal activity of living beings. But then, he has the modern wage-labourer in his eye. Much more aptly, the anonymous predecessor of Adam Smith, quoted above in note 9, this chapter, says “one man has employed himself a week in providing this necessary of life ... and he that gives him some other in exchange cannot make a better estimate of what is a proper equivalent, than by

computing what cost him just as much labour and time; which in effect is no more than exchanging one man's labour in one thing for a time certain, for another man's labour in another thing for the same time." (l.c., p. 39.) [The English language has the advantage of possessing different words for the two aspects of labour here considered. The labour which creates use value, and counts qualitatively, is Work, as distinguished from Labour, that which creates Value and counts quantitatively, is Labour as distinguished from Work - Engels]

<sup>17</sup> The few economists, amongst whom is S. Bailey, who have occupied themselves with the analysis of the form of value, have been unable to arrive at any result, first, because they confuse the form of value with value itself; and second, because, under the coarse influence of the practical bourgeois, they exclusively give their attention to the quantitative aspect of the question. "The command of quantity ... constitutes value." ("Money and its Vicissitudes." London, 1837, p. 11. By S. Bailey.)

<sup>18</sup> The celebrated Franklin, one of the first economists, after Wm. Petty, who saw through the nature of value, says: "Trade in general being nothing else but the exchange of labour for labour, the value of all things is ... most justly measured by labour." ("The works of B. Franklin, &c.," edited by Sparks. Boston, 1836, Vol. II., p. 267.) Franklin is unconscious that by estimating the value of everything in labour, he makes abstraction from any difference in the sorts of labour exchanged, and thus reduces them all to equal human labour. But although ignorant of this, yet he says it. He speaks first of "the one labour," then of "the other labour," and finally of "labour," without further qualification, as the substance of the value of everything.

<sup>19</sup> In a sort of way, it is with man as with commodities. Since he comes into the world neither with a looking glass in his hand, nor as a Fichtian philosopher, to whom "I am I" is sufficient, man first sees and recognises himself in other men. Peter only establishes his own identity as a man by first comparing himself with Paul as being of like kind. And thereby Paul, just as he stands in his Pauline personality, becomes to Peter the type of the genus homo.

<sup>20</sup> Value is here, as occasionally in the preceding pages, used in sense of value determined as to quantity, or of magnitude of value.

<sup>21</sup> This incongruity between the magnitude of value and its relative expression has, with customary ingenuity, been exploited by vulgar economists. For example – "Once admit that A falls, because B, with which it is exchanged, rises, while no less labour is bestowed in the meantime on A, and your general principle of value falls to the ground... If he [Ricardo] allowed that when A rises in value relatively to B, B falls in value relatively to A, he cut away the ground on which he rested his grand proposition, that the value of a commodity is ever determined by the labour embodied in it, for if a change in the cost of A alters not only its own value in relation to B, for which it is exchanged, but also the value of B relatively to that of A, though no change has taken place in the quantity of labour to produce B, then not only the doctrine falls to the ground which asserts that the quantity of labour bestowed on an article regulates its value, but also that which affirms the cost of an article to regulate its value' (J. Broadhurst: "Political Economy," London, 1842, pp. 11 and 14.) Mr. Broadhurst might just as well say: consider the fractions 10/20, 10/50, 10/100, &c., the number 10 remains unchanged, and yet its proportional magnitude, its magnitude relatively to the numbers 20, 50, 100 &c., continually diminishes. Therefore the great principle that the magnitude of a whole number, such as 10, is "regulated" by the number of times unity is contained in it, falls to the ground. [The author explains in section 4 of this chapter, pp. 80-81, note 2 (note 33 of this document), what he understands by "Vulgar Economy." – Engels]

<sup>22</sup> Such expressions of relations in general, called by Hegel reflex categories, form a very curious class. For instance, one man is king only because other men stand in the relation of subjects to him. They, on the contrary, imagine that they are subjects because he is king.

<sup>23</sup> F. L. A. Ferrier, sous-inspecteur des douanes, “Du gouvernement considéré dans ses rapports avec le commerce,” Paris, 1805; and Charles Ganilh, “Des Systèmes d’Economie Politique, – 2nd ed., Paris, 1821.

<sup>24</sup> In Homer, for instance, the value of an article is expressed in a series of different things II. VII. 472-475.

<sup>25</sup> For this reason, we can speak of the coat value of the linen when its value is expressed in coats, or of its corn value when expressed in corn, and so on. Every such expression tells us, that what appears in the use values, coat, corn, &c., is the value of the linen. “The value of any commodity denoting its relation in exchange, we may speak of it as ... corn value, cloth value, according to the commodity with which it is compared; and hence there are a thousand different kinds of value, as many kinds of value as there are commodities in existence, and all are equally real and equally nominal.” (“A Critical Dissertation on the Nature, Measures and Causes of Value: chiefly in reference to the writings of Mr. Ricardo and his followers.” By the author of “Essays on the Formation, &c., of Opinions.” London, 1825, p. 39.) S. Bailey, the author of this anonymous work, a work which in its day created much stir in England, fancied that, by thus pointing out the various relative expressions of one and the same value, he had proved the impossibility of any determination of the concept of value. However narrow his own views may have been, yet, that he laid his finger on some serious defects in the Ricardian Theory, is proved by the animosity with which he was attacked by Ricardo’s followers. See the Westminster Review for example.

<sup>26</sup> It is by no means self-evident that this character of direct and universal exchangeability is, so to speak, a polar one, and as intimately connected with its opposite pole, the absence of direct exchangeability, as the positive pole of the magnet is with its negative counterpart. It may therefore be imagined that all commodities can simultaneously have this character impressed upon them, just as it can be imagined that all Catholics can be popes together. It is, of course, highly desirable in the eyes of the petit bourgeois, for whom the production of commodities is the nec plus ultra of human freedom and individual independence, that the inconveniences resulting from this character of commodities not being directly exchangeable, should be removed. Proudhon’s socialism is a working out of this Philistine Utopia, a form of socialism which, as I have elsewhere shown, does not possess even the merit of originality. Long before his time, the task was attempted with much better success by Gray, Bray, and others. But, for all that, wisdom of this kind flourishes even now in certain circles under the name of “science.” Never has any school played more tricks with the word science, than that of Proudhon, for “wo Begriffe fehlen, Da stellt zur rechten Zeit ein Wort sich ein.” [“Where thoughts are absent, Words are brought in as convenient replacements,” Goethe’s, Faust, See Proudhon’s Philosophy of Poverty]

<sup>26a</sup> In the German edition, there is the following footnote here: “One may recall that China and the tables began to dance when the rest of the world appeared to be standing still – pour encourager les autres [to encourage the others].” The defeat of the 1848-49 revolutions was followed by a period of dismal political reaction in Europe. At that time, spiritualism, especially table-turning, became the rage among the European aristocracy. In 1850-64, China was swept by an anti-feudal liberation movement in the form of a large-scale peasant war, the Taiping Revolt. – Note by editors of MECW.

<sup>27</sup> Among the ancient Germans the unit for measuring land was what could be harvested in a day, and was called Tagwerk, Tagwanne (jurnale, or terra jurnalnis, or diornalis), Mannsmaad, &c. (See G. L. von Maurer, “Einleitung zur Geschichte der Mark, &c. Verfassung,” Munchen, 1854, p. 129 sq.)

<sup>28</sup> When, therefore, Galiani says: Value is a relation between persons – “La Ricchezza e una ragione tra due persone,” – he ought to have added: a relation between persons expressed as a relation between things. (Galiani: Della Moneta, p. 221, V. III. of Custodi’s collection of “Scrittori Classici Italiani di Economia Politica.” Parte Moderna, Milano 1803.)

<sup>29</sup> “What are we to think of a law that asserts itself only by periodical revolutions? It is just nothing but a law of Nature, founded on the want of knowledge of those whose action is the subject of it.” (Friedrich Engels: “Umrisse zu einer Kritik der Nationalökonomie,” in the “Deutsch-Französische Jahrbücher,” edited by Arnold Ruge and Karl Marx. Paris. 1844.)

<sup>30</sup> Even Ricardo has his stories à la Robinson. “He makes the primitive hunter and the primitive fisher straightway, as owners of commodities, exchange fish and game in the proportion in which labour time is incorporated in these exchange values. On this occasion he commits the anachronism of making these men apply to the calculation, so far as their implements have to be taken into account, the annuity tables in current use on the London Exchange in the year 1817. The parallelograms of Mr. Owen appear to be the only form of society, besides the bourgeois form, with which he was acquainted.” (Karl Marx: “Zur Kritik, &c..” pp. 38, 39)

<sup>31</sup> A ridiculous presumption has latterly got abroad that common property in its primitive form is specifically a Slavonian, or even exclusively Russian form. It is the primitive form that we can prove to have existed amongst Romans, Teutons, and Celts, and even to this day we find numerous examples, ruins though they be, in India. A more exhaustive study of Asiatic, and especially of Indian forms of common property, would show how from the different forms of primitive common property, different forms of its dissolution have been developed. Thus, for instance, the various original types of Roman and Teutonic private property are deducible from different forms of Indian common property.” (Karl Marx, “Zur Kritik, &c..” p. 10.)

<sup>32</sup> The insufficiency of Ricardo’s analysis of the magnitude of value, and his analysis is by far the best, will appear from the 3rd and 4th books of this work. As regards value in general, it is the weak point of the classical school of Political Economy that it nowhere expressly and with full consciousness, distinguishes between labour, as it appears in the value of a product, and the same labour, as it appears in the use value of that product. Of course the distinction is practically made, since this school treats labour, at one time under its quantitative aspect, at another under its qualitative aspect. But it has not the least idea, that when the difference between various kinds of labour is treated as purely quantitative, their qualitative unity or equality, and therefore their reduction to abstract human labour, is implied. For instance, Ricardo declares that he agrees with Destutt de Tracy in this proposition: “As it is certain that our physical and moral faculties are alone our original riches, the employment of those faculties, labour of some kind, is our only original treasure, and it is always from this employment that all those things are created which we call riches... It is certain, too, that all those things only represent the labour which has created them, and if they have a value, or even two distinct values, they can only derive them from that (the value) of the labour from which they emanate.” (Ricardo, “The Principles of Pol. Econ.,” 3 Ed. Lond. 1821, p. 334.) We would here only point out, that Ricardo puts his own more profound interpretation upon the words of Destutt. What the latter really says is, that on the one hand all things which constitute wealth represent the labour that creates them, but that on the other hand, they acquire their “two different values” (use value and exchange value) from “the value of labour.” He thus falls into the commonplace error of the vulgar economists, who assume the value of one commodity (in this case labour) in order to determine the values of the rest. But Ricardo reads him as if he had said, that labour (not the value of labour) is embodied both in use value and exchange value. Nevertheless, Ricardo himself pays so little attention to the two-fold character of the labour which has a two-fold embodiment, that he devotes the whole of his chapter on “Value and Riches, Their Distinctive Properties,” to a laborious examination of the trivialities of a J.B. Say. And at the finish he is quite astonished to find that Destutt on the one hand agrees with him as to labour being the source of value, and on the other hand with J. B. Say as to the notion of value.

<sup>33</sup> It is one of the chief failings of classical economy that it has never succeeded, by means of its analysis of commodities, and, in particular, of their value, in discovering that form under which value becomes exchange value. Even Adam Smith and Ricardo, the best representatives of the school, treat

the form of value as a thing of no importance, as having no connection with the inherent nature of commodities. The reason for this is not solely because their attention is entirely absorbed in the analysis of the magnitude of value. It lies deeper. The value form of the product of labour is not only the most abstract, but is also the most universal form, taken by the product in bourgeois production, and stamps that production as a particular species of social production, and thereby gives it its special historical character. If then we treat this mode of production as one eternally fixed by Nature for every state of society, we necessarily overlook that which is the *differentia specifica* of the value form, and consequently of the commodity form, and of its further developments, money form, capital form, &c. We consequently find that economists, who are thoroughly agreed as to labour time being the measure of the magnitude of value, have the most strange and contradictory ideas of money, the perfected form of the general equivalent. This is seen in a striking manner when they treat of banking, where the commonplace definitions of money will no longer hold water. This led to the rise of a restored mercantile system (Ganilh, &c.), which sees in value nothing but a social form, or rather the unsubstantial ghost of that form. Once for all I may here state, that by classical Political Economy, I understand that economy which, since the time of W. Petty, has investigated the real relations of production in bourgeois society in contradistinction to vulgar economy, which deals with appearances only, ruminates without ceasing on the materials long since provided by scientific economy, and there seeks plausible explanations of the most obtrusive phenomena, for bourgeois daily use, but for the rest, confines itself to systematising in a pedantic way, and proclaiming for everlasting truths, the trite ideas held by the self-complacent bourgeoisie with regard to their own world, to them the best of all possible worlds.

<sup>34</sup> “Les économistes ont une singulière manière de procéder. Il n’y a pour eux que deux sortes d’institutions, celles de l’art et celles de la nature. Les institutions de la féodalité sont des institutions artificielles celles de la bourgeoisie sont des institutions naturelles. Ils ressemblent en ceci aux théologiens, qui eux aussi établissent deux sortes de religions. Toute religion qui n’est pas la leur, est une invention des hommes tandis que leur propre religion est une émanation de Dieu – Ainsi il y a eu de l’histoire, mais il n’y en a plus.” [“Economists have a singular method of procedure. There are only two kinds of institutions for them, artificial and natural. The institutions of feudalism are artificial institutions, those of the bourgeoisie are natural institutions. In this they resemble the theologians, who likewise establish two kinds of religion. Every religion which is not theirs is an invention of men, while their own is an emanation from God. ... Thus there has been history, but there is no longer any”] (Karl Marx. *Misère de la Philosophie. Réponse a la Philosophie de la Misère* par M. Proudhon, 1847, p. 113.) Truly comical is M. Bastiat, who imagines that the ancient Greeks and Romans lived by plunder alone. But when people plunder for centuries, there must always be something at hand for them to seize; the objects of plunder must be continually reproduced. It would thus appear that even Greeks and Romans had some process of production, consequently, an economy, which just as much constituted the material basis of their world, as bourgeois economy constitutes that of our modern world. Or perhaps Bastiat means, that a mode of production based on slavery is based on a system of plunder. In that case he treads on dangerous ground. If a giant thinker like Aristotle erred in his appreciation of slave labour, why should a dwarf economist like Bastiat be right in his appreciation of wage labour? I seize this opportunity of shortly answering an objection taken by a German paper in America, to my work, “Zur Kritik der Pol. Oekonomie, 1859.” In the estimation of that paper, my view that each special mode of production and the social relations corresponding to it, in short, that the economic structure of society, is the real basis on which the juridical and political superstructure is raised and to which definite social forms of thought correspond; that the mode of production determines the character of the social, political, and intellectual life generally, all this is very true for our own times, in which material interests preponderate, but not for the middle ages, in which Catholicism, nor for Athens and Rome, where politics, reigned supreme. In the first place it strikes

---

one as an odd thing for any one to suppose that these well-worn phrases about the middle ages and the ancient world are unknown to anyone else. This much, however, is clear, that the middle ages could not live on Catholicism, nor the ancient world on politics. On the contrary, it is the mode in which they gained a livelihood that explains why here politics, and there Catholicism, played the chief part. For the rest, it requires but a slight acquaintance with the history of the Roman republic, for example, to be aware that its secret history is the history of its landed property. On the other hand, Don Quixote long ago paid the penalty for wrongly imagining that knight errantry was compatible with all economic forms of society.

<sup>35</sup> “Observations on certain verbal disputes in Pol. Econ., particularly relating to value and to demand and supply” Lond., 1821, p. 16.

<sup>36</sup> S. Bailey, l.c., p. 165.

<sup>37</sup> The author of “Observations” and S. Bailey accuse Ricardo of converting exchange value from something relative into something absolute. The opposite is the fact. He has explained the apparent relation between objects, such as diamonds and pearls, in which relation they appear as exchange values, and disclosed the true relation hidden behind the appearances, namely, their relation to each other as mere expressions of human labour. If the followers of Ricardo answer Bailey somewhat rudely, and by no means convincingly, the reason is to be sought in this, that they were unable to find in Ricardo’s own works any key to the hidden relations existing between value and its form, exchange value.

## Chapter 2: Exchange

It is plain that commodities cannot go to market and make exchanges of their own account. We must, therefore, have recourse to their guardians, who are also their owners. Commodities are things, and therefore without power of resistance against man. If they are wanting in docility he can use force; in other words, he can take possession of them.<sup>1</sup> In order that these objects may enter into relation with each other as commodities, their guardians must place themselves in relation to one another, as persons whose will resides in those objects, and must behave in such a way that each does not appropriate the commodity of the other, and part with his own, except by means of an act done by mutual consent. They must therefore, mutually recognise in each other the rights of private proprietors. This juridical relation, which thus expresses itself in a contract, whether such contract be part of a developed legal system or not, is a relation between two wills, and is but the reflex of the real economic relation between the two. It is this economic relation that determines the subject-matter comprised in each such juridical act.<sup>2</sup>

The persons exist for one another merely as representatives of, and, therefore, as owners of, commodities. In the course of our investigation we shall find, in general, that the characters who appear on the economic stage are but the personifications of the economic relations that exist between them.

What chiefly distinguishes a commodity from its owner is the fact, that it looks upon every other commodity as but the form of appearance of its own value. A born leveller and a cynic, it is always ready to exchange not only soul, but body, with any and every other commodity, be the same more repulsive than Maritornes herself. The owner makes up for this lack in the commodity of a sense of the concrete, by his own five and more senses. His commodity possesses for himself no immediate use-value. Otherwise, he would not bring it to the market. It has use-value for others; but for himself its only direct use-value is that of being a depository of exchange-value, and, consequently, a means of exchange.<sup>3</sup> Therefore, he makes up his mind to part with it for commodities whose value in use is of service to him. All commodities are non-use-values for their owners, and use-values for their non-owners. Consequently, they must all change hands. But this change of hands is what constitutes their exchange, and the latter puts them in relation with each other as values, and realises them as values. Hence commodities must be realised as values before they can be realised as use-values.

On the other hand, they must show that they are use-values before they can be realised as values. For the labour spent upon them counts effectively, only in so far as it is spent in a form that is useful for others. Whether that labour is useful for others, and its product consequently capable of satisfying the wants of others, can be proved only by the act of exchange.

Every owner of a commodity wishes to part with it in exchange only for those commodities whose use-value satisfies some want of his. Looked at in this way, exchange is for him simply a private transaction. On the other hand, he desires to realise the value of his commodity, to convert it into any other suitable commodity of equal value, irrespective of whether his own commodity has or has not any use-value for the owner of the other. From this point of view, exchange is for him a social transaction of a general character. But one and the same set of transactions cannot be simultaneously for all owners of commodities both exclusively private and exclusively social and general.

Let us look at the matter a little closer. To the owner of a commodity, every other commodity is, in regard to his own, a particular equivalent, and consequently his own commodity is the

universal equivalent for all the others. But since this applies to every owner, there is, in fact, no commodity acting as universal equivalent, and the relative value of commodities possesses no general form under which they can be equated as values and have the magnitude of their values compared. So far, therefore, they do not confront each other as commodities, but only as products or use-values. In their difficulties our commodity owners think like Faust: “Im Anfang war die Tat.” [“In the beginning was the deed.” – Goethe, *Faust*.] They therefore acted and transacted before they thought. Instinctively they conform to the laws imposed by the nature of commodities. They cannot bring their commodities into relation as values, and therefore as commodities, except by comparing them with some one other commodity as the universal equivalent. That we saw from the analysis of a commodity. But a particular commodity cannot become the universal equivalent except by a social act. The social action therefore of all other commodities, sets apart the particular commodity in which they all represent their values. Thereby the bodily form of this commodity becomes the form of the socially recognised universal equivalent. To be the universal equivalent, becomes, by this social process, the specific function of the commodity thus excluded by the rest. Thus it becomes – money. “Illi unum consilium habent et virtutem et potestatem suam bestiae tradunt. Et ne quis possit emere aut vendere, nisi qui habet characterem aut nomen bestiae aut numerum nominis ejus.” [“These have one mind, and shall give their power and strength unto the beast.” Revelations, 17:13; “And that no man might buy or sell, save he that had the mark, or the name of the beast, or the number of his name.” Revelations, 13:17.] (*Apocalypse*.)

Money is a crystal formed of necessity in the course of the exchanges, whereby different products of labour are practically equated to one another and thus by practice converted into commodities. The historical progress and extension of exchanges develops the contrast, latent in commodities, between use-value and value. The necessity for giving an external expression to this contrast for the purposes of commercial intercourse, urges on the establishment of an independent form of value, and finds no rest until it is once for all satisfied by the differentiation of commodities into commodities and money. At the same rate, then, as the conversion of products into commodities is being accomplished, so also is the conversion of one special commodity into money.<sup>4</sup>

The direct barter of products attains the elementary form of the relative expression of value in one respect, but not in another. That form is  $x$  Commodity A =  $y$  Commodity B. The form of direct barter is  $x$  use-value A =  $y$  use-value B.<sup>5</sup> The articles A and B in this case are not as yet commodities, but become so only by the act of barter. The first step made by an object of utility towards acquiring exchange-value is when it forms a non-use-value for its owner, and that happens when it forms a superfluous portion of some article required for his immediate wants. Objects in themselves are external to man, and consequently alienable by him. In order that this alienation may be reciprocal, it is only necessary for men, by a tacit understanding, to treat each other as private owners of those alienable objects, and by implication as independent individuals. But such a state of reciprocal independence has no existence in a primitive society based on property in common, whether such a society takes the form of a patriarchal family, an ancient Indian community, or a Peruvian Inca State. The exchange of commodities, therefore, first begins on the boundaries of such communities, at their points of contact with other similar communities, or with members of the latter. So soon, however, as products once become commodities in the external relations of a community, they also, by reaction, become so in its internal intercourse. The proportions in which they are exchangeable are at first quite a matter of chance. What makes them exchangeable is the mutual desire of their owners to alienate them. Meantime the need for foreign objects of utility gradually establishes itself. The constant repetition of exchange makes it a normal social act. In the course of time, therefore, some portion at least of the products of

labour must be produced with a special view to exchange. From that moment the distinction becomes firmly established between the utility of an object for the purposes of consumption, and its utility for the purposes of exchange. Its use-value becomes distinguished from its exchange-value. On the other hand, the quantitative proportion in which the articles are exchangeable, becomes dependent on their production itself. Custom stamps them as values with definite magnitudes.

In the direct barter of products, each commodity is directly a means of exchange to its owner, and to all other persons an equivalent, but that only in so far as it has use-value for them. At this stage, therefore, the articles exchanged do not acquire a value-form independent of their own use-value, or of the individual needs of the exchangers. The necessity for a value-form grows with the increasing number and variety of the commodities exchanged. The problem and the means of solution arise simultaneously. Commodity-owners never equate their own commodities to those of others, and exchange them on a large scale, without different kinds of commodities belonging to different owners being exchangeable for, and equated as values to, one and the same special article. Such last-mentioned article, by becoming the equivalent of various other commodities, acquires at once, though within narrow limits, the character of a general social equivalent. This character comes and goes with the momentary social acts that called it into life. In turns and transiently it attaches itself first to this and then to that commodity. But with the development of exchange it fixes itself firmly and exclusively to particular sorts of commodities, and becomes crystallised by assuming the money-form. The particular kind of commodity to which it sticks is at first a matter of accident. Nevertheless there are two circumstances whose influence is decisive. The money-form attaches itself either to the most important articles of exchange from outside, and these in fact are primitive and natural forms in which the exchange-value of home products finds expression; or else it attaches itself to the object of utility that forms, like cattle, the chief portion of indigenous alienable wealth. Nomad races are the first to develop the money-form, because all their worldly goods consist of moveable objects and are therefore directly alienable; and because their mode of life, by continually bringing them into contact with foreign communities, solicits the exchange of products. Man has often made man himself, under the form of slaves, serve as the primitive material of money, but has never used land for that purpose. Such an idea could only spring up in a bourgeois society already well developed. It dates from the last third of the 17th century, and the first attempt to put it in practice on a national scale was made a century afterwards, during the French bourgeois revolution.

In proportion as exchange bursts its local bonds, and the value of commodities more and more expands into an embodiment of human labour in the abstract, in the same proportion the character of money attaches itself to commodities that are by Nature fitted to perform the social function of a universal equivalent. Those commodities are the precious metals.

The truth of the proposition that, “although gold and silver are not by Nature money, money is by Nature gold and silver,”<sup>6</sup> is shown by the fitness of the physical properties of these metals for the functions of money.<sup>7</sup> Up to this point, however, we are acquainted only with one function of money, namely, to serve as the form of manifestation of the value of commodities, or as the material in which the magnitudes of their values are socially expressed. An adequate form of manifestation of value, a fit embodiment of abstract, undifferentiated, and therefore equal human labour, that material alone can be whose every sample exhibits the same uniform qualities. On the other hand, since the difference between the magnitudes of value is purely quantitative, the money commodity must be susceptible of merely quantitative differences, must therefore be divisible at will, and equally capable of being reunited. Gold and silver possess these properties by Nature.

The use-value of the money-commodity becomes two-fold. In addition to its special use-value as a commodity (gold, for instance, serving to stop teeth, to form the raw material of articles of luxury, &c.), it acquires a formal use-value, originating in its specific social function.

Since all commodities are merely particular equivalents of money, the latter being their universal equivalent, they, with regard to the latter as the universal commodity, play the parts of particular commodities.<sup>8</sup>

We have seen that the money-form is but the reflex, thrown upon one single commodity, of the value relations between all the rest. That money is a commodity<sup>9</sup> is therefore a new discovery only for those who, when they analyse it, start from its fully developed shape. The act of exchange gives to the commodity converted into money, not its value, but its specific value-form. By confounding these two distinct things some writers have been led to hold that the value of gold and silver is imaginary.<sup>10</sup> The fact that money can, in certain functions, be replaced by mere symbols of itself, gave rise to that other mistaken notion, that it is itself a mere symbol. Nevertheless under this error lurked a presentiment that the money-form of an object is not an inseparable part of that object, but is simply the form under which certain social relations manifest themselves. In this sense every commodity is a symbol, since, in so far as it is value, it is only the material envelope of the human labour spent upon it.<sup>11</sup> But if it be declared that the social characters assumed by objects, or the material forms assumed by the social qualities of labour under the régime of a definite mode of production, are mere symbols, it is in the same breath also declared that these characteristics are arbitrary fictions sanctioned by the so-called universal consent of mankind. This suited the mode of explanation in favour during the 18th century. Unable to account for the origin of the puzzling forms assumed by social relations between man and man, people sought to denude them of their strange appearance by ascribing to them a conventional origin.

It has already been remarked above that the equivalent form of a commodity does not imply the determination of the magnitude of its value. Therefore, although we may be aware that gold is money, and consequently directly exchangeable for all other commodities, yet that fact by no means tells how much 10 lbs., for instance, of gold is worth. Money, like every other commodity, cannot express the magnitude of its value except relatively in other commodities. This value is determined by the labour-time required for its production, and is expressed by the quantity of any other commodity that costs the same amount of labour-time.<sup>12</sup> Such quantitative determination of its relative value takes place at the source of its production by means of barter. When it steps into circulation as money, its value is already given. In the last decades of the 17th century it had already been shown that money is a commodity, but this step marks only the infancy of the analysis. The difficulty lies, not in comprehending that money is a commodity, but in discovering how, why, and by what means a commodity becomes money.<sup>13</sup>

We have already seen, from the most elementary expression of value,  $x$  commodity A =  $y$  commodity B, that the object in which the magnitude of the value of another object is represented, appears to have the equivalent form independently of this relation, as a social property given to it by Nature. We followed up this false appearance to its final establishment, which is complete so soon as the universal equivalent form becomes identified with the bodily form of a particular commodity, and thus crystallised into the money-form. What appears to happen is, not that gold becomes money, in consequence of all other commodities expressing their values in it, but, on the contrary, that all other commodities universally express their values in gold, because it is money. The intermediate steps of the process vanish in the result and leave no trace behind. Commodities find their own value already completely represented, without any initiative on their part, in another commodity existing in company with them. These objects, gold

and silver, just as they come out of the bowels of the earth, are forthwith the direct incarnation of all human labour. Hence the magic of money. In the form of society now under consideration, the behaviour of men in the social process of production is purely atomic. Hence their relations to each other in production assume a material character independent of their control and conscious individual action. These facts manifest themselves at first by products as a general rule taking the form of commodities. We have seen how the progressive development of a society of commodity-producers stamps one privileged commodity with the character of money. Hence the riddle presented by money is but the riddle presented by commodities; only it now strikes us in its most glaring form.

---

<sup>1</sup> In the 12th century, so renowned for its piety, they included amongst commodities some very delicate things. Thus a French poet of the period enumerates amongst the goods to be found in the market of Landit, not only clothing, shoes, leather, agricultural implements, &c., but also “femmes folles de leur corps.”

<sup>2</sup> Proudhon begins by taking his ideal of Justice, of “justice éternelle,” from the juridical relations that correspond to the production of commodities: thereby, it may be noted, he proves, to the consolation of all good citizens, that the production of commodities is a form of production as everlasting as justice. Then he turns round and seeks to reform the actual production of commodities, and the actual legal system corresponding thereto, in accordance with this ideal. What opinion should we have of a chemist, who, instead of studying the actual laws of the molecular changes in the composition and decomposition of matter, and on that foundation solving definite problems, claimed to regulate the composition and decomposition of matter by means of the “eternal ideas,” of “naturalité” and “affinité”? Do we really know any more about “usury,” when we say it contradicts “justice éternelle,” “équité éternelle,” “mutualité éternelle,” and other “vérités éternelles” than the fathers of the church did when they said it was incompatible with “grâce éternelle,” “foi éternelle,” and “la volonté éternelle de Dieu”?

<sup>3</sup> For two-fold is the use of every object.... The one is peculiar to the object as such, the other is not, as a sandal which may be worn, and is also exchangeable. Both are uses of the sandal, for even he who exchanges the sandal for the money or food he is in want of, makes use of the sandal as a sandal. But not in its natural way. For it has not been made for the sake of being exchanged.” (Aristoteles, “De Rep.” I. i. c. 9.)

<sup>4</sup> From this we may form an estimate of the shrewdness of the petit-bourgeois socialism, which, while perpetuating the production of commodities, aims at abolishing the “antagonism” between money and commodities, and consequently, since money exists only by virtue of this antagonism, at abolishing money itself. We might just as well try to retain Catholicism without the Pope. For more on this point see my work, “Zur Kritik der Pol. Oekon.,” p. 61, sq.

<sup>5</sup> So long as, instead of two distinct use-values being exchanged, a chaotic mass of articles are offered as the equivalent of a single article, which is often the case with savages, even the direct barter of products is in its first infancy.

<sup>6</sup> Karl Marx, l.c., p. 135. “I metalli ... naturalmente moneta.” [“The metals ... are by their nature money.”] (Galvani, “Della moneta” in Custodi’s Collection: Parte Moderna t. iii.)

<sup>7</sup> For further details on this subject see in my work cited above, the chapter on “The precious metals.”

<sup>8</sup> “Il danaro è la merce universale”(Verri, l.c., p. 16).

<sup>9</sup> “Silver and gold themselves (which we may call by the general name of bullion) are ... commodities ... rising and falling in ... value ... Bullion, then, may be reckoned to be of higher value where the smaller weight will purchase the greater quantity of the product or manufacture of the country,” &c. (“A Discourse of the General Notions of Money, Trade, and Exchanges, as They Stand in Relation

each to other.” By a Merchant. Lond., 1695, p. 7.) “Silver and gold, coined or uncoined, though they are used for a measure of all other things, are no less a commodity than wine, oil, tobacco, cloth, or stuffs.” (“A Discourse concerning Trade, and that in particular of the East Indies,” &c. London, 1689, p. 2.) “The stock and riches of the kingdom cannot properly be confined to money, nor ought gold and silver to be excluded from being merchandise.” (“The East-India Trade a Most Profitable Trade.” London, 1677, p. 4.)

<sup>10</sup> L’oro e l’argento hanno valore come metalli anteriore all’esser moneta.” [“Gold and silver have value as metals before they are money”] (Galiani, l.c.) Locke says, “The universal consent of mankind gave to silver, on account of its qualities which made it suitable for money, an imaginary value.” Law, on the other hand. “How could different nations give an imaginary value to any single thing... or how could this imaginary value have maintained itself?” But the following shows how little he himself understood about the matter: “Silver was exchanged in proportion to the value in use it possessed, consequently in proportion to its real value. By its adoption as money it received an additional value (une valeur additionnelle).” (Jean Law: “Considérations sur le numéraire et le commerce” in E. Daire’s Edit. of “Economistes Financiers du XVIII siècle,” p. 470.)

<sup>11</sup> “L’Argent en (des denrées) est le signe.” [“Money is their (the commodities’) symbol”] (V. de Forbonnais: “Eléments du Commerce, Nouv. Edit. Leyde, 1766,” t. II., p. 143.) “Comme signe il est attiré par les denrées.” [“As a symbol it is attracted by the commodities”] (l.c., p. 155.) “L’argent est un signe d’une chose et la représente.” [“Money is a symbol of a thing and represents it.”] (Montesquieu: “Esprit des Lois,” (Oeuvres, Lond. 1767, t. II, p. 2.) “L’argent n’est pas simple signe, car il est lui-même richesse, il ne représente pas les valeurs, il les équivaut.” [“Money is not a mere symbol, for it is itself wealth; it does not represent the values, it is their equivalents”] (Le Trosne, l.c., p. 910.) “The notion of value contemplates the valuable article as a mere symbol - the article counts not for what it is, but for what it is worth.” (Hegel, l.c., p. 100.) Lawyers started long before economists the idea that money is a mere symbol, and that the value of the precious metals is purely imaginary. This they did in the sycophantic service of the crowned heads, supporting the right of the latter to debase the coinage, during the whole of the middle ages, by the traditions of the Roman Empire and the conceptions of money to be found in the Pandects. “Qu’aucun puisse ni doive faire doute,” [“Let no one call into question,”] says an apt scholar of theirs, Philip of Valois, in a decree of 1346, “que à nous et à notre majesté royale n’appartiennent seulement ... le mestier, le fait, l’état, la provision et toute l’ordonnance des monnaies, de donner tel cours, et pour tel prix comme il nous plait et bon nous semble.” [“that the trade, the composition, the supply and the power of issuing ordinances on the currency ... belongs exclusively to us and to our royal majesty, to fix such a rate and at such price as it shall please us and seem good to us”] It was a maxim of the Roman Law that the value of money was fixed by decree of the emperor. It was expressly forbidden to treat money as a commodity. “Pecunias vero nulli emere fas erit, nam in usu publico constitutas oportet non esse mercem.” [“However, it shall not be lawful to anyone to buy money, for, as it was created for public use, it is not permissible for it to be a commodity”] Some good work on this question has been done by G. F. Pagnini: “Saggio sopra il giusto pregio delle cose, 1751”; Custodi “Parte Moderna,” t. II. In the second part of his work Pagnini directs his polemics especially against the lawyers.

<sup>12</sup> “If a man can bring to London an ounce of Silver out of the Earth in Peru, in the same time that he can produce a bushel of Corn, then the one is the natural price of the other; now, if by reason of new or more easier mines a man can procure two ounces of silver as easily as he formerly did one, the corn will be as cheap at ten shillings the bushel as it was before at five shillings, caeteris paribus.” William Petty. “A Treatise of Taxes and Contributions.” Lond., 1667, p. 32.

<sup>13</sup> The learned Professor Roscher, after first informing us that “the false definitions of money may be divided into two main groups: those which make it more, and those which make it less, than a commodity,” gives us a long and very mixed catalogue of works on the nature of money, from which

---

it appears that he has not the remotest idea of the real history of the theory; and then he moralises thus: “For the rest, it is not to be denied that most of the later economists do not bear sufficiently in mind the peculiarities that distinguish money from other commodities” (it is then, after all, either more or less than a commodity!)... “So far, the semi-mercantilist reaction of Ganilh is not altogether without foundation.” (Wilhelm Roscher: “Die Grundlagen der Nationaloekonomie,” 3rd Edn. 1858, pp. 207-210.) More! less! not sufficiently! so far! not altogether! What clearness and precision of ideas and language! And such eclectic professorial twaddle is modestly baptised by Mr. Roscher, “the anatomico-physiological method” of Political Economy! One discovery however, he must have credit for, namely, that money is “a pleasant commodity.”

# Chapter 3: Money, Or the Circulation of Commodities

## Section 1: The Measure of Values

Throughout this work, I assume, for the sake of simplicity, gold as the money-commodity.

The first chief function of money is to supply commodities with the material for the expression of their values, or to represent their values as magnitudes of the same denomination, qualitatively equal, and quantitatively comparable. It thus serves as a *universal measure of value*. And only by virtue of this function does gold, the equivalent commodity *par excellence*, become money.

It is not money that renders commodities commensurable. Just the contrary. It is because all commodities, as values, are realised human labour, and therefore commensurable, that their values can be measured by one and the same special commodity, and the latter be converted into the common measure of their values, *i.e.*, into money. Money as a measure of value, is the phenomenal form that must of necessity be assumed by that measure of value which is immanent in commodities, labour-time.<sup>1</sup>

The expression of the value of a commodity in gold –  $x$  commodity A =  $y$  money-commodity – is its money-form or price. A single equation, such as 1 ton of iron = 2 ounces of gold, now suffices to express the value of the iron in a socially valid manner. There is no longer any need for this equation to figure as a link in the chain of equations that express the values of all other commodities, because the equivalent commodity, gold, now has the character of money. The general form of relative value has resumed its original shape of simple or isolated relative value. On the other hand, the expanded expression of relative value, the endless series of equations, has now become the form peculiar to the relative value of the money-commodity. The series itself, too, is now given, and has social recognition in the prices of actual commodities. We have only to read the quotations of a price-list backwards, to find the magnitude of the value of money expressed in all sorts of commodities. But money itself has no price. In order to put it on an equal footing with all other commodities in this respect, we should be obliged to equate it to itself as its own equivalent.

The price or money-form of commodities is, like their form of value generally, a form quite distinct from their palpable bodily form; it is, therefore, a purely ideal or mental form. Although invisible, the value of iron, linen and corn has actual existence in these very articles: it is ideally made perceptible by their equality with gold, a relation that, so to say, exists only in their own heads. Their owner must, therefore, lend them his tongue, or hang a ticket on them, before their prices can be communicated to the outside world.<sup>2</sup> Since the expression of the value of commodities in gold is a merely ideal act, we may use for this purpose imaginary or ideal money. Every trader knows, that he is far from having turned his goods into money, when he has expressed their value in a price or in imaginary money, and that it does not require the least bit of real gold, to estimate in that metal millions of pounds' worth of goods. When, therefore, money serves as a measure of value, it is employed only as imaginary or ideal money. This circumstance has given rise to the wildest theories.<sup>3</sup> But, although the money that performs the functions of a measure of value is only ideal money, price depends entirely upon the actual substance that is money. The value, or in other words, the quantity of human labour contained in a ton of iron, is expressed in imagination by such a quantity of the money-commodity as contains the same amount of labour as the iron. According, therefore, as the measure of value is gold, silver, or

copper, the value of the ton of iron will be expressed by very different prices, or will be represented by very different quantities of those metals respectively.

If, therefore, two different commodities, such as gold and silver, are simultaneously measures of value, all commodities have two prices – one a gold-price, the other a silver-price. These exist quietly side by side, so long as the ratio of the value of silver to that of gold remains unchanged, say, at 15:1. Every change in their ratio disturbs the ratio which exists between the gold-prices and the silver-prices of commodities, and thus proves, by facts, that a double standard of value is inconsistent with the functions of a standard.<sup>4</sup>

Commodities with definite prices present themselves under the form: *a* commodity A = *x* gold; *b* commodity B = *z* gold; *c* commodity C = *y* gold, &c., where *a*, *b*, *c*, represent definite quantities of the commodities A, B, C and *x*, *z*, *y*, definite quantities of gold. The values of these commodities are, therefore, changed in imagination into so many different quantities of gold. Hence, in spite of the confusing variety of the commodities themselves, their values become magnitudes of the same denomination, gold-magnitudes. They are now capable of being compared with each other and measured, and the want becomes technically felt of comparing them with some fixed quantity of gold as a unit measure. This unit, by subsequent division into aliquot parts, becomes itself the standard or scale. Before they become money, gold, silver, and copper already possess such standard measures in their standards of weight, so that, for example, a pound weight, while serving as the unit, is, on the one hand, divisible into ounces, and, on the other, may be combined to make up hundredweights.<sup>5</sup> It is owing to this that, in all metallic currencies, the names given to the standards of money or of price were originally taken from the pre-existing names of the standards of weight.

As *measure of Value*, and as *standard of price*, money has two entirely distinct functions to perform. It is the measure of value inasmuch as it is the socially recognised incarnation of human labour; it is the standard of price inasmuch as it is a fixed weight of metal. As the measure of value it serves to convert the values of all the manifold commodities into prices, into imaginary quantities of gold; as the standard of price it measures those quantities of gold. The measure of values measures commodities considered as values; the standard of price measures, on the contrary, quantities of gold by a unit quantity of gold, not the value of one quantity of gold by the weight of another. In order to make gold a standard of price, a certain weight must be fixed upon as the unit. In this case, as in all cases of measuring quantities of the same denomination, the establishment of an unvarying unit of measure is all-important. Hence, the less the unit is subject to variation, so much the better does the standard of price fulfil its office. But only in so far as it is itself a product of labour, and, therefore, potentially variable in value, can gold serve as a measure of value.<sup>6</sup>

It is, in the first place, quite clear that a change in the value of gold does not, in any way, affect its function as a standard of price. No matter how this value varies, the proportions between the values of different quantities of the metal remain constant. However great the fall in its value, 12 ounces of gold still have 12 times the value of 1 ounce; and in prices, the only thing considered is the relation between different quantities of gold. Since, on the other hand, no rise or fall in the value of an ounce of gold can alter its weight, no alteration can take place in the weight of its aliquot parts. Thus gold always renders the same service as an invariable standard of price, however much its value may vary.

In the second place, a change in the value of gold does not interfere with its functions as a measure of value. The change affects all commodities simultaneously, and, therefore, *caeteris paribus*, leaves their relative values *inter se*, unaltered, although those values are now expressed in higher or lower gold-prices.

Just as when we estimate the value of any commodity by a definite quantity of the use-value of some other commodity, so in estimating the value of the former in gold, we assume nothing more than that the production of a given quantity of gold costs, at the given period, a given amount of labour. As regards the fluctuations of prices generally, they are subject to the laws of elementary relative value investigated in a former chapter.

A general rise in the prices of commodities can result only, either from a rise in their values – the value of money remaining constant – or from a fall in the value of money, the values of commodities remaining constant. On the other hand, a general fall in prices can result only, either from a fall in the values of commodities – the value of money remaining constant – or from a rise in the value of money, the values of commodities remaining constant. It therefore by no means follows, that a rise in the value of money necessarily implies a proportional fall in the prices of commodities; or that a fall in the value of money implies a proportional rise in prices. Such change of price holds good only in the case of commodities whose value remains constant. With those, for example, whose value rises, simultaneously with, and proportionally to, that of money, there is no alteration in price. And if their value rise either slower or faster than that of money, the fall or rise in their prices will be determined by the difference between the change in their value and that of money; and so on.

Let us now go back to the consideration of the price-form.

By degrees there arises a discrepancy between the current money-names of the various weights of the precious metal figuring as money, and the actual weights which those names originally represented. This discrepancy is the result of historical causes, among which the chief are: – (1) The importation of foreign money into an imperfectly developed community. This happened in Rome in its early days, where gold and silver coins circulated at first as foreign commodities. The names of these foreign coins never coincide with those of the indigenous weights. (2) As wealth increases, the less precious metal is thrust out by the more precious from its place as a measure of value, copper by silver, silver by gold, however much this order of sequence may be in contradiction with poetical chronology.<sup>7</sup> The word pound, for instance, was the money-name given to an actual pound weight of silver. When gold replaced silver as a measure of value, the same name was applied according to the ratio between the values of silver and gold, to perhaps 1-15th of a pound of gold. The word pound, as a money-name, thus becomes differentiated from the same word as a weight-name.<sup>8</sup> (3) The debasing of money carried on for centuries by kings and princes to such an extent that, of the original weights of the coins, nothing in fact remained but the names.<sup>9</sup>

These historical causes convert the separation of the money-name from the weight-name into an established habit with the community. Since the standard of money is on the one hand purely conventional, and must on the other hand find general acceptance, it is in the end regulated by law. A given weight of one of the precious metals, an ounce of gold, for instance, becomes officially divided into aliquot parts, with legally bestowed names, such as pound, dollar, &c. These aliquot parts, which thenceforth serve as units of money, are then subdivided into other aliquot parts with legal names, such as shilling, penny, &c.<sup>10</sup> But, both before and after these divisions are made, a definite weight of metal is the standard of metallic money. The sole alteration consists in the subdivision and denomination.

The prices, or quantities of gold, into which the values of commodities are ideally changed, are therefore now expressed in the names of coins, or in the legally valid names of the subdivisions of the gold standard. Hence, instead of saying: A quarter of wheat is worth an ounce of gold; we say, it is worth £3 17s. 10 1/2d. In this way commodities express by their prices how much they are

worth, and money serves as *money of account* whenever it is a question of fixing the value of an article in its money-form.<sup>11</sup>

The name of a thing is something distinct from the qualities of that thing. I know nothing of a man, by knowing that his name is Jacob. In the same way with regard to money, every trace of a value-relation disappears in the names pound, dollar, franc, ducat, &c. The confusion caused by attributing a hidden meaning to these cabalistic signs is all the greater, because these money-names express both the values of commodities, and, at the same time, aliquot parts of the weight of the metal that is the standard of money.<sup>12</sup> On the other hand, it is absolutely necessary that value, in order that it may be distinguished from the varied bodily forms of commodities, should assume this material and unmeaning, but, at the same time, purely social form.<sup>13</sup>

Price is the money-name of the labour realised in a commodity. Hence the expression of the equivalence of a commodity with the sum of money constituting its price, is a tautology<sup>14</sup>, just as in general the expression of the relative value of a commodity is a statement of the equivalence of two commodities. But although price, being the exponent of the magnitude of a commodity's value, is the exponent of its exchange-ratio with money, it does not follow that the exponent of this exchange-ratio is necessarily the exponent of the magnitude of the commodity's value. Suppose two equal quantities of socially necessary labour to be respectively represented by 1 quarter of wheat and £2 (nearly 1/2 oz. of gold), £2 is the expression in money of the magnitude of the value of the quarter of wheat, or is its price. If now circumstances allow of this price being raised to £3, or compel it to be reduced to £1, then although £1 and £3 may be too small or too great properly to express the magnitude of the wheat's value; nevertheless they are its prices, for they are, in the first place, the form under which its value appears, *i.e.*, money; and in the second place, the exponents of its exchange-ratio with money. If the conditions of production, in other words, if the productive power of labour remain constant, the same amount of social labour-time must, both before and after the change in price, be expended in the reproduction of a quarter of wheat. This circumstance depends, neither on the will of the wheat producer, nor on that of the owners of other commodities.

Magnitude of value expresses a relation of social production, it expresses the connexion that necessarily exists between a certain article and the portion of the total labour-time of society required to produce it. As soon as magnitude of value is converted into price, the above necessary relation takes the shape of a more or less accidental exchange-ratio between a single commodity and another, the money-commodity. But this exchange-ratio may express either the real magnitude of that commodity's value, or the quantity of gold deviating from that value, for which, according to circumstances, it may be parted with. The possibility, therefore, of quantitative incongruity between price and magnitude of value, or the deviation of the former from the latter, is inherent in the price-form itself. This is no defect, but, on the contrary, admirably adapts the price-form to a mode of production whose inherent laws impose themselves only as the mean of apparently lawless irregularities that compensate one another.

The price-form, however, is not only compatible with the possibility of a quantitative incongruity between magnitude of value and price, *i.e.*, between the former and its expression in money, but it may also conceal a qualitative inconsistency, so much so, that, although money is nothing but the value-form of commodities, price ceases altogether to express value. Objects that in themselves are no commodities, such as conscience, honour, &c., are capable of being offered for sale by their holders, and of thus acquiring, through their price, the form of commodities. Hence an object may have a price without having value. The price in that case is imaginary, like certain quantities in mathematics. On the other hand, the imaginary price-form may sometimes conceal

either a direct or indirect real value-relation; for instance, the price of uncultivated land, which is without value, because no human labour has been incorporated in it.

Price, like relative value in general, expresses the value of a commodity (*e.g.*, a ton of iron), by stating that a given quantity of the equivalent (*e.g.*, an ounce of gold), is directly exchangeable for iron. But it by no means states the converse, that iron is directly exchangeable for gold. In order, therefore, that a commodity may in practice act effectively as exchange-value, it must quit its bodily shape, must transform itself from mere imaginary into real gold, although to the commodity such transubstantiation may be more difficult than to the Hegelian “concept,” the transition from “necessity” to “freedom,” or to a lobster the casting of his shell, or to Saint Jerome the putting off of the old Adam.<sup>15</sup> Though a commodity may, side by side with its actual form (iron, for instance), take in our imagination the form of gold, yet it cannot at one and the same time actually be both iron and gold. To fix its price, it suffices to equate it to gold in imagination. But to enable it to render to its owner the service of a universal equivalent, it must be actually replaced by gold. If the owner of the iron were to go to the owner of some other commodity offered for exchange, and were to refer him to the price of the iron as proof that it was already money, he would get the same answer as St. Peter gave in heaven to Dante, when the latter recited the creed –

“Assad bene e trascorsa  
D’esta moneta gia la lega e’l peso,  
Ma dimmi se tu l’hai nella tua borsa.”

A price therefore implies both that a commodity is exchangeable for money, and also that it must be so exchanged. On the other hand, gold serves as an ideal measure of value, only because it has already, in the process of exchange, established itself as the money-commodity. Under the ideal measure of values there lurks the hard cash.

## Section 2: The Medium of Circulation

### A. The Metamorphosis of Commodities

We saw in a former chapter that the exchange of commodities implies contradictory and mutually exclusive conditions. The differentiation of commodities into commodities and money does not sweep away these inconsistencies, but develops a *modus vivendi*, a form in which they can exist side by side. This is generally the way in which real contradictions are reconciled. For instance, it is a contradiction to depict one body as constantly falling towards another, and as, at the same time, constantly flying away from it. The ellipse is a form of motion which, while allowing this contradiction to go on, at the same time reconciles it.

In so far as exchange is a process, by which commodities are transferred from hands in which they are non-use-values, to hands in which they become use-values, it is a social circulation of matter. The product of one form of useful labour replaces that of another. When once a commodity has found a resting-place, where it can serve as a use-value, it falls out of the sphere of exchange into that of consumption. But the former sphere alone interests us at present. We have, therefore, now to consider exchange from a formal point of view; to investigate the change of form or metamorphosis of commodities which effectuates the social circulation of matter.

The comprehension of this change of form is, as a rule, very imperfect. The cause of this imperfection is, apart from indistinct notions of value itself, that every change of form in a commodity results from the exchange of two commodities, an ordinary one and the money-commodity. If we keep in view the material fact alone that a commodity has been exchanged for gold, we overlook the very thing that we ought to observe – namely, what has happened to the

form of the commodity. We overlook the facts that gold, when a mere commodity, is not money, and that when other commodities express their prices in gold, this gold is but the money-form of those commodities themselves.

Commodities, first of all, enter into the process of exchange just as they are. The process then differentiates them into commodities and money, and thus produces an external opposition corresponding to the internal opposition inherent in them, as being at once use-values and values. Commodities as use-values now stand opposed to money as exchange-value. On the other hand, both opposing sides are commodities, unities of use-value and value. But this unity of differences manifests itself at two opposite poles, and at each pole in an opposite way. Being poles they are as necessarily opposite as they are connected. On the one side of the equation we have an ordinary commodity, which is in reality a use-value. Its value is expressed only ideally in its price, by which it is equated to its opponent, the gold, as to the real embodiment of its value. On the other hand, the gold, in its metallic reality, ranks as the embodiment of value, as money. Gold, as gold, is exchange-value itself. As to its use-value, that has only an ideal existence, represented by the series of expressions of relative value in which it stands face to face with all other commodities, the sum of whose uses makes up the sum of the various uses of gold. These antagonistic forms of commodities are the real forms in which the process of their exchange moves and takes place.

Let us now accompany the owner of some commodity – say, our old friend the weaver of linen – to the scene of action, the market. His 20 yards of linen has a definite price, £2. He exchanges it for the £2, and then, like a man of the good old stamp that he is, he parts with the £2 for a family Bible of the same price. The linen, which in his eyes is a mere commodity, a depository of value, he alienates in exchange for gold, which is the linen's value-form, and this form he again parts with for another commodity, the Bible, which is destined to enter his house as an object of utility and of edification to its inmates. The exchange becomes an accomplished fact by two metamorphoses of opposite yet supplementary character – the conversion of the commodity into money, and the re-conversion of the money into a commodity.<sup>16</sup> The two phases of this metamorphosis are both of them distinct transactions of the weaver – selling, or the exchange of the commodity for money; buying, or the exchange of the money for a commodity; and, the unity of the two acts, selling in order to buy.

The result of the whole transaction, as regards the weaver, is this, that instead of being in possession of the linen, he now has the Bible; instead of his original commodity, he now possesses another of the same value but of different utility. In like manner he procures his other means of subsistence and means of production. From his point of view, the whole process effectuates nothing more than the exchange of the product of his labour for the product of some one else's, nothing more than an exchange of products.

The exchange of commodities is therefore accompanied by the following changes in their form.

Commodity – Money – Commodity.  
C ——— M ——— C.

The result of the whole process is, so far as concerns the objects themselves, C – C, the exchange of one commodity for another, the circulation of materialised social labour. When this result is attained, the process is at an end.

### **C – M. First metamorphosis, or sale**

The leap taken by value from the body of the commodity, into the body of the gold, is, as I have elsewhere called it, the salto mortale of the commodity. If it falls short, then, although the commodity itself is not harmed, its owner decidedly is. The social division of labour causes his

labour to be as one-sided as his wants are many-sided. This is precisely the reason why the product of his labour serves him solely as exchange-value. But it cannot acquire the properties of a socially recognised universal equivalent, except by being converted into money. That money, however, is in some one else's pocket. In order to entice the money out of that pocket, our friend's commodity must, above all things, be a use-value to the owner of the money. For this, it is necessary that the labour expended upon it, be of a kind that is socially useful, of a kind that constitutes a branch of the social division of labour. But division of labour is a system of production which has grown up spontaneously and continues to grow behind the backs of the producers. The commodity to be exchanged may possibly be the product of some new kind of labour, that pretends to satisfy newly arisen requirements, or even to give rise itself to new requirements. A particular operation, though yesterday, perhaps, forming one out of the many operations conducted by one producer in creating a given commodity, may to-day separate itself from this connexion, may establish itself as an independent branch of labour and send its incomplete product to market as an independent commodity. The circumstances may or may not be ripe for such a separation. To-day the product satisfies a social want. Tomorrow the article may, either altogether or partially, be superseded by some other appropriate product. Moreover, although our weaver's labour may be a recognised branch of the social division of labour, yet that fact is by no means sufficient to guarantee the utility of his 20 yards of linen. If the community's want of linen, and such a want has a limit like every other want, should already be saturated by the products of rival weavers, our friend's product is superfluous, redundant, and consequently useless. Although people do not look a gift-horse in the mouth, our friend does not frequent the market for the purpose of making presents. But suppose his product turn out a real use-value, and thereby attracts money? The question arises, how much will it attract? No doubt the answer is already anticipated in the price of the article, in the exponent of the magnitude of its value. We leave out of consideration here any accidental miscalculation of value by our friend, a mistake that is soon rectified in the market. We suppose him to have spent on his product only that amount of labour-time that is on an average socially necessary. The price then, is merely the money-name of the quantity of social labour realised in his commodity. But without the leave, and behind the back, of our weaver, the old-fashioned mode of weaving undergoes a change. The labour-time that yesterday was without doubt socially necessary to the production of a yard of linen, ceases to be so to-day, a fact which the owner of the money is only too eager to prove from the prices quoted by our friend's competitors. Unluckily for him, weavers are not few and far between. Lastly, suppose that every piece of linen in the market contains no more labour-time than is socially necessary. In spite of this, all these pieces taken as a whole, may have had superfluous labour-time spent upon them. If the market cannot stomach the whole quantity at the normal price of 2 shillings a yard, this proves that too great a portion of the total labour of the community has been expended in the form of weaving. The effect is the same as if each individual weaver had expended more labour-time upon his particular product than is socially necessary. Here we may say, with the German proverb: caught together, hung together. All the linen in the market counts but as one article of commerce, of which each piece is only an aliquot part. And as a matter of fact, the value also of each single yard is but the materialised form of the same definite and socially fixed quantity of homogeneous human labour.<sup>17</sup>

We see then, commodities are in love with money, but "the course of true love never did run smooth." The quantitative division of labour is brought about in exactly the same spontaneous and accidental manner as its qualitative division. The owners of commodities therefore find out, that the same division of labour that turns them into independent private producers, also frees the social process of production and the relations of the individual producers to each other within that process, from all dependence on the will of those producers, and that the seeming mutual

independence of the individuals is supplemented by a system of general and mutual dependence through or by means of the products.

The division of labour converts the product of labour into a commodity, and thereby makes necessary its further conversion into money. At the same time it also makes the accomplishment of this transubstantiation quite accidental. Here, however, we are only concerned with the phenomenon in its integrity, and we therefore assume its progress to be normal. Moreover, if the conversion take place at all, that is, if the commodity be not absolutely unsaleable, its metamorphosis does take place although the price realised may be abnormally above or below the value.

The seller has his commodity replaced by gold, the buyer has his gold replaced by a commodity. The fact which here stares us in the face is, that a commodity and gold, 20 yards of linen and £2, have changed hands and places, in other words, that they have been exchanged. But for what is the commodity exchanged? For the shape assumed by its own value, for the universal equivalent. And for what is the gold exchanged? For a particular form of its own use-value. Why does gold take the form of money face to face with the linen? Because the linen's price of £2, its denomination in money, has already equated the linen to gold in its character of money. A commodity strips off its original commodity-form on being alienated, *i.e.*, on the instant its use-value actually attracts the gold, that before existed only ideally in its price. The realisation of a commodity's price, or of its ideal value-form, is therefore at the same time the realisation of the ideal use-value of money; the conversion of a commodity into money, is the simultaneous conversion of money into a commodity. The apparently single process is in reality a double one. From the pole of the commodity-owner it is a sale, from the opposite pole of the money-owner, it is a purchase. In other words, a sale is a purchase, C–M is also M–C.<sup>18</sup>

Up to this point we have considered men in only one economic capacity, that of owners of commodities, a capacity in which they appropriate the produce of the labour of others, by alienating that of their own labour. Hence, for one commodity-owner to meet with another who has money, it is necessary, either, that the product of the labour of the latter person, the buyer, should be in itself money, should be gold, the material of which money consists, or that his product should already have changed its skin and have stripped off its original form of a useful object. In order that it may play the part of money, gold must of course enter the market at some point or other. This point is to be found at the source of production of the metal, at which place gold is bartered, as the immediate product of labour, for some other product of equal value. From that moment it always represents the realised price of some commodity.<sup>19</sup> Apart from its exchange for other commodities at the source of its production, gold, in whose-so-ever hands it may be, is the transformed shape of some commodity alienated by its owner; it is the product of a sale or of the first metamorphosis C–M.<sup>20</sup> Gold, as we saw, became ideal money, or a measure of values, in consequence of all commodities measuring their values by it, and thus contrasting it ideally with their natural shape as useful objects, and making it the shape of their value. It became real money, by the general alienation of commodities, by actually changing places with their natural forms as useful objects, and thus becoming in reality the embodiment of their values. When they assume this money-shape, commodities strip off every trace of their natural use-value, and of the particular kind of labour to which they owe their creation, in order to transform themselves into the uniform, socially recognised incarnation of homogeneous human labour. We cannot tell from the mere look of a piece of money, for what particular commodity it has been exchanged. Under their money-form all commodities look alike. Hence, money may be dirt, although dirt is not money. We will assume that the two gold pieces, in consideration of which our weaver has parted with his linen, are the metamorphosed shape of a quarter of wheat. The

sale of the linen, C–M, is at the same time its purchase, M–C. But the sale is the first act of a process that ends with a transaction of an opposite nature, namely, the purchase of a Bible; the purchase of the linen, on the other hand, ends a movement that began with a transaction of an opposite nature, namely, with the sale of the wheat. C–M (linen–money), which is the first phase of C–M–C (linen–money–Bible), is also M–C (money–linen), the last phase of another movement C–M–C (wheat–money–linen). The first metamorphosis of one commodity, its transformation from a commodity into money, is therefore also invariably the second metamorphosis of some other commodity, the retransformation of the latter from money into a commodity.<sup>21</sup>

### **M–C, or purchase.**

#### ***The second and concluding metamorphosis of a commodity***

Because money is the metamorphosed shape of all other commodities, the result of their general alienation, for this reason it is alienable itself without restriction or condition. It reads all prices backwards, and thus, so to say, depicts itself in the bodies of all other commodities, which offer to it the material for the realisation of its own use-value. At the same time the prices, wooing glances cast at money by commodities, define the limits of its convertibility, by pointing to its quantity. Since every commodity, on becoming money, disappears as a commodity, it is impossible to tell from the money itself, how it got into the hands of its possessor, or what article has been changed into it. Non olet, from whatever source it may come. Representing on the one hand a sold commodity, it represents on the other a commodity to be bought.<sup>22</sup>

M–C, a purchase, is, at the same time, C–M, a sale; the concluding metamorphosis of one commodity is the first metamorphosis of another. With regard to our weaver, the life of his commodity ends with the Bible, into which he has reconverted his £2. But suppose the seller of the Bible turns the £2 set free by the weaver into brandy M–C, the concluding phase of C–M–C (linen–money–Bible), is also C–M, the first phase of C–M–C (Bible–money–brandy). The producer of a particular commodity has that one article alone to offer; this he sells very often in large quantities, but his many and various wants compel him to split up the price realised, the sum of money set free, into numerous purchases. Hence a sale leads to many purchases of various articles. The concluding metamorphosis of a commodity thus constitutes an aggregation of first metamorphoses of various other commodities.

If we now consider the completed metamorphosis of a commodity, as a whole, it appears in the first place, that it is made up of two opposite and complementary movements, C–M and M–C. These two antithetical transmutations of a commodity are brought about by two antithetical social acts on the part of the owner, and these acts in their turn stamp the character of the economic parts played by him. As the person who makes a sale, he is a seller; as the person who makes a purchase, he is a buyer. But just as, upon every such transmutation of a commodity, its two forms, commodity-form and money-form, exist simultaneously but at opposite poles, so every seller has a buyer opposed to him, and every buyer a seller. While one particular commodity is going through its two transmutations in succession, from a commodity into money and from money into another commodity, the owner of the commodity changes in succession his part from that of seller to that of buyer. These characters of seller and buyer are therefore not permanent, but attach themselves in turns to the various persons engaged in the circulation of commodities.

The complete metamorphosis of a commodity, in its simplest form, implies four extremes, and three dramatic personae. First, a commodity comes face to face with money; the latter is the form taken by the value of the former, and exists in all its hard reality, in the pocket of the buyer. A commodity-owner is thus brought into contact with a possessor of money. So soon, now, as the commodity has been changed into money, the money becomes its transient equivalent-form, the use-value of which equivalent-form is to be found in the bodies of other commodities. Money, the

final term of the first transmutation, is at the same time the starting-point for the second. The person who is a seller in the first transaction thus becomes a buyer in the second, in which a third commodity-owner appears on the scene as a seller.<sup>23</sup>

The two phases, each inverse to the other, that make up the metamorphosis of a commodity constitute together a circular movement, a circuit: commodity-form, stripping off of this form, and return to the commodity-form. No doubt, the commodity appears here under two different aspects. At the starting-point it is not a use-value to its owner; at the finishing point it is. So, too, the money appears in the first phase as a solid crystal of value, a crystal into which the commodity eagerly solidifies, and in the second, dissolves into the mere transient equivalent-form destined to be replaced by a use-value.

The two metamorphoses constituting the circuit are at the same time two inverse partial metamorphoses of two other commodities. One and the same commodity, the linen, opens the series of its own metamorphoses, and completes the metamorphosis of another (the wheat). In the first phase or sale, the linen plays these two parts in its own person. But, then, changed into gold, it completes its own second and final metamorphosis, and helps at the same time to accomplish the first metamorphosis of a third commodity. Hence the circuit made by one commodity in the course of its metamorphoses is inextricably mixed up with the circuits of other commodities. The total of all the different circuits constitutes *the circulation of commodities*.

The circulation of commodities differs from the direct exchange of products (barter), not only in form, but in substance. Only consider the course of events. The weaver has, as a matter of fact, exchanged his linen for a Bible, his own commodity for that of some one else. But this is true only so far as he himself is concerned. The seller of the Bible, who prefers something to warm his inside, no more thought of exchanging his Bible for linen than our weaver knew that wheat had been exchanged for his linen. B's commodity replaces that of A, but A and B do not mutually exchange those commodities. It may, of course, happen that A and B make simultaneous purchases, the one from the other; but such exceptional transactions are by no means the necessary result of the general conditions of the circulation of commodities. We see here, on the one hand, how the exchange of commodities breaks through all local and personal bounds inseparable from direct barter, and develops the circulation of the products of social labour; and on the other hand, how it develops a whole network of social relations spontaneous in their growth and entirely beyond the control of the actors. It is only because the farmer has sold his wheat that the weaver is enabled to sell his linen, only because the weaver has sold his linen that our Hotspur is enabled to sell his Bible, and only because the latter has sold the water of everlasting life that the distiller is enabled to sell his *eau-de-vie*, and so on.

The process of circulation, therefore, does not, like direct barter of products, become extinguished upon the use-values changing places and hands. The money does not vanish on dropping out of the circuit of the metamorphosis of a given commodity. It is constantly being precipitated into new places in the arena of circulation vacated by other commodities. In the complete metamorphosis of the linen, for example, linen – money – Bible, the linen first falls out of circulation, and money steps into its place. Then the Bible falls out of circulation, and again money takes its place. When one commodity replaces another, the money-commodity always sticks to the hands of some third person.<sup>24</sup> Circulation sweats money from every pore.

Nothing can be more childish than the dogma, that because every sale is a purchase, and every purchase a sale, therefore the circulation of commodities necessarily implies an equilibrium of sales and purchases. If this means that the number of actual sales is equal to the number of purchases, it is mere tautology. But its real purport is to prove that every seller brings his buyer to market with him. Nothing of the kind. The sale and the purchase constitute one identical act, an

exchange between a commodity-owner and an owner of money, between two persons as opposed to each other as the two poles of a magnet. They form two distinct acts, of polar and opposite characters, when performed by one single person. Hence the identity of sale and purchase implies that the commodity is useless, if, on being thrown into the alchemical retort of circulation, it does not come out again in the shape of money; if, in other words, it cannot be sold by its owner, and therefore be bought by the owner of the money. That identity further implies that the exchange, if it does take place, constitutes a period of rest, an interval, long or short, in the life of the commodity. Since the first metamorphosis of a commodity is at once a sale and a purchase, it is also an independent process in itself. The purchaser has the commodity, the seller has the money, *i.e.*, a commodity ready to go into circulation at any time. No one can sell unless some one else purchases. But no one is forthwith bound to purchase, because he has just sold. Circulation bursts through all restrictions as to time, place, and individuals, imposed by direct barter, and this it effects by splitting up, into the antithesis of a sale and a purchase, the direct identity that in barter does exist between the alienation of one's own and the acquisition of some other man's product. To say that these two independent and antithetical acts have an intrinsic unity, are essentially one, is the same as to say that this intrinsic oneness expresses itself in an external antithesis. If the interval in time between the two complementary phases of the complete metamorphosis of a commodity become too great, if the split between the sale and the purchase become too pronounced, the intimate connexion between them, their oneness, asserts itself by producing – a crisis. The antithesis, use-value and value; the contradictions that private labour is bound to manifest itself as direct social labour, that a particularised concrete kind of labour has to pass for abstract human labour; the contradiction between the personification of objects and the representation of persons by things; all these antitheses and contradictions, which are immanent in commodities, assert themselves, and develop their modes of motion, in the antithetical phases of the metamorphosis of a commodity. These modes therefore imply the possibility, and no more than the possibility, of crises. The conversion of this mere possibility into a reality is the result of a long series of relations, that, from our present standpoint of simple circulation, have as yet no existence.<sup>25</sup>

## B. The currency<sup>26</sup> of money

The change of form, C–M–C, by which the circulation of the material products of labour is brought about, requires that a given value in the shape of a commodity shall begin the process, and shall, also in the shape of a commodity, end it. The movement of the commodity is therefore a circuit. On the other hand, the form of this movement precludes a circuit from being made by the money. The result is not the return of the money, but its continued removal further and further away from its starting-point. So long as the seller sticks fast to his money, which is the transformed shape of his commodity, that commodity is still in the first phase of its metamorphosis, and has completed only half its course. But so soon as he completes the process, so soon as he supplements his sale by a purchase, the money again leaves the hands of its possessor. It is true that if the weaver, after buying the Bible, sell more linen, money comes back into his hands. But this return is not owing to the circulation of the first 20 yards of linen; that circulation resulted in the money getting into the hands of the seller of the Bible. The return of money into the hands of the weaver is brought about only by the renewal or repetition of the process of circulation with a fresh commodity, which renewed process ends with the same result as its predecessor did. Hence the movement directly imparted to money by the circulation of commodities takes the form of a constant motion away from its starting-point, of a course from the hands of one commodity-owner into those of another. This course constitutes its currency (*cours de la monnaie*).

The currency of money is the constant and monotonous repetition of the same process. The commodity is always in the hands of the seller; the money, as a means of purchase, always in the hands of the buyer. And money serves as a means of purchase by realising the price of the commodity. This realisation transfers the commodity from the seller to the buyer and removes the money from the hands of the buyer into those of the seller, where it again goes through the same process with another commodity. That this one-sided character of the money's motion arises out of the two-sided character of the commodity's motion, is a circumstance that is veiled over. The very nature of the circulation of commodities begets the opposite appearance. The first metamorphosis of a commodity is visibly, not only the money's movement, but also that of the commodity itself; in the second metamorphosis, on the contrary, the movement appears to us as the movement of the money alone. In the first phase of its circulation the commodity changes place with the money. Thereupon the commodity, under its aspect of a useful object, falls out of circulation into consumption.<sup>27</sup> In its stead we have its value-shape – the money. It then goes through the second phase of its circulation, not under its own natural shape, but under the shape of money. The continuity of the movement is therefore kept up by the money alone, and the same movement that as regards the commodity consists of two processes of an antithetical character, is, when considered as the movement of the money, always one and the same process, a continued change of places with ever fresh commodities. Hence the result brought about by the circulation of commodities, namely, the replacing of one commodity by another, takes the appearance of having been effected not by means of the change of form of the commodities but rather by the money acting as a medium of circulation, by an action that circulates commodities, to all appearance motionless in themselves, and transfers them from hands in which they are non-use-values, to hands in which they are use-values; and that in a direction constantly opposed to the direction of the money. The latter is continually withdrawing commodities from circulation and stepping into their places, and in thus way continually moving further and further from its starting-point. Hence although the movement of the money is merely the expression of the circulation of commodities, yet the contrary appears to be the actual fact, and the circulation of commodities seems to be the result of the movement of the money.<sup>28</sup>

Again, money functions as a means of circulation only because in it the values of commodities have independent reality. Hence its movement, as the medium of circulation, is, in fact, merely the movement of commodities while changing their forms. This fact must therefore make itself plainly visible in the currency of money. Thus the linen for instance, first of all changes its commodity-form into its money-form. The second term of its first metamorphosis, C–M, the money form, then becomes the first term of its final metamorphosis, M–C, its re-conversion into the Bible. But each of these two changes of form is accomplished by an exchange between commodity and money, by their *reciprocal displacement*. The same pieces of coin come into the seller's hand *as the alienated form of the commodity* and leave it *as the absolutely alienable form of the commodity*. They are displaced twice. The first metamorphosis of the linen puts these coins into the weaver's pocket, the second draws them out of it. The two inverse changes undergone by the same commodity are reflected in the displacement, twice repeated, but in opposite directions, of the same pieces of coin.

If, on the contrary, only one phase of the metamorphosis is gone through, if there are only sales or only purchases, then a given piece of money changes its place only once. Its second change of place always expresses the second metamorphosis of the commodity, its re-conversion from money. The frequent repetition of the displacement of the same coins reflects not only the series of metamorphoses that a single commodity has gone through, but also the intertwining of the innumerable metamorphoses in the world of commodities in general. It is a matter of course, that

all this is applicable to the simple circulation of commodities alone, the only form that we are now considering.

Every commodity, when it first steps into circulation, and undergoes its first change of form, does so only to fall out of circulation again and to be replaced by other commodities. Money, on the contrary, as the medium of circulation, keeps continually within the sphere of circulation, and moves about in it. The question therefore arises, how much money this sphere constantly absorbs?

In a given country there take place every day at the same time, but in different localities, numerous one-sided metamorphoses of commodities, or, in other words, numerous sales and numerous purchases. The commodities are equated beforehand in imagination, by their prices, to definite quantities of money. And since, in the form of circulation now under consideration, money and commodities always come bodily face to face, one at the positive pole of purchase, the other at the negative pole of sale, it is clear that the amount of the means of circulation required, is determined beforehand by the sum of the prices of all these commodities. As a matter of fact, the money in reality represents the quantity or sum of gold ideally expressed beforehand by the sum of the prices of the commodities. The equality of these two sums is therefore self-evident. We know, however, that, the values of commodities remaining constant, their prices vary with the value of gold (the material of money), rising in proportion as it falls, and falling in proportion as it rises. Now if, in consequence of such a rise or fall in the value of gold, the sum of the prices of commodities fall or rise, the quantity of money in currency must fall or rise to the same extent. The change in the quantity of the circulating medium is, in this case, it is true, caused by the money itself, yet not in virtue of its function as a medium of circulation, but of its function as a measure of value. First, the price of the commodities varies inversely as the value of the money, and then the quantity of the medium of circulation varies directly as the price of the commodities. Exactly the same thing would happen if, for instance, instead of the value of gold falling, gold were replaced by silver as the measure of value, or if, instead of the value of silver rising, gold were to thrust silver out from being the measure of value. In the one case, more silver would be current than gold was before; in the other case, less gold would be current than silver was before. In each case the value of the material of money, *i.e.*, the value of the commodity that serves as the measure of value, would have undergone a change, and therefore so, too, would the prices of commodities which express their values in money, and so, too, would the quantity of money current whose function it is to realise those prices. We have already seen, that the sphere of circulation has an opening through which gold (or the material of money generally) enters into it as a commodity with a given value. Hence, when money enters on its functions as a measure of value, when it expresses prices, its value is already determined. If now its value fall, this fact is first evidenced by a change in the prices of those commodities that are directly bartered for the precious metals at the sources of their production. The greater part of all other commodities, especially in the imperfectly developed stages of civil society, will continue for a long time to be estimated by the former antiquated and illusory value of the measure of value. Nevertheless, one commodity infects another through their common value-relation, so that their prices, expressed in gold or in silver, gradually settle down into the proportions determined by their comparative values, until finally the values of all commodities are estimated in terms of the new value of the metal that constitutes money. This process is accompanied by the continued increase in the quantity of the precious metals, an increase caused by their streaming in to replace the articles directly bartered for them at their sources of production. In proportion therefore as commodities in general acquire their true prices, in proportion as their values become estimated according to the fallen value of the precious metal, in the same proportion the quantity of that metal necessary

for realising those new prices is provided beforehand. A one-sided observation of the results that followed upon the discovery of fresh supplies of gold and silver, led some economists in the 17th, and particularly in the 18th century, to the false conclusion, that the prices of commodities had gone up in consequence of the increased quantity of gold and silver serving as means of circulation. Henceforth we shall consider the value of gold to be given, as, in fact, it is momentarily, whenever we estimate the price of a commodity.

On this supposition then, the quantity of the medium of circulation is determined by the sum of the prices that have to be realised. If now we further suppose the price of each commodity to be given, the sum of the prices clearly depends on the mass of commodities in circulation. It requires but little racking of brains to comprehend that if one quarter of wheat costs £2, 100 quarters will cost £200, 200 quarters £400, and so on, that consequently the quantity of money that changes place with the wheat, when sold, must increase with the quantity of that wheat.

If the mass of commodities remain constant, the quantity of circulating money varies with the fluctuations in the prices of those commodities. It increases and diminishes because the sum of the prices increases or diminishes in consequence of the change of price. To produce this effect, it is by no means requisite that the prices of all commodities should rise or fall simultaneously. A rise or a fall in the prices of a number of leading articles, is sufficient in the one case to increase, in the other to diminish, the sum of the prices of all commodities, and, therefore, to put more or less money in circulation. Whether the change in the price correspond to an actual change of value in the commodities, or whether it be the result of mere fluctuations in market-prices, the effect on the quantity of the medium of circulation remains the same. Suppose the following articles to be sold or partially metamorphosed simultaneously in different localities: say, one quarter of wheat, 20 yards of linen, one Bible, and 4 gallons of brandy. If the price of each article be £2, and the sum of the prices to be realised be consequently £8, it follows that £8 in money must go into circulation. If, on the other hand, these same articles are links in the following chain of metamorphoses: 1 quarter of wheat – £2 – 20 yards of linen – £2 – 1 Bible – £2 – 4 gallons of brandy – £2, a chain that is already well known to us, in that case the £2 cause the different commodities to circulate one after the other, and after realising their prices successively, and therefore the sum of those prices, £8, they come to rest at last in the pocket of the distiller. The £2 thus make four moves. This repeated change of place of the same pieces of money corresponds to the double change in form of the commodities, to their motion in opposite directions through two stages of circulation. and to the interlacing of the metamorphoses of different commodities.<sup>29</sup> These antithetic and complementary phases, of which the process of metamorphosis consists, are gone through, not simultaneously, but successively. Time is therefore required for the completion of the series. Hence the velocity of the currency of money is measured by the number of moves made by a given piece of money in a given time. Suppose the circulation of the 4 articles takes a day. The sum of the prices to be realised in the day is £8, the number of moves of the two pieces of money is four, and the quantity of money circulating is £2. Hence, for a given interval of time during the process of circulation, we have the following relation: the quantity of money functioning as the circulating medium is equal to the sum of the prices of the commodities divided by the number of moves made by coins of the same denomination. This law holds generally.

The total circulation of commodities in a given country during a given period is made up on the one hand of numerous isolated and simultaneous partial metamorphoses, sales which are at the same time purchases, in which each coin changes its place only once, or makes only one move; on the other hand, of numerous distinct series of metamorphoses partly running side by side, and partly coalescing with each other, in each of which series each coin makes a number of moves,

the number being greater or less according to circumstances. The total number of moves made by all the circulating coins of one denomination being given, we can arrive at the average number of moves made by a single coin of that denomination, or at the average velocity of the currency of money. The quantity of money thrown into the circulation at the beginning of each day is of course determined by the sum of the prices of all the commodities circulating simultaneously side by side. But once in circulation, coins are, so to say, made responsible for one another. If the one increase its velocity, the other either retards its own, or altogether falls out of circulation; for the circulation can absorb only such a quantity of gold as when multiplied by the mean number of moves made by one single coin or element, is equal to the sum of the prices to be realised. Hence if the number of moves made by the separate pieces increase, the total number of those pieces in circulation diminishes. If the number of the moves diminish, the total number of pieces increases. Since the quantity of money capable of being absorbed by the circulation is given for a given mean velocity of currency, all that is necessary in order to abstract a given number of sovereigns from the circulation is to throw the same number of one-pound notes into it, a trick well known to all bankers.

Just as the currency of money, generally considered, is but a reflex of the circulation of commodities, or of the antithetical metamorphoses they undergo, so, too, the velocity of that currency reflects the rapidity with which commodities change their forms, the continued interlacing of one series of metamorphoses with another, the hurried social interchange of matter, the rapid disappearance of commodities from the sphere of circulation, and the equally rapid substitution of fresh ones in their places. Hence, in the velocity of the currency we have the fluent unity of the antithetical and complementary phases, the unity of the conversion of the useful aspect of commodities into their value-aspect, and their re-conversion from the latter aspect to the former, or the unity of the two processes of sale and purchase. On the other hand, the retardation of the currency reflects the separation of these two processes into isolated antithetical phases, reflects the stagnation in the change of form, and therefore, in the social interchange of matter. The circulation itself, of course, gives no clue to the origin of this stagnation; it merely puts in evidence the phenomenon itself. The general public, who, simultaneously with the retardation of the currency, see money appear and disappear less frequently at the periphery of circulation, naturally attribute this retardation to a quantitative deficiency in the circulating medium.<sup>30</sup>

The total quantity of money functioning during a given period as the circulating medium, is determined, on the one hand, by the sum of the prices of the circulating commodities, and on the other hand, by the rapidity with which the antithetical phases of the metamorphoses follow one another. On this rapidity depends what proportion of the sum of the prices can, on the average, be realised by each single coin. But the sum of the prices of the circulating commodities depends on the quantity, as well as on the prices, of the commodities. These three factors, however, state of prices, quantity of circulating commodities, and velocity of money-currency, are all variable. Hence, the sum of the prices to be realised, and consequently the quantity of the circulating medium depending on that sum, will vary with the numerous variations of these three factors in combination. Of these variations we shall consider those alone that have been the most important in the history of prices.

While prices remain constant, the quantity of the circulating medium may increase owing to the number of circulating commodities increasing, or to the velocity of currency decreasing, or to a combination of the two. On the other hand the quantity of the circulating medium may decrease with a decreasing number of commodities, or with an increasing rapidity of their circulation.

With a general rise in the prices of commodities, the quantity of the circulating medium will remain constant, provided the number of commodities in circulation decrease proportionally to

the increase in their prices, or provided the velocity of currency increase at the same rate as prices rise, the number of commodities in circulation remaining constant. The quantity of the circulating medium may decrease, owing to the number of commodities decreasing more rapidly; or to the velocity of currency increasing more rapidly, than prices rise.

With a general fall in the prices of commodities, the quantity of the circulating medium will remain constant, provided the number of commodities increase proportionally to their fall in price, or provided the velocity of currency decrease in the same proportion. The quantity of the circulating medium will increase, provided the number of commodities increase quicker, or the rapidity of circulation decrease quicker, than the prices fall.

The variations of the different factors may mutually compensate each other, so that notwithstanding their continued instability, the sum of the prices to be realised and the quantity of money in circulation remain constant; consequently, we find, especially if we take long periods into consideration, that the deviations from the average level, of the quantity of money current in any country, are much smaller than we should at first sight expect, apart of course from excessive perturbations periodically arising from industrial and commercial crises, or less frequently, from fluctuations in the value of money.

The law, that the quantity of the circulating medium is determined by the sum of the prices of the commodities circulating, and the average velocity of currency<sup>31</sup> may also be stated as follows: given the sum of the values of commodities, and the average rapidity of their metamorphoses, the quantity of precious metal current as money depends on the value of that precious metal. The erroneous opinion that it is, on the contrary, prices that are determined by the quantity of the circulating medium, and that the latter depends on the quantity of the precious metals in a country;<sup>32</sup> this opinion was based by those who first held it, on the absurd hypothesis that commodities are without a price, and money without a value, when they first enter into circulation, and that, once in the circulation, an aliquot part of the medley of commodities is exchanged for an aliquot part of the heap of precious metals.<sup>33</sup>

### C. Coin and symbols of value

That money takes the shape of coin, springs from its function as the circulating medium. The weight of gold represented in imagination by the prices or money-names of commodities, must confront those commodities, within the circulation, in the shape of coins or pieces of gold of a given denomination. Coining, like the establishment of a standard of prices, is the business of the State. The different national uniforms worn at home by gold and silver as coins, and doffed again in the market of the world, indicate the separation between the internal or national spheres of the circulation of commodities, and their universal sphere.

The only difference, therefore, between coin and bullion, is one of shape, and gold can at any time pass from one form to the other.<sup>34</sup> But no sooner does coin leave the mint, than it immediately finds itself on the high-road to the melting pot. During their currency, coins wear away, some more, others less. Name and substance, nominal weight and real weight, begin their process of separation. Coins of the same denomination become different in value, because they are different in weight. The weight of gold fixed upon as the standard of prices, deviates from the weight that serves as the circulating medium, and the latter thereby ceases any longer to be a real equivalent of the commodities whose prices it realises. The history of coinage during the middle ages and down into the 18th century, records the ever renewed confusion arising from this cause. The natural tendency of circulation to convert coins into a mere semblance of what they profess to be, into a symbol of the weight of metal they are officially supposed to contain, is recognised

by modern legislation, which fixes the loss of weight sufficient to demonetise a gold coin, or to make it no longer legal tender.

The fact that the currency of coins itself effects a separation between their nominal and their real weight, creating a distinction between them as mere pieces of metal on the one hand, and as coins with a definite function on the other – this fact implies the latent possibility of replacing metallic coins by tokens of some other material, by symbols serving the same purposes as coins. The practical difficulties in the way of coining extremely minute quantities of gold or silver, and the circumstance that at first the less precious metal is used as a measure of value instead of the more precious, copper instead of silver, silver instead of gold, and that the less precious circulates as money until dethroned by the more precious – all these facts explain the parts historically played by silver and copper tokens as substitutes for gold coins. Silver and copper tokens take the place of gold in those regions of the circulation where coins pass from hand to hand most rapidly, and are subject to the maximum amount of wear and tear. This occurs where sales and purchases on a very small scale are continually happening. In order to prevent these satellites from establishing themselves permanently in the place of gold, positive enactments determine the extent to which they must be compulsorily received as payment instead of gold. The particular tracks pursued by the different species of coin in currency, run naturally into each other. The tokens keep company with gold, to pay fractional parts of the smallest gold coin; gold is, on the one hand, constantly pouring into retail circulation, and on the other hand is as constantly being thrown out again by being changed into tokens.<sup>35</sup>

The weight of metal in the silver and copper tokens is arbitrarily fixed by law. When in currency, they wear away even more rapidly than gold coins. Hence their functions are totally independent of their weight, and consequently of all value. The function of gold as coin becomes completely independent of the metallic value of that gold. Therefore things that are relatively without value, such as paper notes, can serve as coins in its place. This purely symbolic character is to a certain extent masked in metal tokens. In paper money it stands out plainly. In fact, *ce n'est que le premier pas qui coûte*.

We allude here only to inconvertible paper money issued by the State and having compulsory circulation. It has its immediate origin in the metallic currency. Money based upon credit implies on the other hand conditions, which, from our standpoint of the simple circulation of commodities, are as yet totally unknown to us. But we may affirm this much, that just as true paper money takes its rise in the function of money as the circulating medium, so money based upon credit takes root spontaneously in the function of money as the means of payment.<sup>36</sup>

The State puts in circulation bits of paper on which their various denominations, say £1, £5, &c., are printed. In so far as they actually take the place of gold to the same amount, their movement is subject to the laws that regulate the currency of money itself. A law peculiar to the circulation of paper money can spring up only from the proportion in which that paper money represents gold. Such a law exists; stated simply, it is as follows: the issue of paper money must not exceed in amount the gold (or silver as the case may be) which would actually circulate if not replaced by symbols. Now the quantity of gold which the circulation can absorb, constantly fluctuates about a given level. Still, the mass of the circulating medium in a given country never sinks below a certain minimum easily ascertained by actual experience. The fact that this minimum mass continually undergoes changes in its constituent parts, or that the pieces of gold of which it consists are being constantly replaced by fresh ones, causes of course no change either in its amount or in the continuity of its circulation. It can therefore be replaced by paper symbols. If, on the other hand, all the conduits of circulation were to-day filled with paper money to the full extent of their capacity for absorbing money, they might to-morrow be overflowing in

consequence of a fluctuation in the circulation of commodities. There would no longer be any standard. If the paper money exceed its proper limit, which is the amount in gold coins of the like denomination that can actually be current, it would, apart from the danger of falling into general disrepute, represent only that quantity of gold, which, in accordance with the laws of the circulation of commodities, is required, and is alone capable of being represented by paper. If the quantity of paper money issued be double what it ought to be, then, as a matter of fact, £1 would be the money-name not of 1/4 of an ounce, but of 1/8 of an ounce of gold. The effect would be the same as if an alteration had taken place in the function of gold as a standard of prices. Those values that were previously expressed by the price of £1 would now be expressed by the price of £2.

Paper money is a token representing gold or money. The relation between it and the values of commodities is this, that the latter are ideally expressed in the same quantities of gold that are symbolically represented by the paper. Only in so far as paper money represents gold, which like all other commodities has value, is it a symbol of value.<sup>37</sup>

Finally, some one may ask why gold is capable of being replaced by tokens that have no value? But, as we have already seen, it is capable of being so replaced only in so far as it functions exclusively as coin, or as the circulating medium, and as nothing else. Now, money has other functions besides this one, and the isolated function of serving as the mere circulating medium is not necessarily the only one attached to gold coin, although this is the case with those abraded coins that continue to circulate. Each piece of money is a mere coin, or means of circulation, only so long as it actually circulates. But this is just the case with that minimum mass of gold, which is capable of being replaced by paper money. That mass remains constantly within the sphere of circulation, continually functions as a circulating medium, and exists exclusively for that purpose. Its movement therefore represents nothing but the continued alternation of the inverse phases of the metamorphosis C–M–C, phases in which commodities confront their value-forms, only to disappear again immediately. The independent existence of the exchange-value of a commodity is here a transient apparition, by means of which the commodity is immediately replaced by another commodity. Hence, in this process which continually makes money pass from hand to hand, the mere symbolical existence of money suffices. Its functional existence absorbs, so to say, its material existence. Being a transient and objective reflex of the prices of commodities, it serves only as a symbol of itself, and is therefore capable of being replaced by a token.<sup>38</sup> One thing is, however, requisite; this token must have an objective social validity of its own, and this the paper symbol acquires by its forced currency. This compulsory action of the State can take effect only within that inner sphere of circulation which is coterminous with the territories of the community, but it is also only within that sphere that money completely responds to its function of being the circulating medium, or becomes coin.

### Section 3: Money

The commodity that functions as a measure of value, and, either in its own person or by a representative, as the medium of circulation, is money. Gold (or silver) is therefore money. It functions as money, on the one hand, when it has to be present in its own golden person. It is then the money-commodity, neither merely ideal, as in its function of a measure of value, nor capable of being represented, as in its function of circulating medium. On the other hand, it also functions as money, when by virtue of its function, whether that function be performed in person or by representative, it congeals into the sole form of value, the only adequate form of existence of exchange-value, in opposition to use-value, represented by all other commodities.

## A. Hoarding

The continual movement in circuits of the two antithetical metamorphoses of commodities, or the never ceasing alternation of sale and purchase, is reflected in the restless currency of money, or in the function that money performs of a *perpetuum mobile* of circulation. But so soon as the series of metamorphoses is interrupted, so soon as sales are not supplemented by subsequent purchases, money ceases to be mobilised; it is transformed, as Boisguillebert says, from “meuble” into “immeuble,” from movable into immovable, from coin into money.

With the very earliest development of the circulation of commodities, there is also developed the necessity, and the passionate desire, to hold fast the product of the first metamorphosis. This product is the transformed shape of the commodity, or its gold-chrysalis.<sup>39</sup> Commodities are thus sold not for the purpose of buying others, but in order to replace their commodity-form by their money-form. From being the mere means of effecting the circulation of commodities, this change of form becomes the end and aim. The changed form of the commodity is thus prevented from functioning as its unconditionally alienable form, or as its merely transient money-form. The money becomes petrified into a hoard, and the seller becomes a hoarder of money.

In the early stages of the circulation of commodities, it is the surplus use-values alone that are converted into money. Gold and silver thus become of themselves social expressions for superfluity or wealth. This naive form of hoarding becomes perpetuated in those communities in which the traditional mode of production is carried on for the supply of a fixed and limited circle of home wants. It is thus with the people of Asia, and particularly of the East Indies. Vanderlint, who fancies that the prices of commodities in a country are determined by the quantity of gold and silver to be found in it, asks himself why Indian commodities are so cheap. Answer: Because the Hindus bury their money. From 1602 to 1734, he remarks, they buried 150 millions of pounds sterling of silver, which originally came from America to Europe.<sup>40</sup> In the 10 years from 1856 to 1866, England exported to India and China £120,000,000 in silver, which had been received in exchange for Australian gold. Most of the silver exported to China makes its way to India.

As the production of commodities further develops, every producer of commodities is compelled to make sure of the nexus rerum or the social pledge.<sup>41</sup> His wants are constantly making themselves felt, and necessitate the continual purchase of other people’s commodities, while the production and sale of his own goods require time, and depend upon circumstances. In order then to be able to buy without selling, he must have sold previously without buying. This operation, conducted on a general scale, appears to imply a contradiction. But the precious metals at the sources of their production are directly exchanged for other commodities. And here we have sales (by the owners of commodities) without purchases (by the owners of gold or silver).<sup>42</sup> And subsequent sales, by other producers, unfollowed by purchases, merely bring about the distribution of the newly produced precious metals among all the owners of commodities. In this way, all along the line of exchange, hoards of gold and silver of varied extent are accumulated. With the possibility of holding and storing up exchange-value in the shape of a particular commodity, arises also the greed for gold. Along with the extension of circulation, increases the power of money, that absolutely social form of wealth ever ready for use. “Gold is a wonderful thing! Whoever possesses it is lord of all he wants. By means of gold one can even get souls into Paradise.” (Columbus in his letter from Jamaica, 1503.) Since gold does not disclose what has been transformed into it, everything, commodity or not, is convertible into gold. Everything becomes saleable and buyable. The circulation becomes the great social retort into which everything is thrown, to come out again as a gold-crystal. Not even are the bones of saints, and still less are more delicate *res sacrosanctae*, *extra commercium hominum* able to withstand this alchemy.<sup>43</sup> Just as every qualitative difference between commodities is extinguished in money,

so money, on its side, like the radical leveller that it is, does away with all distinctions.<sup>43a</sup> But money itself is a commodity, an external object, capable of becoming the private property of any individual. Thus social power becomes the private power of private persons. The ancients therefore denounced money as subversive of the economic and moral order of things.<sup>43b</sup> Modern society, which, soon after its birth, pulled Plutus by the hair of his head from the bowels of the earth,<sup>44</sup> greets gold as its Holy Grail, as the glittering incarnation of the very principle of its own life.

A commodity, in its capacity of a use-value, satisfies a particular want, and is a particular element of material wealth. But the value of a commodity measures the degree of its attraction for all other elements of material wealth, and therefore measures the social wealth of its owner. To a barbarian owner of commodities, and even to a West-European peasant, value is the same as value-form, and therefore, to him the increase in his hoard of gold and silver is an increase in value. It is true that the value of money varies, at one time in consequence of a variation in its own value, at another, in consequence of a change in the values of commodities. But this, on the one hand, does not prevent 200 ounces of gold from still containing more value than 100 ounces, nor, on the other hand, does it hinder the actual metallic form of this article from continuing to be the universal equivalent form of all other commodities, and the immediate social incarnation of all human labour. The desire after hoarding is in its very nature unsatiable. In its qualitative aspect, or formally considered, money has no bounds to its efficacy, *i.e.*, it is the universal representative of material wealth, because it is directly convertible into any other commodity. But, at the same time, every actual sum of money is limited in amount, and, therefore, as a means of purchasing, has only a limited efficacy. This antagonism between the quantitative limits of money and its qualitative boundlessness, continually acts as a spur to the hoarder in his Sisyphus-like labour of accumulating. It is with him as it is with a conqueror who sees in every new country annexed, only a new boundary.

In order that gold may be held as money, and made to form a hoard, it must be prevented from circulating, or from transforming itself into a means of enjoyment. The hoarder, therefore, makes a sacrifice of the lusts of the flesh to his gold fetish. He acts in earnest up to the Gospel of abstention. On the other hand, he can withdraw from circulation no more than what he has thrown into it in the shape of commodities. The more he produces, the more he is able to sell. Hard work, saving, and avarice are, therefore, his three cardinal virtues, and to sell much and buy little the sum of his political economy.<sup>45</sup>

By the side of the gross form of a hoard, we find also its aesthetic form in the possession of gold and silver articles. This grows with the wealth of civil society. “Soyons riches ou paraissions riches” (Diderot).

In this way there is created, on the one hand, a constantly extending market for gold and silver, unconnected with their functions as money, and, on the other hand, a latent source of supply, to which recourse is had principally in times of crisis and social disturbance.

Hoarding serves various purposes in the economy of the metallic circulation. Its first function arises out of the conditions to which the currency of gold and silver coins is subject. We have seen how, along with the continual fluctuations in the extent and rapidity of the circulation of commodities and in their prices, the quantity of money current unceasingly ebbs and flows. This mass must, therefore, be capable of expansion and contraction. At one time money must be attracted in order to act as circulating coin, at another, circulating coin must be repelled in order to act again as more or less stagnant money. In order that the mass of money, actually current, may constantly saturate the absorbing power of the circulation, it is necessary that the quantity of gold and silver in a country be greater than the quantity required to function as coin. This

condition is fulfilled by money taking the form of hoards. These reserves serve as conduits for the supply or withdrawal of money to or from the circulation, which in this way never overflows its banks.<sup>46</sup>

## B. Means of Payment

In the simple form of the circulation of commodities hitherto considered, we found a given value always presented to us in a double shape, as a commodity at one pole, as money at the opposite pole. The owners of commodities came therefore into contact as the respective representatives of what were already equivalents. But with the development of circulation, conditions arise under which the alienation of commodities becomes separated, by an interval of time, from the realisation of their prices. It will be sufficient to indicate the most simple of these conditions. One sort of article requires a longer, another a shorter time for its production. Again, the production of different commodities depends on different seasons of the year. One sort of commodity may be born on its own market place, another has to make a long journey to market. Commodity-owner No. 1, may therefore be ready to sell, before No. 2 is ready to buy. When the same transactions are continually repeated between the same persons, the conditions of sale are regulated in accordance with the conditions of production. On the other hand, the use of a given commodity, of a house, for instance, is sold (in common parlance, let) for a definite period. Here, it is only at the end of the term that the buyer has actually received the use-value of the commodity. He therefore buys it before he pays for it. The vendor sells an existing commodity, the purchaser buys as the mere representative of money, or rather of future money. The vendor becomes a creditor, the purchaser becomes a debtor. Since the metamorphosis of commodities, or the development of their value-form, appears here under a new aspect, money also acquires a fresh function; it becomes the means of payment.

The character of creditor, or of debtor, results here from the simple circulation. The change in the form of that circulation stamps buyer and seller with this new die. At first, therefore, these new parts are just as transient and alternating as those of seller and buyer, and are in turns played by the same actors. But the opposition is not nearly so pleasant, and is far more capable of crystallisation.<sup>47</sup> The same characters can, however, be assumed independently of the circulation of commodities. The class-struggles of the ancient world took the form chiefly of a contest between debtors and creditors, which in Rome ended in the ruin of the plebeian debtors. They were displaced by slaves. In the middle ages the contest ended with the ruin of the feudal debtors, who lost their political power together with the economic basis on which it was established. Nevertheless, the money relation of debtor and creditor that existed at these two periods reflected only the deeper-lying antagonism between the general economic conditions of existence of the classes in question.

Let us return to the circulation of commodities. The appearance of the two equivalents, commodities and money, at the two poles of the process of sale, has ceased to be simultaneous. The money functions now, first as a measure of value in the determination of the price of the commodity sold; the price fixed by the contract measures the obligation of the debtor, or the sum of money that he has to pay at a fixed date. Secondly, it serves as an ideal means of purchase. Although existing only in the promise of the buyer to pay, it causes the commodity to change hands. It is not before the day fixed for payment that the means of payment actually steps into circulation, leaves the hand of the buyer for that of the seller. The circulating medium was transformed into a hoard, because the process stopped short after the first phase, because the converted shape of the commodity, viz., the money, was withdrawn from circulation. The means of payment enters the circulation, but only after the commodity has left it. The money is no longer the means that brings about the process. It only brings it to a close, by stepping in as the

absolute form of existence of exchange-value, or as the universal commodity. The seller turned his commodity into money, in order thereby to satisfy some want, the hoarder did the same in order to keep his commodity in its money-shape, and the debtor in order to be able to pay; if he do not pay, his goods will be sold by the sheriff. The value-form of commodities, money, is therefore now the end and aim of a sale, and that owing to a social necessity springing out of the process of circulation itself.

The buyer converts money back into commodities before he has turned commodities into money: in other words, he achieves the second metamorphosis of commodities before the first. The seller's commodity circulates, and realises its price, but only in the shape of a legal claim upon money. It is converted into a use-value before it has been converted into money. The completion of its first metamorphosis follows only at a later period.<sup>48</sup>

The obligations falling due within a given period, represent the sum of the prices of the commodities, the sale of which gave rise to those obligations. The quantity of gold necessary to realise this sum, depends, in the first instance, on the rapidity of currency of the means of payment. That quantity is conditioned by two circumstances: first the relations between debtors and creditors form a sort of chain, in such a way that A, when he receives money from his debtor B, straightway hands it over to C his creditor, and so on; the second circumstance is the length of the intervals between the different due-days of the obligations. The continuous chain of payments, or retarded first metamorphoses, is essentially different from that interlacing of the series of metamorphoses which we considered on a former page. By the currency of the circulating medium, the connexion between buyers and sellers, is not merely expressed. This connexion is originated by, and exists in, the circulation alone. Contrariwise, the movement of the means of payment expresses a social relation that was in existence long before.

The fact that a number of sales take place simultaneously, and side by side, limits the extent to which coin can be replaced by the rapidity of currency. On the other hand, this fact is a new lever in economising the means of payment. In proportion as payments are concentrated at one spot, special institutions and methods are developed for their liquidation. Such in the middle ages were the *virements* at Lyons. The debts due to A from B, to B from C, to C from A, and so on, have only to be confronted with each other, in order to annul each other to a certain extent like positive and negative quantities. There thus remains only a single balance to pay. The greater the amount of the payments concentrated, the less is this balance relatively to that amount, and the less is the mass of the means of payment in circulation.

The function of money as the means of payment implies a contradiction without a terminus medius. In so far as the payments balance one another, money functions only ideally as money of account, as a measure of value. In so far as actual payments have to be made, money does not serve as a circulating medium, as a mere transient agent in the interchange of products, but as the individual incarnation of social labour, as the independent form of existence of exchange-value, as the universal commodity. This contradiction comes to a head in those phases of industrial and commercial crises which are known as monetary crises.<sup>49</sup> Such a crisis occurs only where the ever-lengthening chain of payments, and an artificial system of settling them, has been fully developed. Whenever there is a general and extensive disturbance of this mechanism, no matter what its cause, money becomes suddenly and immediately transformed, from its merely ideal shape of money of account, into hard cash. Profane commodities can no longer replace it. The use-value of commodities becomes valueless, and their value vanishes in the presence of its own independent form. On the eve of the crisis, the bourgeois, with the self-sufficiency that springs from intoxicating prosperity, declares money to be a vain imagination. Commodities alone are money. But now the cry is everywhere: money alone is a commodity! As the hart pants after fresh

water, so pants his soul after money, the only wealth.<sup>50</sup> In a crisis, the antithesis between commodities and their value-form, money, becomes heightened into an absolute contradiction. Hence, in such events, the form under which money appears is of no importance. The money famine continues, whether payments have to be made in gold or in credit money such as bank-notes.<sup>51</sup>

If we now consider the sum total of the money current during a given period, we shall find that, given the rapidity of currency of the circulating medium and of the means of payment, it is equal to the sum of the prices to be realised, plus the sum of the payments falling due, minus the payments that balance each other, minus finally the number of circuits in which the same piece of coin serves in turn as means of circulation and of payment. Hence, even when prices, rapidity of currency, and the extent of the economy in payments, are given, the quantity of money current and the mass of commodities circulating during a given period, such as a day, no longer correspond. Money that represents commodities long withdrawn from circulation, continues to be current. Commodities circulate, whose equivalent in money will not appear on the scene till some future day. Moreover, the debts contracted each day, and the payments falling due on the same day, are quite incommensurable quantities.<sup>52</sup>

Credit-money springs directly out of the function of money as a means of payment. Certificates of the debts owing for the purchased commodities circulate for the purpose of transferring those debts to others. On the other hand, to the same extent as the system of credit is extended, so is the function of money as a means of payment. In that character it takes various forms peculiar to itself under which it makes itself at home in the sphere of great commercial transactions. Gold and silver coin, on the other hand, are mostly relegated to the sphere of retail trade.<sup>53</sup>

When the production of commodities has sufficiently extended itself, money begins to serve as the means of payment beyond the sphere of the circulation of commodities. It becomes the commodity that is the universal subject-matter of all contracts.<sup>54</sup> Rents, taxes, and such like payments are transformed from payments in kind into money payments. To what extent this transformation depends upon the general conditions of production, is shown, to take one example, by the fact that the Roman Empire twice failed in its attempt to levy all contributions in money. The unspeakable misery of the French agricultural population under Louis XIV., a misery so eloquently denounced by Boisguillebert, Marshal Vauban, and others, was due not only to the weight of the taxes, but also to the conversion of taxes in kind into money taxes.<sup>55</sup> In Asia, on the other hand, the fact that state taxes are chiefly composed of rents payable in kind, depends on conditions of production that are reproduced with the regularity of natural phenomena. And this mode of payment tends in its turn to maintain the ancient form of production. It is one of the secrets of the conservation of the Ottoman Empire. If the foreign trade, forced upon Japan by Europeans, should lead to the substitution of money rents for rents in kind, it will be all up with the exemplary agriculture of that country. The narrow economic conditions under which that agriculture is carried on, will be swept away.

In every country, certain days of the year become by habit recognised settling days for various large and recurrent payments. These dates depend, apart from other revolutions in the wheel of reproduction, on conditions closely connected with the seasons. They also regulate the dates for payments that have no direct connexion with the circulation of commodities such as taxes, rents, and so on. The quantity of money requisite to make the payments, falling due on those dates all over the country, causes periodical, though merely superficial, perturbations in the economy of the medium of payment.<sup>56</sup>

From the law of the rapidity of currency of the means of payment, it follows that the quantity of the means of payment required for all periodical payments, whatever their source, is in inverse<sup>57</sup> proportion to the length of their periods.<sup>58</sup>

The development of money into a medium of payment makes it necessary to accumulate money against the dates fixed for the payment of the sums owing. While hoarding, as a distinct mode of acquiring riches, vanishes with the progress of civil society, the formation of reserves of the means of payment grows with that progress.

### C. Universal Money

When money leaves the home sphere of circulation, it strips off the local garbs which it there assumes, of a standard of prices, of coin, of tokens, and of a symbol of value, and returns to its original form of bullion. In the trade between the markets of the world, the value of commodities is expressed so as to be universally recognised. Hence their independent value-form also, in these cases, confronts them under the shape of universal money. It is only in the markets of the world that money acquires to the full extent the character of the commodity whose bodily form is also the immediate social incarnation of human labour in the abstract. Its real mode of existence in this sphere adequately corresponds to its ideal concept.

Within the sphere of home circulation, there can be but one commodity which, by serving as a measure of value, becomes money. In the markets of the world a double measure of value holds sway, gold and silver.<sup>59</sup>

Money of the world serves as the universal medium of payment, as the universal means of purchasing, and as the universally recognised embodiment of all wealth. Its function as a means of payment in the settling of international balances is its chief one. Hence the watchword of the mercantilists, balance of trade.<sup>60</sup> Gold and silver serve as international means of purchasing chiefly and necessarily in those periods when the customary equilibrium in the interchange of products between different nations is suddenly disturbed. And lastly, it serves as the universally recognised embodiment of social wealth, whenever the question is not of buying or paying, but of transferring wealth from one country to another, and whenever this transference in the form of commodities is rendered impossible, either by special conjunctures in the markets or by the purpose itself that is intended.<sup>61</sup>

Just as every country needs a reserve of money for its home circulation so, too, it requires one for external circulation in the markets of the world. The functions of hoards, therefore, arise in part out of the function of money, as the medium of the home circulation and home payments, and in part out of its function of money of the world.<sup>62</sup> For this latter function, the genuine money-commodity, actual gold and silver, is necessary. On that account, Sir James Steuart, in order to distinguish them from their purely local substitutes, calls gold and silver “money of the world.”

The current of the stream of gold and silver is a double one. On the one hand, it spreads itself from its sources over all the markets of the world, in order to become absorbed, to various extents, into the different national spheres of circulation, to fill the conduits of currency, to replace abraded gold and silver coins, to supply the material of articles of luxury, and to petrify into hoards.<sup>63</sup> This first current is started by the countries that exchange their labour, realised in commodities, for the labour embodied in the precious metals by gold and silver-producing countries. On the other hand, there is a continual flowing backwards and forwards of gold and silver between the different national spheres of circulation, a current whose motion depends on the ceaseless fluctuations in the course of exchange.<sup>64</sup>

Countries in which the bourgeois form of production is developed to a certain extent, limit the hoards concentrated in the strong rooms of the banks to the minimum required for the proper

performance of their peculiar functions.<sup>65</sup> Whenever these hoards are strikingly above their average level, it is, with some exceptions, an indication of stagnation in the circulation of commodities, of an interruption in the even flow of their metamorphoses.<sup>66</sup>

---

<sup>1</sup> The question — Why does not money directly represent labour-time, so that a piece of paper may represent, for instance, x hours' labour, is at bottom the same as the question why, given the production of commodities, must products take the form of commodities? This is evident, since their taking the form of commodities implies their differentiation into commodities and money. Or, why cannot private labour — labour for the account of private individuals — be treated as its opposite, immediate social labour? I have elsewhere examined thoroughly the Utopian idea of “labour-money” in a society founded on the production of commodities (l. c., p. 61, seq.). On this point I will only say further, that Owen's “labour-money,” for instance, is no more “money” than a ticket for the theatre. Owen pre-supposes directly associated labour, a form of production that is entirely inconsistent with the production of commodities. The certificate of labour is merely evidence of the part taken by the individual in the common labour, and of his right to a certain portion of the common produce destined for consumption. But it never enters into Owen's head to pre-suppose the production of commodities, and at the same time, by juggling with money, to try to evade the necessary conditions of that production.

<sup>2</sup> Savages and half-civilised races use the tongue differently. Captain Parry says of the inhabitants on the west coast of Baffin's Bay: “In this case (he refers to barter) they licked it (the thing represented to them) twice to their tongues, after which they seemed to consider the bargain satisfactorily concluded.” In the same way, the Eastern Esquimaux licked the articles they received in exchange. If the tongue is thus used in the North as the organ of appropriation, no wonder that, in the South, the stomach serves as the organ of accumulated property, and that a Kaffir estimates the wealth of a man by the size of his belly. That the Kaffirs know what they are about is shown by the following: at the same time that the official British Health Report of 1864 disclosed the deficiency of fat-forming food among a large part of the working-class, a certain Dr. Harvey (not, however, the celebrated discoverer of the circulation of the blood), made a good thing by advertising recipes for reducing the superfluous fat of the bourgeoisie and aristocracy.

<sup>3</sup> See Karl Marx: “Zur Kritik, &c.” “Theorien von der Masseinheit des Geldes,” p. 53, seq.

<sup>4</sup> “Wherever gold and silver have by law been made to perform the function of money or of a measure of value side by side, it has always been tried, but in vain, to treat them as one and the same material. To assume that there is an invariable ratio between the quantities of gold and silver in which a given quantity of labour-time is incorporated, is to assume in fact, that gold and silver are of one and the same material, and that a given mass of the less valuable metal, silver, is a constant fraction of a given mass of gold. From the reign of Edward III. to the time of George II., the history of money in England consists of one long series of perturbations caused by the clashing of the legally fixed ratio between the values of gold and silver, with the fluctuations in their real values. At one time gold was too high, at another, silver. The metal that for the time being was estimated below its value, was withdrawn from circulation, mated and exported. The ratio between the two metals was then again altered by law, but the new nominal ratio soon came into conflict again with the real one. In our own times, the slight and transient fall in the value of gold compared with silver, which was a consequence of the Indo-Chinese demand for silver, produced on a far more extended scale in France the same phenomena, export of silver, and its expulsion from circulation by gold. During the years 1855, 1856 and 1857, the excess in France of gold-imports over gold-exports amounted to £41,580,000, while the excess of

silver-exports over silver-imports was £14,704,000. In fact, in those countries in which both metals are legally measures of value, and therefore both legal tender, so that everyone has the option of paying in either metal, the metal that rises in value is at a premium, and, like every other commodity, measures its price in the over-estimated metal which alone serves in reality as the standard of value. The result of all experience and history with regard to this equation is simply that, where two commodities perform by law the functions of a measure of value, in practice one alone maintains that position.” (Karl Marx, *l.c.*, pp. 52, 53.)

<sup>5</sup> The peculiar circumstance, that while the ounce of gold serves in England as the unit of the standard of money, the pound sterling does not form an aliquot part of it, has been explained as follows: “Our coinage was originally adapted to the employment of silver only, hence, an ounce of silver can always be divided into a certain adequate number of pieces of coin, but as gold was introduced at a later period into a coinage adapted only to silver, an ounce of gold cannot be coined into an aliquot number of pieces.” Maclaren, “A Sketch of the History of the Currency.” London, 1858, p. 16.

<sup>6</sup> With English writers the confusion between measure of value and standard of price (standard of value) is indescribable. Their functions, as well as their names, are constantly interchanged.

<sup>7</sup> Moreover, it has not general historical validity.

<sup>8</sup> It is thus that the pound sterling in English denotes less than one-third of its original weight; the pound Scot, before the union, only 1-36th; the French livre, 1-74th; the Spanish maravedi, less than 1-1,000th; and the Portuguese rei a still smaller fraction.

<sup>9</sup> “Le monete le quali oggi sono ideal, sono le piû antiche d’ogni nazione, e tutte furono un tempo real, e perche erano reali con esse si contava” [“The coins which today are ideal are the oldest coins of every nation, and all of them were once real, and precisely because they were real they were used for calculation”] (Galiani: *Della moneta, l.c.*, p. 153.)

<sup>10</sup> David Urquhart remarks in his “Familiar Words” on the monstrosity (!) that now-a-days a pound (sterling), which is the unit of the English standard of money, is equal to about a quarter of an ounce of gold. “This is falsifying a measure, not establishing a standard.” He sees in this “false denomination” of the weight of gold, as in everything else, the falsifying hand of civilisation.

<sup>11</sup> When Anacharsis was asked for what purposes the Greeks used money, he replied, “For reckoning.” (Ashen. *Deipn.* 1. iv. 49 v. 2. ed. Schweighauser, 1802.)

<sup>12</sup> “Owing to the fact that money, when serving as the standard of price, appears under the same reckoning names as do the prices of commodities, and that therefore the sum of £3 17s. 10 1/2d. may signify on the one hand an ounce weight of gold, and on the other, the value of a ton of iron, this reckoning name of money has been called its mint-price. Hence there sprang up the extraordinary notion, that the value of gold is estimated in its own material, and that, in contradistinction to all other commodities, its price is fixed by the State. It was erroneously thought that the giving of reckoning names to definite weights of gold, is the same thing as fixing the value of those weights.” (Karl Marx, *l.c.*, p. 52.)

<sup>13</sup> See “Theorien von der Masseinheit des Geldes” in “Zur Kritik der Pol Oekon. &c.,” p. 53, seq. The fantastic notions about raising or lowering the mint-price of money by transferring to greater or smaller weights of gold or silver, the names already legally appropriated to fixed weights of those metals; such notions, at least in those cases in which they aim, not at clumsy financial operations against creditors, both public and private but at economic quack remedies, have been so exhaustively treated by Wm. Petty in his “Quantulumcunque concerning money: To the Lord Marquis of Halifax, 1682,” that even his immediate followers, Sir Dudley North and John Locke, not to mention later ones, could only dilute him. “If the wealth of a nation” he remarks, “could be decupled by a

proclamation, it were strange that such proclamations have not long since been made by our Governors.” (l.c., p. 36.)

<sup>14</sup> “Ou bien, il faut consentir à dire qu’une valeur d’un million en argent vaut plus qu’une valeur égale en marchandises.” [“Or indeed it must be admitted that a million in money is worth more than an equal value in commodities”] (Le Trosne, l.c., p. 919), which amounts to saying “qu’une valeur vaut plus qu’une valeur égale.” [“that one value is worth more than another value which is equal to it.”]

<sup>15</sup> Jerome had to wrestle hard, not only in his youth with the bodily flesh, as is shown by his fight in the desert with the handsome women of his imagination, but also in his old age with the spiritual flesh. “I thought,” he says, “I was in the spirit before the Judge of the Universe.” “Who art thou?” asked a voice. “I am a Christian.” “Thou liest,” thundered back the great Judge, “thou art nought but a Ciceronian.”

<sup>16</sup>

“εχ σε του ... πυρος τ’ανταμειβεσθαι παντα, φησιν δ’Ηρακληιτος, και πυρ απαντων, ωο περ χρυσου χρηματα και χρηματων χρυσοσ.” [“As Heraclitus says, all things are exchanged for fire and fire for all things, as wares are exchanged for gold and gold for wares.”] (F. Lassalle: “Die Philosophie Herakleitos des Dunkeln.” Berlin, 1858, Vol. I, p. 222.) Lassalle in his note on this passage, p. 224, n. 3., erroneously makes gold a mere symbol of value.

<sup>17</sup> *Note by the Institute of Marxism-Leninism in the Russian edition.* — In his letter of November 28, 1878, to N. F. Danielson (Nikolai-on) Marx proposed that this sentence be corrected to read as follows: “And, as a matter of fact, the value of each single yard is but the materialised form of a part of the social labour expended on the whole number of yards.” An analogous correction was made in a copy of the second German edition of the first volume of “Capital” belonging to Marx; however, not in his handwriting.

<sup>18</sup> “Toute vente est achat.” [“Every sale is a purchase.”] (Dr. Quesnay: “Dialogues sur le Commerce et les Travaux des Artisans.” Physiocrates ed. Daire I. Partie, Paris, 1846, p. 170), or as Quesnay in his “Maximes générales” puts it, “Vendre est acheter.” [“To sell is to buy.”]

<sup>19</sup> “Le prix d’une marchandise ne pouvant être payé que par le prix d’une autre marchandise” (Mercier de la Rivière: “L’Ordre naturel et essentiel des sociétés politiques.” [“The price of one commodity can only be paid by the price of another commodity”] Physiocrates, ed. Daire II. Partie, p. 554.)

<sup>20</sup> “Pour avoir cet argent, il faut avoir vendu,” [“In order to have this money, one must have made a sale,”] l.c., p. 543.

<sup>21</sup> As before remarked, the actual producer of gold or silver forms an exception. He exchanges his product directly for another commodity, without having first sold it.

<sup>22</sup> “Si l’argent représente, dans nos mains, les choses que nous pouvons désirer d’acheter, il y représente aussi les choses que nous avons vendues pour cet argent.” [“If money represents, in our hands, the things we can wish to buy, it also represents the things we have sold to obtain that money”] (Mercier de la Rivière, l.c., p. 586.)

<sup>23</sup> “Il y a donc ... quatre termes et trois contractants, dont l’un intervient deux fois” [“There are therefore ... four terms and three contracting parties, one of whom intervenes twice”] (Le Trosne, l.c., p. 909.)

<sup>24</sup> Self-evident as this may be, it is nevertheless for the most part unobserved by political economists, and especially by the “Free-trader Vulgaris.”

<sup>25</sup> See my observations on James Mill in “Zur Kritik, &c.,” pp. 74-76. With regard to this subject, we may notice two methods characteristic of apologetic economy. The first is the identification of the

circulation of commodities with the direct barter of products, by simple abstraction from their points of difference; the second is, the attempt to explain away the contradictions of capitalist production, by reducing the relations between the persons engaged in that mode of production, to the simple relations arising out of the circulation of commodities. The production and circulation of commodities are however, phenomena that occur to a greater or less extent in modes of production the most diverse. If we are acquainted with nothing but the abstract categories of circulation, which are common to all these modes of production, we cannot possibly know anything of the specific points of difference of those modes, nor pronounce any judgment upon them. In no science is such a big fuss made with commonplace truisms as in Political Economy. For instance, J. B. Say sets himself up as a judge of crises, because, forsooth, he knows that a commodity is a product.

<sup>26</sup> *Translator's note.* — This word is here used in its original signification of the course or track pursued by money as it changes from hand to hand, a course which essentially differs from circulation.

<sup>27</sup> Even when the commodity is sold over and over again, a phenomenon that at present has no existence for us, it falls, when definitely sold for the last time, out of the sphere of circulation into that of consumption, where it serves either as means of subsistence or means of production.

<sup>28</sup> “Il (l'argent) n'a d'autre mouvement que celui qui lui est imprimé par les productions.” [“It” (money) “has no other motion than that imparted to it by the products”] (Le Trosne, l.c., p. 885.)

<sup>29</sup> “Ce sont les productions qui le (l'argent) mettent en mouvement et le font circuler ... La célérité de son mouvement (c. de l'argent) supplée à sa quantité. Lorsqu'il en est besoin il ne fait que glisser d'une main dans l'autre sans s'arrêter un instant.” [“It is products which set it” (money) “in motion and make it circulate ... The velocity of its” (money's) “motion supplements its quantity. When necessary, it does nothing but slide from hand to hand, without stopping for a moment”] (Le Trosne, l.c.. pp. 915, 916.)

<sup>30</sup> “Money being ... the common measure of buying and selling, everybody who hath anything to sell, and cannot procure chapmen for it, is presently apt to think, that want of money in the kingdom, or country, is the cause why his goods do not go off; and so, want of money is the common cry; which is a great mistake... What do these people want, who cry out for money? ... The farmer complains ... he thinks that were more money in the country; he should have a price for his goods. Then it seems money is not his want, but a price for his corn and cattel, which he would sell, but cannot... Why cannot he get a price? ... (1) Either there is too much corn and cattel in the country, so that most who come to market have need of selling, as he hath, and few of buying; or (2) There wants the usual vent abroad by transportation..., or (3) The consumption fails, as when men, by reason of poverty, do not spend so much in their houses as formerly they did; wherefore it is not the increase of specific money, which would at all advance the farmer's goods, but the removal of any of these three causes, which do truly keep down the market... The merchant and shopkeeper want money in the same manner, that is, they want a vent for the goods they deal in, by reason that the markets fail” ... [A nation] “never thrives better, than when riches are tost from hand to hand.” (Sir Dudley North: “Discourses upon Trade,” Lond. 1691, pp. 11-15, passim.) Herrenschwand's fanciful notions amount merely to this, that the antagonism, which has its origin in the nature of commodities, and is reproduced in their circulation, can be removed by increasing the circulating medium. But if, on the one hand, it is a popular delusion to ascribe stagnation in production and circulation to insufficiency of the circulating medium, it by no means follows, on the other hand, that an actual paucity of the medium in consequence, *e.g.*, of bungling legislative interference with the regulation of currency, may not give rise to such stagnation.

<sup>31</sup> “There is a certain measure and proportion of money requisite to drive the trade of a nation, more or less than which would prejudice the same. Just as there is a certain proportion of farthings necessary

in a small retail trade, to change silver money, and to even such reckonings as cannot be adjusted with the smallest silver pieces.... Now, as the proportion of the number of farthings requisite in commerce is to be taken from the number of people, the frequency of their exchanges: as also, and principally, from the value of the smallest silver pieces of money; so in like manner, the proportion of money [gold and silver specie] requisite in our trade, is to be likewise taken from the frequency of commutations, and from the bigness of the payments.” (William Petty, “A Treatise of Taxes and Contributions.” Lond. 1667, p. 17.) The Theory of Hume was defended against the attacks of J. Steuart and others, by A. Young, in his “Political Arithmetic,” Lond. 1774, in which work there is a special chapter entitled “Prices depend on quantity of money, at p. 112, sqq. I have stated in “Zur Kritik, &c.,” p. 149: “He (Adam Smith) passes over without remark the question as to the quantity of coin in circulation, and treats money quite wrongly as a mere commodity.” This statement applies only in so far as Adam Smith, ex officio, treats of money. Now and then, however, as in his criticism of the earlier systems of Political Economy, he takes the right view. “The quantity of coin in every country is regulated by the value of the commodities which are to be circulated by it.... The value of the goods annually bought and sold in any country requires a certain quantity of money to circulate and distribute them to their proper consumers, and can give employment to no more. The channel of circulation necessarily draws to itself a sum sufficient to fill it, and never admits any more.” (“Wealth of Nations.” Bk. IV., ch. 1.) In like manner, ex officio, he opens his work with an apotheosis on the division of labour. Afterwards, in the last book which treats of the sources of public revenue, he occasionally repeats the denunciations of the division of labour made by his teacher, A. Ferguson.

<sup>32</sup> “The prices of things will certainly rise in every nation, as the gold and silver increase amongst the people, and consequently, where the gold and silver decrease in any nation, the prices of all things must fall proportionately to such decrease of money.” (Jacob Vanderlint: “Money Answers all Things.” Lond. 1734, p. 5.) A careful comparison of this book with Hume’s “Essays,” proves to my mind without doubt that Hume was acquainted with and made use of Vanderlint’s work, which is certainly an important one. The opinion that prices are determined by the quantity of the circulating medium, was also held by Barbon and other much earlier writers. “No inconvenience,” says Vanderlint, “can arise by an unrestrained trade, but very great advantage; since, if the cash of the nation be decreased by it, which prohibitions are designed to prevent, those nations that get the cash will certainly find everything advance in price, as the cash increases amongst them. And ... our manufactures, and everything else, will soon become so moderate as to turn the balance of trade in our favour, and thereby fetch the money back again.” (l.c.. pp. 43, 44.)

<sup>33</sup> That the price of each single kind of commodity forms a part of the sum of the prices of all the commodities in circulation, is a self-evident proposition. But how use-values which are incommensurable with regard to each other, are to be exchanged, en masse for the total sum of gold and silver in a country, is quite incomprehensible. If we start from the notion that all commodities together form one single commodity, of which each is but an aliquot part, we get the following beautiful result: The total commodity = x cwt. of gold; commodity A = an aliquot part of the total commodity = the same aliquot part of x cwt. of gold. This is stated in all seriousness by Montesquieu: “Si l’on compare la masse de l’or et de l’argent qui est dans le monde avec la somme des marchandises qui s’y vend il est certain que chaque denrée ou marchandise, en particulier, pourra être comparée à une certaine portion de la masse entière. Supposons qu’il n’y ait qu’une seule denrée ou marchandise dans le monde, ou qu’il n’y ait qu’une seule qui s’achète, et qu’elle se divise comme l’argent: Cette partie de cette marchandise répondra à une partie de la masse de l’argent; la moitié du total de l’une à la moitié du total de l’autre, &c.... L’établissement du prix des choses dépend toujours fondamentalement de la raison du total des choses au total des signes.” [“If one compares the amount of gold and silver in the world with the sum of the commodities available, it is certain that each product or commodity, taken in isolation, could be compared with a certain portion of the total amount

of money. Let us suppose that there is only one product, or commodity, in the world, or only one that can be purchased, and that it can be divided in the same way as money: a certain part of this commodity would then correspond to a part of the total amount of money; half the total of the one would correspond to half the total of the other &c. ... the determination of the prices of things always depends, fundamentally, on the relation between the total amount of things and the total amount of their monetary symbols”] (Montesquieu, l.c. t. III, pp. 12, 13.) As to the further development of this theory by Ricardo and his disciples, James Mill, Lord Overstone, and others, see “Zur Kritik, &c.,” pp. 140-146, and p. 150, sqq. John Stuart Mill, with his usual eclectic logic, understands how to hold at the same time the view of his father, James Mill, and the opposite view. On a comparison of the text of his compendium, “Principles of Pol. Econ.,” with his preface to the first edition, in which preface he announces himself as the Adam Smith of his day — we do not know whether to admire more the simplicity of the man, or that of the public, who took him, in good faith, for the Adam Smith he announced himself to be, although he bears about as much resemblance to Adam Smith as say General Williams, of Kars, to the Duke of Wellington. The original researches of Mr. J. S. Mill which are neither extensive nor profound, in the domain of Political Economy, will be found mustered in rank and file in his little work, “Some Unsettled Questions of Political Economy,” which appeared in 1844. Locke asserts point blank the connexion between the absence of value in gold and silver, and the determination of their values by quantity alone. “Mankind having consented to put an imaginary value upon gold and silver ... the intrinsic value, regarded in these metals, is nothing but the quantity.” (“Some Considerations,” &c., 1691, Works Ed. 1777, Vol. II., p. 15.)

<sup>34</sup> It lies of course, entirely beyond my purpose to take into consideration such details as the s

eignorage on minting. I will, however, cite for the benefit of the romantic sycophant, Adam Muller, who admires the “generous liberality” with which the English Government coins gratuitously, the following opinion of Sir Dudley North: “Silver and gold, like other commodities, have their ebbs and flowings. Upon the arrival of quantities from Spain ... it is carried into the Tower, and coined. Not long after there will come a demand for bullion to be exported again. If there is none, but all happens to be in coin, what then? Melt it down again; there’s no loss in it, for the coining costs the owner nothing. Thus the nation has been abused, and made to pay for the twisting of straw for asses to eat. If the merchant were made to pay the price of the coinage, he would not have sent his silver to the Tower without consideration, and coined money would always keep a value above uncoined silver.” (North, l.c., p. 18.) North was himself one of the foremost merchants in the reign of Charles II.

<sup>35</sup> “If silver never exceed what is wanted for the smaller payments it cannot be collected in sufficient quantities for the larger payments ... the use of gold in the main payments necessarily implies also its use in the retail trade: those who have gold coin offering them for small purchases, and receiving with the commodity purchased a balance of silver in return; by which means the surplus of silver that would otherwise encumber the retail dealer, is drawn off and dispersed into general circulation. But if there is as much silver as will transact the small payments independent of gold, the retail trader must then receive silver for small purchases; and it must of necessity accumulate in his hands.” (David Buchanan; “Inquiry into the Taxation and Commercial Policy of Great Britain.” Edinburgh, 1844, pp. 248, 249.)

<sup>36</sup> The mandarin Wan-mao-in, the Chinese Chancellor of the Exchequer, took it into his head one day to lay before the Son of Heaven a proposal that secretly aimed at converting the *assignats* of the empire into convertible bank-notes. The assignats Committee, in its report of April, 1854, gives him a severe snubbing. Whether he also received the traditional drubbing with bamboos is not stated. The concluding part of the report is as follows: — “The Committee has carefully examined his proposal and finds that it is entirely in favour of the merchants, and that no advantage will result to the crown.” (“Arbeiten der Kaiserlich Russischen Gesandtschaft zu Peking über China.” Aus dem Russischen von Dr. K. Abel und F. A. Mecklenburg. Erster Band. Berlin, 1858, p. 47 sq.) In his evidence before the

Committee of the House of Lords on the Bank Acts, a governor of the Bank of England says, with regard to the abrasion of gold coins during currency: "Every year a fresh class of sovereigns becomes too light. The class which one year passes with full weight, loses enough by wear and tear to draw the scales next year against it." (House of Lords' Committee, 1848, n. 429.)

<sup>37</sup> The following passage from Fullarton shows the want of clearness on the part of even the best writers on money, in their comprehension of its various functions: "That, as far as concerns our domestic exchanges, all the monetary functions which are usually performed by gold and silver coins, may be performed as effectually by a circulation of inconvertible notes paying no value but that factitious and conventional value they derive from the law is a fact which admits, I conceive, of no denial. Value of this description may be made to answer all the purposes of intrinsic value, and supersede even the necessity for a standard, provided only the quantity of issues be kept under due limitation." (Fullarton: "Regulation of Currencies," London, 1845, p. 21.) Because the commodity that serves as money is capable of being replaced in circulation by mere symbols of value, therefore its functions as a measure of value and a standard of prices are declared to be superfluous!

<sup>38</sup> From the fact that gold and silver, so far as they are coins, or exclusively serve as the medium of circulation, become mere tokens of themselves, Nicholas Barbon deduces the right of Governments "to raise money," that is, to give to the weight of silver that is called a shilling the name of a greater weight, such as a crown; and so to pay creditors shillings, instead of crowns. "Money does wear and grow lighter by often telling over... It is the denomination and currency of the money that men regard in bargaining, and not the quantity of silver... 'Tis the public authority upon the metal that makes it money." (N. Barbon, *l.c.*, pp. 29, 30, 25.)

<sup>39</sup> "Une richesse en argent n'est que ... richesse en productions, converties en argent." ["Monetary wealth is nothing but ... wealth in products, transformed into money"] (Mercier de la Rivière, *l.c.*) "Une valeur en productions n'a fait que changer de forme." ["A value in the form of products, which has merely changed its form."] (*Id.*, p. 486.)

<sup>40</sup> "'Tis by this practice' they keep all their goods and manufactures at such low rates." (Vanderlint, *l.c.*, pp. 95, 96.)

<sup>41</sup> "Money ... is a pledge." (John Bellers: "Essays about the Poor, Manufactures, Trade, Plantations, and Immorality," *Lond.*, 1699, p. 13.)

<sup>42</sup> A purchase, in a "categorical" sense, implies that gold and silver are already the converted form of commodities, or the product of a sale.

<sup>43</sup> Henry III., most Christian king of France, robbed cloisters of their relics, and turned them into money. It is well known what part the despoiling of the Delphic Temple, by the Phocians, played in the history of Greece. Temples with the ancients served as the dwellings of the gods of commodities. They were "sacred banks." With the Phoenicians, a trading people par excellence, money was the transmuted shape of everything. It was, therefore, quite in order that the virgins, who, at the feast of the Goddess of Love, gave themselves up to strangers, should offer to the goddess the piece of money they received.

<sup>43a</sup> "Gold, yellow, glittering, precious gold!  
 Thus much of this, will make black white; foul, fair;  
 Wrong, right; base, noble; old, young; coward, valiant.  
 ... What this, you gods? Why, this  
 Will lug your priests and servants from your sides;  
 Pluck stout men's pillows from below their heads;  
 This yellow slave  
 Will knit and break religions; bless the accurs'd;  
 Make the hoar leprosy ador'd; place thieves,

And give them title, knee and approbation,  
 With senators on the bench; this is it,  
 That makes the wappen'd widow wed again:  
 ... Come damned earth,  
 Though common whore of mankind."  
 (Shakespeare: *Timon of Athens*.)

<sup>43b</sup> "Money! Nothing worse  
 in our lives, so current, rampant, so corrupting.  
 Money — you demolish cities, root men from their homes,  
 you train and twist good minds and set them on  
 to the most atrocious schemes. No limit,  
 you make them adept at every kind of outrage,  
 every godless crimes — money!"  
 (Sophocles, *Antigone*.)

<sup>44</sup> "The desire of avarice to draw Pluto himself out of the bowels of the earth." (The *Deipnosophists*, VI, 23, Athenaeus)

<sup>45</sup> "Accrescere quanto più si può il numero de' venditori d'ogni merce, diminuire quanto più si puo il numero dei compratori, questi sono i cardini sui quali si raggirano tutte le operazioni di economia politica." ["These are the pivots around which all the measures of political economy turn: the maximum possible increase in the number of sellers of each commodity, and the maximum possible decrease in the number of buyers"] (Verri, *l.c.*, p. 52.)

<sup>46</sup> "There is required for carrying on the trade of the nation a determinate sum of specifick money which varies, and is sometimes more, sometimes less, as the circumstances we are in require.... This ebbing and flowing of money supplies and accommodates itself, without any aid of Politicians.... The buckets work alternately; when money is scarce, bullion is coined; when bullion is scarce, money is melted." (Sir D. North, *l.c.*, Postscript, p. 3.) John Stuart Mill, who for a long time was an official of the East India Company, confirms the fact that in India silver ornaments still continue to perform directly the functions of a hoard. The silver ornaments are brought out and coined when there is a high rate of interest, and go back again when the rate of interest falls. (J. S. Mill's *Evidence "Reports on Bank Acts,"* 1857, 2084.) According to a Parliamentary document of 1864 on the gold and silver import and export of India, the import of gold and silver in 1863 exceeded the export by £19,367,764. During the 8 years immediately preceding 1864, the excess of imports over exports of the precious metals amounted to £109,652,917. During this century far more than £200,000,000 has been coined in India.

<sup>47</sup> The following shows the debtor and creditor relations existing between English traders at the beginning of the 18th century. "Such a spirit of crudity reigns here in England among the men of trade, that is not to be met with in any other society of men, nor in any other kingdom of the world." ("An Essay on Credit and the Bankrupt Act," Lond., 1707, p. 2.)

<sup>48</sup> It will be seen from the following quotation from my book which appeared in 1859, why I take no notice in the text of an opposite form: "Contrariwise, in the process in M—C, the money can be alienated as a real means of purchase, and in that way, the price of the commodity can be realised before the use-value of the money is realised and the commodity actually delivered. This occurs constantly under the every-day form of prepayments. And it is under this form, that the English government purchases opium from the ryots of India.... In these cases, however, the money always acts as a means of purchase.... Of course capital also is advanced in the shape of money.... This point of view, however, does not fall within the horizon of simple circulation." ("Zur Kritik, &c.," pp. 119, 120.)

<sup>49</sup> The monetary crisis referred to in the text, being a phase of every crisis, must be clearly distinguished from that particular form of crisis, which also is called a monetary crisis, but which may be produced by itself as an independent phenomenon in such a way as to react only indirectly on industry and commerce. The pivot of these crises is to be found in moneyed capital, and their sphere of direct action is therefore the sphere of that capital, viz., banking, the stock exchange, and finance.

<sup>50</sup> “The sudden reversion from a system of credit to a system of hard cash heaps theoretical fright on top of the practical panic; and the dealers by whose agency circulation is affected, shudder before the impenetrable mystery in which their own economic relations are involved” (Karl Marx, *l.c.*, p. 126.) “The poor stand still, because the rich have no money to employ them, though they have the same land and hands to provide victuals and clothes, as ever they had; ...which is the true riches of a nation, and not the money.” John Bellers, *Proposals for Raising a College of Industry*, London, 1696, p3.

<sup>51</sup> The following shows how such times are exploited by the “amis du commerce.” “On one occasion (1839) an old grasping banker (in the city) in his private room raised the lid of the desk he sat over, and displayed to a friend rolls of bank-notes, saying with intense glee there were £600,000 of them, they were held to make money tight, and would all be let out after three o’clock on the same day.” (“The Theory of Exchanges. The Bank Charter Act of 1844.” Lond. 1864, p. 81). The *Observer*, a semi-official government organ, contained the following paragraph on 24th April, 1864: “Some very curious rumours are current of the means which have been resorted to in order to create a scarcity of banknotes.... Questionable as it would seem, to suppose that any trick of the kind would be adopted, the report has been so universal that it really deserves mention.”

<sup>52</sup> “The amount of purchases or contracts entered upon during the course of any given day, will not affect the quantity of money afloat on that particular day, but, in the vast majority of cases, will resolve themselves into multifarious drafts upon the quantity of money which may be afloat at subsequent dates more or less distant.... The bills granted or credits opened, to-day, need have no resemblance whatever, either in quantity, amount or duration, to those granted or entered upon to-morrow or next day, nay, many of today’s bills, and credits, when due, fall in with a mass of liabilities whose origins traverse a range of antecedent dates altogether indefinite, bills at 12, 6, 3 months or 1 often aggregating together to swell the common liabilities of one particular day....” (“The Currency Theory Reviewed; in a Letter to the Scottish People.” By a Banker in England. Edinburgh, 1845, pp. 29, 30 *passim*.)

<sup>53</sup> As an example of how little ready money is required in true commercial operations, I give below a statement by one of the largest London houses of its yearly receipts and payments. Its transactions during the year 1856, extending to many millions of pounds sterling, are here reduced to the scale of one million.

| <i>Receipts.</i>                          |          | <i>Payments.</i>          |          |
|---|----------|---------------------------|----------|
| Bankers’ and Merchants’                   | £533,596 | Bills payable after date  | £302,674 |
| Cheques on Bankers, &c. payable on demand | 357,715  | Cheques on London Bankers | 663,672  |
| Country Notes                             | 9,627    | Bank of England Notes     | 22,743   |
| Bank of England Notes                     | 68,554   | Gold                      | 9,427    |
| Gold                                      | 28,089   | Silver and Copper         | 1,484    |

---

|                    |                  |                  |
|--------------------|------------------|------------------|
| Silver and Copper  | 1,486            |                  |
| Post Office Orders | 933              |                  |
|                    | Total £1,000,000 | Total £1,000,000 |

“Report from the Select Committee on the Bank Acts, July, 1858,” p. lxxi.

<sup>54</sup> “The course of trade being thus turned, from exchanging of goods for goods, or delivering and taking, to selling and paying, all the bargains ... are now stated upon the foot of a Price in money.” (“An Essay upon Publick Credit.” 3rd Ed. Lond., 1710, p. 8.)

<sup>55</sup> “L’argent ... est devenu le bourreau de toutes choses.” Finance is the “alambic, qui a fait évaporer une quantité effroyable de biens et de denrées pour faire ce fatal précis.” “L’argent déclare la guerre à tout le genre humain.” [“Money ... has become the executioner of all things.” Finance is the “alembic that evaporates a frightful quantity of goods and commodities in order to obtain this fatal extract.” “Money [...] declares war [...] on the whole human race”] (Boisguillebert: “Dissertation sur la nature des richesses, de l’argent et des tributs.” Edit. Daire. Economistes financiers. Paris, 1843, t. i., pp. 413, 419, 417.)

<sup>56</sup> “On Whitsuntide, 1824,” says Mr. Craig before the Commons’ Committee of 1826, “there was such an immense demand for notes upon the banks of Edinburgh, that by 11 o’clock they had not a note left in their custody. They sent round to all the different banks to borrow, but could not get them, and many of the transactions were adjusted by slips of paper only; yet by three o’clock the whole of the notes were returned into the banks from which they had issued! It was a mere transfer from hand to hand. “Although the average effective circulation of bank-notes in Scotland is less than three millions sterling, yet on certain pay days in the year, every single note in the possession of the bankers, amounting in the whole to about £7,000,000, is called into activity. On these occasions the notes have a single and specific function to perform, and so soon as they have performed it, they flow back into the various banks from which they issued. (See John Fullarton, “Regulation of Currencies.” Lond. 1845, p. 86, note.) In explanation it should be stated, that in Scotland, at the date of Fullarton’s work, notes and not cheques were used to withdraw deposits.

<sup>57</sup> *Note by the Institute of Marxism-Leninism in the Russian edition:* Apparently a slip of the pen. When writing *inverse* the author evidently meant *direct*.

<sup>58</sup> To the question, “If there were occasion to raise 40 millions p. a., whether the same 6 millions (gold) ... would suffice for such revolutions and circulations thereof, as trade requires,” Petty replies in his usual masterly manner, “I answer yes: for the expense being 40 millions, if the revolutions were in such short circles, viz., weekly, as happens among poor artisans and labourers, who receive and pay every Saturday, then 40/52 parts of 1 million of money would answer these ends, but if the circles be quarterly, according to our custom of paying rent, and gathering taxes, then 10 millions were requisite. Wherefore, supposing payments in general to be of a mixed circle between one week and 13, then add 10 millions to 40/52, the half of which will be 5½, so as if we have 5½ millions we have enough.” (William Petty: “Political Anatomy of Ireland.” 1672, Edit.: Lond. 1691, pp. 13, 14.)

<sup>59</sup> Hence the absurdity of every law prescribing that the banks of a country shall form reserves of that precious metal alone which circulates at home. The “pleasant difficulties” thus self-created by the Bank of England, are well known. On the subject of the great epochs in the history of the changes in the relative value of gold and silver, see Karl Marx, l.c., p. 136 sq. Sir Robert Peel, by his Bank Act of 1844, sought to tide over the difficulty, by allowing the Bank of England to issue notes against silver

bullion, on condition that the reserve of silver should never exceed more than one-fourth of the reserve of gold. The value of silver being for that purpose estimated at its price in the London market.

*Added in the 4th German edition.* — [We find ourselves once more in a period of serious change in the relative values of gold and silver. About 25 years ago the ratio expressing the relative value of gold and silver was 15-1/2:1; now it is approximately 22:1, and silver is still constantly falling as against gold. This is essentially the result of a revolution in the mode of production of both metals. Formerly gold was obtained almost exclusively by washing it out from gold-bearing alluvial deposits, products of the weathering of auriferous rocks. Now this method has become inadequate and has been forced into the background by the processing of the quartz lodes themselves, a way of extraction which formerly was only of secondary importance, although well known to the ancients (Diodorus, III, 12-14) (Diodor's v. Sicilien "Historische Bibliothek," book III, 12-14. Stuttgart 1828, pp. 258-261). Moreover, not only were new huge silver deposits discovered in North America, in the Western part of the Rocky Mountains, but these and the Mexican silver mines were really opened up by the laying of railways, which made possible the shipment of modern machinery and fuel and in consequence the mining of silver on a very large scale at a low cost. However there is a great difference in the way the two metals occur in the quartz lodes. The gold is mostly native, but disseminated throughout the quartz in minute quantities. The whole mass of the vein must therefore be crushed and the gold either washed out or extracted by means of mercury. Often 1,000,000 grammes of quartz barely yield 1-3 and very seldom 30-60 grammes of gold. Silver is seldom found native, however it occurs in special quartz that is separated from the lode with comparative ease and contains mostly 40-90% silver; or it is contained, in smaller quantities, in copper, lead and other ores which in themselves are worthwhile working. From this alone it is apparent that the labour expended on the production of gold is rather increasing while that expended on silver production has decidedly decreased, which quite naturally explains the drop in the value of the latter. This fall in value would express itself in a still greater fall in price if the price of silver were not pegged even to-day by artificial means. But America's rich silver deposits have so far barely been tapped, and thus the prospects are that the value of this metal will keep on dropping for rather a long time to come. A still greater contributing factor here is the relative decrease in the requirement of silver for articles of general use and for luxuries, that is its replacement by plated goods, aluminium, etc. One may thus gauge the utopianism of the bimetallist idea that compulsory international quotation will raise silver again to the old value ratio of 1:15-1/2. It is more likely that silver will forfeit its money function more and more in the markets of the world. — *F E.*]

<sup>60</sup> The opponents, themselves, of the mercantile system, a system which considered the settlement of surplus trade balances in gold and silver as the aim of international trade, entirely misconceived the functions of money of the world. I have shown by the example of Ricardo in what way their false conception of the laws that regulate the quantity of the circulating medium, is reflected in their equally false conception of the international movement of the precious metals (l.c., pp. 150 sq.). His erroneous dogma: "An unfavourable balance of trade never arises but from a redundant currency.... The exportation of the coin is caused by its cheapness, and is not the effect, but the cause of an unfavourable balance," already occurs in Barbon: "The Balance of Trade, if there be one, is not the cause of sending away the money out of a nation; but that proceeds from the difference of the value of bullion in every country." (N. Barbon; l.c., pp. 59, 60.) MacCulloch in "The Literature of Political Economy, a classified catalogue, Lond. 1845," praises Barbon for this anticipation, but prudently passes over the naive forms, in which Barbon clothes the absurd supposition on which the "currency principle" is based. The absence of real criticism and even of honesty, in that catalogue culminates in the sections devoted to the history of the theory of money; the reason is that MacCulloch in this part of the work is flattering Lord Overstone whom he calls "facile princeps argentanorum."

<sup>61</sup> For instance, in subsidies, money loans for carrying on wars or for enabling banks to resume cash payments, &c., it is the money-form, and no other, of value that may be wanted.

<sup>62</sup> “I would desire, indeed, no more convincing evidence of the competency of the machinery of the hoards in specie-paying countries to perform every necessary office of international adjustment, without any sensible aid from the general circulation, than the facility with which France, when but just recovering from the shock of a destructive foreign invasion, completed within the space of 27 months the payment of her forced contribution of nearly 20 millions to the allied powers, and a considerable proportion of the sum in specie, without any perceptible contraction or derangement of her domestic currency, or even any alarming fluctuation of her exchanges.” (Fullerton, l.c., p. 141.) [Added in the 4th German edition. — We have a still more striking example in the facility with which the same France was able in 1871-73 to pay off within 30 months a forced contribution more than ten times as great, a considerable part of it likewise in specie. — *F. E.*]

<sup>63</sup> “L’argent se partage entre les nations relativement au besoin qu’elles en ont ... étant toujours attiré par les productions.” [“Money is shared among the nations in accordance with their need for it ... as it is always attracted by the products”] (Le Trosne, l.c., p. 916.) “The mines which are continually giving gold and silver, do give sufficient to supply such a needful balance to every nation.” (J. Vanderlint, l.c., p. 40.)

<sup>64</sup> “Exchanges rise and fall every week, and at some particular times in the year run high against a nation, and at other times run as high on the contrary.” (N. Barbon, l.c., p. 39)

<sup>65</sup> These various functions are liable to come into dangerous conflict with one another whenever gold and silver have also to serve as a fund for the conversion of bank-notes.

<sup>66</sup> “What money is more than of absolute necessity for a Home Trade, is dead stock ... and brings no profit to that country it’s kept in, but as it is transported in trade, as well as imported.” (John Bellers, “Essays,” p. 13.) “What if we have too much coin? We may melt down the heaviest and turn it into the splendour of plate, vessels or utensils of gold or silver, or send it out as a commodity, where the same is wanted or desired; or let it out at interest, where interest is high.” (W. Petty: “Quantulumcunque,” p. 39.) “Money is but the fat of the Body Politick, whereof too much doth as often hinder its agility, as too little makes it sick ... as fat lubricates the motion of the muscles, feeds in want of victuals, fills up the uneven cavities, and beautifies the body; so doth money in the state quicken its action, feeds from abroad in time of dearth at home, evens accounts ... and beautifies the whole; altho more especially the particular persons that have it in plenty.” (W. Petty, “Political Anatomy of Ireland,” p. 14.)

## **Part 2: Transformation of Money into Capital**

## Chapter 4: The General Formula for Capital

The circulation of commodities is the starting-point of capital. The production of commodities, their circulation, and that more developed form of their circulation called commerce, these form the historical ground-work from which it rises. The modern history of capital dates from the creation in the 16th century of a world-embracing commerce and a world-embracing market.

If we abstract from the material substance of the circulation of commodities, that is, from the exchange of the various use-values, and consider only the economic forms produced by this process of circulation, we find its final result to be money: this final product of the circulation of commodities is the first form in which capital appears.

As a matter of history, capital, as opposed to landed property, invariably takes the form at first of money; it appears as moneyed wealth, as the capital of the merchant and of the usurer.<sup>1</sup> But we have no need to refer to the origin of capital in order to discover that the first form of appearance of capital is money. We can see it daily under our very eyes. All new capital, to commence with, comes on the stage, that is, on the market, whether of commodities, labour, or money, even in our days, in the shape of money that by a definite process has to be transformed into capital.

The first distinction we notice between money that is money only, and money that is capital, is nothing more than a difference in their form of circulation.

The simplest form of the circulation of commodities is C-M-C, the transformation of commodities into money, and the change of the money back again into commodities; or selling in order to buy. But alongside of this form we find another specifically different form: M-C-M, the transformation of money into commodities, and the change of commodities back again into money; or buying in order to sell. Money that circulates in the latter manner is thereby transformed into, becomes capital, and is already potentially capital.

Now let us examine the circuit M-C-M a little closer. It consists, like the other, of two antithetical phases. In the first phase, M-C, or the purchase, the money is changed into a commodity. In the second phase, C-M, or the sale, the commodity is changed back again into money. The combination of these two phases constitutes the single movement whereby money is exchanged for a commodity, and the same commodity is again exchanged for money; whereby a commodity is bought in order to be sold, or, neglecting the distinction in form between buying and selling, whereby a commodity is bought with money, and then money is bought with a commodity.<sup>2</sup> The result, in which the phases of the process vanish, is the exchange of money for money, M-M. If I purchase 2,000 lbs. of cotton for £100, and resell the 2,000 lbs. of cotton for £110, I have, in fact, exchanged £100 for £110, money for money.

Now it is evident that the circuit M-C-M would be absurd and without meaning if the intention were to exchange by this means two equal sums of money, £100 for £100. The miser's plan would be far simpler and surer; he sticks to his £100 instead of exposing it to the dangers of circulation. And yet, whether the merchant who has paid £100 for his cotton sells it for £110, or lets it go for £100, or even £50, his money has, at all events, gone through a characteristic and original movement, quite different in kind from that which it goes through in the hands of the peasant who sells corn, and with the money thus set free buys clothes. We have therefore to examine first the distinguishing characteristics of the forms of the circuits M-C-M and C-M-C, and in doing this the real difference that underlies the mere difference of form will reveal itself.

Let us see, in the first place, what the two forms have in common.

Both circuits are resolvable into the same two antithetical phases, C-M, a sale, and M-C, a purchase. In each of these phases the same material elements - a commodity, and money, and the same economic dramatis personae, a buyer and a seller - confront one another. Each circuit is the unity of the same two antithetical phases, and in each case this unity is brought about by the intervention of three contracting parties, of whom one only sells, another only buys, while the third both buys and sells.

What, however, first and foremost distinguishes the circuit C-M-C from the circuit M-C-M, is the inverted order of succession of the two phases. The simple circulation of commodities begins with a sale and ends with a purchase, while the circulation of money as capital begins with a purchase and ends with a sale. In the one case both the starting-point and the goal are commodities, in the other they are money. In the first form the movement is brought about by the intervention of money, in the second by that of a commodity.

In the circulation C-M-C, the money is in the end converted into a commodity, that serves as a use-value; it is spent once for all. In the inverted form, M-C-M, on the contrary, the buyer lays out money in order that, as a seller, he may recover money. By the purchase of his commodity he throws money into circulation, in order to withdraw it again by the sale of the same commodity. He lets the money go, but only with the sly intention of getting it back again. The money, therefore, is not spent, it is merely advanced.<sup>3</sup>

In the circuit C-M-C, the same piece of money changes its place twice. The seller gets it from the buyer and pays it away to another seller. The complete circulation, which begins with the receipt, concludes with the payment, of money for commodities. It is the very contrary in the circuit M-C-M. Here it is not the piece of money that changes its place twice, but the commodity. The buyer takes it from the hands of the seller and passes it into the hands of another buyer. Just as in the simple circulation of commodities the double change of place of the same piece of money effects its passage from one hand into another, so here the double change of place of the same commodity brings about the reflux of the money to its point of departure.

Such reflux is not dependent on the commodity being sold for more than was paid for it. This circumstance influences only the amount of the money that comes back. The reflux itself takes place, so soon as the purchased commodity is resold, in other words, so soon as the circuit M-C-M is completed. We have here, therefore, a palpable difference between the circulation of money as capital, and its circulation as mere money.

The circuit C-M-C comes completely to an end, so soon as the money brought in by the sale of one commodity is abstracted again by the purchase of another.

If, nevertheless, there follows a reflux of money to its starting-point, this can only happen through a renewal or repetition of the operation. If I sell a quarter of corn for £3, and with this £3 buy clothes, the money, so far as I am concerned, is spent and done with. It belongs to the clothes merchant. If I now sell a second quarter of corn, money indeed flows back to me, not however as a sequel to the first transaction, but in consequence of its repetition. The money again leaves me, so soon as I complete this second transaction by a fresh purchase. Therefore, in the circuit C-M-C, the expenditure of money has nothing to do with its reflux. On the other hand, in M-C-M, the reflux of the money is conditioned by the very mode of its expenditure. Without this reflux, the operation fails, or the process is interrupted and incomplete, owing to the absence of its complementary and final phase, the sale.

The circuit C-M-C starts with one commodity, and finishes with another, which falls out of circulation and into consumption. Consumption, the satisfaction of wants, in one word, use-value,

is its end and aim. The circuit M-C-M, on the contrary, commences with money and ends with money. Its leading motive, and the goal that attracts it, is therefore mere exchange-value.

In the simple circulation of commodities, the two extremes of the circuit have the same economic form. They are both commodities, and commodities of equal value. But they are also use-values differing in their qualities, as, for example, corn and clothes. The exchange of products, of the different materials in which the labour of society is embodied, forms here the basis of the movement. It is otherwise in the circulation M-C-M, which at first sight appears purposeless, because tautological. Both extremes have the same economic form. They are both money, and therefore are not qualitatively different use-values; for money is but the converted form of commodities, in which their particular use-values vanish. To exchange £100 for cotton, and then this same cotton again for £100, is merely a roundabout way of exchanging money for money, the same for the same, and appears to be an operation just as purposeless as it is absurd.<sup>4</sup> One sum of money is distinguishable from another only by its amount. The character and tendency of the process M-C-M, is therefore not due to any qualitative difference between its extremes, both being money, but solely to their quantitative difference. More money is withdrawn from circulation at the finish than was thrown into it at the start. The cotton that was bought for £100 is perhaps resold for £100 + £10 or £110. The exact form of this process is therefore M-C-M', where  $M' = M + D M$  = the original sum advanced, plus an increment. This increment or excess over the original value I call "surplus-value." The value originally advanced, therefore, not only remains intact while in circulation, but adds to itself a surplus-value or expands itself. It is this movement that converts it into capital.

Of course, it is also possible, that in C-M-C, the two extremes C-C, say corn and clothes, may represent different quantities of value. The farmer may sell his corn above its value, or may buy the clothes at less than their value. He may, on the other hand, "be done" by the clothes merchant. Yet, in the form of circulation now under consideration, such differences in value are purely accidental. The fact that the corn and the clothes are equivalents, does not deprive the process of all meaning, as it does in M-C-M. The equivalence of their values is rather a necessary condition to its normal course.

The repetition or renewal of the act of selling in order to buy, is kept within bounds by the very object it aims at, namely, consumption or the satisfaction of definite wants, an aim that lies altogether outside the sphere of circulation. But when we buy in order to sell, we, on the contrary, begin and end with the same thing, money, exchange-value; and thereby the movement becomes interminable. No doubt,  $M$  becomes  $M + D M$ , £100 become £110. But when viewed in their qualitative aspect alone, £110 are the same as £100, namely money; and considered quantitatively, £110 is, like £100, a sum of definite and limited value. If now, the £110 be spent as money, they cease to play their part. They are no longer capital. Withdrawn from circulation, they become petrified into a hoard, and though they remained in that state till doomsday, not a single farthing would accrue to them. If, then, the expansion of value is once aimed at, there is just the same inducement to augment the value of the £110 as that of the £100; for both are but limited expressions for exchange-value, and therefore both have the same vocation to approach, by quantitative increase, as near as possible to absolute wealth. Momentarily, indeed, the value originally advanced, the £100 is distinguishable from the surplus-value of £10 that is annexed to it during circulation; but the distinction vanishes immediately. At the end of the process, we do not receive with one hand the original £100, and with the other, the surplus-value of £10. We simply get a value of £110, which is in exactly the same condition and fitness for commencing the expanding process, as the original £100 was. Money ends the movement only to begin it again.<sup>5</sup> Therefore, the final result of every separate circuit, in which a purchase and consequent

sale are completed, forms of itself the starting-point of a new circuit. The simple circulation of commodities - selling in order to buy - is a means of carrying out a purpose unconnected with circulation, namely, the appropriation of use-values, the satisfaction of wants. The circulation of money as capital is, on the contrary, an end in itself, for the expansion of value takes place only within this constantly renewed movement. The circulation of capital has therefore no limits.<sup>6</sup>

As the conscious representative of this movement, the possessor of money becomes a capitalist. His person, or rather his pocket, is the point from which the money starts and to which it returns. The expansion of value, which is the objective basis or main-spring of the circulation M-C-M, becomes his subjective aim, and it is only in so far as the appropriation of ever more and more wealth in the abstract becomes the sole motive of his operations, that he functions as a capitalist, that is, as capital personified and endowed with consciousness and a will. Use-values must therefore never be looked upon as the real aim of the capitalist;<sup>7</sup> neither must the profit on any single transaction. The restless never-ending process of profit-making alone is what he aims at.<sup>8</sup> This boundless greed after riches, this passionate chase after exchange-value<sup>9</sup>, is common to the capitalist and the miser; but while the miser is merely a capitalist gone mad, the capitalist is a rational miser. The never-ending augmentation of exchange-value, which the miser strives after, by seeking to save<sup>10</sup> his money from circulation, is attained by the more acute capitalist, by constantly throwing it afresh into circulation.<sup>11</sup>

The independent form, *i.e.*, the money-form, which the value of commodities assumes in the case of simple circulation, serves only one purpose, namely, their exchange, and vanishes in the final result of the movement. On the other hand, in the circulation M-C-M, both the money and the commodity represent only different modes of existence of value itself, the money its general mode, and the commodity its particular, or, so to say, disguised mode.<sup>12</sup> It is constantly changing from one form to the other without thereby becoming lost, and thus assumes an automatically active character. If now we take in turn each of the two different forms which self-expanding value successively assumes in the course of its life, we then arrive at these two propositions: Capital is money: Capital is commodities.<sup>13</sup> In truth, however, value is here the active factor in a process, in which, while constantly assuming the form in turn of money and commodities, it at the same time changes in magnitude, differentiates itself by throwing off surplus-value from itself; the original value, in other words, expands spontaneously. For the movement, in the course of which it adds surplus-value, is its own movement, its expansion, therefore, is automatic expansion. Because it is value, it has acquired the occult quality of being able to add value to itself. It brings forth living offspring, or, at the least, lays golden eggs.

Value, therefore, being the active factor in such a process, and assuming at one time the form of money, at another that of commodities, but through all these changes preserving itself and expanding, it requires some independent form, by means of which its identity may at any time be established. And this form it possesses only in the shape of money. It is under the form of money that value begins and ends, and begins again, every act of its own spontaneous generation. It began by being £100, it is now £110, and so on. But the money itself is only one of the two forms of value. Unless it takes the form of some commodity, it does not become capital. There is here no antagonism, as in the case of hoarding, between the money and commodities. The capitalist knows that all commodities, however scurvy they may look, or however badly they may smell, are in faith and in truth money, inwardly circumcised Jews, and what is more, a wonderful means whereby out of money to make more money.

In simple circulation, C-M-C, the value of commodities attained at the most a form independent of their use-values, *i.e.*, the form of money; but that same value now in the circulation M-C-M, or the circulation of capital, suddenly presents itself as an independent substance, endowed with a

motion of its own, passing through a life-process of its own, in which money and commodities are mere forms which it assumes and casts off in turn. Nay, more: instead of simply representing the relations of commodities, it enters now, so to say, into private relations with itself. It differentiates itself as original value from itself as surplus-value; as the father differentiates himself from himself qua the son, yet both are one and of one age: for only by the surplus-value of £10 does the £100 originally advanced become capital, and so soon as this takes place, so soon as the son, and by the son, the father, is begotten, so soon does their difference vanish, and they again become one, £110.

Value therefore now becomes value in process, money in process, and, as such, capital. It comes out of circulation, enters into it again, preserves and multiplies itself within its circuit, comes back out of it with expanded bulk, and begins the same round ever afresh.<sup>14</sup> M-M', money which begets money, such is the description of Capital from the mouths of its first interpreters, the Mercantilists.

Buying in order to sell, or, more accurately, buying in order to sell dearer, M-C-M', appears certainly to be a form peculiar to one kind of capital alone, namely, merchants' capital. But industrial capital too is money, that is changed into commodities, and by the sale of these commodities, is re-converted into more money. The events that take place outside the sphere of circulation, in the interval between the buying and selling, do not affect the form of this movement. Lastly, in the case of interest-bearing capital, the circulation M-C-M' appears abridged. We have its result without the intermediate stage, in the form M-M', "en style lapidaire" so to say, money that is worth more money, value that is greater than itself.

M-C-M' is therefore in reality the general formula of capital as it appears *prima facie* within the sphere of circulation.

---

<sup>1</sup> The contrast between the power, based on the personal relations of dominion and servitude, that is conferred by landed property, and the impersonal power that is given by money, is well expressed by the two French proverbs, "Nulle terre sans seigneur," and "L'argent n'a pas de maître," – "No land without its lord," and "Money has no master."

<sup>2</sup> "Avec de l'argent on achète des marchandises et avec des marchandises on achète de l'argent." ["With money one buys commodities, and with commodities one buys money"] (Mercier de la Rivière: "L'ordre naturel et essentiel des sociétés politiques," p. 543.)

<sup>3</sup> "When a thing is bought in order to be sold again, the sum employed is called money advanced; when it is bought not to be sold, it may be said to be expended." — (James Steuart: "Works," &c. Edited by Gen. Sir James Steuart, his son. Lond., 1805, V. I., p. 274.)

<sup>4</sup> "On n'échange pas de l'argent contre de l'argent," ["One does not exchange money for money,"] says Mercier de la Rivière to the Mercantilists (l.c., p. 486.) In a work, which, ex professo treats of "trade" and "speculation," occurs the following: "All trade consists in the exchange of things of different kinds; and the advantage" (to the merchant?) "arises out of this difference. To exchange a pound of bread against a pound of bread ... would be attended with no advantage; ... Hence trade is advantageously contrasted with gambling, which consists in a mere exchange of money for money." (Th. Corbet, "An Inquiry into the Causes and Modes of the Wealth of Individuals; or the Principles of Trade and Speculation Explained." London, 1841, p. 5.) Although Corbet does not see that M-M, the exchange of money for money, is the characteristic form of circulation, not only of merchants' capital but of all capital, yet at least he acknowledges that this form is common to gambling and to one species of trade, viz., speculation: but then comes MacCulloch and makes out, that to buy in order to sell, is to speculate, and thus the difference between Speculation and Trade vanishes. "Every transaction in which an individual buys produce in order to sell it again, is, in fact, a speculation."

(MacCulloch: “A Dictionary Practical, &c., of Commerce.” Lond., 1847, p. 1009.) With much more naïveté, Pinto, the Pindar of the Amsterdam Stock Exchange, remarks, “Le commerce est un jeu: (taken from Locke) et ce n’est pas avec des gueux qu’on peut gagner. Si l’on gagnait longtemps en tout avec tous, il faudrait rendre de bon accord les plus grandes parties du profit pour recommencer le jeu.” [“Trade is a game, and nothing can be won from beggars. If one won everything from everybody all the time, it would be necessary to give back the greater part of the profit voluntarily, in order to begin the game again”] (Pinto: “Traité de la Circulation et du Crédit.” Amsterdam, 1771. p. 231.)

<sup>5</sup> “Capital is divisible ... into the original capital and the profit, the increment to the capital ... although in practice this profit is immediately turned into capital, and set in motion with the original.” (F. Engels, “Umrisse zu einer Kritik der Nationalökonomie, in: Deutsch-Französische Jahrbücher, herausgegeben von Arnold Ruge und Karl Marx.” Paris, 1844, p. 99.)

<sup>6</sup> Aristotle opposes Oeconomic to Chrematistic. He starts from the former. So far as it is the art of gaining a livelihood, it is limited to procuring those articles that are necessary to existence, and useful either to a household or the state. “True wealth (o aleqinos ploutos) consists of such values in use; for the quantity of possessions of this kind, capable of making life pleasant, is not unlimited. There is, however, a second mode of acquiring things, to which we may by preference and with correctness give the name of Chrematistic, and in this case there appear to be no limits to riches and possessions. Trade (e kapelike is literally retail trade, and Aristotle takes this kind because in it values in use predominate) does not in its nature belong to Chrematistic, for here the exchange has reference only to what is necessary to themselves (the buyer or seller).” Therefore, as he goes on to show, the original form of trade was barter, but with the extension of the latter, there arose the necessity for money. On the discovery of money, barter of necessity developed into kapelike, into trading in commodities, and this again, in opposition to its original tendency, grew into Chrematistic, into the art of making money. Now Chrematistic is distinguishable from Oeconomic in this way, that “in the case of Chrematistic circulation is the source of riches poietike crematon ... dia chrematon diaboles. And it appears to revolve about money, for money is the beginning and end of this kind of exchange (to nomisma stoiceion tes allages estin). Therefore also riches, such as Chrematistic strives for, are unlimited. Just as every art that is not a means to an end, but an end in itself, has no limit to its aims, because it seeks constantly to approach nearer and nearer to that end, while those arts that pursue means to an end, are not boundless, since the goal itself imposes a limit upon them, so with Chrematistic, there are no bounds to its aims, these aims being absolute wealth. Oeconomic not Chrematistic has a limit ... the object of the former is something different from money, of the latter the augmentation of money.... By confounding these two forms, which overlap each other, some people have been led to look upon the preservation and increase of money ad infinitum as the end and aim of Oeconomic.” (Aristoteles, *De Rep.* edit. Bekker, lib. I.c. 8, 9. passim.)

<sup>7</sup> “Commodities (here used in the sense of use-values) are not the terminating object of the trading capitalist, money is his terminating object.” (Th. Chalmers, *On Pol. Econ. &c.*, 2nd Ed., Glasgow, 1832, pp. 165, 166.)

<sup>8</sup> “Il mercante non conta quasi per niente il lucro fatto, ma mira sempre al futuro.” [“The merchant counts the money he has made as almost nothing; he always looks to the future.”] (A. Genovesi, *Lezioni di Economia Civile* (1765), Custodi’s edit. of Italian Economists. Parte Moderna t. viii, p. 139.)

<sup>9</sup> “The inextinguishable passion for gain, the auri sacra fames, will always lead capitalists.” (MacCulloch: “The Principles of Polit. Econ.” London, 1830, p. 179.) This view, of course, does not prevent the same MacCulloch and others of his kidney, when in theoretical difficulties, such, for

example, as the question of over-production, from transforming the same capitalist into a moral citizen, whose sole concern is for use-values, and who even develops an insatiable hunger for boots, hats, eggs, calico, and other extremely familiar sorts of use-values.

<sup>10</sup> *Sozein* is a characteristic Greek expression for hoarding. So in English to save has the same two meanings: *sauver* and *épargner*.

<sup>11</sup> “Questo infinito che le cose non hanno in progresso, hanno in giro.” [“That infinity which things do not possess, they possess in circulation.”] (Galiani.)

<sup>12</sup> “Ce n’est pas la matière qui fait le capital, mais la valeur de ces matières.” [“It is not matter which makes capital, but the value of that matter.”] (J. B. Say: “Traité d’Econ. Polit.” 3ème éd. Paris, 1817, t. II., p. 429.)

<sup>13</sup> “Currency (!) employed in producing articles... is capital.” (Macleod: “The Theory and Practice of Banking.” London, 1855, v. 1, ch. i, p. 55.) “Capital is commodities.” (James Mill: “Elements of Pol. Econ.” Lond., 1821, p. 74.)

<sup>14</sup> Capital: “portion fructifiante de la richesse accumulée... valeur permanente, multipliante.” (Sismondi: “Nouveaux Principes d’Econ. Polit.,” t. i., p. 88, 89.)

## Chapter 5: Contradictions in the General Formula of Capital

The form which circulation takes when money becomes capital, is opposed to all the laws we have hitherto investigated bearing on the nature of commodities, value and money, and even of circulation itself. What distinguishes this form from that of the simple circulation of commodities, is the inverted order of succession of the two antithetical processes, sale and purchase. How can this purely formal distinction between these processes change their character as it were by magic? But that is not all. This inversion has no existence for two out of the three persons who transact business together. As capitalist, I buy commodities from A and sell them again to B, but as a simple owner of commodities, I sell them to B and then purchase fresh ones from A. A and B see no difference between the two sets of transactions. They are merely buyers or sellers. And I on each occasion meet them as a mere owner of either money or commodities, as a buyer or a seller, and, what is more, in both sets of transactions, I am opposed to A only as a buyer and to B only as a seller, to the one only as money, to the other only as commodities, and to neither of them as capital or a capitalist, or as representative of anything that is more than money or commodities, or that can produce any effect beyond what money and commodities can. For me the purchase from A and the sale to B are part of a series. But the connexion between the two acts exists for me alone. A does not trouble himself about my transaction with B, nor does B about my business with A. And if I offered to explain to them the meritorious nature of my action in inverting the order of succession, they would probably point out to me that I was mistaken as to that order of succession, and that the whole transaction, instead of beginning with a purchase and ending with a sale, began, on the contrary, with a sale and was concluded with a purchase. In truth, my first act, the purchase, was from the standpoint of A, a sale, and my second act, the sale, was from the standpoint of B, a purchase. Not content with that, A and B would declare that the whole series was superfluous and nothing but Hokus Pokus; that for the future A would buy direct from B, and B sell direct to A. Thus the whole transaction would be reduced to a single act forming an isolated, non-complemented phase in the ordinary circulation of commodities, a mere sale from A's point of view, and from B's, a mere purchase. The inversion, therefore, of the order of succession, does not take us outside the sphere of the simple circulation of commodities, and we must rather look, whether there is in this simple circulation anything permitting an expansion of the value that enters into circulation, and, consequently, a creation of surplus-value.

Let us take the process of circulation in a form under which it presents itself as a simple and direct exchange of commodities. This is always the case when two owners of commodities buy from each other, and on the settling day the amounts mutually owing are equal and cancel each other. The money in this case is money of account and serves to express the value of the commodities by their prices, but is not, itself, in the shape of hard cash, confronted with them. So far as regards use-values, it is clear that both parties may gain some advantage. Both part with goods that, as use-values, are of no service to them, and receive others that they can make use of. And there may also be a further gain. A, who sells wine and buys corn, possibly produces more wine, with given labour-time, than farmer B could, and B on the other hand, more corn than wine-grower A could. A, therefore, may get, for the same exchange-value, more corn, and B more wine, than each would respectively get without any exchange by producing his own corn and wine. With reference, therefore, to use-value, there is good ground for saying that "exchange is a transaction by which both sides gain."<sup>1</sup> It is otherwise with exchange-value. "A man who has

plenty of wine and no corn treats with a man who has plenty of corn and no wine; an exchange takes place between them of corn to the value of 50, for wine of the same value. This act produces no increase of exchange-value either for the one or the other; for each of them already possessed, before the exchange, a value equal to that which he acquired by means of that operation.”<sup>2</sup> The result is not altered by introducing money, as a medium of circulation, between the commodities, and making the sale and the purchase two distinct acts.<sup>3</sup> The value of a commodity is expressed in its price before it goes into circulation, and is therefore a precedent condition of circulation, not its result.<sup>4</sup>

Abstractedly considered, that is, apart from circumstances not immediately flowing from the laws of the simple circulation of commodities, there is in an exchange nothing (if we except the replacing of one use-value by another) but a metamorphosis, a mere change in the form of the commodity. The same exchange-value, i.e., the same quantity of incorporated social labour, remains throughout in the hands of the owner of the commodity, first in the shape of his own commodity, then in the form of the money for which he exchanged it, and lastly, in the shape of the commodity he buys with that money. This change of form does not imply a change in the magnitude of the value. But the change, which the value of the commodity undergoes in this process, is limited to a change in its money-form. This form exists first as the price of the commodity offered for sale, then as an actual sum of money, which, however, was already expressed in the price, and lastly, as the price of an equivalent commodity. This change of form no more implies, taken alone, a change in the quantity of value, than does the change of a £5 note into sovereigns, half sovereigns and shillings. So far therefore as the circulation of commodities effects a change in the form alone of their values, and is free from disturbing influences, it must be the exchange of equivalents. Little as Vulgar-Economy knows about the nature of value, yet whenever it wishes to consider the phenomena of circulation in their purity, it assumes that supply and demand are equal, which amounts to this, that their effect is nil. If therefore, as regards the use-values exchanged, both buyer and seller may possibly gain something, this is not the case as regards the exchange-values. Here we must rather say, “Where equality exists there can be no gain.”<sup>5</sup> It is true, commodities may be sold at prices deviating from their values, but these deviations are to be considered as infractions of the laws of the exchange of commodities<sup>6</sup>, which in its normal state is an exchange of equivalents, consequently, no method for increasing value.<sup>7</sup>

Hence, we see that behind all attempts to represent the circulation of commodities as a source of surplus-value, there lurks a *quid pro quo*, a mixing up of use-value and exchange-value. For instance, Condillac says: “It is not true that on an exchange of commodities we give value for value. On the contrary, each of the two contracting parties in every case, gives a less for a greater value. ... If we really exchanged equal values, neither party could make a profit. And yet, they both gain, or ought to gain. Why? The value of a thing consists solely in its relation to our wants. What is more to the one is less to the other, and *vice versa*. ... It is not to be assumed that we offer for sale articles required for our own consumption. ... We wish to part with a useless thing, in order to get one that we need; we want to give less for more. ... It was natural to think that, in an exchange, value was given for value, whenever each of the articles exchanged was of equal value with the same quantity of gold. ... But there is another point to be considered in our calculation. The question is, whether we both exchange something superfluous for something necessary.”<sup>8</sup> We see in this passage, how Condillac not only confuses use-value with exchange-value, but in a really childish manner assumes, that in a society, in which the production of commodities is well developed, each producer produces his own means of subsistence, and throws into circulation only the excess over his own requirements<sup>9</sup> Still, Condillac’s argument is frequently used by

modern economists, more especially when the point is to show, that the exchange of commodities in its developed form, commerce, is productive of surplus-value. For instance, "Commerce ... adds value to products, for the same products in the hands of consumers, are worth more than in the hands of producers, and it may strictly be considered an act of production."<sup>10</sup> But commodities are not paid for twice over, once on account of their use-value, and again on account of their value. And though the use-value of a commodity is more serviceable to the buyer than to the seller, its money-form is more serviceable to the seller. Would he otherwise sell it? We might therefore just as well say that the buyer performs "strictly an act of production," by converting stockings, for example, into money.

If commodities, or commodities and money, of equal exchange-value, and consequently equivalents, are exchanged, it is plain that no one abstracts more value from, than he throws into, circulation. There is no creation of surplus-value. And, in its normal form, the circulation of commodities demands the exchange of equivalents. But in actual practice, the process does not retain its normal form. Let us, therefore, assume an exchange of non-equivalents.

In any case the market for commodities is only frequented by owners of commodities, and the power which these persons exercise over each other, is no other than the power of their commodities. The material variety of these commodities is the material incentive to the act of exchange, and makes buyers and sellers mutually dependent, because none of them possesses the object of his own wants, and each holds in his hand the object of another's wants. Besides these material differences of their use-values, there is only one other difference between commodities, namely, that between their bodily form and the form into which they are converted by sale, the difference between commodities and money. And consequently the owners of commodities are distinguishable only as sellers, those who own commodities, and buyers, those who own money.

Suppose then, that by some inexplicable privilege, the seller is enabled to sell his commodities above their value, what is worth 100 for 110, in which case the price is nominally raised 10%. The seller therefore pockets a surplus-value of 10. But after he has sold he becomes a buyer. A third owner of commodities comes to him now as seller, who in this capacity also enjoys the privilege of selling his commodities 10% too dear. Our friend gained 10 as a seller only to lose it again as a buyer.<sup>11</sup> The net result is, that all owners of commodities sell their goods to one another at 10% above their value, which comes precisely to the same as if they sold them at their true value. Such a general and nominal rise of prices has the same effect as if the values had been expressed in weight of silver instead of in weight of gold. The nominal prices of commodities would rise, but the real relation between their values would remain unchanged.

Let us make the opposite assumption, that the buyer has the privilege of purchasing commodities under their value. In this case it is no longer necessary to bear in mind that he in his turn will become a seller. He was so before he became buyer; he had already lost 10% in selling before he gained 10% as buyer.<sup>12</sup> Everything is just as it was.

The creation of surplus-value, and therefore the conversion of money into capital, can consequently be explained neither on the assumption that commodities are sold above their value, nor that they are bought below their value.<sup>13</sup>

The problem is in no way simplified by introducing irrelevant matters after the manner of Col. Torrens: "Effectual demand consists in the power and inclination (!), on the part of consumers, to give for commodities, either by immediate or circuitous barter, some greater portion of ... capital than their production costs."<sup>14</sup> In relation to circulation, producers and consumers meet only as buyers and sellers. To assert that the surplus-value acquired by the producer has its origin in the fact that consumers pay for commodities more than their value, is only to say in other words: The owner of commodities possesses, as a seller, the privilege of selling too dear. The seller has

himself produced the commodities or represents their producer, but the buyer has to no less extent produced the commodities represented by his money, or represents their producer. The distinction between them is, that one buys and the other sells. The fact that the owner of the commodities, under the designation of producer, sells them over their value, and under the designation of consumer, pays too much for them, does not carry us a single step further.<sup>15</sup>

To be consistent therefore, the upholders of the delusion that surplus-value has its origin in a nominal rise of prices or in the privilege which the seller has of selling too dear, must assume the existence of a class that only buys and does not sell, i.e., only consumes and does not produce. The existence of such a class is inexplicable from the standpoint we have so far reached, viz., that of simple circulation. But let us anticipate. The money with which such a class is constantly making purchases, must constantly flow into their pockets, without any exchange, gratis, by might or right, from the pockets of the commodity-owners themselves. To sell commodities above their value to such a class, is only to crib back again a part of the money previously given to it.<sup>16</sup> The towns of Asia Minor thus paid a yearly money tribute to ancient Rome. With this money Rome purchased from them commodities, and purchased them too dear. The provincials cheated the Romans, and thus got back from their conquerors, in the course of trade, a portion of the tribute. Yet, for all that, the conquered were the really cheated. Their goods were still paid for with their own money. That is not the way to get rich or to create surplus-value.

Let us therefore keep within the bounds of exchange where sellers are also buyers, and buyers, sellers. Our difficulty may perhaps have arisen from treating the actors as personifications instead of as individuals.

A may be clever enough to get the advantage of B or C without their being able to retaliate. A sells wine worth £40 to B, and obtains from him in exchange corn to the value of £50. A has converted his £40 into £50, has made more money out of less, and has converted his commodities into capital. Let us examine this a little more closely. Before the exchange we had £40 worth of wine in the hands of A, and £50 worth of corn in those of B, a total value of £90. After the exchange we have still the same total value of £90. The value in circulation has not increased by one iota, it is only distributed differently between A and B. What is a loss of value to B is surplus-value to A; what is "minus" to one is "plus" to the other. The same change would have taken place, if A, without the formality of an exchange, had directly stolen the £10 from B. The sum of the values in circulation can clearly not be augmented by any change in their distribution, any more than the quantity of the precious metals in a country by a Jew selling a Queen Anne's farthing for a guinea. The capitalist class, as a whole, in any country, cannot over-reach themselves.<sup>17</sup>

Turn and twist then as we may, the fact remains unaltered. If equivalents are exchanged, no surplus-value results, and if non-equivalents are exchanged, still no surplus-value.<sup>18</sup> Circulation, or the exchange of commodities, begets no value.<sup>19</sup>

The reason is now therefore plain why, in analysing the standard form of capital, the form under which it determines the economic organisation of modern society, we entirely left out of consideration its most popular, and, so to say, antediluvian forms, merchants' capital and money-lenders' capital.

The circuit M-C-M, buying in order to sell dearer, is seen most clearly in genuine merchants' capital. But the movement takes place entirely within the sphere of circulation. Since, however, it is impossible, by circulation alone, to account for the conversion of money into capital, for the formation of surplus-value, it would appear, that merchants' capital is an impossibility, so long as equivalents are exchanged;<sup>20</sup> that, therefore, it can only have its origin in the two-fold advantage gained, over both the selling and the buying producers, by the merchant who parasitically shoves

himself in between them. It is in this sense that Franklin says, “war is robbery, commerce is generally cheating.”<sup>21</sup> If the transformation of merchants’ money into capital is to be explained otherwise than by the producers being simply cheated, a long series of intermediate steps would be necessary, which, at present, when the simple circulation of commodities forms our only assumption, are entirely wanting.

What we have said with reference to merchants’ capital, applies still more to money-lenders’ capital. In merchants’ capital, the two extremes, the money that is thrown upon the market, and the augmented money that is withdrawn from the market, are at least connected by a purchase and a sale, in other words by the movement of the circulation. In money-lenders’ capital the form M-C-M is reduced to the two extremes without a mean, M-M, money exchanged for more money, a form that is incompatible with the nature of money, and therefore remains inexplicable from the standpoint of the circulation of commodities. Hence Aristotle: “since chrematistic is a double science, one part belonging to commerce, the other to economic, the latter being necessary and praiseworthy, the former based on circulation and with justice disapproved (for it is not based on Nature, but on mutual cheating), therefore the usurer is most rightly hated, because money itself is the source of his gain, and is not used for the purposes for which it was invented. For it originated for the exchange of commodities, but interest makes out of money, more money. Hence its name (τοκοϛ interest and offspring). For the begotten are like those who beget them. But interest is money of money, so that of all modes of making a living, this is the most contrary to Nature.”<sup>22</sup>

In the course of our investigation, we shall find that both merchants’ capital and interest-bearing capital are derivative forms, and at the same time it will become clear, why these two forms appear in the course of history before the modern standard form of capital.

We have shown that surplus-value cannot be created by circulation, and, therefore, that in its formation, something must take place in the background, which is not apparent in the circulation itself.<sup>23</sup> But can surplus-value possibly originate anywhere else than in circulation, which is the sum total of all the mutual relations of commodity-owners, as far as they are determined by their commodities? Apart from circulation, the commodity-owner is in relation only with his own commodity. So far as regards value, that relation is limited to this, that the commodity contains a quantity of his own labour, that quantity being measured by a definite social standard. This quantity is expressed by the value of the commodity, and since the value is reckoned in money of account, this quantity is also expressed by the price, which we will suppose to be £10. But his labour is not represented both by the value of the commodity, and by a surplus over that value, not by a price of 10 that is also a price of 11, not by a value that is greater than itself. The commodity owner can, by his labour, create value, but not self-expanding value. He can increase the value of his commodity, by adding fresh labour, and therefore more value to the value in hand, by making, for instance, leather into boots. The same material has now more value, because it contains a greater quantity of labour. The boots have therefore more value than the leather, but the value of the leather remains what it was; it has not expanded itself, has not, during the making of the boots, annexed surplus-value. It is therefore impossible that outside the sphere of circulation, a producer of commodities can, without coming into contact with other commodity-owners, expand value, and consequently convert money or commodities into capital.

It is therefore impossible for capital to be produced by circulation, and it is equally impossible for it to originate apart from circulation. It must have its origin both in circulation and yet not in circulation.

We have, therefore, got a double result.

The conversion of money into capital has to be explained on the basis of the laws that regulate the exchange of commodities, in such a way that the starting-point is the exchange of equivalents.<sup>24</sup> Our friend, Moneybags, who as yet is only an embryo capitalist, must buy his commodities at their value, must sell them at their value, and yet at the end of the process must withdraw more value from circulation than he threw into it at starting. His development into a full-grown capitalist must take place, both within the sphere of circulation and without it. These are the conditions of the problem. *Hic Rhodus, hic salta!*<sup>25</sup>

<sup>1</sup> “L’échange est une transaction admirable dans laquelle les deux contractants gagnent - toujours (!)” [“Exchange is a transaction in which the two contracting parties always gain, both of them (!)”] (Destutt de Tracy: “Traité de la Volonté et de ses effets.” Paris, 1826, p. 68.) This work appeared afterwards as “Traité d’Econ. Polit.”

<sup>2</sup> “Mercier de la Rivière,” l. c., p. 544.

<sup>3</sup> “Que l’une de ces deux valeurs soit argent, ou qu’elles soient toutes deux marchandises usuelles, rien de plus indifférent en soi.” [“Whether one of those two values is money, or they are both ordinary commodities, is in itself a matter of complete indifference.”] (“Mercier de la Rivière,” l.c., p. 543.)

<sup>4</sup> “Ce ne sont pas les contractants qui prononcent sur la valeur; elle est décidée avant la convention.” [“It is not the parties to a contract who decide on the value; that has been decided before the contract.”] (Le Trosne, p. 906.)

<sup>5</sup> “Dove è egualità non è lucro.” (Galiani, “Della Moneta in Custodi, Parte Moderna,” t. iv., p. 244.)

<sup>6</sup> “L’échange devient désavantageux pour l’une des parties, lorsque quelque chose étrangère vient diminuer ou exagérer le prix; alors l’égalité est blessée, mais la lésion procède de cette cause et non de l’échange.” [“The exchange becomes unfavourable for one of the parties when some external circumstance comes to lessen or increase the price; then equality is infringed, but this infringement arises from that cause and not from the exchange itself.”] (Le Trosne, l.c., p. 904.)

<sup>7</sup> “L’échange est de sa nature un contrat d’égalité qui se fait de valeur pour valeur égale. Il n’est donc pas un moyen de s’enrichir, puisque l’on donne autant que l’on reçoit.” [“Exchange is by its nature a contract which rests on equality, i.e., it takes place between two equal values, and it is not a means of self-enrichment, since as much is given as is received.”] (Le Trosne, l.c., p. 903.)

<sup>8</sup> Condillac: “Le Commerce et le Gouvernement” (1776). Edit. Daire et Molinari in the “Mélanges d’Econ. Polit.” Paris, 1847, pp. 267, 291.

<sup>9</sup> Le Trosne, therefore, answers his friend Condillac with justice as follows: “Dans une ... société formée il n’y a pas de surabondant en aucun genre.” [“In a developed society absolutely nothing is superfluous.”] At the same time, in a bantering way, he remarks: “If both the persons who exchange receive more to an equal amount, and part with less to an equal amount, they both get the same.” It is because Condillac has not the remotest idea of the nature of exchange-value that he has been chosen by Herr Professor Wilhelm Roscher as a proper person to answer for the soundness of his own childish notions. See Roscher’s “Die Grundlagen der Nationalökonomie, Dritte Auflage,” 1858.

<sup>10</sup> S. P. Newman: “Elements of Polit. Econ.” Andover and New York, 1835, p. 175.

<sup>11</sup> “By the augmentation of the nominal value of the produce... sellers not enriched... since what they gain as sellers, they precisely expend in the quality of buyers.” (“The Essential Principles of the Wealth of Nations.” &c., London, 1797, p. 66.)

<sup>12</sup> “Si l’on est forcé de donner pour 18 livres une quantité de telle production qui en valait 24, lorsqu’on emploiera ce même argent à acheter, on aura également pour 18 l. ce que l’on payait 24.” [“If one is compelled to sell a quantity of a certain product for 18 livres when it has a value of 24 livres, when one employs the same amount of money in buying, one will receive for 18 livres the same quantity of the product as 24 livres would have bought otherwise.”] (Le Trosne, I. c., p. 897.)

<sup>13</sup> “Chaque vendeur ne peut donc parvenir à renchérir habituellement ses marchandises, qu’en se soumettant aussi à payer habituellement plus cher les marchandises des autres vendeurs; et par la même raison, chaque consommateur ne peut payer habituellement moins cher ce qu’il achète, qu’en se soumettant aussi à une diminution semblable sur le prix des choses qu’il vend.” [“A seller can normally only succeed in raising the prices of his commodities if he agrees to pay, by and large, more for the commodities of the other sellers; and for the same reason a consumer can normally only pay less for his purchases if he submits to a similar reduction in the prices of the things he sells.”] (Mercier de la Rivière, I. c., p. 555.)

<sup>14</sup> Torrens. “An Essay on the Production of Wealth.” London, 1821, p. 349.

<sup>15</sup> “The idea of profits being paid by the consumers, is, assuredly, very absurd. Who are the consumers?” (G. Ramsay: “An Essay on the Distribution of Wealth.” Edinburgh, 1836, p. 183.)

<sup>16</sup> “When a man is in want of a demand, does Mr. Malthus recommend him to pay some other person to take off his goods?” is a question put by an angry disciple of Ricardo to Malthus, who, like his disciple, Parson Chalmers, economically glorifies this class of simple buyers or consumers. (See “An Inquiry into those Principles Respecting the Nature of Demand and the Necessity of Consumption, lately advocated by Mr. Malthus,” &c. Lond., 1821, p. 55.)

<sup>17</sup> Destutt de Tracy, although, or perhaps because, he was a member of the Institute, held the opposite view. He says, industrial capitalists make profits because “they all sell for more than it has cost to produce. And to whom do they sell? In the first instance to one another.” (I. c., p. 239.)

<sup>18</sup> “L’échange qui se fait de deux valeurs égales n’augmente ni ne diminue la masse des valeurs subsistantes dans la société. L’échange de deux valeurs inégales ... ne change rien non plus à la somme des valeurs sociales, bien qu’il ajoute à la fortune de l’un ce qu’il ôte de la fortune de l’autre.” [“The exchange of two equal values neither increases nor diminishes the amount of the values available in society. Nor does the exchange of two unequal values ... change anything in the sum of social values, although it adds to the wealth of one person what it removes from the wealth of another.”] (J. B. Say, I. c., t. II, pp. 443, 444.) Say, not in the least troubled as to the consequences of this statement, borrows it, almost word for word, from the Physiocrats. The following example will show how Monsieur Say turned to account the writings of the Physiocrats, in his day quite forgotten, for the purpose of expanding the “value” of his own. His most celebrated saying, “On n’achète des produits qu’avec des produits” [“Products can only be bought with products.”] (I. c., t. II. p. 441.) runs as follows in the original physiocratic work: “Les productions ne se paient qu’avec des productions.” [“Products can only be paid for with products.”] (Le Trosne, I. c., p. 899.)

<sup>19</sup> “Exchange confers no value at all upon products.” (F. Wayland: “The Elements of Political Economy.” Boston, 1843, p. 169.)

<sup>20</sup> Under the rule of invariable equivalents commerce would be impossible. (G. Opdyke: “A Treatise on Polit. Economy.” New York, 1851, pp. 66-69.) “The difference between real value and exchange-value is based upon this fact, namely, that the value of a thing is different from the so-called equivalent given for it in trade, i.e., that this equivalent is no equivalent.” (F. Engels, I. c., p. 96.)

<sup>21</sup> Benjamin Franklin: Works, Vol. II, edit. Sparks in “Positions to be examined concerning National Wealth,” p. 376.

<sup>22</sup> Aristotle, I. c., c. 10.

<sup>23</sup> “Profit, in the usual condition of the market, is not made by exchanging. Had it not existed before, neither could it after that transaction.” (Ramsay, l.c., p. 184.)

<sup>24</sup> From the foregoing investigation, the reader will see that this statement only means that the formation of capital must be possible even though the price and value of a commodity be the same; for its formation cannot be attributed to any deviation of the one from the other. If prices actually differ from values, we must, first of all, reduce the former to the latter, in other words, treat the difference as accidental in order that the phenomena may be observed in their purity, and our observations not interfered with by disturbing circumstances that have nothing to do with the process in question. We know, moreover, that this reduction is no mere scientific process. The continual oscillations in prices, their rising and falling, compensate each other, and reduce themselves to an average price, which is their hidden regulator. It forms the guiding star of the merchant or the manufacturer in every undertaking that requires time. He knows that when a long period of time is taken, commodities are sold neither over nor under, but at their average price. If therefore he thought about the matter at all, he would formulate the problem of the formation of capital as follows: How can we account for the origin of capital on the supposition that prices are regulated by the average price, i. e., ultimately by the value of the commodities? I say “ultimately,” because average prices do not directly coincide with the values of commodities, as Adam Smith, Ricardo, and others believe.

<sup>25</sup> “Hic Rhodus, hic saltus!” – Latin, usually translated: “Rhodes is here, here is where you jump!”

Originates from the traditional Latin translation of the punch line from Aesop’s fable *The Boastful Athlete* which has been the subject of some mistranslations. In Greek, the maxim reads:

“ἰδοῦ ἡ ρόδος,  
ἰδοῦ καὶ τὸ πῆδημα”

The story is that an athlete boasts that when in Rhodes, he performed a stupendous jump, and that there were witnesses who could back up his story. A bystander then remarked, ‘Alright! Let’s say this is Rhodes, demonstrate the jump here and now.’ The fable shows that people must be known by their deeds, not by their own claims for themselves. In the context in which Hegel used it in the *Philosophy of Right*, this could be taken to mean that the philosophy of right must have to do with the *actuality* of modern society, not the theories and ideals that societies create for themselves, nor, as Hegel goes on to say, to “teach the world what it ought to be.”

The epigram is given by Hegel first in Greek, then in Latin (in the form “*Hic Rhodus, hic saltus*”), and he then says: “With little change, the above saying would read (in German): “*Hier ist die Rose, hier tanze*”: “Here is the rose, dance here”

This is taken to be an allusion to the ‘rose in the cross’ of the Rosicrucians (who claimed to possess esoteric knowledge with which they could transform social life), implying that the material for understanding and changing society is given in society itself, not in some other-worldly theory, punning first on the Greek (*Rhodos* = Rhodes, *rhodon* = rose), then on the Latin (*saltus* = jump [noun], *salta* = dance [imperative]). [MIA Editors.]

## Chapter 6: The Buying and Selling of Labour-Power

The change of value that occurs in the case of money intended to be converted into capital, cannot take place in the money itself, since in its function of means of purchase and of payment, it does no more than realise the price of the commodity it buys or pays for; and, as hard cash, it is value petrified, never varying.<sup>1</sup> Just as little can it originate in the second act of circulation, the re-sale of the commodity, which does no more than transform the article from its bodily form back again into its money-form. The change must, therefore, take place in the commodity bought by the first act, M-C, but not in its value, for equivalents are exchanged, and the commodity is paid for at its full value. We are, therefore, forced to the conclusion that the change originates in the use-value, as such, of the commodity, i.e., in its consumption. In order to be able to extract value from the consumption of a commodity, our friend, Moneybags, must be so lucky as to find, within the sphere of circulation, in the market, a commodity, whose use-value possesses the peculiar property of being a source of value, whose actual consumption, therefore, is itself an embodiment of labour, and, consequently, a creation of value. The possessor of money does find on the market such a special commodity in capacity for labour or labour-power.

By labour-power or capacity for labour is to be understood the aggregate of those mental and physical capabilities existing in a human being, which he exercises whenever he produces a use-value of any description.

But in order that our owner of money may be able to find labour-power offered for sale as a commodity, various conditions must first be fulfilled. The exchange of commodities of itself implies no other relations of dependence than those which result from its own nature. On this assumption, labour-power can appear upon the market as a commodity, only if, and so far as, its possessor, the individual whose labour-power it is, offers it for sale, or sells it, as a commodity. In order that he may be able to do this, he must have it at his disposal, must be the untrammelled owner of his capacity for labour, i.e., of his person.<sup>2</sup> He and the owner of money meet in the market, and deal with each other as on the basis of equal rights, with this difference alone, that one is buyer, the other seller; both, therefore, equal in the eyes of the law. The continuance of this relation demands that the owner of the labour-power should sell it only for a definite period, for if he were to sell it rump and stump, once for all, he would be selling himself, converting himself from a free man into a slave, from an owner of a commodity into a commodity. He must constantly look upon his labour-power as his own property, his own commodity, and this he can only do by placing it at the disposal of the buyer temporarily, for a definite period of time. By this means alone can he avoid renouncing his rights of ownership over it.<sup>3</sup>

The second essential condition to the owner of money finding labour-power in the market as a commodity is this – that the labourer instead of being in the position to sell commodities in which his labour is incorporated, must be obliged to offer for sale as a commodity that very labour-power, which exists only in his living self.

In order that a man may be able to sell commodities other than labour-power, he must of course have the means of production, as raw material, implements, &c. No boots can be made without leather. He requires also the means of subsistence. Nobody – not even “a musician of the future” – can live upon future products, or upon use-values in an unfinished state; and ever since the first moment of his appearance on the world’s stage, man always has been, and must still be a consumer, both before and while he is producing. In a society where all products assume the form

of commodities, these commodities must be sold after they have been produced, it is only after their sale that they can serve in satisfying the requirements of their producer. The time necessary for their sale is superadded to that necessary for their production.

For the conversion of his money into capital, therefore, the owner of money must meet in the market with the free labourer, free in the double sense, that as a free man he can dispose of his labour-power as his own commodity, and that on the other hand he has no other commodity for sale, is short of everything necessary for the realisation of his labour-power.

The question why this free labourer confronts him in the market, has no interest for the owner of money, who regards the labour-market as a branch of the general market for commodities. And for the present it interests us just as little. We cling to the fact theoretically, as he does practically. One thing, however, is clear – Nature does not produce on the one side owners of money or commodities, and on the other men possessing nothing but their own labour-power. This relation has no natural basis, neither is its social basis one that is common to all historical periods. It is clearly the result of a past historical development, the product of many economic revolutions, of the extinction of a whole series of older forms of social production.

So, too, the economic categories, already discussed by us, bear the stamp of history. Definite historical conditions are necessary that a product may become a commodity. It must not be produced as the immediate means of subsistence of the producer himself. Had we gone further, and inquired under what circumstances all, or even the majority of products take the form of commodities, we should have found that this can only happen with production of a very specific kind, capitalist production. Such an inquiry, however, would have been foreign to the analysis of commodities. Production and circulation of commodities can take place, although the great mass of the objects produced are intended for the immediate requirements of their producers, are not turned into commodities, and consequently social production is not yet by a long way dominated in its length and breadth by exchange-value. The appearance of products as commodities pre-supposes such a development of the social division of labour, that the separation of use-value from exchange-value, a separation which first begins with barter, must already have been completed. But such a degree of development is common to many forms of society, which in other respects present the most varying historical features. On the other hand, if we consider money, its existence implies a definite stage in the exchange of commodities. The particular functions of money which it performs, either as the mere equivalent of commodities, or as means of circulation, or means of payment, as hoard or as universal money, point, according to the extent and relative preponderance of the one function or the other, to very different stages in the process of social production. Yet we know by experience that a circulation of commodities relatively primitive, suffices for the production of all these forms. Otherwise with capital. The historical conditions of its existence are by no means given with the mere circulation of money and commodities. It can spring into life, only when the owner of the means of production and subsistence meets in the market with the free labourer selling his labour-power. And this one historical condition comprises a world's history. Capital, therefore, announces from its first appearance a new epoch in the process of social production.<sup>4</sup>

We must now examine more closely this peculiar commodity, labour-power. Like all others it has a value.<sup>5</sup> How is that value determined?

The value of labour-power is determined, as in the case of every other commodity, by the labour-time necessary for the production, and consequently also the reproduction, of this special article. So far as it has value, it represents no more than a definite quantity of the average labour of society incorporated in it. Labour-power exists only as a capacity, or power of the living individual. Its production consequently pre-supposes his existence. Given the individual, the

production of labour-power consists in his reproduction of himself or his maintenance. For his maintenance he requires a given quantity of the means of subsistence. Therefore the labour-time requisite for the production of labour-power reduces itself to that necessary for the production of those means of subsistence; in other words, the value of labour-power is the value of the means of subsistence necessary for the maintenance of the labourer. Labour-power, however, becomes a reality only by its exercise; it sets itself in action only by working. But thereby a definite quantity of human muscle, nerve, brain, &c., is wasted, and these require to be restored. This increased expenditure demands a larger income.<sup>6</sup> If the owner of labour-power works to-day, to-morrow he must again be able to repeat the same process in the same conditions as regards health and strength. His means of subsistence must therefore be sufficient to maintain him in his normal state as a labouring individual. His natural wants, such as food, clothing, fuel, and housing, vary according to the climatic and other physical conditions of his country. On the other hand, the number and extent of his so-called necessary wants, as also the modes of satisfying them, are themselves the product of historical development, and depend therefore to a great extent on the degree of civilisation of a country, more particularly on the conditions under which, and consequently on the habits and degree of comfort in which, the class of free labourers has been formed.<sup>7</sup> In contradistinction therefore to the case of other commodities, there enters into the determination of the value of labour-power a historical and moral element. Nevertheless, in a given country, at a given period, the average quantity of the means of subsistence necessary for the labourer is practically known.

The owner of labour-power is mortal. If then his appearance in the market is to be continuous, and the continuous conversion of money into capital assumes this, the seller of labour-power must perpetuate himself, "in the way that every living individual perpetuates himself, by procreation."<sup>8</sup> The labour-power withdrawn from the market by wear and tear and death, must be continually replaced by, at the very least, an equal amount of fresh labour-power. Hence the sum of the means of subsistence necessary for the production of labour-power must include the means necessary for the labourer's substitutes, i.e., his children, in order that this race of peculiar commodity-owners may perpetuate its appearance in the market.<sup>9</sup>

In order to modify the human organism, so that it may acquire skill and handiness in a given branch of industry, and become labour-power of a special kind, a special education or training is requisite, and this, on its part, costs an equivalent in commodities of a greater or less amount. This amount varies according to the more or less complicated character of the labour-power. The expenses of this education (excessively small in the case of ordinary labour-power), enter pro tanto into the total value spent in its production.

The value of labour-power resolves itself into the value of a definite quantity of the means of subsistence. It therefore varies with the value of these means or with the quantity of labour requisite for their production.

Some of the means of subsistence, such as food and fuel, are consumed daily, and a fresh supply must be provided daily. Others such as clothes and furniture last for longer periods and require to be replaced only at longer intervals. One article must be bought or paid for daily, another weekly, another quarterly, and so on. But in whatever way the sum total of these outlays may be spread over the year, they must be covered by the average income, taking one day with another. If the total of the commodities required daily for the production of labour-power = A, and those required weekly = B, and those required quarterly = C, and so on, the daily average of these commodities =  $(365A + 52B + 4C + \&c) / 365$ . Suppose that in this mass of commodities requisite for the average day there are embodied 6 hours of social labour, then there is incorporated daily in labour-power half a day's average social labour, in other words, half a day's

labour is requisite for the daily production of labour-power. This quantity of labour forms the value of a day's labour-power or the value of the labour-power daily reproduced. If half a day's average social labour is incorporated in three shillings, then three shillings is the price corresponding to the value of a day's labour-power. If its owner therefore offers it for sale at three shillings a day, its selling price is equal to its value, and according to our supposition, our friend Moneybags, who is intent upon converting his three shillings into capital, pays this value.

The minimum limit of the value of labour-power is determined by the value of the commodities, without the daily supply of which the labourer cannot renew his vital energy, consequently by the value of those means of subsistence that are physically indispensable. If the price of labour-power fall to this minimum, it falls below its value, since under such circumstances it can be maintained and developed only in a crippled state. But the value of every commodity is determined by the labour-time requisite to turn it out so as to be of normal quality.

It is a very cheap sort of sentimentality which declares this method of determining the value of labour-power, a method prescribed by the very nature of the case, to be a brutal method, and which wails with Rossi that, "To comprehend capacity for labour (*puissance de travail*) at the same time that we make abstraction from the means of subsistence of the labourers during the process of production, is to comprehend a phantom (*être de raison*). When we speak of labour, or capacity for labour, we speak at the same time of the labourer and his means of subsistence, of labourer and wages."<sup>10</sup> When we speak of capacity for labour, we do not speak of labour, any more than when we speak of capacity for digestion, we speak of digestion. The latter process requires something more than a good stomach. When we speak of capacity for labour, we do not abstract from the necessary means of subsistence. On the contrary, their value is expressed in its value. If his capacity for labour remains unsold, the labourer derives no benefit from it, but rather he will feel it to be a cruel nature-imposed necessity that this capacity has cost for its production a definite amount of the means of subsistence and that it will continue to do so for its reproduction. He will then agree with Sismondi: "that capacity for labour ... is nothing unless it is sold."<sup>11</sup>

One consequence of the peculiar nature of labour-power as a commodity is, that its use-value does not, on the conclusion of the contract between the buyer and seller, immediately pass into the hands of the former. Its value, like that of every other commodity, is already fixed before it goes into circulation, since a definite quantity of social labour has been spent upon it; but its use-value consists in the subsequent exercise of its force. The alienation of labour-power and its actual appropriation by the buyer, its employment as a use-value, are separated by an interval of time. But in those cases in which the formal alienation by sale of the use-value of a commodity, is not simultaneous with its actual delivery to the buyer, the money of the latter usually functions as means of payment.<sup>12</sup> In every country in which the capitalist mode of production reigns, it is the custom not to pay for labour-power before it has been exercised for the period fixed by the contract, as for example, the end of each week. In all cases, therefore, the use-value of the labour-power is advanced to the capitalist: the labourer allows the buyer to consume it before he receives payment of the price; he everywhere gives credit to the capitalist. That this credit is no mere fiction, is shown not only by the occasional loss of wages on the bankruptcy of the capitalist,<sup>13</sup> but also by a series of more enduring consequences.<sup>14</sup> Nevertheless, whether money serves as a means of purchase or as a means of payment, this makes no alteration in the nature of the exchange of commodities. The price of the labour-power is fixed by the contract, although it is not realised till later, like the rent of a house. The labour-power is sold, although it is only paid for at a later period. It will, therefore, be useful, for a clear comprehension of the relation of the parties, to assume provisionally, that the possessor of labour-power, on the occasion of each sale, immediately receives the price stipulated to be paid for it.

We now know how the value paid by the purchaser to the possessor of this peculiar commodity, labour-power, is determined. The use-value which the former gets in exchange, manifests itself only in the actual utilisation, in the consumption of the labour-power. The money-owner buys everything necessary for this purpose, such as raw material, in the market, and pays for it at its full value. The consumption of labour-power is at one and the same time the production of commodities and of surplus-value. The consumption of labour-power is completed, as in the case of every other commodity, outside the limits of the market or of the sphere of circulation. Accompanied by Mr. Moneybags and by the possessor of labour-power, we therefore take leave for a time of this noisy sphere, where everything takes place on the surface and in view of all men, and follow them both into the hidden abode of production, on whose threshold there stares us in the face “No admittance except on business.” Here we shall see, not only how capital produces, but how capital is produced. We shall at last force the secret of profit making.

This sphere that we are deserting, within whose boundaries the sale and purchase of labour-power goes on, is in fact a very Eden of the innate rights of man. There alone rule Freedom, Equality, Property and Bentham. Freedom, because both buyer and seller of a commodity, say of labour-power, are constrained only by their own free will. They contract as free agents, and the agreement they come to, is but the form in which they give legal expression to their common will. Equality, because each enters into relation with the other, as with a simple owner of commodities, and they exchange equivalent for equivalent. Property, because each disposes only of what is his own. And Bentham, because each looks only to himself. The only force that brings them together and puts them in relation with each other, is the selfishness, the gain and the private interests of each. Each looks to himself only, and no one troubles himself about the rest, and just because they do so, do they all, in accordance with the pre-established harmony of things, or under the auspices of an all-shrewd providence, work together to their mutual advantage, for the common weal and in the interest of all.

On leaving this sphere of simple circulation or of exchange of commodities, which furnishes the “Free-trader *Vulgaris*” with his views and ideas, and with the standard by which he judges a society based on capital and wages, we think we can perceive a change in the physiognomy of our *dramatis personae*. He, who before was the money-owner, now strides in front as capitalist; the possessor of labour-power follows as his labourer. The one with an air of importance, smirking, intent on business; the other, timid and holding back, like one who is bringing his own hide to market and has nothing to expect but – a hiding.

---

<sup>1</sup> “In the form of money ... capital is productive of no profit.” (Ricardo: “Princ. of Pol. Econ.,” p. 267.)

<sup>2</sup> In encyclopaedias of classical antiquities we find such nonsense as this — that in the ancient world capital was fully developed, “except that the free labourer and a system of credit was wanting.” Mommsen also, in his “History of Rome,” commits, in this respect, one blunder after another.

<sup>3</sup> Hence legislation in various countries fixes a maximum for labour-contracts. Wherever free labour is the rule, the laws regulate the mode of terminating this contract. In some States, particularly in Mexico (before the American Civil War, also in the territories taken from Mexico, and also, as a matter of fact, in the Danubian provinces till the revolution effected by Kusa), slavery is hidden under the form of *peonage*. By means of advances, repayable in labour, which are handed down from generation to generation, not only the individual labourer, but his family, become, *de facto*, the property of other persons and their families. Juarez abolished *peonage*. The so-called Emperor Maximilian re-established it by a decree, which, in the House of Representatives at Washington, was aptly denounced as a decree for the re-introduction of slavery into Mexico. “I may make over to another the

use, for a limited time, of my particular bodily and mental aptitudes and capabilities; because in consequence of this restriction, they are impressed with a character of alienation with regard to me as a whole. But by the alienation of all my labour-time and the whole of my work, I should be converting the substance itself, in other words, my general activity and reality, my person, into the property of another.” (Hegel, “Philosophie des Rechts.” Berlin, 1840, p. 104, § 67.)

<sup>4</sup> The capitalist epoch is therefore characterised by this, that labour-power takes in the eyes of the labourer himself the form of a commodity which is his property; his labour consequently becomes wage-labour. On the other hand, it is only from this moment that the produce of labour universally becomes a commodity.

<sup>5</sup> “The value or worth of a man, is as of all other things his price — that is to say, so much as would be given for the use of his power.” (Th. Hobbes: “Leviathan” in Works, Ed. Molesworth. Lond. 1839-44, v. iii. p. 76.)

<sup>6</sup> Hence the Roman *Villicus*, as overlooker of the agricultural slaves, received “more meagre fare than working slaves, because his work was lighter.” (Th. Mommsen, *Röm. Geschichte*, 1856, p. 810.)

<sup>7</sup> Compare W. Th. Thornton: “Over-population and its Remedy,” Lond., 1846.

<sup>8</sup> Petty.

<sup>9</sup> “Its (labour’s) natural price ... consists in such a quantity of necessaries and comforts of life, as, from the nature of the climate, and the habits of the country, are necessary to support the labourer, and to enable him to rear such a family as may preserve, in the market, an undiminished supply of labour.” (R. Torrens: “An Essay on the External Corn Trade.” Lond. 1815, p. 62.) The word labour is here wrongly used for labour-power.

<sup>10</sup> Rossi: “Cours d’Econ. Polit.,” Bruxelles, 1842, p. 370.

<sup>11</sup> Sismondi: “Nouv. Princ. etc.,” t. I, p. 112.

<sup>12</sup> “All labour is paid after it has ceased.” (“An Inquiry into those Principles Respecting the Nature of Demand,” &c., p. 104.) *Le crédit commercial a dû commencer au moment où l’ouvrier, premier artisan de la production, a pu, au moyen de ses économies, attendre le salaire de son travail jusqu’à la fin de la semaine, de la quinzaine, du mois, du trimestre, &c.* [“The system of commercial credit had to start at the moment when the labourer, the prime creator of products, could, thanks to his savings, wait for his wages until the end of the week.”] (Ch. Ganiilh: “Des Systèmes d’Econ. Polit.” 2<sup>ème</sup> édit. Paris, 1821, t. II, p. 150.)

<sup>13</sup> “L’ouvrier prête son industrie,” but adds Storch slyly: he “risks nothing” except “de perdre son salaire ... l’ouvrier ne transmet rien de matériel.” [“The labourer lends his industry ... the loss of his wages ... the labourer does not hand over anything of a material nature.”] (Storch: “Cours d’Econ. Polit.” Pétersbourg, 1815, t. II., p. 37.)

<sup>14</sup> One example. In London there are two sorts of bakers, the “full priced,” who sell bread at its full value, and the “undersellers,” who sell it under its value. The latter class comprises more than three-fourths of the total number of bakers. (p. xxxii in the Report of H. S. Tremenheere, commissioner to examine into “the grievances complained of by the journeymen bakers,” &c., Lond. 1862.) The undersellers, almost without exception, sell bread adulterated with alum, soap, pearl ashes, chalk, Derbyshire stone-dust, and such like agreeable nourishing and wholesome ingredients. (See the above cited Blue book, as also the report of “the committee of 1855 on the adulteration of bread,” and Dr. Hassall’s “Adulterations Detected,” 2nd Ed. Lond. 1861.) Sir John Gordon stated before the committee of 1855, that “in consequence of these adulterations, the poor man, who lives on two pounds of bread a day, does not now get one fourth part of nourishing matter, let alone the deleterious effects on his health.” Tremenheere states (l.c., p. xlvi), as the reason, why a very large part of the working-class, although well aware of this adulteration, nevertheless accept the alum, stone-dust, &c.,

---

as part of their purchase: that it is for them “a matter of necessity to take from their baker or from the chandler’s shop, such bread as they choose to supply.” As they are not paid their wages before the end of the week, they in their turn are unable “to pay for the bread consumed by their families, during the week, before the end of the week,” and Tremenheere adds on the evidence of witnesses, “it is notorious that bread composed of those mixtures, is made expressly for sale in this manner.” In many English and still more Scotch agricultural districts, wages are paid fortnightly and even monthly; with such long intervals between the payments, the agricultural labourer is obliged to buy on credit... He must pay higher prices, and is in fact tied to the shop which gives him credit. Thus at Horningham in Wilts, for example, where the wages are monthly, the same flour that he could buy elsewhere at 1s 10d per stone, costs him 2s 4d per stone. (“Sixth Report” on “Public Health” by “The Medical Officer of the Privy Council, &c., 1864,” p.264.) “The block printers of Paisley and Kilmarnock enforced, by a strike, fortnightly, instead of monthly payment of wages.” (“Reports of the Inspectors of Factories for 31st Oct., 1853,” p. 34.) As a further pretty result of the credit given by the workmen to the capitalist, we may refer to the method current in many English coal mines, where the labourer is not paid till the end of the month, and in the meantime, receives sums on account from the capitalist, often in goods for which the miner is obliged to pay more than the market price (Truck-system). “It is a common practice with the coal masters to pay once a month, and advance cash to their workmen at the end of each intermediate week. The cash is given in the shop” (i.e., the Tommy shop which belongs to the master); “the men take it on one side and lay it out on the other.” (“Children’s Employment Commission, III. Report,” Lond. 1864, p. 38, n. 192.)

## **Part 3: The Production of Absolute Surplus-Value**

## Chapter 7: The Labour-Process and the Process of Producing Surplus-Value

### Section 1: The Labour-Process or the Production of Use-Values

The capitalist buys labour-power in order to use it; and labour-power in use is labour itself. The purchaser of labour-power consumes it by setting the seller of it to work. By working, the latter becomes actually, what before he only was potentially, labour-power in action, a labourer. In order that his labour may re-appear in a commodity, he must, before all things, expend it on something useful, on something capable of satisfying a want of some sort. Hence, what the capitalist sets the labourer to produce, is a particular use-value, a specified article. The fact that the production of use-values, or goods, is carried on under the control of a capitalist and on his behalf, does not alter the general character of that production. We shall, therefore, in the first place, have to consider the labour-process independently of the particular form it assumes under given social conditions.

Labour is, in the first place, a process in which both man and Nature participate, and in which man of his own accord starts, regulates, and controls the material re-actions between himself and Nature. He opposes himself to Nature as one of her own forces, setting in motion arms and legs, head and hands, the natural forces of his body, in order to appropriate Nature's productions in a form adapted to his own wants. By thus acting on the external world and changing it, he at the same time changes his own nature. He develops his slumbering powers and compels them to act in obedience to his sway. We are not now dealing with those primitive instinctive forms of labour that remind us of the mere animal. An immeasurable interval of time separates the state of things in which a man brings his labour-power to market for sale as a commodity, from that state in which human labour was still in its first instinctive stage. We pre-suppose labour in a form that stamps it as exclusively human. A spider conducts operations that resemble those of a weaver, and a bee puts to shame many an architect in the construction of her cells. But what distinguishes the worst architect from the best of bees is this, that the architect raises his structure in imagination before he erects it in reality. At the end of every labour-process, we get a result that already existed in the imagination of the labourer at its commencement. He not only effects a change of form in the material on which he works, but he also realises a purpose of his own that gives the law to his *modus operandi*, and to which he must subordinate his will. And this subordination is no mere momentary act. Besides the exertion of the bodily organs, the process demands that, during the whole operation, the workman's will be steadily in consonance with his purpose. This means close attention. The less he is attracted by the nature of the work, and the mode in which it is carried on, and the less, therefore, he enjoys it as something which gives play to his bodily and mental powers, the more close his attention is forced to be.

The elementary factors of the labour-process are 1, the personal activity of man, *i.e.*, work itself, 2, the subject of that work, and 3, its instruments.

The soil (and this, economically speaking, includes water) in the virgin state in which it supplies<sup>1</sup> man with necessaries or the means of subsistence ready to hand, exists independently of him, and is the universal subject of human labour. All those things which labour merely separates from immediate connexion with their environment, are subjects of labour spontaneously provided by Nature. Such are fish which we catch and take from their element, water, timber which we fell in the virgin forest, and ores which we extract from their veins. If, on the other hand, the subject of labour has, so to say, been filtered through previous labour, we call it raw material; such is ore

already extracted and ready for washing. All raw material is the subject of labour, but not every subject of labour is raw material: it can only become so, after it has undergone some alteration by means of labour.

An instrument of labour is a thing, or a complex of things, which the labourer interposes between himself and the subject of his labour, and which serves as the conductor of his activity. He makes use of the mechanical, physical, and chemical properties of some substances in order to make other substances subservient to his aims.<sup>2</sup> Leaving out of consideration such ready-made means of subsistence as fruits, in gathering which a man's own limbs serve as the instruments of his labour, the first thing of which the labourer possesses himself is not the subject of labour but its instrument. Thus Nature becomes one of the organs of his activity, one that he annexes to his own bodily organs, adding stature to himself in spite of the Bible. As the earth is his original larder, so too it is his original tool house. It supplies him, for instance, with stones for throwing, grinding, pressing, cutting, &c. The earth itself is an instrument of labour, but when used as such in agriculture implies a whole series of other instruments and a comparatively high development of labour.<sup>3</sup> No sooner does labour undergo the least development, than it requires specially prepared instruments. Thus in the oldest caves we find stone implements and weapons. In the earliest period of human history domesticated animals, *i.e.*, animals which have been bred for the purpose, and have undergone modifications by means of labour, play the chief part as instruments of labour along with specially prepared stones, wood, bones, and shells.<sup>4</sup> The use and fabrication of instruments of labour, although existing in the germ among certain species of animals, is specifically characteristic of the human labour-process, and Franklin therefore defines man as a tool-making animal. Relics of bygone instruments of labour possess the same importance for the investigation of extinct economic forms of society, as do fossil bones for the determination of extinct species of animals. It is not the articles made, but how they are made, and by what instruments, that enables us to distinguish different economic epochs.<sup>5</sup> Instruments of labour not only supply a standard of the degree of development to which human labour has attained, but they are also indicators of the social conditions under which that labour is carried on. Among the instruments of labour, those of a mechanical nature, which, taken as a whole, we may call the bone and muscles of production, offer much more decided characteristics of a given epoch of production, than those which, like pipes, tubs, baskets, jars, &c., serve only to hold the materials for labour, which latter class, we may in a general way, call the vascular system of production. The latter first begins to play an important part in the chemical industries.

In a wider sense we may include among the instruments of labour, in addition to those things that are used for directly transferring labour to its subject, and which therefore, in one way or another, serve as conductors of activity, all such objects as are necessary for carrying on the labour-process. These do not enter directly into the process, but without them it is either impossible for it to take place at all, or possible only to a partial extent. Once more we find the earth to be a universal instrument of this sort, for it furnishes a *locus standi* to the labourer and a field of employment for his activity. Among instruments that are the result of previous labour and also belong to this class, we find workshops, canals, roads, and so forth.

In the labour-process, therefore, man's activity, with the help of the instruments of labour, effects an alteration, designed from the commencement, in the material worked upon. The process disappears in the product, the latter is a use-value, Nature's material adapted by a change of form to the wants of man. Labour has incorporated itself with its subject: the former is materialised, the latter transformed. That which in the labourer appeared as movement, now appears in the product as a fixed quality without motion. The blacksmith forges and the product is a forging.

If we examine the whole process from the point of view of its result, the product, it is plain that both the instruments and the subject of labour, are means of production,<sup>6</sup> and that the labour itself is productive labour.<sup>7</sup>

Though a use-value, in the form of a product, issues from the labour-process, yet other use-values, products of previous labour, enter into it as means of production. The same use-value is both the product of a previous process, and a means of production in a later process. Products are therefore not only results, but also essential conditions of labour.

With the exception of the extractive industries, in which the material for labour is provided immediately by Nature, such as mining, hunting, fishing, and agriculture (so far as the latter is confined to breaking up virgin soil), all branches of industry manipulate raw material, objects already filtered through labour, already products of labour. Such is seed in agriculture. Animals and plants, which we are accustomed to consider as products of Nature, are in their present form, not only products of, say last year's labour, but the result of a gradual transformation, continued through many generations, under man's superintendence, and by means of his labour. But in the great majority of cases, instruments of labour show even to the most superficial observer, traces of the labour of past ages.

Raw material may either form the principal substance of a product, or it may enter into its formation only as an accessory. An accessory may be consumed by the instruments of labour, as coal under a boiler, oil by a wheel, hay by draft-horses, or it may be mixed with the raw material in order to produce some modification thereof, as chlorine into unbleached linen, coal with iron, dye-stuff with wool, or again, it may help to carry on the work itself, as in the case of the materials used for heating and lighting workshops. The distinction between principal substance and accessory vanishes in the true chemical industries, because there none of the raw material re-appears, in its original composition, in the substance of the product.<sup>8</sup>

Every object possesses various properties, and is thus capable of being applied to different uses. One and the same product may therefore serve as raw material in very different processes. Corn, for example, is a raw material for millers, starch-manufacturers, distillers, and cattlebreeders. It also enters as raw material into its own production in the shape of seed; coal, too, is at the same time the product of, and a means of production in, coal-mining.

Again, a particular product may be used in one and the same process, both as an instrument of labour and as raw material. Take, for instance, the fattening of cattle, where the animal is the raw material, and at the same time an instrument for the production of manure.

A product, though ready for immediate consumption, may yet serve as raw material for a further product, as grapes when they become the raw material for wine. On the other hand, labour may give us its product in such a form, that we can use it only as raw material, as is the case with cotton, thread, and yarn. Such a raw material, though itself a product, may have to go through a whole series of different processes: in each of these in turn, it serves, with constantly varying form, as raw material, until the last process of the series leaves it a perfect product, ready for individual consumption, or for use as an instrument of labour.

Hence we see, that whether a use-value is to be regarded as raw material, as instrument of labour, or as product, this is determined entirely by its function in the labour-process, by the position it there occupies: as this varies, so does its character.

Whenever therefore a product enters as a means of production into a new labour-process, it thereby loses its character of product, and becomes a mere factor in the process. A spinner treats spindles only as implements for spinning, and flax only as the material that he spins. Of course it is impossible to spin without material and spindles; and therefore the existence of these things as

products, at the commencement of the spinning operation, must be presumed: but in the process itself, the fact that they are products of previous labour, is a matter of utter indifference; just as in the digestive process, it is of no importance whatever, that bread is the produce of the previous labour of the farmer, the miller, and the baker. On the contrary, it is generally by their imperfections as products, that the means of production in any process assert themselves in their character of products. A blunt knife or weak thread forcibly remind us of Mr. A., the cutler, or Mr. B., the spinner. In the finished product the labour by means of which it has acquired its useful qualities is not palpable, has apparently vanished.

A machine which does not serve the purposes of labour, is useless. In addition, it falls a prey to the destructive influence of natural forces. Iron rusts and wood rots. Yarn with which we neither weave nor knit, is cotton wasted. Living labour must seize upon these things and rouse them from their death-sleep, change them from mere possible use-values into real and effective ones. Bathed in the fire of labour, appropriated as part and parcel of labour's organism, and, as it were, made alive for the performance of their functions in the process, they are in truth consumed, but consumed with a purpose, as elementary constituents of new use-values, of new products, ever ready as means of subsistence for individual consumption, or as means of production for some new labour-process.

If then, on the one hand, finished products are not only results, but also necessary conditions, of the labour-process, on the other hand, their assumption into that process, their contact with living labour, is the sole means by which they can be made to retain their character of use-values, and be utilised.

Labour uses up its material factors, its subject and its instruments, consumes them, and is therefore a process of consumption. Such productive consumption is distinguished from individual consumption by this, that the latter uses up products, as means of subsistence for the living individual; the former, as means whereby alone, labour, the labour-power of the living individual, is enabled to act. The product, therefore, of individual consumption, is the consumer himself; the result of productive consumption, is a product distinct from the consumer.

In so far then, as its instruments and subjects are themselves products, labour consumes products in order to create products, or in other words, consumes one set of products by turning them into means of production for another set. But, just as in the beginning, the only participators in the labour-process were man and the earth, which latter exists independently of man, so even now we still employ in the process many means of production, provided directly by Nature, that do not represent any combination of natural substances with human labour.

The labour-process, resolved as above into its simple elementary factors, is human action with a view to the production of use-values, appropriation of natural substances to human requirements; it is the necessary condition for effecting exchange of matter between man and Nature; it is the everlasting Nature-imposed condition of human existence, and therefore is independent of every social phase of that existence, or rather, is common to every such phase. It was, therefore, not necessary to represent our labourer in connexion with other labourers; man and his labour on one side, Nature and its materials on the other, sufficed. As the taste of the porridge does not tell you who grew the oats, no more does this simple process tell you of itself what are the social conditions under which it is taking place, whether under the slave-owner's brutal lash, or the anxious eye of the capitalist, whether Cincinnatus carries it on in tilling his modest farm or a savage in killing wild animals with stones.<sup>9</sup>

Let us now return to our would-be capitalist. We left him just after he had purchased, in the open market, all the necessary factors of the labour process; its objective factors, the means of production, as well as its subjective factor, labour-power. With the keen eye of an expert, he has

selected the means of production and the kind of labour-power best adapted to his particular trade, be it spinning, bootmaking, or any other kind. He then proceeds to consume the commodity, the labour-power that he has just bought, by causing the labourer, the impersonation of that labour-power, to consume the means of production by his labour. The general character of the labour-process is evidently not changed by the fact, that the labourer works for the capitalist instead of for himself; moreover, the particular methods and operations employed in bootmaking or spinning are not immediately changed by the intervention of the capitalist. He must begin by taking the labour-power as he finds it in the market, and consequently be satisfied with labour of such a kind as would be found in the period immediately preceding the rise of capitalists. Changes in the methods of production by the subordination of labour to capital, can take place only at a later period, and therefore will have to be treated of in a later chapter.

The labour-process, turned into the process by which the capitalist consumes labour-power, exhibits two characteristic phenomena. First, the labourer works under the control of the capitalist to whom his labour belongs; the capitalist taking good care that the work is done in a proper manner, and that the means of production are used with intelligence, so that there is no unnecessary waste of raw material, and no wear and tear of the implements beyond what is necessarily caused by the work.

Secondly, the product is the property of the capitalist and not that of the labourer, its immediate producer. Suppose that a capitalist pays for a day's labour-power at its value; then the right to use that power for a day belongs to him, just as much as the right to use any other commodity, such as a horse that he has hired for the day. To the purchaser of a commodity belongs its use, and the seller of labour-power, by giving his labour, does no more, in reality, than part with the use-value that he has sold. From the instant he steps into the workshop, the use-value of his labour-power, and therefore also its use, which is labour, belongs to the capitalist. By the purchase of labour-power, the capitalist incorporates labour, as a living ferment, with the lifeless constituents of the product. From his point of view, the labour-process is nothing more than the consumption of the commodity purchased, *i. e.*, of labour-power; but this consumption cannot be effected except by supplying the labour-power with the means of production. The labour-process is a process between things that the capitalist has purchased, things that have become his property. The product of this process belongs, therefore, to him, just as much as does the wine which is the product of a process of fermentation completed in his cellar.<sup>10</sup>

## Section 2: The Production of Surplus-Value

The product appropriated by the capitalist is a use-value, as yarn, for example, or boots. But, although boots are, in one sense, the basis of all social progress, and our capitalist is a decided "progressist," yet he does not manufacture boots for their own sake. Use-value is, by no means, the thing "qu'on aime pour lui-même" in the production of commodities. Use-values are only produced by capitalists, because, and in so far as, they are the material substratum, the depositories of exchange-value. Our capitalist has two objects in view: in the first place, he wants to produce a use-value that has a value in exchange, that is to say, an article destined to be sold, a commodity; and secondly, he desires to produce a commodity whose value shall be greater than the sum of the values of the commodities used in its production, that is, of the means of production and the labour-power, that he purchased with his good money in the open market. His aim is to produce not only a use-value, but a commodity also; not only use-value, but value; not only value, but at the same time surplus-value.

It must be borne in mind, that we are now dealing with the production of commodities, and that, up to this point, we have only considered one aspect of the process. Just as commodities are, at

the same time, use-values and values, so the process of producing them must be a labour-process, and at the same time, a process of creating value.<sup>11</sup>

Let us now examine production as a creation of value.

We know that the value of each commodity is determined by the quantity of labour expended on and materialised in it, by the working-time necessary, under given social conditions, for its production. This rule also holds good in the case of the product that accrued to our capitalist, as the result of the labour-process carried on for him. Assuming this product to be 10 lbs. of yarn, our first step is to calculate the quantity of labour realised in it.

For spinning the yarn, raw material is required; suppose in this case 10 lbs. of cotton. We have no need at present to investigate the value of this cotton, for our capitalist has, we will assume, bought it at its full value, say of ten shillings. In this price the labour required for the production of the cotton is already expressed in terms of the average labour of society. We will further assume that the wear and tear of the spindle, which, for our present purpose, may represent all other instruments of labour employed, amounts to the value of 2s. If, then, twenty-four hours' labour, or two working days, are required to produce the quantity of gold represented by twelve shillings, we have here, to begin with, two days' labour already incorporated in the yarn.

We must not let ourselves be misled by the circumstance that the cotton has taken a new shape while the substance of the spindle has to a certain extent been used up. By the general law of value, if the value of 40 lbs. of yarn = the value of 40 lbs. of cotton + the value of a whole spindle, *i. e.*, if the same working-time is required to produce the commodities on either side of this equation, then 10 lbs. of yarn are an equivalent for 10 lbs. of cotton, together with one-fourth of a spindle. In the case we are considering the same working-time is materialised in the 10 lbs. of yarn on the one hand, and in the 10 lbs. of cotton and the fraction of a spindle on the other. Therefore, whether value appears in cotton, in a spindle, or in yarn, makes no difference in the amount of that value. The spindle and cotton, instead of resting quietly side by side, join together in the process, their forms are altered, and they are turned into yarn; but their value is no more affected by this fact than it would be if they had been simply exchanged for their equivalent in yarn.

The labour required for the production of the cotton, the raw material of the yarn, is part of the labour necessary to produce the yarn, and is therefore contained in the yarn. The same applies to the labour embodied in the spindle, without whose wear and tear the cotton could not be spun.

Hence, in determining the value of the yarn, or the labour-time required for its production, all the special processes carried on at various times and in different places, which were necessary, first to produce the cotton and the wasted portion of the spindle, and then with the cotton and spindle to spin the yarn, may together be looked on as different and successive phases of one and the same process. The whole of the labour in the yarn is past labour; and it is a matter of no importance that the operations necessary for the production of its constituent elements were carried on at times which, referred to the present, are more remote than the final operation of spinning. If a definite quantity of labour, say thirty days, is requisite to build a house, the total amount of labour incorporated in it is not altered by the fact that the work of the last day is done twenty-nine days later than that of the first. Therefore the labour contained in the raw material and the instruments of labour can be treated just as if it were labour expended in an earlier stage of the spinning process, before the labour of actual spinning commenced.

The values of the means of production, *i. e.*, the cotton and the spindle, which values are expressed in the price of twelve shillings, are therefore constituent parts of the value of the yarn, or, in other words, of the value of the product.

Two conditions must nevertheless be fulfilled. First, the cotton and spindle must concur in the production of a use-value; they must in the present case become yarn. Value is independent of the particular use-value by which it is borne, but it must be embodied in a use-value of some kind. Secondly, the time occupied in the labour of production must not exceed the time really necessary under the given social conditions of the case. Therefore, if no more than 1 lb. of cotton be requisite to spin 1 lb. of yarn, care must be taken that no more than this weight of cotton is consumed in the production of 1 lb. of yarn; and similarly with regard to the spindle. Though the capitalist have a hobby, and use a gold instead of a steel spindle, yet the only labour that counts for anything in the value of the yarn is that which would be required to produce a steel spindle, because no more is necessary under the given social conditions.

We now know what portion of the value of the yarn is owing to the cotton and the spindle. It amounts to twelve shillings or the value of two days' work. The next point for our consideration is, what portion of the value of the yarn is added to the cotton by the labour of the spinner.

We have now to consider this labour under a very different aspect from that which it had during the labour-process; there, we viewed it solely as that particular kind of human activity which changes cotton into yarn; there, the more the labour was suited to the work, the better the yarn, other circumstances remaining the same. The labour of the spinner was then viewed as specifically different from other kinds of productive labour, different on the one hand in its special aim, viz., spinning, different, on the other hand, in the special character of its operations, in the special nature of its means of production and in the special use-value of its product. For the operation of spinning, cotton and spindles are a necessity, but for making rifled cannon they would be of no use whatever. Here, on the contrary, where we consider the labour of the spinner only so far as it is value-creating, *i.e.*, a source of value, his labour differs in no respect from the labour of the man who bores cannon, or (what here more nearly concerns us), from the labour of the cotton-planter and spindle-maker incorporated in the means of production. It is solely by reason of this identity, that cotton planting, spindle making and spinning, are capable of forming the component parts differing only quantitatively from each other, of one whole, namely, the value of the yarn. Here, we have nothing more to do with the quality, the nature and the specific character of the labour, but merely with its quantity. And this simply requires to be calculated. We proceed upon the assumption that spinning is simple, unskilled labour, the average labour of a given state of society. Hereafter we shall see that the contrary assumption would make no difference.

While the labourer is at work, his labour constantly undergoes a transformation: from being motion, it becomes an object without motion; from being the labourer working, it becomes the thing produced. At the end of one hour's spinning, that act is represented by a definite quantity of yarn; in other words, a definite quantity of labour, namely that of one hour, has become embodied in the cotton. We say labour, *i.e.*, the expenditure of his vital force by the spinner, and not spinning labour, because the special work of spinning counts here, only so far as it is the expenditure of labour-power in general, and not in so far as it is the specific work of the spinner.

In the process we are now considering it is of extreme importance, that no more time be consumed in the work of transforming the cotton into yarn than is necessary under the given social conditions. If under normal, *i.e.*, average social conditions of production,  $a$  pounds of cotton ought to be made into  $b$  pounds of yarn by one hour's labour, then a day's labour does not count as 12 hours' labour unless  $12a$  pounds of cotton have been made into  $12b$  pounds of yarn; for in the creation of value, the time that is socially necessary alone counts.

Not only the labour, but also the raw material and the product now appear in quite a new light, very different from that in which we viewed them in the labour-process pure and simple. The raw

material serves now merely as an absorbent of a definite quantity of labour. By this absorption it is in fact changed into yarn, because it is spun, because labour-power in the form of spinning is added to it; but the product, the yarn, is now nothing more than a measure of the labour absorbed by the cotton. If in one hour  $1\frac{2}{3}$  lbs. of cotton can be spun into  $1\frac{2}{3}$  lbs. of yarn, then 10 lbs. of yarn indicate the absorption of 6 hours' labour. Definite quantities of product, these quantities being determined by experience, now represent nothing but definite quantities of labour, definite masses of crystallised labour-time. They are nothing more than the materialisation of so many hours or so many days of social labour.

We are here no more concerned about the facts, that the labour is the specific work of spinning, that its subject is cotton and its product yarn, than we are about the fact that the subject itself is already a product and therefore raw material. If the spinner, instead of spinning, were working in a coal mine, the subject of his labour, the coal, would be supplied by Nature; nevertheless, a definite quantity of extracted coal, a hundredweight for example, would represent a definite quantity of absorbed labour.

We assumed, on the occasion of its sale, that the value of a day's labour-power is three shillings, and that six hours' labour is incorporated in that sum; and consequently that this amount of labour is requisite to produce the necessaries of life daily required on an average by the labourer. If now our spinner by working for one hour, can convert  $1\frac{2}{3}$  lbs. of cotton into  $1\frac{2}{3}$  lbs. of yarn,<sup>12</sup> it follows that in six hours he will convert 10 lbs. of cotton into 10 lbs. of yarn. Hence, during the spinning process, the cotton absorbs six hours' labour. The same quantity of labour is also embodied in a piece of gold of the value of three shillings. Consequently by the mere labour of spinning, a value of three shillings is added to the cotton.

Let us now consider the total value of the product, the 10 lbs. of yarn. Two and a half days' labour has been embodied in it, of which two days were contained in the cotton and in the substance of the spindle worn away, and half a day was absorbed during the process of spinning. This two and a half days' labour is also represented by a piece of gold of the value of fifteen shillings. Hence, fifteen shillings is an adequate price for the 10 lbs. of yarn, or the price of one pound is eighteenpence.

Our capitalist stares in astonishment. The value of the product is exactly equal to the value of the capital advanced. The value so advanced has not expanded, no surplus-value has been created, and consequently money has not been converted into capital. The price of the yarn is fifteen shillings, and fifteen shillings were spent in the open market upon the constituent elements of the product, or, what amounts to the same thing, upon the factors of the labour-process; ten shillings were paid for the cotton, two shillings for the substance of the spindle worn away, and three shillings for the labour-power. The swollen value of the yarn is of no avail, for it is merely the sum of the values formerly existing in the cotton, the spindle, and the labour-power: out of such a simple addition of existing values, no surplus-value can possibly arise.<sup>13</sup> These separate values are now all concentrated in one thing; but so they were also in the sum of fifteen shillings, before it was split up into three parts, by the purchase of the commodities.

There is in reality nothing very strange in this result. The value of one pound of yarn being eighteenpence, if our capitalist buys 10 lbs. of yarn in the market, he must pay fifteen shillings for them. It is clear that, whether a man buys his house ready built, or gets it built for him, in neither case will the mode of acquisition increase the amount of money laid out on the house.

Our capitalist, who is at home in his vulgar economy, exclaims: "Oh! but I advanced my money for the express purpose of making more money." The way to Hell is paved with good intentions, and he might just as easily have intended to make money, without producing at all.<sup>14</sup> He threatens all sorts of things. He won't be caught napping again. In future he will buy the commodities in the

market, instead of manufacturing them himself. But if all his brother capitalists were to do the same, where would he find his commodities in the market? And his money he cannot eat. He tries persuasion. "Consider my abstinence; I might have played ducks and drakes with the 15 shillings; but instead of that I consumed it productively, and made yarn with it." Very well, and by way of reward he is now in possession of good yarn instead of a bad conscience; and as for playing the part of a miser, it would never do for him to relapse into such bad ways as that; we have seen before to what results such asceticism leads. Besides, where nothing is, the king has lost his rights; whatever may be the merit of his abstinence, there is nothing wherewith specially to remunerate it, because the value of the product is merely the sum of the values of the commodities that were thrown into the process of production. Let him therefore console himself with the reflection that virtue is its own reward. But no, he becomes importunate. He says: "The yarn is of no use to me: I produced it for sale." In that case let him sell it, or, still better, let him for the future produce only things for satisfying his personal wants, a remedy that his physician MacCulloch has already prescribed as infallible against an epidemic of over-production. He now gets obstinate. "Can the labourer," he asks, "merely with his arms and legs, produce commodities out of nothing? Did I not supply him with the materials, by means of which, and in which alone, his labour could be embodied? And as the greater part of society consists of such ne'er-do-wells, have I not rendered society incalculable service by my instruments of production, my cotton and my spindle, and not only society, but the labourer also, whom in addition I have provided with the necessaries of life? And am I to be allowed nothing in return for all this service?" Well, but has not the labourer rendered him the equivalent service of changing his cotton and spindle into yarn? Moreover, there is here no question of service.<sup>15</sup> A service is nothing more than the useful effect of a use-value, be it of a commodity, or be it of labour.<sup>16</sup> But here we are dealing with exchange-value. The capitalist paid to the labourer a value of 3 shillings, and the labourer gave him back an exact equivalent in the value of 3 shillings, added by him to the cotton: he gave him value for value. Our friend, up to this time so purse-proud, suddenly assumes the modest demeanour of his own workman, and exclaims: "Have I myself not worked? Have I not performed the labour of superintendence and of overlooking the spinner? And does not this labour, too, create value?" His overlooker and his manager try to hide their smiles. Meanwhile, after a hearty laugh, he re-assumes his usual mien. Though he chanted to us the whole creed of the economists, in reality, he says, he would not give a brass farthing for it. He leaves this and all such like subterfuges and juggling tricks to the professors of Political Economy, who are paid for it. He himself is a practical man; and though he does not always consider what he says outside his business, yet in his business he knows what he is about.

Let us examine the matter more closely. The value of a day's labour-power amounts to 3 shillings, because on our assumption half a day's labour is embodied in that quantity of labour-power, *i.e.*, because the means of subsistence that are daily required for the production of labour-power, cost half a day's labour. But the past labour that is embodied in the labour-power, and the living labour that it can call into action; the daily cost of maintaining it, and its daily expenditure in work, are two totally different things. The former determines the exchange-value of the labour-power, the latter is its use-value. The fact that half a day's labour is necessary to keep the labourer alive during 24 hours, does not in any way prevent him from working a whole day. Therefore, the value of labour-power, and the value which that labour-power creates in the labour-process, are two entirely different magnitudes; and this difference of the two values was what the capitalist had in view, when he was purchasing the labour-power. The useful qualities that labour-power possesses, and by virtue of which it makes yarn or boots, were to him nothing more than a *conditio sine qua non*; for in order to create value, labour must be expended in a useful manner. What really influenced him was the specific use-value which this commodity possesses of being a

*source not only of value, but of more value than it has itself.* This is the special service that the capitalist expects from labour-power, and in this transaction he acts in accordance with the “eternal laws” of the exchange of commodities. The seller of labour-power, like the seller of any other commodity, realises its exchange-value, and parts with its use-value. He cannot take the one without giving the other. The use-value of labour-power, or in other words, labour, belongs just as little to its seller, as the use-value of oil after it has been sold belongs to the dealer who has sold it. The owner of the money has paid the value of a day’s labour-power; his, therefore, is the use of it for a day; a day’s labour belongs to him. The circumstance, that on the one hand the daily sustenance of labour-power costs only half a day’s labour, while on the other hand the very same labour-power can work during a whole day, that consequently the value which its use during one day creates, is double what he pays for that use, this circumstance is, without doubt, a piece of good luck for the buyer, but by no means an injury to the seller.

Our capitalist foresaw this state of things, and that was the cause of his laughter. The labourer therefore finds, in the workshop, the means of production necessary for working, not only during six, but during twelve hours. Just as during the six hours’ process our 10 lbs. of cotton absorbed six hours’ labour, and became 10 lbs. of yarn, so now, 20 lbs. of cotton will absorb 12 hours’ labour and be changed into 20 lbs. of yarn. Let us now examine the product of this prolonged process. There is now materialised in this 20 lbs. of yarn the labour of five days, of which four days are due to the cotton and the lost steel of the spindle, the remaining day having been absorbed by the cotton during the spinning process. Expressed in gold, the labour of five days is thirty shillings. This is therefore the price of the 20 lbs. of yarn, giving, as before, eighteenpence as the price of a pound. But the sum of the values of the commodities that entered into the process amounts to 27 shillings. The value of the yarn is 30 shillings. Therefore the value of the product is 1/9 greater than the value advanced for its production; 27 shillings have been transformed into 30 shillings; a surplus-value of 3 shillings has been created. The trick has at last succeeded; money has been converted into capital.

Every condition of the problem is satisfied, while the laws that regulate the exchange of commodities, have been in no way violated. Equivalent has been exchanged for equivalent. For the capitalist as buyer paid for each commodity, for the cotton, the spindle and the labour-power, its full value. He then did what is done by every purchaser of commodities; he consumed their use-value. The consumption of the labour-power, which was also the process of producing commodities, resulted in 20 lbs. of yarn, having a value of 30 shillings. The capitalist, formerly a buyer, now returns to market as a seller, of commodities. He sells his yarn at eighteenpence a pound, which is its exact value. Yet for all that he withdraws 3 shillings more from circulation than he originally threw into it. This metamorphosis, this conversion of money into capital, takes place both within the sphere of circulation and also outside it; within the circulation, because conditioned by the purchase of the labour-power in the market; outside the circulation, because what is done within it is only a stepping-stone to the production of surplus-value, a process which is entirely confined to the sphere of production. Thus “tout est pour le mieux dans le meilleur des mondes possibles.” [“Everything is for the best in the best of all possible worlds.” – Voltaire, *Candide*]

By turning his money into commodities that serve as the material elements of a new product, and as factors in the labour-process, by incorporating living labour with their dead substance, the capitalist at the same time converts value, *i.e.*, past, materialised, and dead labour into capital, into value big with value, a live monster that is fruitful and multiplies.

If we now compare the two processes of producing value and of creating surplus-value, we see that the latter is nothing but the continuation of the former beyond a definite point. If on the one

hand the process be not carried beyond the point, where the value paid by the capitalist for the labour-power is replaced by an exact equivalent, it is simply a process of producing value; if, on the other hand, it be continued beyond that point, it becomes a process of creating surplus-value.

If we proceed further, and compare the process of producing value with the labour-process, pure and simple, we find that the latter consists of the useful labour, the work, that produces use-values. Here we contemplate the labour as producing a particular article; we view it under its qualitative aspect alone, with regard to its end and aim. But viewed as a value-creating process, the same labour-process presents itself under its quantitative aspect alone. Here it is a question merely of the time occupied by the labourer in doing the work; of the period during which the labour-power is usefully expended. Here, the commodities that take part in the process, do not count any longer as necessary adjuncts of labour-power in the production of a definite, useful object. They count merely as depositories of so much absorbed or materialised labour; that labour, whether previously embodied in the means of production, or incorporated in them for the first time during the process by the action of labour-power, counts in either case only according to its duration; it amounts to so many hours or days as the case may be.

Moreover, only so much of the time spent in the production of any article is counted, as, under the given social conditions, is necessary. The consequences of this are various. In the first place, it becomes necessary that the labour should be carried on under normal conditions. If a self-acting mule is the implement in general use for spinning, it would be absurd to supply the spinner with a distaff and spinning wheel. The cotton too must not be such rubbish as to cause extra waste in being worked, but must be of suitable quality. Otherwise the spinner would be found to spend more time in producing a pound of yarn than is socially necessary, in which case the excess of time would create neither value nor money. But whether the material factors of the process are of normal quality or not, depends not upon the labourer, but entirely upon the capitalist. Then again, the labour-power itself must be of average efficacy. In the trade in which it is being employed, it must possess the average skill, handiness and quickness prevalent in that trade, and our capitalist took good care to buy labour-power of such normal goodness. This power must be applied with the average amount of exertion and with the usual degree of intensity; and the capitalist is as careful to see that this is done, as that his workmen are not idle for a single moment. He has bought the use of the labour-power for a definite period, and he insists upon his rights. He has no intention of being robbed. Lastly, and for this purpose our friend has a penal code of his own, all wasteful consumption of raw material or instruments of labour is strictly forbidden, because what is so wasted, represents labour superfluously expended, labour that does not count in the product or enter into its value.<sup>17</sup>

We now see, that the difference between labour, considered on the one hand as producing utilities, and on the other hand, as creating value, a difference which we discovered by our analysis of a commodity, resolves itself into a distinction between two aspects of the process of production.

The process of production, considered on the one hand as the unity of the labour-process and the process of creating value, is production of commodities; considered on the other hand as the unity of the labour-process and the process of producing surplus-value, it is the capitalist process of production, or capitalist production of commodities.

We stated, on a previous page, that in the creation of surplus-value it does not in the least matter, whether the labour appropriated by the capitalist be simple unskilled labour of average quality or more complicated skilled labour. All labour of a higher or more complicated character than average labour is expenditure of labour-power of a more costly kind, labour-power whose production has cost more time and labour, and which therefore has a higher value, than unskilled

or simple labour-power. This power being higher-value, its consumption is labour of a higher class, labour that creates in equal times proportionally higher values than unskilled labour does. Whatever difference in skill there may be between the labour of a spinner and that of a jeweller, the portion of his labour by which the jeweller merely replaces the value of his own labour-power, does not in any way differ in quality from the additional portion by which he creates surplus-value. In the making of jewellery, just as in spinning, the surplus-value results only from a quantitative excess of labour, from a lengthening-out of one and the same labour-process, in the one case, of the process of making jewels, in the other of the process of making yarn.<sup>18</sup>

But on the other hand, in every process of creating value, the reduction of skilled labour to average social labour, *e.g.*, one day of skilled to six days of unskilled labour, is unavoidable.<sup>19</sup> We therefore save ourselves a superfluous operation, and simplify our analysis, by the assumption, that the labour of the workman employed by the capitalist is unskilled average labour.

---

<sup>1</sup> “The earth’s spontaneous productions being in small quantity, and quite independent of man, appear, as it were, to be furnished by Nature, in the same way as a small sum is given to a young man, in order to put him in a way of industry, and of making his fortune.” (James Steuart: “Principles of Polit. Econ.” edit. Dublin, 1770, v. I, p.116.)

<sup>2</sup> “Reason is just as cunning as she is powerful. Her cunning consists principally in her mediating activity, which, by causing objects to act and re-act on each other in accordance with their own nature, in this way, without any direct interference in the process, carries out reason’s intentions.” (Hegel: “Enzyklopädie, Erster Theil, Die Logik,” Berlin, 1840, p. 382.)

<sup>3</sup> In his otherwise miserable work (“Théorie de l’Econ. Polit.” Paris, 1815), Ganilh enumerates in a striking manner in opposition to the “Physiocrats” the long series of previous processes necessary before agriculture properly so called can commence.

<sup>4</sup> Turgot in his “Réflexions sur la Formation et la Distribution des Richesses” (1766) brings well into prominence the importance of domesticated animals to early civilisation.

<sup>5</sup> The least important commodities of all for the technological comparison of different epochs of production are articles of luxury, in the strict meaning of the term. However little our written histories up to this time notice the development of material production, which is the basis of all social life, and therefore of all real history, yet prehistoric times have been classified in accordance with the results, not of so-called historical, but of materialistic investigations. These periods have been divided, to correspond with the materials from which their implements and weapons were made, *viz.*, into the stone, the bronze, and the iron ages.

<sup>6</sup> It appears paradoxical to assert, that uncaught fish, for instance, are a means of production in the fishing industry. But hitherto no one has discovered the art of catching fish in waters that contain none.

<sup>7</sup> This method of determining, from the standpoint of the labour-process alone, what is productive labour, is by no means directly applicable to the case of the capitalist process of production.

<sup>8</sup> Storch calls true raw materials “matières,” and accessory material “matériaux.” Cherbuliez describes accessories as “matières instrumentales.”

<sup>9</sup> By a wonderful feat of logical acumen, Colonel Torrens has discovered, in this stone of the savage the origin of capital. “In the first stone which he [the savage] flings at the wild animal he pursues, in the first stick that he seizes to strike down the fruit which hangs above his reach, we see the appropriation of one article for the purpose of aiding in the acquisition of another, and thus discover the origin of capital.” (R. Torrens: “An Essay on the Production of Wealth,” &c., pp. 70-71.)

<sup>10</sup> “Products are appropriated before they are converted into capital; this conversion does not secure them from such appropriation.” (Cheibuliez: “Richesse ou Pauvreté,” edit. Paris, 1841, p. 54.) “The Proletarian, by selling his labour for a definite quantity of the necessaries of life, renounces all claim to a share in the product. The mode of appropriation of the products remains the same as before; it is in no way altered by the bargain we have mentioned. The product belongs exclusively to the capitalist, who supplied the raw material and the necessaries of life; and this is a rigorous consequence of the law of appropriation, a law whose fundamental principle was the very opposite, namely, that every labourer has an exclusive right to the ownership of what he produces.” (l.c., p. 58.) “When the labourers receive wages for their labour ... the capitalist is then the owner not of the capital only” (he means the means of production) “but of the labour also. If what is paid as wages is included, as it commonly is, in the term capital, it is absurd to talk of labour separately from capital. The word capital as thus employed includes labour and capital both.” (James Mill: “Elements of Pol. Econ.,” &c., Ed. 1821, pp. 70, 71.)

<sup>11</sup> As has been stated in a previous note, the English language has two different expressions for these two different aspects of labour: in the Simple Labour-process, the process of producing Use-Values, it is *Work*; in the process of creation of Value, it is *Labour*, taking the term in its strictly economic sense. — *F. E.*

<sup>12</sup> These figures are quite arbitrary.

<sup>13</sup> This is the fundamental proposition on which is based the doctrine of the Physiocrats as to the unproductiveness of all labour that is not agriculture: it is irrefutable for the orthodox economist. “Cette façon d’imputer à une seule chose la valeur de plusieurs autres” (par exemple au lin la consommation du tisserand), “d’appliquer, pour ainsi dire, couche sur couche, plusieurs valeurs sur une seule, fait que celle-ci grossit d’autant.... Le terme d’addition peint très bien la manière dont se forme le prix des ouvrages de main d’œuvre; ce prix n’est qu’un total de plusieurs valeurs consommées et additionnées ensemble; or, additionner n’est pas multiplier.” [“This method of adding to one particular object the value of a number of others,” (for example, adding the living costs of the weaver to the flax), “of as it were heaping up various values in layers on top of one single value, has the result that this value grows to the same extent ... The expression ‘addition’ gives a very clear picture of the way in which the price of a manufactured product is formed; this price is only the sum of a number of values which have been consumed, and it is arrived at by adding them together; however, addition is not the same as multiplication.”] (“Mercier de la Rivière,” l.c., p. 599.)

<sup>14</sup> Thus from 1844-47 he withdrew part of his capital from productive employment, in order to throw it away in railway speculations; and so also, during the American Civil War, he closed his factory, and turned his work-people into the streets, in order to gamble on the Liverpool cotton exchange.

<sup>15</sup> “Extol thyself, put on finery and adorn thyself ... but whoever takes more or better than he gives, that is usury, and is not service, but wrong done to his neighbour, as when one steals and robs. All is not service and benefit to a neighbour that is called service and benefit. For an adulteress and adulterer do one another great service and pleasure. A horseman does an incendiary a great service, by helping him to rob on the highway, and pillage land and houses. The papists do ours a great service, in that they don’t drown, burn, murder all of them, or let them all rot in prison; but let some live, and only drive them out, or take from them what they have. The devil himself does his servants inestimable service.... To sum up, the world is full of great, excellent, and daily service and benefit.” (Martin Luther: “An die Pfarrherrn wider den Wucher zu predigen,” Wittenberg, 1540.)

<sup>16</sup> In “Zur Kritik der Pol. Oek.,” p. 14, I make the following remark on this point — “It is not difficult to understand what ‘service’ the category ‘service’ must render to a class of economists like J. B. Say and F. Bastiat.”

<sup>17</sup> This is one of the circumstances that makes production by slave labour such a costly process. The labourer here is, to use a striking expression of the ancients, distinguishable only as *instrumentum vocale*, from an animal as *instrumentum semi-vocale*, and from an implement as *instrumentum mutum*. But he himself takes care to let both beast and implement feel that he is none of them, but is a man. He convinces himself with immense satisfaction, that he is a different being, by treating the one unmercifully and damaging the other *con amore*. Hence the principle, universally applied in this method of production, only to employ the rudest and heaviest implements and such as are difficult to damage owing to their sheer clumsiness. In the slave-states bordering on the Gulf of Mexico, down to the date of the civil war, ploughs constructed on old Chinese models, which turned up the soil like a hog or a mole, instead of making furrows, were alone to be found. Conf. J. E. Cairnes. "The Slave Power," London, 1862, p. 46 sqq. In his "Sea Board Slave States," Olmsted tells us: "I am here shown tools that no man in his senses, with us, would allow a labourer, for whom he was paying wages, to be encumbered with; and the excessive weight and clumsiness of which, I would judge, would make work at least ten per cent greater than with those ordinarily used with us. And I am assured that, in the careless and clumsy way they must be used by the slaves, anything lighter or less rude could not be furnished them with good economy, and that such tools as we constantly give our labourers and find our profit in giving them, would not last out a day in a Virginia cornfield – much lighter and more free from stones though it be than ours. So, too, when I ask why mules are so universally substituted for horses on the farm, the first reason given, and confessedly the most conclusive one, is that horses cannot bear the treatment that they always must get from negroes; horses are always soon foundered or crippled by them, while mules will bear cudgelling, or lose a meal or two now and then, and not be materially injured, and they do not take cold or get sick, if neglected or overworked. But I do not need to go further than to the window of the room in which I am writing, to see at almost any time, treatment of cattle that would ensure the immediate discharge of the driver by almost any farmer owning them in the North."

<sup>18</sup> The distinction between skilled and unskilled labour rests in part on pure illusion, or, to say the least, on distinctions that have long since ceased to be real, and that survive only by virtue of a traditional convention; in part on the helpless condition of some groups of the working-class, a condition that prevents them from exacting equally with the rest the value of their labour-power. Accidental circumstances here play so great a part, that these two forms of labour sometimes change places. Where, for instance, the physique of the working-class has deteriorated, and is, relatively speaking, exhausted, which is the case in all countries with a well developed capitalist production, the lower forms of labour, which demand great expenditure of muscle, are in general considered as skilled, compared with much more delicate forms of labour; the latter sink down to the level of unskilled labour. Take as an example the labour of a bricklayer, which in England occupies a much higher level than that of a damask-weaver. Again, although the labour of a fustian cutter demands great bodily exertion, and is at the same time unhealthy, yet it counts only as unskilled labour. And then, we must not forget, that the so-called skilled labour does not occupy a large space in the field of national labour. Laing estimates that in England (and Wales) the livelihood of 11,300,000 people depends on unskilled labour. If from the total population of 18,000,000 living at the time when he wrote, we deduct 1,000,000 for the "genteel population," and 1,500,000 for paupers, vagrants, criminals, prostitutes, &c., and 4,650,000 who compose the middle-class, there remain the above mentioned 11,000,000. But in his middle-class he includes people that live on the interest of small investments, officials, men of letters, artists, schoolmasters and the like, and in order to swell the number he also includes in these 4,650,000 the better paid portion of the factory operatives! The bricklayers, too, figure amongst them. (S. Laing: "National Distress," &c., London, 1844). "The great class who have nothing to give for food but ordinary labour, are the great bulk of the people." (James Mill, in art.: "Colony," Supplement to the Encyclop. Brit., 1831.)

---

<sup>19</sup> “Where reference is made to labour as a measure of value, it necessarily implies labour of one particular kind ... the proportion which the other kinds bear to it being easily ascertained.” (“Outlines of Pol. Econ.,” Lond., 1832, pp. 22 and 23.)

## Chapter 8: Constant Capital and Variable Capital

The various factors of the labour-process play different parts in forming the value of the product.

The labourer adds fresh value to the subject of his labour by expending upon it a given amount of additional labour, no matter what the specific character and utility of that labour may be. On the other hand, the values of the means of production used up in the process are preserved, and present themselves afresh as constituent parts of the value of the product; the values of the cotton and the spindle, for instance, re-appear again in the value of the yarn. The value of the means of production is therefore preserved, by being transferred to the product. This transfer takes place during the conversion of those means into a product, or in other words, during the labour-process. It is brought about by labour; but how?

The labourer does not perform two operations at once, one in order to add value to the cotton, the other in order to preserve the value of the means of production, or, what amounts to the same thing, to transfer to the yarn, to the product, the value of the cotton on which he works, and part of the value of the spindle with which he works. But, by the very act of adding new value, he preserves their former values. Since, however, the addition of new value to the subject of his labour, and the preservation of its former value, are two entirely distinct results, produced simultaneously by the labourer, during one operation, it is plain that this two-fold nature of the result can be explained only by the two-fold nature of his labour; at one and the same time, it must in one character create value, and in another character preserve or transfer value.

Now, in what manner does every labourer add new labour and consequently new value? Evidently, only by labouring productively in a particular way; the spinner by spinning, the weaver by weaving, the smith by forging. But, while thus incorporating labour generally, that is value, it is by the particular form alone of the labour, by the spinning, the weaving and the forging respectively, that the means of production, the cotton and spindle, the yarn and loom, and the iron and anvil become constituent elements of the product, of a new use-value.<sup>1</sup> Each use-value disappears, but only to re-appear under a new form in a new use-value. Now, we saw, when we were considering the process of creating value, that, if a use-value be effectively consumed in the production of a new use-value, the quantity of labour expended in the production of the consumed article, forms a portion of the quantity of labour necessary to produce the new use-value; this portion is therefore labour transferred from the means of production to the new product. Hence, the labourer preserves the values of the consumed means of production, or transfers them as portions of its value to the product, not by virtue of his additional labour, abstractedly considered, but by virtue of the particular useful character of that labour, by virtue of its special productive form. In so far then as labour is such specific productive activity, in so far as it is spinning, weaving, or forging, it raises, by mere contact, the means of production from the dead, makes them living factors of the labour-process, and combines with them to form the new products.

If the special productive labour of the workman were not spinning, he could not convert the cotton into yarn, and therefore could not transfer the values of the cotton and spindle to the yarn. Suppose the same workman were to change his occupation to that of a joiner, he would still by a day's labour add value to the material he works upon. Consequently, we see, first, that the addition of new value takes place not by virtue of his labour being spinning in particular, or joiner in particular, but because it is labour in the abstract, a portion of the total labour of society; and we see next, that the value added is of a given definite amount, not because his

labour has a special utility, but because it is exerted for a definite time. On the one hand, then, it is by virtue of its general character, as being expenditure of human labour-power in the abstract, that spinning adds new value to the values of the cotton and the spindle; and on the other hand, it is by virtue of its special character, as being a concrete, useful process, that the same labour of spinning both transfers the values of the means of production to the product, and preserves them in the product. Hence at one and the same time there is produced a two-fold result.

By the simple addition of a certain quantity of labour, new value is added, and by the quality of this added labour, the original values of the means of production are preserved in the product. This two-fold effect, resulting from the two-fold character of labour, may be traced in various phenomena.

Let us assume, that some invention enables the spinner to spin as much cotton in 6 hours as he was able to spin before in 36 hours. His labour is now six times as effective as it was, for the purposes of useful production. The product of 6 hours' work has increased six-fold, from 6 lbs. to 36 lbs. But now the 36 lbs. of cotton absorb only the same amount of labour as formerly did the 6 lbs. One-sixth as much new labour is absorbed by each pound of cotton, and consequently, the value added by the labour to each pound is only one-sixth of what it formerly was. On the other hand, in the product, in the 36 lbs. of yarn, the value transferred from the cotton is six times as great as before. By the 6 hours' spinning, the value of the raw material preserved and transferred to the product is six times as great as before, although the new value added by the labour of the spinner to each pound of the very same raw material is one-sixth what it was formerly. This shows that the two properties of labour, by virtue of which it is enabled in one case to preserve value, and in the other to create value, are essentially different. On the one hand, the longer the time necessary to spin a given weight of cotton into yarn, the greater is the new value added to the material; on the other hand, the greater the weight of the cotton spun in a given time, the greater is the value preserved, by being transferred from it to the product.

Let us now assume, that the productiveness of the spinner's labour, instead of varying, remains constant, that he therefore requires the same time as he formerly did, to convert one pound of cotton into yarn, but that the exchange-value of the cotton varies, either by rising to six times its former value or falling to one-sixth of that value. In both these cases, the spinner puts the same quantity of labour into a pound of cotton, and therefore adds as much value, as he did before the change in the value: he also produces a given weight of yarn in the same time as he did before. Nevertheless, the value that he transfers from the cotton to the yarn is either one-sixth of what it was before the variation, or, as the case may be, six times as much as before. The same result occurs when the value of the instruments of labour rises or falls, while their useful efficacy in the process remains unaltered.

Again, if the technical conditions of the spinning process remain unchanged, and no change of value takes place in the means of production, the spinner continues to consume in equal working-times equal quantities of raw material, and equal quantities of machinery of unvarying value. The value that he preserves in the product is directly proportional to the new value that he adds to the product. In two weeks he incorporates twice as much labour, and therefore twice as much value, as in one week, and during the same time he consumes twice as much material, and wears out twice as much machinery, of double the value in each case: he therefore preserves, in the product of two weeks, twice as much value as in the product of one week. So long as the conditions of production remain the same, the more value the labourer adds by fresh labour, the more value he transfers and preserves; but he does so merely because this addition of new value takes place under conditions that have not varied and are independent of his own labour. Of course, it may be said in one sense, that the labourer preserves old value always in proportion to the quantity of

new value that he adds. Whether the value of cotton rise from one shilling to two shillings, or fall to sixpence, the workman invariably preserves in the product of one hour only one half as much value as he preserves in two hours. In like manner, if the productiveness of his own labour varies by rising or falling, he will in one hour spin either more or less cotton, as the case may be, than he did before, and will consequently preserve in the product of one hour, more or less value of cotton; but, all the same, he will preserve by two hours' labour twice as much value as he will by one.

Value exists only in articles of utility, in objects: we leave out of consideration its purely symbolical representation by tokens. (Man himself, viewed as the impersonation of labour-power, is a natural object, a thing, although a living conscious thing, and labour is the manifestation of this power residing in him.) If therefore an article loses its utility, it also loses its value. The reason why means of production do not lose their value, at the same time that they lose their use-value, is this: they lose in the labour-process the original form of their use-value, only to assume in the product the form of a new use-value. But, however important it may be to value, that it should have some object of utility to embody itself in, yet it is a matter of complete indifference what particular object serves this purpose; this we saw when treating of the metamorphosis of commodities. Hence it follows that in the labour-process the means of production transfer their value to the product only so far as along with their use-value they lose also their exchange-value. They give up to the product that value alone which they themselves lose as means of production. But in this respect the material factors of the labour-process do not all behave alike.

The coal burnt under the boiler vanishes without leaving a trace; so, too, the tallow with which the axles of wheels are greased. Dye stuffs and other auxiliary substances also vanish but re-appear as properties of the product. Raw material forms the substance of the product, but only after it has changed its form. Hence raw material and auxiliary substances lose the characteristic form with which they are clothed on entering the labour-process. It is otherwise with the instruments of labour. Tools, machines, workshops, and vessels, are of use in the labour-process, only so long as they retain their original shape, and are ready each morning to renew the process with their shape unchanged. And just as during their lifetime, that is to say, during the continued labour-process in which they serve, they retain their shape independent of the product, so, too, they do after their death. The corpses of machines, tools, workshops, &c., are always separate and distinct from the product they helped to turn out. If we now consider the case of any instrument of labour during the whole period of its service, from the day of its entry into the workshop, till the day of its banishment into the lumber room, we find that during this period its use-value has been completely consumed, and therefore its exchange-value completely transferred to the product. For instance, if a spinning machine lasts for 10 years, it is plain that during that working period its total value is gradually transferred to the product of the 10 years. The lifetime of an instrument of labour, therefore, is spent in the repetition of a greater or less number of similar operations. Its life may be compared with that of a human being. Every day brings a man 24 hours nearer to his grave: but how many days he has still to travel on that road, no man can tell accurately by merely looking at him. This difficulty, however, does not prevent life insurance offices from drawing, by means of the theory of averages, very accurate, and at the same time very profitable conclusions. So it is with the instruments of labour. It is known by experience how long on the average a machine of a particular kind will last. Suppose its use-value in the labour-process to last only six days. Then, on the average, it loses each day one-sixth of its use-value, and therefore parts with one-sixth of its value to the daily product. The wear and tear of all instruments, their daily loss of use-value, and the corresponding quantity of value they part with to the product, are accordingly calculated upon this basis.

It is thus strikingly clear, that means of production never transfer more value to the product than they themselves lose during the labour-process by the destruction of their own use-value. If such an instrument has no value to lose, if, in other words, it is not the product of human labour, it transfers no value to the product. It helps to create use-value without contributing to the formation of exchange-value. In this class are included all means of production supplied by Nature without human assistance, such as land, wind, water, metals in situ, and timber in virgin forests.

Yet another interesting phenomenon here presents itself. Suppose a machine to be worth £1,000, and to wear out in 1,000 days. Then one thousandth part of the value of the machine is daily transferred to the day's product. At the same time, though with diminishing vitality, the machine as a whole continues to take part in the labour-process. Thus it appears, that one factor of the labour-process, a means of production, continually enters as a whole into that process, while it enters into the process of the formation of value by fractions only. The difference between the two processes is here reflected in their material factors, by the same instrument of production taking part as a whole in the labour-process, while at the same time as an element in the formation of value, it enters only by fractions.<sup>2</sup>

On the other hand, a means of production may take part as a whole in the formation of value, while into the labour-process it enters only bit by bit. Suppose that in spinning cotton, the waste for every 115 lbs. used amounts to 15 lbs., which is converted, not into yarn, but into "devil's dust." Now, although this 15 lbs. of cotton never becomes a constituent element of the yarn, yet assuming this amount of waste to be normal and inevitable under average conditions of spinning, its value is just as surely transferred to the value of the yarn, as is the value of the 100 lbs. that form the substance of the yarn. The use-value of 15 lbs. of cotton must vanish into dust, before 100 lbs. of yarn can be made. The destruction of this cotton is therefore a necessary condition in the production of the yarn. And because it is a necessary condition, and for no other reason, the value of that cotton is transferred to the product. The same holds good for every kind of refuse resulting from a labour-process, so far at least as such refuse cannot be further employed as a means in the production of new and independent use-values. Such an employment of refuse may be seen in the large machine works at Manchester, where mountains of iron turnings are carted away to the foundry in the evening, in order the next morning to re-appear in the workshops as solid masses of iron.

We have seen that the means of production transfer value to the new product, so far only as during the labour-process they lose value in the shape of their old use-value. The maximum loss of value that they can suffer in the process, is plainly limited by the amount of the original value with which they came into the process, or in other words, by the labour-time necessary for their production. Therefore, the means of production can never add more value to the product than they themselves possess independently of the process in which they assist. However useful a given kind of raw material, or a machine, or other means of production may be, though it may cost £150, or, say, 500 days' labour, yet it cannot, under any circumstances, add to the value of the product more than £150. Its value is determined not by the labour-process into which it enters as a means of production, but by that out of which it has issued as a product. In the labour-process it only serves as a mere use-value, a thing with useful properties, and could not, therefore, transfer any value to the product, unless it possessed such value previously.<sup>3</sup>

While productive labour is changing the means of production into constituent elements of a new product, their value undergoes a metempsychosis. It deserts the consumed body, to occupy the newly created one. But this transmigration takes place, as it were, behind the back of the labourer. He is unable to add new labour, to create new value, without at the same time preserving old values, and this, because the labour he adds must be of a specific useful kind; and he cannot do

work of a useful kind, without employing products as the means of production of a new product, and thereby transferring their value to the new product. The property therefore which labour-power in action, living labour, possesses of preserving value, at the same time that it adds it, is a gift of Nature which costs the labourer nothing, but which is very advantageous to the capitalist inasmuch as it preserves the existing value of his capital.<sup>4</sup> So long as trade is good, the capitalist is too much absorbed in money-grubbing to take notice of this gratuitous gift of labour. A violent interruption of the labour-process by a crisis, makes him sensitively aware of it.<sup>5</sup>

As regards the means of production, what is really consumed is their use-value, and the consumption of this use-value by labour results in the product. There is no consumption of their value,<sup>6</sup> and it would therefore be inaccurate to say that it is reproduced. It is rather preserved; not by reason of any operation it undergoes itself in the process; but because the article in which it originally exists, vanishes, it is true, but vanishes into some other article. Hence, in the value of the product, there is a reappearance of the value of the means of production, but there is, strictly speaking, no reproduction of that value. That which is produced is a new use-value in which the old exchange-value reappears.<sup>7</sup>

It is otherwise with the subjective factor of the labour-process, with labour-power in action. While the labourer, by virtue of his labour being of a specialised kind that has a special object, preserves and transfers to the product the value of the means of production, he at the same time, by the mere act of working, creates each instant an additional or new value. Suppose the process of production to be stopped just when the workman has produced an equivalent for the value of his own labour-power, when, for example, by six hours' labour, he has added a value of three shillings. This value is the surplus, of the total value of the product, over the portion of its value that is due to the means of production. It is the only original bit of value formed during this process, the only portion of the value of the product created by this process. Of course, we do not forget that this new value only replaces the money advanced by the capitalist in the purchase of the labour-power, and spent by the labourer on the necessaries of life. With regard to the money spent, the new value is merely a reproduction; but, nevertheless, it is an actual, and not, as in the case of the value of the means of production, only an apparent, reproduction. The substitution of one value for another, is here effected by the creation of new value.

We know, however, from what has gone before, that the labour-process may continue beyond the time necessary to reproduce and incorporate in the product a mere equivalent for the value of the labour-power. Instead of the six hours that are sufficient for the latter purpose, the process may continue for twelve hours. The action of labour-power, therefore, not only reproduces its own value, but produces value over and above it. This surplus-value is the difference between the value of the product and the value of the elements consumed in the formation of that product, in other words, of the means of production and the labour-power.

By our explanation of the different parts played by the various factors of the labour-process in the formation of the product's value, we have, in fact, disclosed the characters of the different functions allotted to the different elements of capital in the process of expanding its own value. The surplus of the total value of the product, over the sum of the values of its constituent factors, is the surplus of the expanded capital over the capital originally advanced. The means of production on the one hand, labour-power on the other, are merely the different modes of existence which the value of the original capital assumed when from being money it was transformed into the various factors of the labour-process. That part of capital then, which is represented by the means of production, by the raw material, auxiliary material and the instruments of labour does not, in the process of production, undergo any quantitative alteration of value. I therefore call it the constant part of capital, or, more shortly, *constant capital*.

On the other hand, that part of capital, represented by labour-power, does, in the process of production, undergo an alteration of value. It both reproduces the equivalent of its own value, and also produces an excess, a surplus-value, which may itself vary, may be more or less according to circumstances. This part of capital is continually being transformed from a constant into a variable magnitude. I therefore call it the variable part of capital, or, shortly, *variable capital*. The same elements of capital which, from the point of view of the labour-process, present themselves respectively as the objective and subjective factors, as means of production and labour-power, present themselves, from the point of view of the process of creating surplus-value, as constant and variable capital.

The definition of constant capital given above by no means excludes the possibility of a change of value in its elements. Suppose the price of cotton to be one day sixpence a pound, and the next day, in consequence of a failure of the cotton crop, a shilling a pound. Each pound of the cotton bought at sixpence, and worked up after the rise in value, transfers to the product a value of one shilling; and the cotton already spun before the rise, and perhaps circulating in the market as yarn, likewise transfers to the product twice its original value. It is plain, however, that these changes of value are independent of the increment or surplus-value added to the value of the cotton by the spinning itself. If the old cotton had never been spun, it could, after the rise, be resold at a shilling a pound instead of at sixpence. Further, the fewer the processes the cotton has gone through, the more certain is this result. We therefore find that speculators make it a rule when such sudden changes in value occur, to speculate in that material on which the least possible quantity of labour has been spent: to speculate, therefore, in yarn rather than in cloth, in cotton itself, rather than in yarn. The change of value in the case we have been considering, originates, not in the process in which the cotton plays the part of a means of production, and in which it therefore functions as constant capital, but in the process in which the cotton itself is produced. The value of a commodity, it is true, is determined by the quantity of labour contained in it, but this quantity is itself limited by social conditions. If the time socially necessary for the production of any commodity alters – and a given weight of cotton represents, after a bad harvest, more labour than after a good one – all previously existing commodities of the same class are affected, because they are, as it were, only individuals of the species,<sup>8</sup> and their value at any given time is measured by the labour socially necessary, *i.e.*, by the labour necessary for their production under the then existing social conditions.

As the value of the raw material may change, so, too, may that of the instruments of labour, of the machinery, &c., employed in the process; and consequently that portion of the value of the product transferred to it from them, may also change. If in consequence of a new invention, machinery of a particular kind can be produced by a diminished expenditure of labour, the old machinery becomes depreciated more or less, and consequently transfers so much less value to the product. But here again, the change in value originates outside the process in which the machine is acting as a means of production. Once engaged in this process, the machine cannot transfer more value than it possesses apart from the process.

Just as a change in the value of the means of production, even after they have commenced to take a part in the labour-process, does not alter their character as constant capital, so, too, a change in the proportion of constant to variable capital does not affect the respective functions of these two kinds of capital. The technical conditions of the labour-process may be revolutionised to such an extent, that where formerly ten men using ten implements of small value worked up a relatively small quantity of raw material, one man may now, with the aid of one expensive machine, work up one hundred times as much raw material. In the latter case we have an enormous increase in the constant capital, that is represented by the total value of the means of production used, and at

the same time a great reduction in the variable capital, invested in labour-power. Such a revolution, however, alters only the quantitative relation between the constant and the variable capital, or the proportions in which the total capital is split up into its constant and variable constituents; it has not in the least degree affected the essential difference between the two.

---

<sup>1</sup> “Labour gives a new creation for one extinguished.” (“An Essay on the Polit. Econ. of Nations,” London, 1821, p. 13.)

<sup>2</sup> The subject of repairs of the implements of labour does not concern us here. A machine that is undergoing repair, no longer plays the part of an instrument, but that of a subject of labour. Work is no longer done with it, but upon it. It is quite permissible for our purpose to assume, that the labour expended on the repairs of instruments is included in the labour necessary for their original production. But in the text we deal with that wear and tear, which no doctor can cure, and which little by little brings about death, with “that kind of wear which cannot be repaired from time to time, and which, in the case of a knife, would ultimately reduce it to a state in which the cutler would say of it, it is not worth a new blade.” We have shewn in the text, that a machine takes part in every labour-process as an integral machine, but that into the simultaneous process of creating value it enters only bit by bit. How great then is the confusion of ideas exhibited in the following extract! “Mr. Ricardo says a portion of the labour of the engineer in making [stocking] machines” is contained for example in the value of a pair of stockings. “Yet the total labour, that produced each single pair of stockings ... includes the whole labour of the engineer, not a portion; for one machine makes many pairs, and none of those pairs could have been done without any part of the machine.” “Obs. on Certain Verbal Disputes in Pol. Econ., Particularly Relating to Value,” p. 54. The author, an uncommonly self-satisfied wisacre, is right in his confusion and therefore in his contention, to this extent only, that neither Ricardo nor any other economist, before or since him, has accurately distinguished the two aspects of labour, and still less, therefore, the part played by it under each of these aspects in the formation of value.

<sup>3</sup> From this we may judge of the absurdity of J. B. Say, who pretends to account for surplus-value (Interest, Profit, Rent), by the “services productifs” which the means of production, soil, instruments, and raw material, render in the labour-process by means of their use-values. Mr. Wm. Roscher who seldom loses an occasion of registering, in black and white, ingenious apologetic fancies, records the following specimen: - “J. B. Say (Traité, t. 1, ch. 4) very truly remarks: the value produced by an oil mill, after deduction of all costs, is something new, something quite different from the labour by which the oil mill itself was erected.” (l.c., p. 82, note.) Very true, Mr. Professor! the oil produced by the oil mill is indeed something very different from the labour expended in constructing the mill! By value, Mr. Roscher understands such stuff as “oil,” because oil has value, notwithstanding that “Nature” produces petroleum, though relatively “in small quantities,” a fact to which he seems to refer in his further observation: “It (Nature) produces scarcely any exchange-value.” Mr. Roscher’s “Nature” and the exchange-value it produces are rather like the foolish virgin who admitted indeed that she had had a child, but “it was such a little one.” This “savant sérieux” in continuation remarks: “Ricardo’s school is in the habit of including capital as accumulated labour under the head of labour. This is unskilful work, because, indeed, the owner of capital, after all, does something more than the merely creating and preserving of the same: namely, the abstention from the enjoyment of it, for which he demands, e.g., interest.” (l.c.) How very “skilful” is this “anatomico-physiological method” of Political Economy, which, “indeed,” converts a mere desire “after all” into a source of value.

<sup>4</sup> “Of all the instruments of the farmers’ trade, the labour of man ... is that on which he is most to rely for the repayment of his capital. The other two ... the working stock of the cattle and the ... carts, ploughs, spades, and so forth, without a given portion of the first, are nothing at all.” (Edmund Burke: “Thoughts and Details on Scarcity, originally presented to the Right Hon. W. Pitt, in the month of November 1795,” Edit. London, 1800, p. 10.)

<sup>5</sup> In *The Times* of 26th November, 1862, a manufacturer, whose mill employed 800 hands, and consumed, on the average, 150 bales of East Indian, or 130 bales of American cotton, complains, in doleful manner, of the standing expenses of his factory when not working. He estimates them at £6,000 a year. Among them are a number of items that do not concern us here, such as rent, rates, and taxes, insurance, salaries of the manager, book-keeper, engineer, and others. Then he reckons £150 for coal used to heat the mill occasionally, and run the engine now and then. Besides this, he includes the wages of the people employed at odd times to keep the machinery in working order. Lastly, he puts down £1,200 for depreciation of machinery, because “the weather and the natural principle of decay do not suspend their operations because the steam-engine ceases to revolve.” He says, emphatically, he does not estimate his depreciation at more than the small sum of £1,200, because his machinery is already nearly worn out.

<sup>6</sup> “Productive consumption ... where the consumption of a commodity is a part of the process of production. ... In these instances there is no consumption of value.” (S. P. Newman, l.c., p. 296.)

<sup>7</sup> In an American compendium that has gone through, perhaps, 20 editions, this passage occurs: “It matters not in what form capital re-appears;” then after a lengthy enumeration of all the possible ingredients of production whose value re-appears in the product, the passage concludes thus: “The various kinds of food, clothing, and shelter, necessary for the existence and comfort of the human being, are also changed. They are consumed from time to time, and their value re-appears in that new vigour imparted to his body and mind, forming fresh capital, to be employed again in the work of production.” (F. Wayland, l.c., pp. 31, 32.) Without noticing any other oddities, it suffices to observe, that what re-appears in the fresh vigour, is not the bread’s price, but its bloodforming substances. What, on the other hand, re-appears in the value of that vigour, is not the means of subsistence, but their value. The same necessaries of life, at half the price, would form just as much muscle and bone, just as much vigour, but not vigour of the same value. This confusion of “value” and “vigour” coupled with our author’s pharisaical indefiniteness, mark an attempt, futile for all that, to thrash out an explanation of surplus-value from a mere re-appearance of pre-existing values.

<sup>8</sup> “Toutes les productions d’un même genre ne forment proprement qu’une masse, dont le prix se détermine en général et sans égard aux circonstances particulières.” (Le Trosne, l.c., p. 893.) [“Properly speaking, all products of the same kind form a single mass, and their price is determined in general and without regard to particular circumstances.”]

# Chapter 9: The Rate of Surplus-Value

## Section 1: The Degree of Exploitation of Labour-Power

The surplus-value generated in the process of production by  $C$ , the capital advanced, or in other words, the self-expansion of the value of the capital  $C$ , presents itself for our consideration, in the first place, as a surplus, as the amount by which the value of the product exceeds the value of its constituent elements.

The capital  $C$  is made up of two components, one, the sum of money  $c$  laid out upon the means of production, and the other, the sum of money  $v$  expended upon the labour-power;  $c$  represents the portion that has become constant capital, and  $v$  the portion that has become variable capital. At first then,  $C = c + v$ : for example, if £500 is the capital advanced, its components may be such that the £500 = £410 const. + £90 var. When the process of production is finished, we get a commodity whose value =  $(c + v) + s$ , where  $s$  is the surplus-value; or taking our former figures, the value of this commodity may be (£410 const. + £90 var.) + £90 surpl. The original capital has now changed from  $C$  to  $C'$ , from £500 to £590. The difference is  $s$  or a surplus-value of £90. Since the value of the constituent elements of the product is equal to the value of the advanced capital, it is mere tautology to say, that the excess of the value of the product over the value of its constituent elements, is equal to the expansion of the capital advanced or to the surplus-value produced.

Nevertheless, we must examine this tautology a little more closely. The two things compared are, the value of the product and the value of its constituents consumed in the process of production. Now we have seen how that portion of the constant capital which consists of the instruments of labour, transfers to the production only a fraction of its value, while the remainder of that value continues to reside in those instruments. Since this remainder plays no part in the formation of value, we may at present leave it on one side. To introduce it into the calculation would make no difference. For instance, taking our former example,  $c = £410$ : suppose this sum to consist of £312 value of raw material, £44 value of auxiliary material, and £54 value of the machinery worn away in the process; and suppose that the total value of the machinery employed is £1,054. Out of this latter sum, then, we reckon as advanced for the purpose of turning out the product, the sum of £54 alone, which the machinery loses by wear and tear in the process; for this is all it parts with to the product. Now if we also reckon the remaining £1,000, which still continues in the machinery, as transferred to the product, we ought also to reckon it as part of the value advanced, and thus make it appear on both sides of our calculation.<sup>1</sup> We should, in this way, get £1,500 on one side and £1,590 on the other. The difference of these two sums, or the surplus-value, would still be £90. Throughout this Book therefore, by constant capital advanced for the production of value, we always mean, unless the context is repugnant thereto, the value of the means of production actually consumed in the process, and that value alone.

This being so, let us return to the formula  $C = c + v$ , which we saw was transformed into  $C' = (c + v) + s$ ,  $C$  becoming  $C'$ . We know that the value of the constant capital is transferred to, and merely re-appears in the product. The new value actually created in the process, the value produced, or value-product, is therefore not the same as the value of the product; it is not, as it would at first sight appear  $(c + v) + s$  or £410 const. + £90 var. + £90 surpl.; but  $v + s$  or £90 var. + £90 surpl., not £590 but £180. If  $c = 0$ , or in other words, if there were branches of industry in which the capitalist could dispense with all means of production made by previous labour, whether they be raw material, auxiliary material, or instruments of labour, employing only

labour-power and materials supplied by Nature, in that case, there would be no constant capital to transfer to the product. This component of the value of the product, *i.e.*, the £410 in our example, would be eliminated, but the sum of £180, the amount of new value created, or the value produced, which contains £90 of surplus-value, would remain just as great as if  $c$  represented the highest value imaginable. We should have  $C = (0 + v) = v$  or  $C'$  the expanded capital =  $v + s$  and therefore  $C' - C = s$  as before. On the other hand, if  $s = 0$ , or in other words, if the labour-power, whose value is advanced in the form of variable capital, were to produce only its equivalent, we should have  $C = c + v$  or  $C'$  the value of the product =  $(c + v) + 0$  or  $C = C'$ . The capital advanced would, in this case, not have expanded its value.

From what has gone before, we know that surplus-value is purely the result of a variation in the value of  $v$ , of that portion of the capital which is transformed into labour-power; consequently,  $v + s = v + v'$ , or  $v$  plus an increment of  $v$ . But the fact that it is  $v$  alone that varies, and the conditions of that variation, are obscured by the circumstance that in consequence of the increase in the variable component of the capital, there is also an increase in the sum total of the advanced capital. It was originally £500 and becomes £590. Therefore in order that our investigation may lead to accurate results, we must make abstraction from that portion of the value of the product, in which constant capital alone appears, and consequently must equate the constant capital to zero or make  $c = 0$ . This is merely an application of a mathematical rule, employed whenever we operate with constant and variable magnitudes, related to each other by the symbols of addition and subtraction only.

A further difficulty is caused by the original form of the variable capital. In our example,  $C' = £410 \text{ const.} + £90 \text{ var.} + £90 \text{ surpl.}$ ; but £90 is a given and therefore a constant quantity; hence it appears absurd to treat it as variable. But in fact, the term £90 var. is here merely a symbol to show that this value undergoes a process. The portion of the capital invested in the purchase of labour-power is a definite quantity of materialised labour, a constant value like the value of the labour-power purchased. But in the process of production the place of the £90 is taken by the labour-power in action, dead labour is replaced by living labour, something stagnant by something flowing, a constant by a variable. The result is the reproduction of  $v$  plus an increment of  $v$ . From the point of view then of capitalist production, the whole process appears as the spontaneous variation of the originally constant value, which is transformed into labour-power. Both the process and its result, appear to be owing to this value. If, therefore, such expressions as “£90 variable capital,” or “so much self-expanding value,” appear contradictory, this is only because they bring to the surface a contradiction immanent in capitalist production.

At first sight it appears a strange proceeding, to equate the constant capital to zero. Yet it is what we do every day. If, for example, we wish to calculate the amount of England's profits from the cotton industry, we first of all deduct the sums paid for cotton to the United States, India, Egypt and other countries; in other words, the value of the capital that merely re-appears in the value of the product, is put = 0.

Of course the ratio of surplus-value not only to that portion of the capital from which it immediately springs, and whose change of value it represents, but also to the sum total of the capital advanced is economically of very great importance. We shall, therefore, in the third book, treat of this ratio exhaustively. In order to enable one portion of a capital to expand its value by being converted into labour-power, it is necessary that another portion be converted into means of production. In order that variable capital may perform its function, constant capital must be advanced in proper proportion, a proportion given by the special technical conditions of each labour-process. The circumstance, however, that retorts and other vessels, are necessary to a chemical process, does not compel the chemist to notice them in the result of his analysis. If we

look at the means of production, in their relation to the creation of value, and to the variation in the quantity of value, apart from anything else, they appear simply as the material in which labour-power, the value-creator, incorporates itself. Neither the nature, nor the value of this material is of any importance. The only requisite is that there be a sufficient supply to absorb the labour expended in the process of production. That supply once given, the material may rise or fall in value, or even be, as land and the sea, without any value in itself; but this will have no influence on the creation of value or on the variation in the quantity of value.<sup>2</sup>

In the first place then we equate the constant capital to zero. The capital advanced is consequently reduced from  $c + v$  to  $v$ , and instead of the value of the product  $(c + v) + s$  we have now the value produced  $(v + s)$ . Given the new value produced = £180, which sum consequently represents the whole labour expended during the process, then subtracting from it £90 the value of the variable capital, we have remaining £90, the amount of the surplus-value. This sum of £90 or  $s$  expresses the absolute quantity of surplus-value produced. The relative quantity produced, or the increase per cent of the variable capital, is determined, it is plain, by the ratio of the surplus-value to the variable capital, or is expressed by  $s/v$ . In our example this ratio is  $90/90$ , which gives an increase of 100%. This relative increase in the value of the variable capital, or the relative magnitude of the surplus-value, I call, "The rate of surplus-value."<sup>3</sup>

We have seen that the labourer, during one portion of the labour-process, produces only the value of his labour-power, that is, the value of his means of subsistence. Now since his work forms part of a system, based on the social division of labour, he does not directly produce the actual necessaries which he himself consumes; he produces instead a particular commodity, yarn for example, whose value is equal to the value of those necessaries or of the money with which they can be bought. The portion of his day's labour devoted to this purpose, will be greater or less, in proportion to the value of the necessaries that he daily requires on an average, or, what amounts to the same thing, in proportion to the labour-time required on an average to produce them. If the value of those necessaries represent on an average the expenditure of six hours' labour, the workman must on an average work for six hours to produce that value. If instead of working for the capitalist, he worked independently on his own account, he would, other things being equal, still be obliged to labour for the same number of hours, in order to produce the value of his labour-power, and thereby to gain the means of subsistence necessary for his conservation or continued reproduction. But as we have seen, during that portion of his day's labour in which he produces the value of his labour-power, say three shillings, he produces only an equivalent for the value of his labour-power already advanced<sup>4</sup> by the capitalist; the new value created only replaces the variable capital advanced. It is owing to this fact, that the production of the new value of three shillings takes the semblance of a mere reproduction. That portion of the working day, then, during which this reproduction takes place, I call "*necessary*" labour time, and the labour expended during that time I call "*necessary*" labour.<sup>5</sup> Necessary, as regards the labourer, because independent of the particular social form of his labour; necessary, as regards capital, and the world of capitalists, because on the continued existence of the labourer depends their existence also.

During the second period of the labour-process, that in which his labour is no longer necessary labour, the workman, it is true, labours, expends labour-power; but his labour, being no longer necessary labour, he creates no value for himself. He creates surplus-value which, for the capitalist, has all the charms of a creation out of nothing. This portion of the working day, I name surplus labour-time, and to the labour expended during that time, I give the name of surplus labour. It is every bit as important, for a correct understanding of surplus-value, to conceive it as a mere congelation of surplus labour-time, as nothing but materialised surplus labour, as it is, for a

proper comprehension of value, to conceive it as a mere congelation of so many hours of labour, as nothing but materialised labour. The essential difference between the various economic forms of society, between, for instance, a society based on slave-labour, and one based on wage-labour, lies only in the mode in which this surplus labour is in each case extracted from the actual producer, the labourer.<sup>6</sup>

Since, on the one hand, the values of the variable capital and of the labour-power purchased by that capital are equal, and the value of this labour-power determines the necessary portion of the working day; and since, on the other hand, the surplus-value is determined by the surplus portion of the working day, it follows that surplus-value bears the same ratio to variable capital, that surplus labour does to necessary labour, or in other words, the rate of surplus-value,  $s/v = (\text{surplus labour})/(\text{necessary labour})$ . Both ratios,  $s/v$  and  $(\text{surplus labour})/(\text{necessary labour})$ , express the same thing in different ways; in the one case by reference to materialised, incorporated labour, in the other by reference to living, fluent labour.

The rate of surplus-value is therefore an exact expression for the degree of exploitation of labour-power by capital, or of the labourer by the capitalist.<sup>7</sup>

We assumed in our example, that the value of the product = £410 const. + £90 var. + £90 surpl., and that the capital advanced = £500. Since the surplus-value = £90, and the advanced capital = £500, we should, according to the usual way of reckoning, get as the rate of surplus-value (generally confounded with rate of profits) 18%, a rate so low as possibly to cause a pleasant surprise to Mr. Carey and other harmonisers. But in truth, the rate of surplus-value is not equal to  $s/C$  or  $s/(c+v)$ , but to  $s/v$ : thus it is not  $90/500$  but  $90/90$  or 100%, which is more than five times the apparent degree of exploitation. Although, in the case we have supposed, we are ignorant of the actual length of the working day, and of the duration in days or weeks of the labour-process, as also of the number of labourers employed, yet the rate of surplus-value  $s/v$  accurately discloses to us, by means of its equivalent expression, surplus labour/necessary labour the relation between the two parts of the working day. This relation is here one of equality, the rate being 100%. Hence, it is plain, the labourer, in our example, works one half of the day for himself, the other half for the capitalist.

The method of calculating the rate of surplus-value is therefore, shortly, as follows. We take the total value of the product and put the constant capital which merely re-appears in it, equal to zero. What remains, is the only value that has, in the process of producing the commodity, been actually created. If the amount of surplus-value be given, we have only to deduct it from this remainder, to find the variable capital. And *vice versâ*, if the latter be given, and we require to find the surplus-value. If both be given, we have only to perform the concluding operation, viz., to calculate  $s/v$ , the ratio of the surplus-value to the variable capital.

Though the method is so simple, yet it may not be amiss, by means of a few examples, to exercise the reader in the application of the novel principles underlying it.

First we will take the case of a spinning mill containing 10,000 mule spindles, spinning No. 32 yarn from American cotton, and producing 1 lb. of yarn weekly per spindle. We assume the waste to be 6%: under these circumstances 10,600 lbs. of cotton are consumed weekly, of which 600 lbs. go to waste. The price of the cotton in April, 1871, was  $7\frac{3}{4}$ d. per lb.; the raw material therefore costs in round numbers £342. The 10,000 spindles, including preparation-machinery, and motive power, cost, we will assume, £1 per spindle, amounting to a total of £10,000. The wear and tear we put at 10%, or £1,000 yearly = £20 weekly. The rent of the building we suppose to be £300 a year, or £6 a week. Coal consumed (for 100 horse-power indicated, at 4 lbs. of coal per horse-power per hour during 60 hours, and inclusive of that consumed in heating the mill), 11 tons a week at 8s. 6d. a ton, amounts to about £4½ a week: gas, £1 a week, oil, &c., £4½ a week.

Total cost of the above auxiliary materials, £10 weekly. Therefore the constant portion of the value of the week's product is £378. Wages amount to £52 a week. The price of the yarn is 12¼d. per. lb. which gives for the value of 10,000 lbs. the sum of £510. The surplus-value is therefore in this case £510 - £430 = £80. We put the constant part of the value of the product = 0, as it plays no part in the creation of value. There remains £132 as the weekly value created, which = £52 var. + £80 surpl. The rate of surplus-value is therefore  $80/52 = 153 \frac{11}{13}\%$ . In a working day of 10 hours with average labour the result is: necessary labour =  $3 \frac{31}{33}$  hours, and surplus labour =  $6 \frac{2}{33}$ .<sup>8</sup>

One more example. Jacob gives the following calculation for the year 1815. Owing to the previous adjustment of several items it is very imperfect; nevertheless for our purpose it is sufficient. In it he assumes the price of wheat to be 8s. a quarter, and the average yield per acre to be 22 bushels.

| VALUE PRODUCED PER ACRE |             |                                 |            |
|-------------------------|-------------|---------------------------------|------------|
| Seed                    | £1 9s. 0d.  | Tithes, Rates,<br>and taxes,    | £1 1s. 0d. |
| Manure                  | £2 10s. 0d. | Rent                            | £1 8s. 0d. |
| Wages                   | £3 10s. 0d. | Farmer's Profit<br>and Interest | £1 2s. 0d. |
| TOTAL                   | £7 9s. 0d.  | TOTAL                           | £3 11s 0d. |

Assuming that the price of the product is the same as its value, we here find the surplus-value distributed under the various heads of profit, interest, rent, &c. We have nothing to do with these in detail; we simply add them together, and the sum is a surplus-value of £3 11s. 0d. The sum of £3 19s. 0d., paid for seed and manure, is constant capital, and we put it equal to zero. There is left the sum of £3 10s. 0d., which is the variable capital advanced: and we see that a new value of £3 10s. 0d + £3 11s. 0d. has been produced in its place. Therefore  $s/v = £3 \ 11s. \ 0d. / £3 \ 10s. \ 0d.$ , giving a rate of surplus-value of more than 100%. The labourer employs more than one half of his working day in producing the surplus-value, which different persons, under different pretexts, share amongst themselves.<sup>9</sup>

## Section 2: The Representation of the Components of the Value of the Product by Corresponding Proportional Parts of the Product Itself

Let us now return to the example by which we were shown how the capitalist converts money into capital.

The product of a working day of 12 hours is 20 lbs. of yarn, having a value of 30s. No less than 8/10ths of this value, or 24s., is due to mere re-appearance in it, of the value of the means of production (20 lbs. of cotton, value 20s., and spindle worn away, 4s.): it is therefore constant capital. The remaining 2/10ths or 6s. is the new value created during the spinning process: of this one half replaces the value of the day's labour-power, or the variable capital, the remaining half constitutes a surplus-value of 3s. The total value then of the 20 lbs. of yarn is made up as follows:  
30s. value of yarn = 24s. const. + 3s. var. + 3s. surpl.

Since the whole of this value is contained in the 20 lbs. of yarn produced, it follows that the various component parts of this value, can be represented as being contained respectively in corresponding parts of the product.

If the value of 30s. is contained in 20 lbs. of yarn, then 8/10ths of this value, or the 24s. that form its constant part, is contained in 8/10ths of the product or in 16 lbs. of yarn. Of the latter 13 1/3 lbs. represent the value of the raw material, the 20s. worth of cotton spun, and 2 2/3 lbs. represent the 4s. worth of spindle, &c., worn away in the process.

Hence the whole of the cotton used up in spinning the 20 lbs. of yarn, is represented by 13 1/3 lbs. of yarn. This latter weight of yarn contains, it is true, by weight, no more than 13 1/3 lbs. of cotton, worth 13 1/3 shillings; but the 6 2/3 shillings additional value contained in it, are the equivalent for the cotton consumed in spinning the remaining 6 2/3 lbs. of yarn. The effect is the same as if these 6 2/3 lbs. of yarn contained no cotton at all, and the whole 20 lbs. of cotton were concentrated in the 13 1/3 lbs. of yarn. The latter weight, on the other hand, does not contain an atom either of the value of the auxiliary materials and implements, or of the value newly created in the process.

In the same way, the 2 2/3 lbs. of yarn, in which the 4s., the remainder of the constant capital, is embodied, represents nothing but the value of the auxiliary materials and instruments of labour consumed in producing the 20 lbs. of yarn.

We have, therefore, arrived at this result: although eight-tenths of the product, or 16 lbs. of yarn, is, in its character of an article of utility, just as much the fabric of the spinner's labour, as the remainder of the same product, yet when viewed in this connexion, it does not contain, and has not absorbed any labour expended during the process of spinning. It is just as if the cotton had converted itself into yarn, without help; as if the shape it had assumed was mere trickery and deceit: for so soon as our capitalist sells it for 24s., and with the money replaces his means of production, it becomes evident that this 16 lbs. of yarn is nothing more than so much cotton and spindle-waste in disguise.

On the other hand, the remaining 2/10ths of the product, or 4 lbs of yarn, represent nothing but the new value of 6s., created during the 12 hours' spinning process. All the value transferred to those 4 lbs, from the raw material and instruments of labour consumed, was, so to say, intercepted in order to be incorporated in the 16 lbs. first spun. In this case, it is as if the spinner had spun 4 lbs. of yarn out of air, or, as if he had spun them with the aid of cotton and spindles, that, being the spontaneous gift of Nature, transferred no value to the product.

Of this 4 lbs. of yarn, in which the whole of the value newly created during the process, is condensed, one half represents the equivalent for the value of the labour consumed, or the 3s. variable capital, the other half represents the 3s. surplus-value.

Since 12 working-hours of the spinner are embodied in 6s., it follows that in yarn of the value of 30s., there must be embodied 60 working-hours. And this quantity of labour-time does in fact exist in the 20 lbs of yarn; for in 8/10ths or 16 lbs there are materialised the 48 hours of labour expended, before the commencement of the spinning process, on the means of production; and in the remaining 2/10ths or 4 lbs there are materialised the 12 hours' work done during the process itself.

On a former page we saw that the value of the yarn is equal to the sum of the new value created during the production of that yarn plus the value previously existing in the means of production.

It has now been shown how the various component parts of the value of the product, parts that differ functionally from each other, may be represented by corresponding proportional parts of the product itself.

To split up in this manner the product into different parts, of which one represents only the labour previously spent on the means of production, or the constant capital, another, only the necessary labour spent during the process of production, or the variable capital, and another and last part,

only the surplus labour expended during the same process, or the surplus-value; to do this, is, as will be seen later on from its application to complicated and hitherto unsolved problems, no less important than it is simple.

In the preceding investigation we have treated the total product as the final result, ready for use, of a working day of 12 hours. We can however follow this total product through all the stages of its production; and in this way we shall arrive at the same result as before, if we represent the partial products, given off at the different stages, as functionally different parts of the final or total product.

The spinner produces in 12 hours 20 lbs. of yarn, or in 1 hour  $1\frac{2}{3}$  lbs; consequently he produces in 8 hours  $13\frac{2}{3}$  lbs., or a partial product equal in value to all the cotton that is spun in a whole day. In like manner the partial product of the next period of 1 hour and 36 minutes, is  $2\frac{2}{3}$  lbs. of yarn: this represents the value of the instruments of labour that are consumed in 12 hours. In the following hour and 12 minutes, the spinner produces 2 lbs. of yarn worth 3 shillings, a value equal to the whole value he creates in his 6 hours' necessary labour. Finally, in the last hour and 12 minutes he produces another 2 lbs. of yarn, whose value is equal to the surplus-value, created by his surplus labour during half a day. This method of calculation serves the English manufacturer for every-day use; it shows, he will say, that in the first 8 hours, or  $\frac{2}{3}$  of the working day, he gets back the value of his cotton; and so on for the remaining hours. It is also a perfectly correct method: being in fact the first method given above with this difference, that instead of being applied to space, in which the different parts of the completed product lie side by side, it deals with time, in which those parts are successively produced. But it can also be accompanied by very barbarian notions, more especially in the heads of those who are as much interested, practically, in the process of making value beget value, as they are in misunderstanding that process theoretically. Such people may get the notion into their heads, that our spinner, for example, produces or replaces in the first 8 hours of his working day the *value* of the cotton; in the following hour and 36 minutes the *value* of the instruments of labour worn away; in the next hour and 12 minutes the *value* of the wages; and that he devotes to the production of surplus-value for the manufacturer, only that well known "last hour." In this way the poor spinner is made to perform the two-fold miracle not only of producing cotton, spindles, steam-engine, coal, oil, &c., at the same time that he spins with them, but also of turning one working day into five; for, in the example we are considering, the production of the raw material and instruments of labour demands four working days of twelve hours each, and their conversion into yarn requires another such day. That the love of lucre induces an easy belief in such miracles, and that sycophant doctrinaires are never wanting to prove them, is vouched for by the following incident of historical celebrity.

### Section 3: Senior's "Last Hour"

One fine morning, in the year 1836, Nassau W. Senior, who may be called the bel-esprit of English economists, well known, alike for his economic "science," and for his beautiful style, was summoned from Oxford to Manchester, to learn in the latter place, the Political Economy that he taught in the former. The manufacturers elected him as their champion, not only against the newly passed Factory Act, but against the still more menacing Ten-hours' agitation. With their usual practical acuteness, they had found out that the learned Professor "wanted a good deal of finishing;" it was this discovery that caused them to write for him. On his side the Professor has embodied the lecture he received from the Manchester manufacturers, in a pamphlet, entitled: "Letters on the Factory Act, as it affects the cotton manufacture." London, 1837. Here we find, amongst others, the following edifying passage:

“Under the present law, no mill in which persons under 18 years of age are employed, ... can be worked more than 11½ hours a day, that is, 12 hours for 5 days in the week, and nine on Saturday.

“Now the following analysis (!) will show that in a mill so worked, the whole net profit is derived *from the last hour*. I will suppose a manufacturer to invest £100,000: – £80,000 in his mill and machinery, and £20,000 in raw material and wages. The annual return of that mill, supposing the capital to be turned once a year, and gross profits to be 15 per cent., ought to be goods worth £115,000.... Of this £115,000, each of the twenty-three half-hours of work produces 5-115ths or one twenty-third. Of these 23-23rds (constituting the whole £115,000) twenty, that is to say £100,000 out of the £115,000, simply replace the capital; – one twenty-third (or £5,000 out of the £115,000) makes up for the deterioration of the mill and machinery. The remaining 2-23rds, that is, the last two of the twenty-three half-hours of every day, produce the net profit of 10 per cent. If, therefore (prices remaining the same), the factory could be kept at work thirteen hours instead of eleven and a half, with an addition of about £2,600 to the circulating capital, the net profit would be more than doubled. On the other hand, if the hours of working were reduced by one hour per day (prices remaining the same), the *net* profit would be destroyed – if they were reduced by one hour and a half, even the *gross* profit would be destroyed.”<sup>10</sup>

And the Professor calls this an “analysis!” If, giving credence to the out-cries of the manufacturers, he believed that the workmen spend the best part of the day in the production, i.e., the reproduction or replacement of the value of the buildings, machinery, cotton, coal, &c., then his analysis was superfluous. His answer would simply have been: – Gentlemen! if you work your mills for 10 hours instead of 11½, then, other things being equal, the daily consumption of cotton, machinery, &c., will decrease in proportion. You gain just as much as you lose. Your work-people will in future spend one hour and a half less time in reproducing or replacing the capital that has been advanced. – If, on the other hand, he did not believe them without further inquiry, but, as being an expert in such matters, deemed an analysis necessary, then he ought, in a question that is concerned exclusively with the relations of net profit to the length of the working day, before all things to have asked the manufacturers, to be careful not to lump together machinery, workshops, raw material, and labour, but to be good enough to place the constant capital, invested in buildings, machinery, raw material, &c., on one side of the account, and the capital advanced in wages on the other side. If the Professor then found, that in accordance with the calculation of the manufacturers, the workman reproduced or replaced his wages in 2 half-hours, in that case, he should have continued his analysis thus:

According to your figures, the workman in the last hour but one produces his wages, and in the last hour your surplus-value or net profit. Now, since in equal periods he produces equal values, the produce of the last hour but one, must have the same value as that of the last hour. Further, it is only while he labours that he produces any value at all, and the amount of his labour is measured by his labour-time. This you say, amounts to 11½ hours a day. He employs one portion of these 11½ hours, in producing or replacing his wages, and the remaining portion in producing your net profit. Beyond this he does absolutely nothing. But since, on your assumption, his wages, and the surplus-value he yields, are of equal value, it is clear that he produces his wages in 5¾ hours, and your net profit in the other 5¾ hours. Again, since the value of the yarn produced in 2 hours, is equal to the sum of the values of his wages and of your net profit, the measure of the value of this yarn must be 11½ working-hours, of which 5¾ hours measure the value of the yarn

produced in the last hour but one, and  $5\frac{3}{4}$ , the value of the yarn produced in the last hour. We now come to a ticklish point; therefore, attention! The last working-hour but one is, like the first, an ordinary working-hour, neither more nor less. How then can the spinner produce in one hour, in the shape of yarn, a value that embodies  $5\frac{3}{4}$  hours' labour? The truth is that he performs no such miracle. The use-value produced by him in one hour, is a definite quantity of yarn. The value of this yarn is measured by  $5\frac{3}{4}$  working-hours, of which  $4\frac{3}{4}$  were, without any assistance from him, previously embodied in the means of production, in the cotton, the machinery, and so on; the remaining one hour alone is added by him. Therefore since his wages are produced in  $5\frac{3}{4}$  hours, and the yarn produced in one hour also contains  $5\frac{3}{4}$  hours' work, there is no witchcraft in the result, that the value created by his  $5\frac{3}{4}$  hours' spinning, is equal to the value of the product spun in one hour. You are altogether on the wrong track, if you think that he loses a single moment of his working day, in reproducing or replacing the values of the cotton, the machinery, and so on. On the contrary, it is because his labour converts the cotton and spindles into yarn, because he spins, that the values of the cotton and spindles go over to the yarn of their own accord. This result is owing to the quality of his labour, not to its quantity. It is true, he will in one hour transfer to the yarn more value, in the shape of cotton, than he will in half an hour; but that is only because in one hour he spins up more cotton than in half an hour. You see then, your assertion, that the workman produces, in the last hour but one, the value of his wages, and in the last hour your net profit, amounts to no more than this, that in the yarn produced by him in 2 working-hours, whether they are the 2 first or the 2 last hours of the working day, in that yarn, there are incorporated  $11\frac{1}{2}$  working-hours, or just a whole day's work, *i.e.*, two hours of his own work and  $9\frac{1}{2}$  hours of other people's. And my assertion that, in the first  $5\frac{3}{4}$  hours, he produces his wages, and in the last  $5\frac{3}{4}$  hours your net profit, amounts only to this, that you pay him for the former, but not for the latter. In speaking of payment of labour, instead of payment of labour-power, I only talk your own slang. Now, gentlemen, if you compare the working-time you pay for, with that which you do not pay for, you will find that they are to one another, as half a day is to half a day; this gives a rate of 100%, and a very pretty percentage it is. Further, there is not the least doubt, that if you make your "hands" toil for 13 hours, instead of  $11\frac{1}{2}$ , and, as may be expected from you, treat the work done in that extra one hour and a half, as pure surplus labour, then the latter will be increased from  $5\frac{3}{4}$  hours' labour to  $7\frac{1}{4}$  hours' labour, and the rate of surplus-value from 100% to  $126\frac{2}{23}\%$ . So that you are altogether too sanguine, in expecting that by such an addition of  $1\frac{1}{2}$  hours to the working day, the rate will rise from 100% to 200% and more, in other words that it will be "more than doubled." On the other hand – man's heart is a wonderful thing, especially when carried in the purse – you take too pessimist a view, when you fear, that with a reduction of the hours of labour from  $11\frac{1}{2}$  to 10, the whole of your net profit will go to the dogs. Not at all. All other conditions remaining the same, the surplus labour will fall from  $5\frac{3}{4}$  hours to  $4\frac{3}{4}$  hours, a period that still gives a very profitable rate of surplus-value, namely  $82\frac{14}{23}\%$ . But this dreadful "last hour," about which you have invented more stories than have the millenarians about the day of judgment, is "all bosh." If it goes, it will cost neither you, your net profit, nor the boys and girls whom you employ, their "purity of mind."<sup>11</sup> Whenever your "last hour" strikes in earnest, think of the Oxford Professor. And now, gentlemen, "farewell, and may we meet again in yonder better world, but not before."

Senior invented the battle cry of the "last hour" in 1836.<sup>12</sup> In the London *Economist* of the 15th April, 1848, the same cry was again raised by James Wilson, an economic mandarin of high standing: this time in opposition to the 10 hours' bill.

## Section 4: Surplus-Produce

The portion of the product that represents the surplus-value, (one tenth of the 20 lbs., or 2 lbs. of yarn, in the example given in Sec. 2) we call “surplus-produce.” Just as the rate of surplus-value is determined by its relation, not to the sum total of the capital, but to its variable part; in like manner, the relative quantity of surplus-produce is determined by the ratio that this produce bears, not to the remaining part of the total product, but to that part of it in which is incorporated the necessary labour. Since the production of surplus-value is the chief end and aim of capitalist production, it is clear, that the greatness of a man’s or a nation’s wealth should be measured, not by the absolute quantity produced, but by the relative magnitude of the surplus-produce.<sup>13</sup>

The sum of the necessary labour and the surplus labour, *i.e.*, of the periods of time during which the workman replaces the value of his labour-power, and produces the surplus-value, this sum constitutes the actual time during which he works, *i.e.*, the working day.

---

<sup>1</sup> “If we reckon the value of the fixed capital employed as a part of the advances, we must reckon the remaining value of such capital at the end of the year as a part of the annual returns.” (Malthus, “Princ. of Pol. Econ.” 2nd. ed., Lond., 1836, p. 269.)

<sup>2</sup> What Lucretius says is self-evident; “nil posse creari de nihilo,” out of nothing, nothing can be created. Creation of value is transformation of labour-power into labour. Labour-power itself is energy transferred to a human organism by means of nourishing matter.

<sup>3</sup> In the same way that the English use the terms “rate of profit,” “rate of interest.” We shall see, in Book III, that the rate of profit is no mystery, so soon as we know the laws of surplus-value. If we reverse the process, we cannot comprehend either the one or the other.

<sup>4</sup> *Note added in the 3rd German edition.* — The author resorts here to the economic language in current use. It will be remembered that on p. 182 (present edition, p. 174) it was shown that in reality the labourer “advances” to the capitalist and not the capitalist to the labourer. — *F. E.*

<sup>5</sup> In this work, we have, up to now, employed the term “necessary labour-time,” to designate the time necessary under given social conditions for the production of any commodity. Henceforward we use it to designate also the time necessary for the production of the particular commodity labour-power. The use of one and the same technical term in different senses is inconvenient, but in no science can it be altogether avoided. Compare, for instance, the higher with the lower branches of mathematics.

<sup>6</sup> Herr Wilhelm Thucydides Roscher has found a mare’s nest. He has made the important discovery that if, on the one hand, the formation of surplus-value, or surplus-produce, and the consequent accumulation of capital, is now-a-days due to the thrift of the capitalist, on the other hand, in the lowest stages of civilisation it is the strong who compel the weak to economise. (*l.c.*, p. 78.) To economise what? Labour? Or superfluous wealth that does not exist? What is it that makes such men as Roscher account for the origin of surplus-value, by a mere rechauffé of the more or less plausible excuses by the capitalist, for his appropriation of surplus-value? It is, besides their real ignorance, their apologetic dread of a scientific analysis of value and surplus-value, and of obtaining a result, possibly not altogether palatable to the powers that be.

<sup>7</sup> Although the rate of surplus-value is an exact expression for the degree of exploitation of labour-power, it is, in no sense, an expression for the absolute amount of exploitation. For example, if the necessary labour = 5 hours and the surplus labour = 5 hours, the degree of exploitation is 100%. The amount of exploitation is here measured by 5 hours. If, on the other hand, the necessary labour = 6 hours and the surplus labour = 6 hours, the degree of exploitation remains, as before, 100%, while the actual amount of exploitation has increased 20%, namely from five hours to six.

<sup>8</sup> The above data, which may be relied upon, were given me by a Manchester spinner. In England the horse-power of an engine was formerly calculated from the diameter of its cylinder, now the actual horse-power shown by the indicator is taken.

<sup>9</sup> The calculations given in the text are intended merely as illustrations. We have in fact, assumed that prices = values. We shall, however, see, in Book III., that even in the case of average prices the assumption cannot be made in this very simple manner.

<sup>10</sup> Senior, *l.c.*, pp. 12, 13. We let pass such extraordinary notions as are of no importance for our purpose; for instance, the assertion, that manufacturers reckon as part of their profit, gross or net, the amount required to make good wear and tear of machinery, or in other words, to replace a part of the capital. So, too, we pass over any question as to the accuracy of his figures. Leonard Horner has shown in "A Letter to Mr. Senior," &c., London, 1837, that they are worth no more than so-called "Analysis." Leonard Horner was one of the Factory Inquiry Commissioners in 1833, and Inspector, or rather Censor of Factories till 1859. He rendered undying service to the English working-class. He carried on a life-long contest, not only with the embittered manufacturers, but also with the Cabinet, to whom the number of votes given by the masters in the Lower House, was a matter of far greater importance than the number of hours worked by the "hands" in the mills.

Apart from efforts in principle, Senior's statement is confused. What he really intended to say was this: The manufacturer employs the workman for 11½ hours or for 23 half-hours daily. As the working day, so, too, the working year, may be conceived to consist of 11½ hours or 23 half-hours, but each multiplied by the number of working days in the year. On this supposition, the 23 half-hours yield an annual product of £115,000; one half-hour yields  $\frac{1}{23} \times £115,000$ ; 20 half-hours yield  $\frac{20}{23} \times £115,000 = £100,000$ , i.e., they replace no more than the capital advanced. There remain 3 half-hours, which yield  $\frac{1}{23} \times £115,000 = £5,000$  or the gross profit. Of these 3 half-hours, one yields  $\frac{1}{23} \times £115,000 = £5,000$ ; i.e., it makes up for the wear and tear of the machinery; the remaining 2 half-hours, i.e., the last hour, yield  $\frac{2}{23} \times £115,000 = £10,000$  or the net profit. In the text Senior converts the last  $\frac{2}{23}$  of the product into portions of the working day itself.

<sup>11</sup> If, on the one hand, Senior proved that the net profit of the manufacturer, the existence of the English cotton industry, and England's command of the markets of the world, depend on "the last working-hour," on the other hand, Dr. Andrew Ure showed, that if children and young persons under 18 years of age, instead of being kept the full 12 hours in the warm and pure moral atmosphere of the factory, are turned out an hour sooner into the heartless and frivolous outer world, they will be deprived, by idleness and vice, of all hope of salvation for their souls. Since 1848, the factory inspectors have never tired of twitting the masters with this "last," this "fatal hour." Thus Mr. Hovell in his report of the 21st May, 1855: "Had the following ingenious calculation (he quotes Senior) been correct, every cotton factory in the United Kingdom would have been working at a loss since the year 1850." (Reports of the Insp. of Fact., for the half-year, ending 30th April, 1855, pp. 19, 20.) In the year 1848, after the passing of the 10 hours' bill, the masters of some flax spinning mills, scattered, few and far between, over the country on the borders of Dorset and Somerset, foisted a petition against the bill on to the shoulders of a few of their work-people. One of the clauses of this petition is as follows: "Your petitioners, as parents, conceive that an additional hour of leisure will tend more to demoralise the children than otherwise, believing that idleness is the parent of vice." On this the factory report of 31st Oct., 1848, says: The atmosphere of the flax mills, in which the children of these virtuous and tender parents work, is so loaded with dust and fibre from the raw material, that it is exceptionally unpleasant to stand even 10 minutes in the spinning rooms: for you are unable to do so without the most painful sensation, owing to the eyes, the ears, the nostrils, and mouth, being immediately filled by the clouds of flax dust from which there is no escape. The labour itself, owing to the feverish haste of the machinery, demands unceasing application of skill and movement, under the control of a watchfulness that never tires, and it seems somewhat hard, to let parents apply the term

“idling” to their own children, who, after allowing for meal-times, are fettered for 10 whole hours to such an occupation, in such an atmosphere.... These children work longer than the labourers in the neighbouring villages.... Such cruel talk about “idleness and vice” ought to be branded as the purest cant, and the most shameless hypocrisy.... That portion of the public, who, about 12 years ago, were struck by the assurance with which, under the sanction of high authority, it was publicly and most earnestly proclaimed, that the whole net profit of the manufacturer flows from the labour of the last hour, and that, therefore, the reduction of the working day by one hour, would destroy his net profit, that portion of the public, we say, will hardly believe its own eyes, when it now finds, that the original discovery of the virtues of “the last hour” has since been so far improved, as to include morals as well as profit; so that, if the duration of the labour of children, is reduced to a full 10 hours, their morals, together with the net profits of their employers, will vanish, both being dependent on this last, this fatal hour. (See Repts., Insp. of Fact., for 31st Oct., 1848, p. 101.) The same report then gives some examples of the morality and virtue of these same pure-minded manufacturers, of the tricks, the artifices, the cajoling, the threats, and the falsifications, they made use of, in order, first, to compel a few defenceless workmen to sign petitions of such a kind, and then to impose them upon Parliament as the petitions of a whole branch of industry, or a whole country. It is highly characteristic of the present status of so-called economic science, that neither Senior himself, who, at a later period, to his honour be it said, energetically supported the factory legislation, nor his opponents, from first to last, have ever been able to explain the false conclusions of the “original discovery.” They appeal to actual experience, but the why and wherefore remains a mystery.

<sup>12</sup> Nevertheless, the learned professor was not without some benefit from his journey to Manchester. In the “Letters on the Factory Act,” he makes the whole net gains including “profit” and “interests” and even “something more,” depend upon a single unpaid hour’s work of the labourer. One year previously, in his “Outlines of Political Economy,” written for the instruction of Oxford students and cultivated Philistines, he had also “discovered, in opposition to Ricardo’s determination of value by labour, that profit is derived from the labour of the capitalist, and interest from his asceticism, in other words, from his abstinence.” The dodge was an old one, but the word “abstinence” was new. Herr Roscher translates it rightly by “Enthaltung.” Some of his countrymen, the Browns, Jones, and Robinsons, of Germany, not so well versed in Latin as he, have, monk-like, rendered it by “Entsagung” (renunciation).

<sup>13</sup> “To an individual with a capital of £20,000, whose profits were £2,000 per annum, it would be a matter quite indifferent whether his capital would employ a 100 or 1,000 men, whether the commodity produced sold for £10,000 or £20,000, provided, in all cases, his profit were not diminished below £2,000. Is not the real interest of the nation similar? Provided its net real income, its rent and profits, be the same, it is of no importance whether the nation consists of 10 or of 12 millions of inhabitants.” (Ric. l.c., p. 416.) Long before Ricardo, Arthur Young, a fanatical upholder of surplus-produce, for the rest, a rambling, uncritical writer, whose reputation is in the inverse ratio of his merit, says, “Of what use, in a modern kingdom, would be a whole province thus divided [in the old Roman manner, by small independent peasants], however well cultivated, except for the mere purpose of breeding men, which taken singly is a most useless purpose?” (Arthur Young: “Political Arithmetic, &c.” London, 1774, p. 47.)

Very curious is “the strong inclination... to represent net wealth as beneficial to the labouring class... though it is evidently not on account of being net.” (Th. Hopkins, “On Rent of Land, &c.” London, 1828, p. 126.)

# Chapter 10: The Working day

## Section 1: The Limits of the Working day

We started with the supposition that labour-power is bought and sold at its value. Its value, like that of all other commodities, is determined by the working-time necessary to its production. If the production of the average daily means of subsistence of the labourer takes up 6 hours, he must work, on the average, 6 hours every day, to produce his daily labour-power, or to reproduce the value received as the result of its sale. The necessary part of his working day amounts to 6 hours, and is, therefore, *caeteris paribus* [other things being equal], a given quantity. But with this, the extent of the working day itself is not yet given.

Let us assume that the line A—B represents the length of the necessary working-time, say 6 hours. If the labour be prolonged 1, 3, or 6 hours beyond A—B, we have 3 other lines:

|                |                 |                  |
|----------------|-----------------|------------------|
| Working day I. | Working day II. | Working day III. |
| A—B—C.         | A—B—C.          | A—B—C.           |

representing 3 different working days of 7, 9, and 12 hours. The extension B—C of the line A—B represents the length of the surplus labour. As the working day is A—B + B—C or A—C, it varies with the variable quantity B—C. Since A—B is constant, the ratio of B—C to A—B can always be calculated. In working day I, it is 1/6, in working day II, 3/6, in working day III 6/6 of A—B. Since further the ratio (surplus working-time)/(necessary working-time), determines the rate of the surplus-value, the latter is given by the ratio of B—C to A—B. It amounts in the 3 different working days respectively to 16 2/3, 50 and 100 per cent. On the other hand, the rate of surplus-value alone would not give us the extent of the working day. If this rate, *e.g.*, were 100 per cent., the working day might be of 8, 10, 12, or more hours. It would indicate that the 2 constituent parts of the working day, necessary-labour and surplus labour time, were equal in extent, but not how long each of these two constituent parts was.

The working day is thus not a constant, but a variable quantity. One of its parts, certainly, is determined by the working-time required for the reproduction of the labour-power of the labourer himself. But its total amount varies with the duration of the surplus labour. The working day is, therefore, determinable, but is, *per se*, indeterminate.<sup>1</sup>

Although the working day is not a fixed, but a fluent quantity, it can, on the other hand, only vary within certain limits. The minimum limit is, however, not determinable; of course, if we make the extension line B—C or the surplus labour = 0, we have a minimum limit, *i.e.*, the part of the day which the labourer must necessarily work for his own maintenance. On the basis of capitalist production, however, this necessary labour can form a part only of the working day; the working day itself can never be reduced to this minimum. On the other hand, the working day has a maximum limit. It cannot be prolonged beyond a certain point. This maximum limit is conditioned by two things. First, by the physical bounds of labour-power. Within the 24 hours of the natural day a man can expend only a definite quantity of his vital force. A horse, in like manner, can only work from day to day, 8 hours. During part of the day this force must rest, sleep; during another part the man has to satisfy other physical needs, to feed, wash, and clothe himself. Besides these purely physical limitations, the extension of the working day encounters moral ones. The labourer needs time for satisfying his intellectual and social wants, the extent and number of which are conditioned by the general state of social advancement. The variation of the working day fluctuates, therefore, within physical and social bounds. But both these limiting

conditions are of a very elastic nature, and allow the greatest latitude. So we find working days of 8, 10, 12, 14, 16, 18 hours, i.e., of the most different lengths.

The capitalist has bought the labour-power at its day-rate. To him its use-value belongs during one working day. He has thus acquired the right to make the labourer work for him during one day. But, what is a working day? <sup>2</sup>

At all events, less than a natural day. By how much? The capitalist has his own views of this *ultima Thule* [the outermost limit], the necessary limit of the working day. As capitalist, he is only capital personified. His soul is the soul of capital. But capital has one single life impulse, the tendency to create value and surplus-value, to make its constant factor, the means of production, absorb the greatest possible amount of surplus labour. <sup>3</sup>

Capital is dead labour, that, vampire-like, only lives by sucking living labour, and lives the more, the more labour it sucks. The time during which the labourer works, is the time during which the capitalist consumes the labour-power he has purchased of him. <sup>4</sup>

If the labourer consumes his disposable time for himself, he robs the capitalist. <sup>5</sup>

The capitalist then takes his stand on the law of the exchange of commodities. He, like all other buyers, seeks to get the greatest possible benefit out of the use-value of his commodity. Suddenly the voice of the labourer, which had been stifled in the storm and stress of the process of production, rises:

The commodity that I have sold to you differs from the crowd of other commodities, in that its use creates value, and a value greater than its own. That is why you bought it. That which on your side appears a spontaneous expansion of capital, is on mine extra expenditure of labour-power. You and I know on the market only one law, that of the exchange of commodities. And the consumption of the commodity belongs not to the seller who parts with it, but to the buyer, who acquires it. To you, therefore, belongs the use of my daily labour-power. But by means of the price that you pay for it each day, I must be able to reproduce it daily, and to sell it again. Apart from natural exhaustion through age, &c., I must be able on the morrow to work with the same normal amount of force, health and freshness as to-day. You preach to me constantly the gospel of "saving" and "abstinence." Good! I will, like a sensible saving owner, husband my sole wealth, labour-power, and abstain from all foolish waste of it. I will each day spend, set in motion, put into action only as much of it as is compatible with its normal duration, and healthy development. By an unlimited extension of the working day, you may in one day use up a quantity of labour-power greater than I can restore in three. What you gain in labour I lose in substance. The use of my labour-power and the spoliation of it are quite different things. If the average time that (doing a reasonable amount of work) an average labourer can live, is 30 years, the value of my labour-power, which you pay me from day to day is  $1/(365 \times 30)$  or  $1/10950$  of its total value. But if you consume it in 10 years, you pay me daily  $1/10950$  instead of  $1/3650$  of its total value, i.e., only  $1/3$  of its daily value, and you rob me, therefore, every day of  $2/3$  of the value of my commodity. You pay me for one day's labour-power, whilst you use that of 3 days. That is against our contract and the law of exchanges. I demand, therefore, a working day of normal length, and I demand it without any appeal to your heart, for in money matters sentiment is out of place. You may be a model citizen, perhaps a member of the Society for the Prevention of Cruelty to Animals, and in the odour of sanctity to boot; but the thing that you represent face to face with me has no heart in its breast. That which seems to throb there is my own heart-beating. I demand the normal working day because I, like every other seller, demand the value of my commodity. <sup>6</sup>

We see then, that, apart from extremely elastic bounds, the nature of the exchange of commodities itself imposes no limit to the working day, no limit to surplus labour. The capitalist

maintains his rights as a purchaser when he tries to make the working day as long as possible, and to make, whenever possible, two working days out of one. On the other hand, the peculiar nature of the commodity sold implies a limit to its consumption by the purchaser, and the labourer maintains his right as seller when he wishes to reduce the working day to one of definite normal duration. There is here, therefore, an antinomy, right against right, both equally bearing the seal of the law of exchanges. Between equal rights force decides. Hence is it that in the history of capitalist production, the determination of what is a working day, presents itself as the result of a struggle, a struggle between collective capital, *i.e.*, the class of capitalists, and collective labour, *i.e.*, the working-class.

## Section 2: The Greed for Surplus-Labour. Manufacturer and Boyard

Capital has not invented surplus labour. Wherever a part of society possesses the monopoly of the means of production, the labourer, free or not free, must add to the working-time necessary for his own maintenance an extra working-time in order to produce the means of subsistence for the owners of the means of production<sup>7</sup>, whether this proprietor be the Athenian *χαλός γαχαθός* [well-to-do man], Etruscan theocrat, *civis Romanus* [Roman citizen], Norman baron, American slave-owner, Wallachian Boyard, modern landlord or capitalist.<sup>8</sup> It is, however, clear that in any given economic formation of society, where not the exchange-value but the use-value of the product predominates, surplus labour will be limited by a given set of wants which may be greater or less, and that here no boundless thirst for surplus labour arises from the nature of the production itself. Hence in antiquity over-work becomes horrible only when the object is to obtain exchange-value in its specific independent money-form; in the production of gold and silver. Compulsory working to death is here the recognised form of over-work. Only read Diodorus Siculus.<sup>9</sup> Still these are exceptions in antiquity. But as soon as people, whose production still moves within the lower forms of slave-labour, *corvée*-labour, &c., are drawn into the whirlpool of an international market dominated by the capitalistic mode of production, the sale of their products for export becoming their principal interest, the civilised horrors of over-work are grafted on the barbaric horrors of slavery, serfdom, &c. Hence the negro labour in the Southern States of the American Union preserved something of a patriarchal character, so long as production was chiefly directed to immediate local consumption. But in proportion, as the export of cotton became of vital interest to these states, the over-working of the negro and sometimes the using up of his life in 7 years of labour became a factor in a calculated and calculating system. It was no longer a question of obtaining from him a certain quantity of useful products. It was now a question of production of surplus labour itself: So was it also with the *corvée*, e.g., in the Danubian Principalities (now Roumania).

The comparison of the greed for surplus labour in the Danubian Principalities with the same greed in English factories has a special interest, because surplus labour in the *corvée* has an independent and palpable form.

Suppose the working day consists of 6 hours of necessary labour, and 6 hours of surplus labour. Then the free labourer gives the capitalist every week 6 x 6 or 36 hours of surplus labour. It is the same as if he worked 3 days in the week for himself, and 3 days in the week gratis for the capitalist. But this is not evident on the surface. Surplus labour and necessary labour glide one into the other. I can, therefore, express the same relationship by saying, e.g., that the labourer in every minute works 30 seconds for himself, and 30 for the capitalist, etc. It is otherwise with the *corvée*. The necessary labour which the Wallachian peasant does for his own maintenance is

distinctly marked off from his surplus labour on behalf of the Boyard. The one he does on his own field, the other on the seignorial estate. Both parts of the labour-time exist, therefore, independently, side by side one with the other. In the corvée the surplus labour is accurately marked off from the necessary labour. This, however, can make no difference with regard to the quantitative relation of surplus labour to necessary labour. Three days' surplus labour in the week remain three days that yield no equivalent to the labourer himself, whether it be called corvée or wage-labour. But in the capitalist the greed for surplus labour appears in the straining after an unlimited extension of the working day, in the Boyard more simply in a direct hunting after days of corvée.<sup>10</sup>

In the Danubian Principalities the corvée was mixed up with rents in kind and other appurtenances of bondage, but it formed the most important tribute paid to the ruling class. Where this was the case, the corvée rarely arose from serfdom; serfdom much more frequently on the other hand took origin from the corvée.<sup>11</sup> This is what took place in the Roumanian provinces. Their original mode of production was based on community of the soil, but not in the Slavonic or Indian form. Part of the land was cultivated in severalty as freehold by the members of the community, another part – *ager publicus* – was cultivated by them in common. The products of this common labour served partly as a reserve fund against bad harvests and other accidents, partly as a public store for providing the costs of war, religion, and other common expenses. In course of time military and clerical dignitaries usurped, along with the common land, the labour spent upon it. The labour of the free peasants on their common land was transformed into corvée for the thieves of the common land. This corvée soon developed into a servile relationship existing in point of fact, not in point of law, until Russia, the liberator of the world, made it legal under presence of abolishing serfdom. The code of the corvée, which the Russian General Kisseleff proclaimed in 1831, was of course dictated by the Boyards themselves. Thus Russia conquered with one blow the magnates of the Danubian provinces, and the applause of liberal cretins throughout Europe.

According to the “Règlement organique,” as this code of the corvée is called, every Wallachian peasant owes to the so-called landlord, besides a mass of detailed payments in kind: (1), 12 days of general labour; (2), one day of field labour; (3), one day of wood carrying. In all, 14 days in the year. With deep insight into Political Economy, however, the working day is not taken in its ordinary sense, but as the working day necessary to the production of an average daily product; and that average daily product is determined in so crafty a way that no Cyclops would be done with it in 24 hours. In dry words, the Règlement itself declares with true Russian irony that by 12 working days one must understand the product of the manual labour of 36 days, by 1 day of field labour 3 days, and by 1 day of wood carrying in like manner three times as much. In all, 42 corvée days. To this had to be added the so-called jobagie, service due to the lord for extraordinary occasions. In proportion to the size of its population, every village has to furnish annually a definite contingent to the jobagie. This additional corvée is estimated at 14 days for each Wallachian peasant. Thus the prescribed corvée amounts to 56 working days yearly. But the agricultural year in Wallachia numbers in consequence of the severe climate only 210 days, of which 40 for Sundays and holidays, 30 on an average for bad weather, together 70 days, do not count. 140 working days remain. The ratio of the corvée to the necessary labour  $56/84$  or  $66 \frac{2}{3}$  % gives a much smaller rate of surplus-value than that which regulates the labour of the English agricultural or factory labourer. This is, however, only the legally prescribed corvée. And in a spirit yet more “liberal” than the English Factory Acts, the “Règlement organique” has known how to facilitate its own evasion. After it has made 56 days out of 12, the nominal day's work of each of the 56 corvée days is again so arranged that a portion of it must fall on the ensuing day. In

one day, e.g., must be weeded an extent of land, which, for this work, especially in maize plantations, needs twice as much time. The legal day's work for some kinds of agricultural labour is interpretable in such a way that the day begins in May and ends in October. In Moldavia conditions are still harder.

"The 12 corvée days of the 'Règlement organique' cried a Boyard drunk with victory, amount to 365 days in the year."<sup>12</sup>

If the Règlement organique of the Danubian provinces was a positive expression of the greed for surplus labour which every paragraph legalised, the English Factory Acts are the negative expression of the same greed. These acts curb the passion of capital for a limitless draining of labour-power, by forcibly limiting the working day by state regulations, made by a state that is ruled by capitalist-and landlord. Apart from the working-class movement that daily grew more threatening, the limiting of factory labour was dictated by the same necessity which spread guano over the English fields. The same blind eagerness for plunder that in the one case exhausted the soil, had, in the other, torn up by the roots the living force of the nation. Periodical epidemics speak on this point as clearly as the diminishing military standard in Germany and France.<sup>13</sup>

The Factory Act of 1850 now in force (1867) allows for the average working day 10 hours, i.e., for the first 5 days 12 hours from 6 a.m. to 6 p.m., including ½ an hour for breakfast, and an hour for dinner, and thus leaving 10½ working-hours, and 8 hours for Saturday, from 6 a.m. to 2 p.m., of which ½ an hour is subtracted for breakfast. 60 working-hours are left, 10½ for each of the first 5 days, 7½ for the last.<sup>14</sup>

Certain guardians of these laws are appointed, Factory Inspectors, directly under the Home Secretary, whose reports are published half-yearly, by order of Parliament. They give regular and official statistics of the capitalistic greed for surplus labour.

Let us listen, for a moment, to the Factory Inspectors.<sup>15</sup>

"The fraudulent mill-owner begins work a quarter of an hour (sometimes more, sometimes less) before 6 a.m., and leaves off a quarter of an hour (sometimes more, sometimes less) after 6 p.m. He takes 5 minutes from the beginning and from the end of the half hour nominally allowed for breakfast, and 10 minutes at the beginning and end of the hour nominally allowed for dinner. He works for a quarter of an hour (sometimes more, sometimes less) after 2 p.m. on Saturday. Thus his gain is –

|                            |                    |
|----------------------------|--------------------|
| Before 6 a.m.,             | 15 minutes.        |
| After 6 p.m.,              | 15 "               |
| At breakfast time,         | 10 "               |
| At dinner time,            | 20 "               |
| Five days – 300 minutes,   | <u>60 "</u>        |
| On Saturday before 6 a.m., | 15 minutes.        |
| At breakfast time,         | 10 "               |
| After 2 p.m.,              | 15 "               |
|                            | <u>40 minutes.</u> |
| Total weekly,              | 340 minutes.       |

Or 5 hours and 40 minutes weekly, which multiplied by 50 working weeks in the year (allowing two for holidays and occasional stoppages) is equal to 27 working days."<sup>16</sup>

“Five minutes a day’s increased work, multiplied by weeks, are equal to two and a half days of produce in the year.”<sup>17</sup>

“An additional hour a day gained by small instalments before 6 a.m., after 6 p.m., and at the beginning and end of the times nominally fixed for meals, is nearly equivalent to working 13 months in the year.”<sup>18</sup>

Crises during which production is interrupted and the factories work “short time,” i.e., for only a part of the week, naturally do not affect the tendency to extend the working day. The less business there is, the more profit has to be made on the business done. The less time spent in work, the more of that time has to be turned into surplus labour-time.

Thus the Factory Inspector’s report on the period of the crisis from 1857 to 1858:

“It may seem inconsistent that there should be any overworking at a time when trade is so bad; but that very badness leads to the transgression by unscrupulous men, they get the extra profit of it. ... In the last half year, says Leonard Horner, 122 mills in my district have been given up; 143 were found standing,” yet, over-work is continued beyond the legal hours.”<sup>19</sup>

“For a great part of the time,” says Mr. Howell, “owing to the depression of trade, many factories were altogether closed, and a still greater number were working short time. I continue, however, to receive about the usual number of complaints that half, or three-quarters of an hour in the day, are snatched from the workers by encroaching upon the times professedly allowed for rest and refreshment.”<sup>20</sup>

The same phenomenon was reproduced on a smaller scale during the frightful cotton-crises from 1861 to 1865.<sup>21</sup>

“It is sometimes advanced by way of excuse, when persons are found at work in a factory, either at a meal hour, or at some illegal time, that they will not leave the mill at the appointed hour, and that compulsion is necessary to force them to cease work [cleaning their machinery, &c.], especially on Saturday afternoons. But, if the hands remain in a factory after the machinery has ceased to revolve ... they would not have been so employed if sufficient time had been set apart specially for cleaning, &c., either before 6 a.m. [*sic!*] or before 2 p.m. on Saturday afternoons.”<sup>22</sup>

“The profit to be gained by it (over-working in violation of the Act) appears to be, to many, a greater temptation than they can resist; they calculate upon the chance of not being found out; and when they see the small amount of penalty and costs, which those who have been convicted have had to pay, they find that if they should be detected there will still be a considerable balance of gain....<sup>23</sup> In cases where the additional time is gained by a multiplication of small thefts in the course of the day, there are insuperable difficulties to the inspectors making out a case.”<sup>24</sup>

These “small thefts” of capital from the labourer’s meal and recreation time, the factory inspectors also designate as “petty pilferings of minutes,”<sup>25</sup> “snatching a few minutes,”<sup>26</sup> or, as the labourers technically called them, “nibbling and cribbling at meal-times.”<sup>27</sup>

It is evident that in this atmosphere the formation of surplus-value by surplus labour, is no secret.

“If you allow me,” said a highly respectable master to me, “to work only ten minutes in the day over-time, you put one thousand a year in my pocket.”<sup>28</sup>

“Moments are the elements of profit.”<sup>29</sup>

Nothing is from this point of view more characteristic than the designation of the workers who work full time as “full-timers,” and the children under 13 who are only allowed to work 6 hours as “half-timers.” The worker is here nothing more than personified labour-time. All individual distinctions are merged in those of “full-timers” and “half-timers”<sup>30</sup>

### Section 3: Branches of English Industry Without Legal Limits to Exploitation

We have hitherto considered the tendency to the extension of the working day, the were-wolf’s hunger for surplus labour in a department where the monstrous exactions, not surpassed, says an English bourgeois economist, by the cruelties of the Spaniards to the American red-skins<sup>31</sup>, caused capital at last to be bound by the chains of legal regulations. Now, let us cast a glance at certain branches of production in which the exploitation of labour is either free from fetters to this day, or was so yesterday.

Mr. Broughton Charlton, county magistrate, declared, as chairman of a meeting held at the Assembly Rooms, Nottingham, on the 14th January, 1860, “that there was an amount of privation and suffering among that portion of the population connected with the lace trade, unknown in other parts of the kingdom, indeed, in the civilised world .... Children of nine or ten years are dragged from their squalid beds at two, three, or four o’clock in the morning and compelled to work for a bare subsistence until ten, eleven, or twelve at night, their limbs wearing away, their frames dwindling, their faces whitening, and their humanity absolutely sinking into a stone-like torpor, utterly horrible to contemplate.... We are not surprised that Mr. Mallett, or any other manufacturer, should stand forward and protest against discussion.... The system, as the Rev. Montagu Valpy describes it, is one of unmitigated slavery, socially, physically, morally, and spiritually.... What can be thought of a town which holds a public meeting to petition that the period of labour for men shall be diminished to eighteen hours a day? .... We declaim against the Virginian and Carolinian cotton-planters. Is their black-market, their lash, and their barter of human flesh more detestable than this slow sacrifice of humanity which takes place in order that veils and collars may be fabricated for the benefit of capitalists?”<sup>32</sup>

The potteries of Staffordshire have, during the last 22 years, been the subject of three parliamentary inquiries. The result is embodied in Mr. Scriven’s Report of 1841 to the “Children’s Employment Commissioners,” in the report of Dr. Greenhow of 1860 published by order of the medical officer of the Privy Council (Public Health, 3rd Report, 112-113), lastly, in the report of Mr. Longe of 1862 in the “First Report of the Children’s Employment Commission, of the 13th June, 1863.” For my purpose it is enough to take, from the reports of 1860 and 1863, some depositions of the exploited children themselves. From the children we may form an opinion as to the adults, especially the girls and women, and that in a branch of industry by the side of which cotton-spinning appears an agreeable and healthful occupation.<sup>33</sup>

William Wood, 9 years old, was 7 years and 10 months when he began to work. He “ran moulds” (carried ready-moulded articles into the drying-room, afterwards bringing back the empty mould) from the beginning. He came to work every day in the week at 6 a.m., and left off about 9 p.m. “I work till 9 o’clock at night six days in the week. I have done so seven or eight weeks.”

Fifteen hours of labour for a child 7 years old! J. Murray, 12 years of age, says: “I turn jigger, and run moulds. I come at 6. Sometimes I come at 4. I worked all

night last night, till 6 o'clock this morning. I have not been in bed since the night before last. There were eight or nine other boys working last night. All but one have come this morning. I get 3 shillings and sixpence. I do not get any more for working at night. I worked two nights last week."

Fernyhough, a boy of ten:

"I have not always an hour (for dinner). I have only half an hour sometimes; on Thursday, Friday, and Saturday."<sup>34</sup>

Dr. Greenhow states that the average duration of life in the pottery districts of Stoke-on-Trent, and Wolstanton is extraordinarily short. Although in the district of Stoke, only 36.6% and in Wolstanton only 30.4% of the adult male population above 20 are employed in the potteries, among the men of that age in the first district more than half, in the second, nearly 2/5 of the whole deaths are the result of pulmonary diseases among the potters. Dr. Boothroyd, a medical practitioner at Hanley, says:

"Each successive generation of potters is more dwarfed and less robust than the preceding one."

In like manner another doctor, Mr. M'Bean:

"Since he began to practice among the potters 25 years ago, he had observed a marked degeneration especially shown in diminution of stature and breadth."

These statements are taken from the report of Dr. Greenhow in 1860.<sup>35</sup>

From the report of the Commissioners in 1863, the following: Dr. J. T. Arledge, senior physician of the North Staffordshire Infirmary, says:

"The potters as a class, both men and women, represent a degenerated population, both physically and morally. They are, as a rule, stunted in growth, ill-shaped, and frequently ill-formed in the chest; they become prematurely old, and are certainly short-lived; they are phlegmatic and bloodless, and exhibit their debility of constitution by obstinate attacks of dyspepsia, and disorders of the liver and kidneys, and by rheumatism. But of all diseases they are especially prone to chest-disease, to pneumonia, phthisis, bronchitis, and asthma. One form would appear peculiar to them, and is known as potter's asthma, or potter's consumption. Scrofula attacking the glands, or bones, or other parts of the body, is a disease of two-thirds or more of the potters .... That the 'degenerescence' of the population of this district is not even greater than it is, is due to the constant recruiting from the adjacent country, and intermarriages with more healthy races."<sup>36</sup>

Mr. Charles Parsons, late house surgeon of the same institution, writes in a letter to Commissioner Longe, amongst other things:

"I can only speak from personal observation and not from statistical data, but I do not hesitate to assert that my indignation has been aroused again and again at the sight of poor children whose health has been sacrificed to gratify the avarice of either parents or employers." He enumerates the causes of the diseases of the potters, and sums them up in the phrase, "long hours." The report of the Commission trusts that "a manufacture which has assumed so prominent a place in the whole world, will not long be subject to the remark that its great success is accompanied with the physical deterioration, widespread bodily suffering, and early death of the workpeople ... by whose labour and skill such great results have been achieved."<sup>37</sup>

And all that holds of the potteries in England is true of those in Scotland.<sup>38</sup>

The manufacture of lucifer matches dates from 1833, from the discovery of the method of applying phosphorus to the match itself. Since 1845 this manufacture has rapidly developed in England, and has extended especially amongst the thickly populated parts of London as well as in Manchester, Birmingham, Liverpool, Bristol, Norwich, Newcastle and Glasgow. With it has spread the form of lockjaw, which a Vienna physician in 1845 discovered to be a disease peculiar to lucifer-matchmakers. Half the workers are children under thirteen, and young persons under eighteen. The manufacture is on account of its unhealthiness and unpleasantness in such bad odour that only the most miserable part of the labouring class, half-starved widows and so forth, deliver up their children to it, "the ragged, half-starved, untaught children."<sup>39</sup>

Of the witnesses that Commissioner White examined (1863), 270 were under 18, 50 under 10, 10 only 8, and 5 only 6 years old. A range of the working day from 12 to 14 or 15 hours, night-labour, irregular meal-times, meals for the most part taken in the very workrooms that are pestilent with phosphorus. Dante would have found the worst horrors of his Inferno surpassed in this manufacture.

In the manufacture of paper-hangings the coarser sorts are printed by machine; the finer by hand (block-printing). The most active business months are from the beginning of October to the end of April. During this time the work goes on fast and furious without intermission from 6 a.m. to 10 p.m. or further into the night.

J. Leach deposes:

"Last winter six out of nineteen girls were away from ill-health at one time from over-work. I have to bawl at them to keep them awake." W. Duffy: "I have seen when the children could none of them keep their eyes open for the work; indeed, none of us could." J. Lightbourne: "Am 13 ... We worked last winter till 9 (evening), and the winter before till 10. I used to cry with sore feet every night last winter." G. Apsden: "That boy of mine when he was 7 years old I used to carry him on my back to and fro through the snow, and he used to have 16 hours a day ... I have often knelt down to feed him as he stood by the machine, for he could not leave it or stop." Smith, the managing partner of a Manchester factory: "We (he means his "hands" who work for "us") work on with no stoppage for meals, so that day's work of 10½ hours is finished by 4.30 p.m., and all after that is over-time."<sup>40</sup> (Does this Mr. Smith take no meals himself during 10½ hours?) "We (this same Smith) seldom leave off working before 6 p.m. (he means leave off the consumption of "our" labour-power machines), so that we (iterum Crispinus) are really working over-time the whole year round. For all these, children and adults alike (152 children and young persons and 140 adults), the average work for the last 18 months has been at the very least 7 days, 5 hours, or 78 1/2 hours a week. For the six weeks ending May 2nd this year (1862), the average was higher – 8 days or 84 hours a week."

Still this same Mr. Smith, who is so extremely devoted to the *pluralis majestatis* [the Royal "we," i.e., speaking on behalf of his subjects], adds with a smile, "Machine-work is not great." So the employers in the block-printing say: "Hand labour is more healthy than machine work." On the whole, manufacturers declare with indignation against the proposal "to stop the machines at least during meal-times."

"A clause," says Mr. Otley, manager of a wall-paper factory in the Borough, "which allowed work between, say 6 a.m. and 9 p.m. in would suit us (!) very well, but the factory hours, 6 a.m. to 6 p.m., are not suitable. Our machine is always stopped for dinner. (What generosity!) There is no waste of paper and

colour to speak of. But,” he adds sympathetically, “I can understand the loss of time not being liked.”

The report of the Commission opines with naïveté that the fear of some “leading firms” of losing time, *i.e.*, the time for appropriating the labour of others, and thence losing profit is not a sufficient reason for allowing children under 13, and young persons under 18, working 12 to 16 hours per day, to lose their dinner, nor for giving it to them as coal and water are supplied to the steam-engine, soap to wool, oil to the wheel – as merely auxiliary material to the instruments of labour, during the process of production itself.<sup>41</sup>

No branch of industry in England (we do not take into account the making of bread by machinery recently introduced) has preserved up to the present day a method of production so archaic, so – as we see from the poets of the Roman Empire – pre-Christian, as baking. But capital, as was said earlier, is at first indifferent as to the technical character of the labour-process; it begins by taking it just as it finds it.

The incredible adulteration of bread, especially in London, was first revealed by the House of Commons Committee “on the adulteration of articles of food” (1855-56), and Dr. Hassall’s work, “Adulterations detected.”<sup>42</sup> The consequence of these revelations was the Act of August 6th, 1860, “for preventing the adulteration of articles of food and drink,” an inoperative law, as it naturally shows the tenderest consideration for every Free-trader who determines by the buying or selling of adulterated commodities “to turn an honest penny.”<sup>43</sup> The Committee itself formulated more or less naïvely its conviction that Free-trade meant essentially trade with adulterated, or as the English ingeniously put it, “sophisticated” goods. In fact this kind of sophistry knows better than Protagoras how to make white black, and black white, and better than the Eleatics how to demonstrate *ad oculos* [before your own eyes] that everything is only appearance.<sup>44</sup>

At all events the Committee had directed the attention of the public to its “daily bread,” and therefore to the baking trade. At the same time in public meetings and in petitions to Parliament rose the cry of the London journeymen bakers against their over-work, &c. The cry was so urgent that Mr. H. S. Tremenheere, also a member of the Commission of 1863 several times mentioned, was appointed Royal Commissioner of Inquiry. His report,<sup>45</sup> together with the evidence given, roused not the heart of the public but its stomach. Englishmen, always well up in the Bible, knew well enough that man, unless by elective grace a capitalist, or landlord, or sinecurist, is commanded to eat his bread in the sweat of his brow, but they did not know that he had to eat daily in his bread a certain quantity of human perspiration mixed with the discharge of abscesses, cobwebs, dead black-beetles, and putrid German yeast, without counting alum, sand, and other agreeable mineral ingredients. Without any regard to his holiness, Free-trade, the free baking-trade was therefore placed under the supervision of the State inspectors (Close of the Parliamentary session of 1863), and by the same Act of Parliament, work from 9 in the evening to 5 in the morning was forbidden for journeymen bakers under 18. The last clause speaks volumes as to the over-work in this old-fashioned, homely line of business.

“The work of a London journeyman baker begins, as a rule, at about eleven at night. At that hour he ‘makes the dough,’ – a laborious process, which lasts from half an hour to three quarters of an hour, according to the size of the batch or the labour bestowed upon it. He then lies down upon the kneading-board, which is also the covering of the trough in which the dough is ‘made’; and with a sack under him, and another rolled up as a pillow, he sleeps for about a couple of hours. He is then engaged in a rapid and continuous labour for about five hours – throwing out the dough, ‘scaling it off,’ moulding it, putting it into the oven,

preparing and baking rolls and fancy bread, taking the batch bread out of the oven, and up into the shop, &c., &c. The temperature of a bakehouse ranges from about 75 to upwards of 90 degrees, and in the smaller bakehouses approximates usually to the higher rather than to the lower degree of heat. When the business of making the bread, rolls, &c., is over, that of its distribution begins, and a considerable proportion of the journeymen in the trade, after working hard in the manner described during the night, are upon their legs for many hours during the day, carrying baskets, or wheeling hand-carts, and sometimes again in the bakehouse, leaving off work at various hours between 1 and 6 p.m. according to the season of the year, or the amount and nature of their master's business; while others are again engaged in the bakehouse in 'bringing out' more batches until late in the afternoon.<sup>46</sup> ... During what is called 'the London season,' the operatives belonging to the 'full-priced' bakers at the West End of the town, generally begin work at 11 p.m., and are engaged in making the bread, with one or two short (sometimes very short) intervals of rest, up to 8 o'clock the next morning. They are then engaged all day long, up to 4, 5, 6, and as late as 7 o'clock in the evening carrying out bread, or sometimes in the afternoon in the bakehouse again, assisting in the biscuit-baking. They may have, after they have done their work, sometimes five or six, sometimes only four or five hours' sleep before they begin again. On Fridays they always begin sooner, some about ten o'clock, and continue in some cases, at work, either in making or delivering the bread up to 8 p.m. on Saturday night, but more generally up to 4 or 5 o'clock, Sunday morning. On Sundays the men must attend twice or three times during the day for an hour or two to make preparations for the next day's bread.... The men employed by the underselling masters (who sell their bread under the 'full price,' and who, as already pointed out, comprise three-fourths of the London bakers) have not only to work on the average longer hours, but their work is almost entirely confined to the bakehouse. The underselling masters generally sell their bread... in the shop. If they send it out, which is not common, except as supplying chandlers' shops, they usually employ other hands for that purpose. It is not their practice to deliver bread from house to house. Towards the end of the week ... the men begin on Thursday night at 10 o'clock, and continue on with only slight intermission until late on Saturday evening."<sup>47</sup>

Even the bourgeois intellect understands the position of the "underselling" masters. "The unpaid labour of the men was made the source whereby the competition was carried on."<sup>48</sup> And the "full-priced" baker denounces his underselling competitors to the Commission of Inquiry as thieves of foreign labour and adulterators.

"They only exist now by first defrauding the public, and next getting 18 hours' work out of their men for 12 hours' wages."<sup>49</sup>

The adulteration of bread and the formation of a class of bakers that sells the bread below the full price, date from the beginning of the 18th century, from the time when the corporate character of the trade was lost, and the capitalist in the form of the miller or flour-factor, rises behind the nominal master baker.<sup>50</sup> Thus was laid the foundation of capitalistic production in this trade, of the unlimited extension of the working day and of night-labour, although the latter only since 1824 gained a serious footing, even in London.<sup>51</sup>

After what has just been said, it will be understood that the Report of the Commission classes journeymen bakers among the short-lived labourers, who, having by good luck escaped the

normal decimation of the children of the working-class, rarely reach the age of 42. Nevertheless, the baking trade is always overwhelmed with applicants. The sources of the supply of these labour-powers to London are Scotland, the western agricultural districts of England, and Germany.

In the years 1858-60, the journeymen bakers in Ireland organised at their own expense great meetings to agitate against night and Sunday work. The public – e.g., at the Dublin meeting in May, 1860 – took their part with Irish warmth. As a result of this movement, day-labour alone was successfully established in Wexford, Kilkenny, Clonmel, Waterford, &c.

“In Limerick, where the grievances of the journeymen are demonstrated to be excessive, the movement has been defeated by the opposition of the master bakers, the miller bakers being the greatest opponents. The example of Limerick led to a retrogression in Ennis and Tipperary. In Cork, where the strongest possible demonstration of feeling took place, the masters, by exercising their power of turning the men out of employment, have defeated the movement. In Dublin, the master bakers have offered the most determined opposition to the movement, and by discountenancing as much as possible the journeymen promoting it, have succeeded in leading the men into acquiescence in Sunday work and night-work, contrary to the convictions of the men.”<sup>52</sup>

The Committee of the English Government, which Government, in Ireland, is armed to the teeth, and generally knows how to show it, remonstrates in mild, though funereal, tones with the implacable master bakers of Dublin, Limerick, Cork, &c.:

“The Committee believe that the hours of labour are limited by natural laws, which cannot be violated with impunity. That for master bakers to induce their workmen, by the fear of losing employment, to violate their religious convictions and their better feelings, to disobey the laws of the land, and to disregard public opinion (this all refers to Sunday labour), is calculated to provoke ill-feeling between workmen and masters, ... and affords an example dangerous to religion, morality, and social order.... The Committee believe that any constant work beyond 12 hours a-day encroaches on the domestic and private life of the working-man, and so leads to disastrous moral results, interfering with each man’s home, and the discharge of his family duties as a son, a brother, a husband, a father. That work beyond 12 hours has a tendency to undermine the health of the workingman, and so leads to premature old age and death, to the great injury of families of working-men, thus deprived of the care and support of the head of the family when most required.”<sup>53</sup>

So far, we have dealt with Ireland. On the other side of the channel, in Scotland, the agricultural labourer, the ploughman, protests against his 13-14 hours’ work in the most inclement climate, with 4 hours’ additional work on Sunday (in this land of Sabbatarians!),<sup>54</sup> whilst, at the same time, three railway men are standing before a London coroner’s jury – a guard, an engine-driver, a signalman. A tremendous railway accident has hurried hundreds of passengers into another world. The negligence of the employee is the cause of the misfortune. They declare with one voice before the jury that ten or twelve years before, their labour only lasted eight hours a-day. During the last five or six years it had been screwed up to 14, 18, and 20 hours, and under a specially severe pressure of holiday-makers, at times of excursion trains, it often lasted for 40 or 50 hours without a break. They were ordinary men, not Cyclops. At a certain point their labour-power failed. Torpor seized them. Their brain ceased to think, their eyes to see. The thoroughly “respectable” British jurymen answered by a verdict that sent them to the next assizes on a charge

of manslaughter, and, in a gentle “rider” to their verdict, expressed the pious hope that the capitalistic magnates of the railways would, in future, be more extravagant in the purchase of a sufficient quantity of labour-power, and more “abstemious,” more “self-denying,” more “thrifty,” in the draining of paid labour-power.<sup>55</sup>

From the motley crowd of labourers of all callings, ages, sexes, that press on us more busily than the souls of the slain on Ulysses, on whom – without referring to the Blue books under their arms – we see at a glance the mark of over-work, let us take two more figures whose striking contrast proves that before capital all men are alike – a milliner and a blacksmith.

In the last week of June, 1863, all the London daily papers published a paragraph with the “sensational” heading, “Death from simple over-work.” It dealt with the death of the milliner, Mary Anne Walkley, 20 years of age, employed in a highly-respectable dressmaking establishment, exploited by a lady with the pleasant name of Elise. The old, often-told story,<sup>56</sup> was once more recounted. This girl worked, on an average, 16½ hours, during the season often 30 hours, without a break, whilst her failing labour-power was revived by occasional supplies of sherry, port, or coffee. It was just now the height of the season. It was necessary to conjure up in the twinkling of an eye the gorgeous dresses for the noble ladies bidden to the ball in honour of the newly-imported Princess of Wales. Mary Anne Walkley had worked without intermission for 26½ hours, with 60 other girls, 30 in one room, that only afforded 1/3 of the cubic feet of air required for them. At night, they slept in pairs in one of the stifling holes into which the bedroom was divided by partitions of board.<sup>57</sup> And this was one of the best millinery establishments in London. Mary Anne Walkley fell ill on the Friday, died on Sunday, without, to the astonishment of Madame Elise, having previously completed the work in hand. The doctor, Mr. Keys, called too late to the death-bed, duly bore witness before the coroner’s jury that

“Mary Anne Walkley had died from long hours of work in an over-crowded work-room, and a too small and badly ventilated bedroom.”

In order to give the doctor a lesson in good manners, the coroner’s jury thereupon brought in a verdict that

“the deceased had died of apoplexy, but there was reason to fear that her death had been accelerated by over-work in an over-crowded workroom, &c.”

“Our white slaves,” cried the *Morning Star*, the organ of the Free-traders, Cobden and Bright, “our white slaves, who are toiled into the grave, for the most part silently pine and die.”<sup>58</sup>

“It is not in dressmakers’ rooms that working to death is the order of the day, but in a thousand other places; in every place I had almost said, where ‘a thriving business’ has to be done.... We will take the blacksmith as a type. If the poets were true, there is no man so hearty, so merry, as the blacksmith; he rises early and strikes his sparks before the sun; he eats and drinks and sleeps as no other man. Working in moderation, he is, in fact, in one of the best of human positions, physically speaking. But we follow him into the city or town, and we see the stress of work on that strong man, and what then is his position in the death-rate of his country. In Marylebone, blacksmiths die at the rate of 31 per thousand per annum, or 11 above the mean of the male adults of the country in its entirety. The occupation, instinctive almost as a portion of human art, unobjectionable as a branch of human industry, is made by mere excess of work, the destroyer of the man. He can strike so many blows per day, walk so many steps, breathe so many breaths, produce so much work, and live an average, say of fifty years; he is made to strike so many more blows, to walk so many more steps, to breathe so many

more breaths per day, and to increase altogether a fourth of his life. He meets the effort; the result is, that producing for a limited time a fourth more work, he dies at 37 for 50.”<sup>59</sup>

### Section 4: Day and Night Work. The Relay System

Constant capital, the means of production, considered from the standpoint of the creation of surplus-value, only exist to absorb labour, and with every drop of labour a proportional quantity of surplus labour. While they fail to do this, their mere existence causes a relative loss to the capitalist, for they represent during the time they lie fallow, a useless advance of capital. And this loss becomes positive and absolute as soon as the intermission of their employment necessitates additional outlay at the recommencement of work. The prolongation of the working day beyond the limits of the natural day, into the night, only acts as a palliative. It quenches only in a slight degree the vampire thirst for the living blood of labour. To appropriate labour during all the 24 hours of the day is, therefore, the inherent tendency of capitalist production. But as it is physically impossible to exploit the same individual labour-power constantly during the night as well as the day, to overcome this physical hindrance, an alternation becomes necessary between the workpeople whose powers are exhausted by day, and those who are used up by night. This alternation may be effected in various ways; e.g., it may be so arranged that part of the workers are one week employed on day-work, the next week on night-work. It is well known that this relay system, this alternation of two sets of workers, held full sway in the full-blooded youth-time of the English cotton manufacture, and that at the present time it still flourishes, among others, in the cotton spinning of the Moscow district. This 24 hours' process of production exists to-day as a system in many of the branches of industry of Great Britain that are still “free,” in the blast-furnaces, forges, plate-rolling mills, and other metallurgical establishments in England, Wales, and Scotland. The working-time here includes, besides the 24 hours of the 6 working days, a great part also of the 24 hours of Sunday. The workers consist of men and women, adults and children of both sexes. The ages of the children and young persons run through all intermediate grades, from 8 (in some cases from 6) to 18.<sup>60</sup>

In some branches of industry, the girls and women work through the night together with the males.<sup>61</sup>

Placing on one side the generally injurious influence of night-labour,<sup>62</sup> the duration of the process of production, unbroken during the 24 hours, offers very welcome opportunities of exceeding the limits of the normal working day, e.g., in the branches of industry already mentioned, which are of an exceedingly fatiguing nature; the official working day means for each worker usually 12 hours by night or day. But the over-work beyond this amount is in many cases, to use the words of the English official report, “truly fearful.”<sup>63</sup>

“It is impossible,” the report continues, “for any mind to realise the amount of work described in the following passages as being performed by boys of from 9 to 12 years of age ... without coming irresistibly to the conclusion that such abuses of the power of parents and of employers can no longer be allowed to exist.”<sup>64</sup>

“The practice of boys working at all by day and night turns either in the usual course of things, or at pressing times, seems inevitably to open the door to their not unfrequently working unduly long hours. These hours are, indeed, in some cases, not only cruelly but even incredibly long for children. Amongst a number of boys it will, of course, not unfrequently happen that one or more are from some cause absent. When this happens, their place is made up by one or more boys,

who work in the other turn. That this is a well understood system is plain ... from the answer of the manager of some large rolling-mills, who, when I asked him how the place of the boys absent from their turn was made up, 'I daresay, sir, you know that as well as I do,' and admitted the fact."<sup>65</sup>

"At a rolling-mill where the proper hours were from 6 a.m. to 5½ p.m., a boy worked about four nights every week till 8½ p.m. at least ... and this for six months. Another, at 9 years old, sometimes made three 12-hour shifts running, and, when 10, has made two days and two nights running." A third, "now 10 ... worked from 6 a.m. till 12 p.m. three nights, and till 9 p.m. the other nights." "Another, now 13, ... worked from 6 p.m. till 12 noon next day, for a week together, and sometimes for three shifts together, e.g., from Monday morning till Tuesday night." "Another, now 12, has worked in an iron foundry at Stavely from 6 a.m. till 12 p.m. for a fortnight on end; could not do it any more." "George Allinsworth, age 9, came here as cellar-boy last Friday; next morning we had to begin at 3, so I stopped here all night. Live five miles off. Slept on the floor of the furnace, over head, with an apron under me, and a bit of a jacket over me. The two other days I have been here at 6 a.m. Aye! it is hot in here. Before I came here I was nearly a year at the same work at some works in the country. Began there, too, at 3 on Saturday morning – always did, but was very gain [near] home, and could sleep at home. Other days I began at 6 in the morning, and gi'en over at 6 or 7 in the evening," &c.<sup>66</sup>

Let us now hear how capital itself regards this 24 hours' system. The extreme forms of the system, its abuse in the "cruel and incredible" extension of the working day are naturally passed over in silence. Capital only speaks of the system in its "normal" form.

Messrs. Naylor & Vickers, steel manufacturers, who employ between 600 and 700 persons, among whom only 10 per cent are under 18, and of those, only 20 boys under 18 work in night sets, thus express themselves:

"The boys do not suffer from the heat. The temperature is probably from 86° to 90°.... At the forges and in the rolling mills the hands work night and day, in relays, but all the other parts of the work are day-work, *i.e.*, from 6 a.m. to 6 p.m. In the forge the hours are from 12 to 12. Some of the hands always work in the night, without any alternation of day and night work.... We do not find any difference in the health of those who work regularly by night and those who work by day, and probably people can sleep better if they have the same period of rest than if it is changed.... About 20 of the boys under the age of 18 work in the night sets.... We could not well do without lads under 18 working by night. The objection would be the increase in the cost of production.... Skilled hands and the heads in every department are difficult to get, but of lads we could get any number.... But from the small proportion of boys that we employ, the subject (*i.e.*, of restrictions on night-work) is of little importance or interest to us."<sup>67</sup>

Mr. J. Ellis, one of the firm of Messrs. John Brown & Co., steel and iron works, employing about 3,000 men and boys, part of whose operations, namely, iron and heavier steel work, goes on night and day by relays, states "that in the heavier steel work one or two boys are employed to a score or two men." Their concern employs upwards of 500 boys under 18, of whom about 1/3 or 170 are under the age of 13. With reference to the proposed alteration of the law, Mr. Ellis says:

"I do not think it would be very objectionable to require that no person under the age of 18 should work more than 12 hours in the 24. But we do not think that any

line could be drawn over the age of 12, at which boys could be dispensed with for night-work. But we would sooner be prevented from employing boys under the age of 13, or even so high as 14, at all, than not be allowed to employ boys that we do have at night. Those boys who work in the day sets must take their turn in the night sets also, because the men could not work in the night sets only; it would ruin their health.... We think, however, that night-work in alternate weeks is no harm.”

(Messrs. Naylor & Vickers, on the other hand, in conformity with the interest of their business, considered that periodically changed night-labour might possibly do more harm than continual night-labour.)

“We find the men who do it, as well as the others who do other work only by day.... Our objections to not allowing boys under 18 to work at night, would be on account of the increase of expense, but this is the only reason.”

(What cynical naïveté!) “We think that the increase would be more than the trade, with due regard to its being successfully carried out, could fairly bear. (What mealy-mouthed phraseology!) Labour is scarce here, and might fall short if there were such a regulation.” (*i.e.*, Ellis Brown & Co. might fall into the fatal perplexity of being obliged to pay labour-power its full value.)<sup>68</sup>

The “Cyclops Steel and Iron Works,” of Messrs. Cammell & Co., are concocted on the same large scale as those of the above-mentioned John Brown & Co. The managing director had handed in his evidence to the Government Commissioner, Mr. White, in writing. Later he found it convenient to suppress the MS. when it had been returned to him for revision. Mr. White, however, has a good memory. He remembered quite clearly that for the Messrs. Cyclops the forbidding of the night-labour of children and young persons “would be impossible, it would be tantamount to stopping their works,” and yet their business employs little more than 6% of boys under 18, and less than 1% under 13.<sup>69</sup>

On the same subject Mr. E. F. Sanderson, of the firm of Sanderson, Bros., & Co., steel rolling-mills and forges, Attercliffe, says:

“Great difficulty would be caused by preventing boys under 18 from working at night. The chief would be the increase of cost from employing men instead of boys. I cannot say what this would be, but probably it would not be enough to enable the manufacturers to raise the price of steel, and consequently it would fall on them, as of course the men (what queer-headed folk!) would refuse to pay it.”

Mr. Sanderson does not know how much he pays the children, but

“perhaps the younger boys get from 4s. to 5s. a week.... The boys’ work is of a kind for which the strength of the boys is generally (‘generally,’ of course not always) quite sufficient, and consequently there would be no gain in the greater strength of the men to counterbalance the loss, or it would be only in the few cases in which the metal is heavy. The men would not like so well not to have boys under them, as men would be less obedient. Besides, boys must begin young to learn the trade. Leaving day-work alone open to boys would not answer this purpose.”

And why not? Why could not boys learn their handicraft in the day-time? Your reason?

“Owing to the men working days and nights in alternate weeks, the men would be separated half the time from their boys, and would lose half the profit which they make from them. The training which they give to an apprentice is considered as

part of the return for the boys' labour, and thus enables the man to get it at a cheaper rate. Each man would want half of this profit."

In other words, Messrs. Sanderson would have to pay part of the wages of the adult men out of their own pockets instead of by the night-work of the boys. Messrs. Sanderson's profit would thus fall to some extent, and this is the good Sandersonian reason why boys cannot learn their handicraft in the day.<sup>70</sup> In addition to this, it would throw night-labour on those who worked instead of the boys, which they would not be able to stand. The difficulties in fact would be so great that they would very likely lead to the giving up of night-work altogether, and "as far as the work itself is concerned," says E. F. Sanderson, "this would suit as well, but –" But Messrs. Sanderson have something else to make besides steel. Steel-making is simply a pretext for surplus-value making. The smelting furnaces, rolling-mills, &c., the buildings, machinery, iron, coal, &c., have something more to do than transform themselves into steel. They are there to absorb surplus labour, and naturally absorb more in 24 hours than in 12. In fact they give, by grace of God and law, the Sandersons a cheque on the working-time of a certain number of hands for all the 24 hours of the day, and they lose their character as capital, are therefore a pure loss for the Sandersons, as soon as their function of absorbing labour is interrupted.

"But then there would be the loss from so much expensive machinery, lying idle half the time, and to get through the amount of work which we are able to do on the present system, we should have to double our premises and plant, which would double the outlay."

But why should these Sandersons pretend to a privilege not enjoyed by the other capitalists who only work during the day, and whose buildings, machinery, raw material, therefore lie "idle" during the night? E. F. Sanderson answers in the name of all the Sandersons:

"It is true that there is this loss from machinery lying idle in those manufactories in which work only goes on by day. But the use of furnaces would involve a further loss in our case. If they were kept up there would be a waste of fuel (instead of, as now, a waste of the living substance of the workers), and if they were not, there would be loss of time in laying the fires and getting the heat up (whilst the loss of sleeping time, even to children of 8 is a gain of working-time for the Sanderson tribe), and the furnaces themselves would suffer from the changes of temperature." (Whilst those same furnaces suffer nothing from the day and night change of labour.)<sup>71</sup>

## **Section 5: The Struggle for a Normal Working Day. Compulsory Laws for the Extension of the Working Day from the Middle of the 14th to the End of the 17th Century**

"What is a working day? What is the length of time during which capital may consume the labour-power whose daily value it buys? How far may the working day be extended beyond the working-time necessary for the reproduction of labour-power itself?" It has been seen that to these questions capital replies: the working day contains the full 24 hours, with the deduction of the few hours of repose without which labour-power absolutely refuses its services again. Hence it is self-evident that the labourer is nothing else, his whole life through, than labour-power, that therefore all his disposable time is by nature and law labour-time, to be devoted to the self-expansion of capital. Time for education, for intellectual development, for the fulfilling of social

functions and for social intercourse, for the free-play of his bodily and mental activity, even the rest time of Sunday (and that in a country of Sabbatarians!)<sup>72</sup> – moonshine! But in its blind unrestrainable passion, its were-wolf hunger for surplus labour, capital oversteps not only the moral, but even the merely physical maximum bounds of the working day. It usurps the time for growth, development, and healthy maintenance of the body. It steals the time required for the consumption of fresh air and sunlight. It higgles over a meal-time, incorporating it where possible with the process of production itself, so that food is given to the labourer as to a mere means of production, as coal is supplied to the boiler, grease and oil to the machinery. It reduces the sound sleep needed for the restoration, reparation, refreshment of the bodily powers to just so many hours of torpor as the revival of an organism, absolutely exhausted, renders essential. It is not the normal maintenance of the labour-power which is to determine the limits of the working day; it is the greatest possible daily expenditure of labour-power, no matter how diseased, compulsory, and painful it may be, which is to determine the limits of the labourers' period of repose. Capital cares nothing for the length of life of labour-power. All that concerns it is simply and solely the maximum of labour-power, that can be rendered fluent in a working day. It attains this end by shortening the extent of the labourer's life, as a greedy farmer snatches increased produce from the soil by robbing it of its fertility.

The capitalistic mode of production (essentially the production of surplus-value, the absorption of surplus labour), produces thus, with the extension of the working day, not only the deterioration of human labour-power by robbing it of its normal, moral and physical, conditions of development and function. It produces also the premature exhaustion and death of this labour-power itself.<sup>73</sup> It extends the labourer's time of production during a given period by shortening his actual life-time.

But the value of the labour-power includes the value of the commodities necessary for the reproduction of the worker, or for the keeping up of the working-class. If then the unnatural extension of the working day, that capital necessarily strives after in its unmeasured passion for self-expansion, shortens the length of life of the individual labourer, and therefore the duration of his labour-power, the forces used up have to be replaced at a more rapid rate and the sum of the expenses for the reproduction of labour-power will be greater; just as in a machine the part of its value to be reproduced every day is greater the more rapidly the machine is worn out. It would seem therefore that the interest of capital itself points in the direction of a normal working day.

The slave-owner buys his labourer as he buys his horse. If he loses his slave, he loses capital that can only be restored by new outlay in the slave-mart.

But "the rice-grounds of Georgia, or the swamps of the Mississippi may be fatally injurious to the human constitution; but the waste of human life which the cultivation of these districts necessitates, is not so great that it cannot be repaired from the teeming preserves of Virginia and Kentucky. Considerations of economy, moreover, which, under a natural system, afford some security for humane treatment by identifying the master's interest with the slave's preservation, when once trading in slaves is practiced, become reasons for racking to the uttermost the toil of the slave; for, when his place can at once be supplied from foreign preserves, the duration of his life becomes a matter of less moment than its productiveness while it lasts. It is accordingly a maxim of slave management, in slave-importing countries, that the most effective economy is that which takes out of the human chattel in the shortest space of time the utmost amount of exertion it is capable of putting forth. It is in tropical culture, where annual profits often equal the whole capital of plantations, that negro life is most

recklessly sacrificed. It is the agriculture of the West Indies, which has been for centuries prolific of fabulous wealth, that has engulfed millions of the African race. It is in Cuba, at this day, whose revenues are reckoned by millions, and whose planters are princes, that we see in the servile class, the coarsest fare, the most exhausting and unremitting toil, and even the absolute destruction of a portion of its numbers every year.”<sup>74</sup>

*Mutato nomine de te fabula narratur* [It is of you that the story is told – Horace]. For slave-trade read labour-market, for Kentucky and Virginia, Ireland and the agricultural districts of England, Scotland, and Wales, for Africa, Germany. We heard how over-work thinned the ranks of the bakers in London. Nevertheless, the London labour-market is always over-stocked with German and other candidates for death in the bakeries. Pottery, as we saw, is one of the shortest-lived industries. Is there any want therefore of potters? Josiah Wedgwood, the inventor of modern pottery, himself originally a common workman, said in 1785 before the House of Commons that the whole trade employed from 15,000 to 20,000 people.<sup>75</sup> In the year 1861 the population alone of the town centres of this industry in Great Britain numbered 101,302.

“The cotton trade has existed for ninety years.... It has existed for three generations of the English race, and I believe I may safely say that during that period it has destroyed nine generations of factory operatives.”<sup>76</sup>

No doubt in certain epochs of feverish activity the labour-market shows significant gaps. In 1834, *e.g.* But then the manufacturers proposed to the Poor Law Commissioners that they should send the “surplus-population” of the agricultural districts to the north, with the explanation “that the manufacturers would absorb and use it up.”<sup>77</sup>

Agents were appointed with the consent of the Poor Law Commissioners. ... An office was set up in Manchester, to which lists were sent of those workpeople in the agricultural districts wanting employment, and their names were registered in books. The manufacturers attended at these offices, and selected such persons as they chose; when they had selected such persons as their ‘wants required’, they gave instructions to have them forwarded to Manchester, and they were sent, ticketed like bales of goods, by canals, or with carriers, others tramping on the road, and many of them were found on the way lost and half-starved. This system had grown up unto a regular trade. This House will hardly believe it, but I tell them, that this traffic in human flesh was as well kept up, they were in effect as regularly sold to these [Manchester] manufacturers as slaves are sold to the cotton-grower in the United States.... In 1860, ‘the cotton trade was at its zenith.’ ... The manufacturers again found that they were short of hands.... They applied to the ‘flesh agents, as they are called. Those agents sent to the southern downs of England, to the pastures of Dorsetshire, to the glades of Devonshire, to the people tending kine in Wiltshire, but they sought in vain. The surplus-population was ‘absorbed.’”

The *Bury Guardian* said, on the completion of the French treaty, that “10,000 additional hands could be absorbed by Lancashire, and that 30,000 or 40,000 will be needed.” After the “flesh agents and sub-agents” had in vain sought through the agricultural districts,

“a deputation came up to London, and waited on the right hon. gentleman [Mr. Villiers, President of the Poor Law Board] with a view of obtaining poor children from certain union houses for the mills of Lancashire.”<sup>78</sup>

What experience shows to the capitalist generally is a constant excess of population, i.e., an excess in relation to the momentary requirements of surplus labour-absorbing capital, although this excess is made up of generations of human beings stunted, short-lived, swiftly replacing each other, plucked, so to say, before maturity.<sup>79</sup> And, indeed, experience shows to the intelligent observer with what swiftness and grip the capitalist mode of production, dating, historically speaking, only from yesterday, has seized the vital power of the people by the very root – shows how the degeneration of the industrial population is only retarded by the constant absorption of primitive and physically uncorrupted elements from the country – shows how even the country labourers, in spite of fresh air and the principle of natural selection, that works so powerfully amongst them, and only permits the survival of the strongest, are already beginning to die off.<sup>80</sup> Capital that has such good reasons for denying the sufferings of the legions of workers that surround it, is in practice moved as much and as little by the sight of the coming degradation and final depopulation of the human race, as by the probable fall of the earth into the sun. In every stockjobbing swindle every one knows that some time or other the crash must come, but every one hopes that it may fall on the head of his neighbour, after he himself has caught the shower of gold and placed it in safety. *Après moi le déluge!* [*After me, the flood*] is the watchword of every capitalist and of every capitalist nation. Hence Capital is reckless of the health or length of life of the labourer, unless under compulsion from society.<sup>81</sup> To the out-cry as to the physical and mental degradation, the premature death, the torture of over-work, it answers: Ought these to trouble us since they increase our profits? But looking at things as a whole, all this does not, indeed, depend on the good or ill will of the individual capitalist. Free competition brings out the inherent laws of capitalist production, in the shape of external coercive laws having power over every individual capitalist.<sup>82</sup>

The establishment of a normal working day is the result of centuries of struggle between capitalist and labourer. The history of this struggle shows two opposed tendencies. Compare, e.g., the English factory legislation of our time with the English labour Statutes from the 14th century to well into the middle of the 18th.<sup>83</sup> Whilst the modern Factory Acts compulsorily shortened the working day, the earlier statutes tried to lengthen it by compulsion. Of course the pretensions of capital in embryo – when, beginning to grow, it secures the right of absorbing a *quantum sufficit* [sufficient quantity] of surplus labour, not merely by the force of economic relations, but by the help of the State – appear very modest when put face to face with the concessions that, growling and struggling, it has to make in its adult condition. It takes centuries ere the “free” labourer, thanks to the development of capitalistic production, agrees, i.e., is compelled by social conditions, to sell the whole of his active life, his very capacity for work, for the price of the necessaries of life, his birth-right for a mess of pottage. Hence it is natural that the lengthening of the working day, which capital, from the middle of the 14th to the end of the 17th century, tries to impose by State-measures on adult labourers, approximately coincides with the shortening of the working day which, in the second half of the 19th century, has here and there been effected by the State to prevent the coining of children’s blood into capital. That which to-day, e.g., in the State of Massachusetts, until recently the freest State of the North-American Republic, has been proclaimed as the statutory limit of the labour of children under 12, was in England, even in the middle of the 17th century, the normal working day of able-bodied artisans, robust labourers, athletic blacksmiths.<sup>84</sup>

The first “Statute of Labourers” (23 Edward III., 1349) found its immediate pretext (not its cause, for legislation of this kind lasts centuries after the pretext for it has disappeared) in the great plague that decimated the people, so that, as a Tory writer says, “The difficulty of getting men to work on reasonable terms (i.e., at a price that left their employers a reasonable quantity of surplus

labour) grew to such a height as to be quite intolerable.”<sup>85</sup> Reasonable wages were, therefore, fixed by law as well as the limits of the working day. The latter point, the only one that here interests us, is repeated in the Statute of 1496 (Henry VII.). The working day for all artificers and field labourers from March to September ought, according to this statute (which, however, could not be enforced), to last from 5 in the morning to between 7 and 8 in the evening. But the meal-times consist of 1 hour for breakfast, 1½ hours for dinner, and ½ an hour for “noon-meate,” i.e., exactly twice as much as under the factory acts now in force.<sup>86</sup> In winter, work was to last from 5 in the morning until dark, with the same intervals. A statute of Elizabeth of 1562 leaves the length of the working day for all labourers “hired for daily or weekly wage” untouched, but aims at limiting the intervals to 2½ hours in the summer, or to 2 in the winter. Dinner is only to last 1 hour, and the “afternoon-sleep of half an hour” is only allowed between the middle of May and the middle of August. For every hour of absence 1d. is to be subtracted from the wage. In practice, however, the conditions were much more favourable to the labourers than in the statute-book. William Petty, the father of Political Economy, and to some extent the founder of Statistics, says in a work that he published in the last third of the 17th century:

“Labouring-men (then meaning field-labourers) work 10 hours per diem, and make 20 meals per week, viz., 3 a day for working days, and 2 on Sundays; whereby it is plain, that if they could fast on Friday nights, and dine in one hour and an half, whereas they take two, from eleven to one; thereby thus working 1/20 more, and spending 1/20 less, the above-mentioned (tax) might be raised.”<sup>87</sup>

Was not Dr. Andrew Ure right in crying down the 12 hours’ bill of 1833 as a retrogression to the times of the dark ages? It is true these regulations contained in the statute mentioned by Petty, apply also to apprentices. But the condition of child-labour, even at the end of the 17th century, is seen from the following complaint:

“’Tis not their practice (in Germany) as with us in this kingdom, to bind an apprentice for seven years; three or four is their common standard: and the reason is, because they are educated from their cradle to something of employment, which renders them the more apt and docile, and consequently the more capable of attaining to a ripeness and quicker proficiency in business. Whereas our youth, here in England, being bred to nothing before they come to be apprentices, make a very slow progress and require much longer time wherein to reach the perfection of accomplished artists.”<sup>88</sup>

Still, during the greater part of the 18th century, up to the epoch of Modern Industry and machinism, capital in England had not succeeded in seizing for itself, by the payment of the weekly value of labour-power, the whole week of the labourer, with the exception, however, of the agricultural labourers. The fact that they could live for a whole week on the wage of four days, did not appear to the labourers a sufficient reason that they should work the other two days for the capitalist. One party of English economists, in the interest of capital, denounces this obstinacy in the most violent manner, another party defends the labourers. Let us listen, *e.g.*, to the contest between Postlethwayt whose Dictionary of Trade then had the same reputation as the kindred works of MacCulloch and MacGregor to-day, and the author (already quoted) of the “Essay on Trade and Commerce.”<sup>89</sup>

Postlethwayt says among other things:

“We cannot put an end to those few observations, without noticing that trite remark in the mouth of too many; that if the industrious poor can obtain enough to maintain themselves in five days, they will not work the whole six. Whence they infer the necessity of even the necessaries of life being made dear by taxes, or any

other means, to compel the working artisan and manufacturer to labour the whole six days in the week, without ceasing. I must beg leave to differ in sentiment from those great politicians, who contend for the perpetual slavery of the working people of this kingdom; they forget the vulgar adage, all work and no play. Have not the English boasted of the ingenuity and dexterity of her working artists and manufacturers which have heretofore given credit and reputation to British wares in general? What has this been owing to? To nothing more probably than the relaxation of the working people in their own way. Were they obliged to toil the year round, the whole six days in the week, in a repetition of the same work, might it not blunt their ingenuity, and render them stupid instead of alert and dexterous; and might not our workmen lose their reputation instead of maintaining it by such eternal slavery? ... And what sort of workmanship could we expect from such hard-driven animals? ... Many of them will execute as much work in four days as a Frenchman will in five or six. But if Englishmen are to be eternal drudges, 'tis to be feared they will degenerate below the Frenchmen. As our people are famed for bravery in war, do we not say that it is owing to good English roast beef and pudding in their bellies, as well as their constitutional spirit of liberty? And why may not the superior ingenuity and dexterity of, our artists and manufacturers, be owing to that freedom and liberty to direct themselves in their own way, and I hope we shall never have them deprived of such privileges and that good living from whence their ingenuity no less than their courage may proceed.”<sup>90</sup>

Thereupon the author of the “Essay on Trade and Commerce” replies:

“If the making of every seventh day an holiday is supposed to be of divine institution, as it implies the appropriating the other six days to labour” (he means capital as we shall soon see) “surely it will not be thought cruel to enforce it .... That mankind in general, are naturally inclined to ease and indolence, we fatally experience to be true, from the conduct of our manufacturing populace, who do not labour, upon an average, above four days in a week, unless provisions happen to be very dear.... Put all the necessaries of the poor under one denomination; for instance, call them all wheat, or suppose that ... the bushel of wheat shall cost five shillings and that he (a manufacturer) earns a shilling by his labour, he then would be obliged to work five days only in a week. If the bushel of wheat should cost but four shillings, he would be obliged to work but four days; but as wages in this kingdom are much higher in proportion to the price of necessaries ... the manufacturer, who labours four days, has a surplus of money to live idle with the rest of the week . ... I hope I have said enough to make it appear that the moderate labour of six days in a week is no slavery. Our labouring people do this, and to all appearance are the happiest of all our labouring poor,<sup>91</sup> but the Dutch do this in manufactures, and appear to be a very happy people. The French do so, when holidays do not intervene.<sup>92</sup> But our populace have adopted a notion, that as Englishmen they enjoy a birthright privilege of being more free and independent than in any country in Europe. Now this idea, as far as it may affect the bravery of our troops, may be of some use; but the less the manufacturing poor have of it, certainly the better for themselves and for the State. The labouring people should never think themselves independent of their superiors.... It is extremely dangerous to encourage mobs in a commercial state like ours, where, perhaps, seven parts

out of eight of the whole, are people with little or no property. The cure will not be perfect, till our manufacturing poor are contented to labour six days for the same sum which they now earn in four days.”<sup>93</sup>

To this end, and for “extirpating idleness debauchery and excess,” promoting a spirit of industry, “lowering the price of labour in our manufactories, and easing the lands of the heavy burden of poor’s rates,” our “faithful Eckart” of capital proposes this approved device: to shut up such labourers as become dependent on public support, in a word, paupers, in “an *ideal workhouse*.” Such ideal workhouse must be made a “House of Terror,” and not an asylum for the poor, “where they are to be plentifully fed, warmly and decently clothed, and where they do but little work.”<sup>94</sup> In this “House of Terror,” this “ideal workhouse, the poor shall work 14 hours in a day, allowing proper time for meals, in such manner that there shall remain 12 hours of neat-labour.”<sup>95</sup>

Twelve working-hours daily in the Ideal Workhouse, in the “House of Terror” of 1770! 63 years later, in 1833, when the English Parliament reduced the working day for children of 13 to 18, in four branches of industry to 12 full hours, the judgment day of English Industry had dawned! In 1852, when Louis Bonaparte sought to secure his position with the bourgeoisie by tampering with the legal working day, the French working people cried out with one voice “the law that limits the working day to 12 hours is the one good that has remained to us of the legislation of the Republic!”<sup>96</sup> At Zürich the work of children over 10, is limited to 12 hours; in Aargau in 1862, the work of children between 13 and 16, was reduced from 12½ to 12 hours; in Austria in 1860, for children between 14 and 16, the same reduction was made.<sup>97</sup> “What a progress,” since 1770! Macaulay would shout with exultation!

The “House of Terror” for paupers of which the capitalistic soul of 1770 only dreamed, was realised a few years later in the shape of a gigantic “Workhouse” for the industrial worker himself. It is called the Factory. And the ideal this time fades before the reality.

## **Section 6: The Struggle for a Normal Working Day. Compulsory Limitation by Law of the Working-Time. English Factory Acts, 1833**

After capital had taken centuries in extending the working day to its normal maximum limit, and then beyond this to the limit of the natural day of 12 hours,<sup>98</sup> there followed on the birth of machinism and modern industry in the last third of the 18th century, a violent encroachment like that of an avalanche in its intensity and extent. All bounds of morals and nature, age and sex, day and night, were broken down. Even the ideas of day and night, of rustic simplicity in the old statutes, became so confused that an English judge, as late as 1860, needed a quite Talmudic sagacity to explain “judicially” what was day and what was night.<sup>99</sup> Capital celebrated its orgies.

As soon as the working-class, stunned at first by the noise and turmoil of the new system of production, recovered, in some measure, its senses, its resistance began, and first in the native land of machinism, in England. For 30 years, however, the concessions conquered by the workpeople were purely nominal. Parliament passed 5 labour Laws between 1802 and 1833, but was shrewd enough not to vote a penny for their carrying out, for the requisite officials, &c.<sup>100</sup>

They remained a dead letter. “The fact is, that prior to the Act of 1833, young persons and children were worked all night, all day, or both *ad libitum*.”<sup>101</sup>

A normal working day for modern industry only dates from the Factory Act of 1833, which included cotton, wool, flax, and silk factories. Nothing is more characteristic of the spirit of capital than the history of the English Factory Acts from 1833 to 1864.

The Act of 1833 declares the ordinary factory working day to be from half-past five in the morning to half-past eight in the evening and within these limits, a period of 15 hours, it is lawful to employ young persons (*i.e.*, persons between 13 and 18 years of age), at any time of the day, provided no one individual young person should work more than 12 hours in any one day, except in certain cases especially provided for. The 6th section of the Act provided. "That there shall be allowed in the course of every day not less than one and a half hours for meals to every such person restricted as hereinbefore provided." The employment of children under 9, with exceptions mentioned later was forbidden; the work of children between 9 and 13 was limited to 8 hours a day, night-work, *i.e.*, according to this Act, work between 8:30 p.m. and 5:30 a.m., was forbidden for all persons between 9 and 18.

The law-makers were so far from wishing to trench on the freedom of capital to exploit adult labour-power, or, as they called it, "the freedom of labour," that they created a special system in order to prevent the Factory Acts from having a consequence so outrageous.

"The great evil of the factory system as at present conducted," says the first report of the Central Board of the Commission of June 28th 1833, "has appeared to us to be that it entails the necessity of continuing the labour of children to the utmost length of that of the adults. The only remedy for this evil, short of the limitation of the labour of adults which would, in our opinion, create an evil greater than that which is sought to be remedied, appears to be the plan of working double sets of children."

... Under the name of System of Relays, this "plan" was therefore carried out, so that, e.g., from 5.30 a.m. until 1.30 in the afternoon, one set of children between 9 and 13, and from 1.30 p.m. to 8.30 in the evening another set were "put to," &c.

In order to reward the manufacturers for having, in the most barefaced way, ignored all the Acts as to children's labour passed during the last twenty-two years, the pill was yet further gilded for them. Parliament decreed that after March 1st, 1834, no child under 11, after March 1st 1835, no child under 12, and after March 1st, 1836, no child under 13 was to work more than eight hours in a factory. This "liberalism," so full of consideration for "capital," was the more noteworthy as Dr. Farre, Sir A. Carlisle, Sir B. Brodie, Sir C. Bell, Mr. Guthrie, &c., in a word, the most distinguished physicians and surgeons in London, had declared in their evidence before the House of Commons, that there was danger in delay. Dr. Farre expressed himself still more coarsely.

"Legislation is necessary for the prevention of death, in any form in which it can be prematurely inflicted, and certainly this (*i.e.*, the factory method) must be viewed as a most cruel mode of inflicting it."

That same "reformed" Parliament, which in its delicate consideration for the manufacturers, condemned children under 13, for years to come, to 72 hours of work per week in the Factory Hell, on the other hand, in the Emancipation Act, which also administered freedom drop by drop, forbade the planters, from the outset, to work any negro slave more than 45 hours a week.

But in no wise conciliated, capital now began a noisy agitation that went on for several years. It turned chiefly on the age of those who, under the name of children, were limited to 8 hours' work, and were subject to a certain amount of compulsory education. According to capitalistic anthropology, the age of childhood ended at 10, or at the outside, at 11. The more nearly the time approached for the coming into full force of the Factory Act, the fatal year 1836, the more wildly raged the mob of manufacturers. They managed, in fact, to intimidate the government to such an extent that in 1835 it proposed to lower the limit of the age of childhood from 13 to 12. In the meantime the pressure from without grew more threatening. Courage failed the House of

Commons. It refused to throw children of 13 under the Juggernaut Car of capital for more than 8 hours a day, and the Act of 1833 came into full operation. It remained unaltered until June, 1844.

In the ten years during which it regulated factory work, first in part, and then entirely, the official reports of the factory inspectors teem with complaints as to the impossibility of putting the Act into force. As the law of 1833 left it optional with the lords of capital during the 15 hours, from 5.30 a.m. to 8.30 p.m., to make every "young person," and every "child" begin, break off, resume, or end his 12 or 8 hours at any moment they liked, and also permitted them to assign to different persons, different times for meals, these gentlemen soon discovered a new "system of relays," by which the labour-horses were not changed at fixed stations, but were constantly reharnessed at changing stations. We do not pause longer on the beauty of this system, as we shall have to return to it later. But this much is clear at the first glance: that this system annulled the whole Factory Act, not only in the spirit, but in the letter. How could factory inspectors, with this complex bookkeeping in respect to each individual child or young person, enforce the legally determined work-time and the granting of the legal mealtimes? In a great many of the factories, the old brutalities soon blossomed out again unpunished. In an interview with the Home Secretary (1844), the factory inspectors demonstrated the impossibility of any control under the newly invented relay system.<sup>102</sup> In the meantime, however, circumstances had greatly changed. The factory hands, especially since 1838, had made the Ten Hours' Bill their economic, as they had made the Charter their political, election-cry. Some of the manufacturers, even, who had managed their factories in conformity with the Act of 1833, overwhelmed Parliament with memorials on the immoral competition of their false brethren whom greater impudence, or more fortunate local circumstances, enabled to break the law. Moreover, however much the individual manufacturer might give the rein to his old lust for gain, the spokesmen and political leaders of the manufacturing class ordered a change of front and of speech towards the workpeople. They had entered upon the contest for the repeal of the Corn Laws, and needed the workers to help them to victory. They promised therefore, not only a double-sized loaf of bread, but the enactment of the Ten Hours' Bill in the Free-trade millennium.<sup>103</sup> Thus they still less dared to oppose a measure intended only to make the law of 1833 a reality. Threatened in their holiest interest, the rent of land, the Tories thundered with philanthropic indignation against the "nefarious practices"<sup>104</sup> of their foes.

This was the origin of the additional Factory Act of June 7th, 1844. It came into effect on September 10th, 1844. It places under protection a new category of workers, viz., the women over 18. They were placed in every respect on the same footing as the young persons, their work time limited to twelve hours, their night-labour forbidden, &c. For the first time, legislation saw itself compelled to control directly and officially the labour of adults. In the Factory Report of 1844-1845, it is said with irony:

"No instances have come to my knowledge of adult women having expressed any regret at their *rights* being thus far interfered with."<sup>105</sup> The working-time of children under 13 was reduced to 6½, and in certain circumstances to 7 hours a-day.<sup>106</sup>

To get rid of the abuses of the "spurious relay system," the law established besides others the following important regulations: –

"That the hours of work of children and young persons shall be reckoned from the time when any child or young person shall begin to work in the morning."

So that if A, *e.g.*, begins work at 8 in the morning, and B at 10, B's work-day must nevertheless end at the same hour as A's. "The time shall be regulated by a public clock," for example, the nearest railway clock, by which the factory clock is to be set. The occupier is to hang up a

“legible” printed notice stating the hours for the beginning and ending of work and the times allowed for the several meals. Children beginning work before 12 noon may not be again employed after 1 p.m. The afternoon shift must therefore consist of other children than those employed in the morning. Of the hour and a half for meal-times,

“one hour thereof at the least shall be given before three of the clock in the afternoon ... and at the same period of the day. No child or young person shall be employed more than five hours before 1 p.m. without an interval for meal-time of at least 30 minutes. No child or young person [or female] shall be employed or allowed to remain in any room in which any manufacturing process is then [*i.e.*, at mealtimes] carried on,” &c.

It has been seen that these minutiae, which, with military uniformity, regulate by stroke of the clock the times, limits, pauses of the work were not at all the products of Parliamentary fancy. They developed gradually out of circumstances as natural laws of the modern mode of production. Their formulation, official recognition, and proclamation by the State, were the result of a long struggle of classes. One of their first consequences was that in practice the working day of the adult males in factories became subject to the same limitations, since in most processes of production the co-operation of the children, young persons, and women is indispensable. On the whole, therefore, during the period from 1844 to 1847, the 12 hours’ working day became general and uniform in all branches of industry under the Factory Act.

The manufacturers, however, did not allow this “progress” without a compensating “retrogression.” At their instigation the House of Commons reduced the minimum age for exploitable children from 9 to 8, in order to assure that additional supply of factory children which is due to capitalists, according to divine and human law.<sup>107</sup>

The years 1846-47 are epoch-making in the economic history of England. The Repeal of the Corn Laws, and of the duties on cotton and other raw material; Free-trade proclaimed as the guiding star of legislation; in a word, the arrival of the millennium. On the other hand, in the same years, the Chartist movement and the 10 hours’ agitation reached their highest point. They found allies in the Tories panting for revenge. Despite the fanatical opposition of the army of perjured Free-traders, with Bright and Cobden at their head, the Ten Hours’ Bill, struggled for so long, went through Parliament.

The new Factory Act of June 8th, 1847, enacted that on July 1st, 1847, there should be a preliminary shortening of the working day for “young persons” (from 13 to 18), and all females to 11 hours, but that on May 1st, 1848, there should be a definite limitation of the working day to 10 hours. In other respects, the Act only amended and completed the Acts of 1833 and 1844.

Capital now entered upon a preliminary campaign in order to hinder the Act from coming into full force on May 1st, 1848. And the workers themselves, under the presence that they had been taught by experience, were to help in the destruction of their own work. The moment was cleverly chosen.

“It must be remembered, too, that there has been more than two years of great suffering (in consequence of the terrible crisis of 1846-47) among the factory operatives, from many mills having worked short time, and many being altogether closed. A considerable number of the operatives must therefore be in very narrow circumstances many, it is to be feared, in debt; so that it might fairly have been presumed that at the present time they would prefer working the longer time, in order to make up for past losses, perhaps to pay off debts, or get their furniture out

of pawn, or replace that sold, or to get a new supply of clothes for themselves and their families.”<sup>108</sup>

The manufacturers tried to aggravate the natural effect of these circumstances by a general reduction of wages by 10%. This was done so to say, to celebrate the inauguration of the new Free-trade era. Then followed a further reduction of 8 1/3% as soon as the working day was shortened to 11, and a reduction of double that amount as soon as it was finally shortened to 10 hours. Wherever, therefore, circumstances allowed it, a reduction of wages of at least 25% took place.<sup>109</sup> Under such favourably prepared conditions the agitation among the factory workers for the repeal of the Act of 1847 was begun. Neither lies, bribery, nor threats were spared in this attempt. But all was in vain. Concerning the half-dozen petitions in which workpeople were made to complain of “their oppression by the Act,” the petitioners themselves declared under oral examination, that their signatures had been extorted from them. “They felt themselves oppressed, but not exactly by the Factory Act.”<sup>110</sup> But if the manufacturers did not succeed in making the workpeople speak as they wished, they themselves shrieked all the louder in press and Parliament in the name of the workpeople. They denounced the Factory Inspectors as a kind of revolutionary commissioners like those of the French National Convention ruthlessly sacrificing the unhappy factory workers to their humanitarian crotchet. This manoeuvre also failed. Factory Inspector Leonard Horner conducted in his own person, and through his sub-inspectors, many examinations of witnesses in the factories of Lancashire. About 70% of the workpeople examined declared in favour of 10 hours, a much smaller percentage in favour of 11, and an altogether insignificant minority for the old 12 hours.<sup>111</sup>

Another “friendly” dodge was to make the adult males work 12 to 15 hours, and then to blazon abroad this fact as the best proof of what the proletariat desired in its heart of hearts. But the “ruthless” Factory Inspector Leonard Horner was again to the fore. The majority of the “over-times” declared:

“They would much prefer working ten hours for less wages, but that they had no choice; that so many were out of employment (so many spinners getting very low wages by having to work as piecers, being unable to do better), that if they refused to work the longer time, others would immediately get their places, so that it was a question with them of agreeing to work the longer time, or of being thrown out of employment altogether.”<sup>112</sup>

The preliminary campaign of capital thus came to grief, and the Ten Hours’ Act came into force May 1st, 1848. But meanwhile the fiasco of the Chartist party whose leaders were imprisoned, and whose organisation was dismembered, had shaken the confidence of the English working-class in its own strength. Soon after this the June insurrection in Paris and its bloody suppression united, in England as on the Continent, all fractions of the ruling classes, landlords and capitalists, stock-exchange wolves and shop-keepers, Protectionists and Freetraders, government and opposition, priests and freethinkers, young whores and old nuns, under the common cry for the salvation of Property, Religion, the Family and Society. The working-class was everywhere proclaimed, placed under a ban, under a virtual law of suspects. The manufacturers had no need any longer to restrain themselves. They broke out in open revolt not only against the Ten Hours’ Act, but against the whole of the legislation that since 1833 had aimed at restricting in some measure the “free” exploitation of labour-power. It was a pro-slavery rebellion in miniature, carried on for over two years with a cynical recklessness, a terrorist energy all the cheaper because the rebel capitalist risked nothing except the skin of his “hands.”

To understand that which follows we must remember that the Factory Acts of 1833, 1844, and 1847 were all three in force so far as the one did not amend the other: that not one of these limited

the working day of the male worker over 18, and that since 1833 the 15 hours from 5.30 a.m. to 8.30 p.m. had remained the legal “day,” within the limits of which at first the 12, and later the 10 hours’ labour of young persons and women had to be performed under the prescribed conditions.

The manufacturers began by here and there discharging a part of, in many cases half of the young persons and women employed by them, and then, for the adult males, restoring the almost obsolete night-work. The Ten Hours’ Act, they cried, leaves no other alternative.<sup>113</sup>

Their second step dealt with the legal pauses for meals. Let us hear the Factory Inspectors.

“Since the restriction of the hours of work to ten, the factory occupiers maintain, although they have not yet practically gone the whole length, that supposing the hours of work to be from 9 a.m. to 7 p.m. they fulfil the provisions of the statutes by allowing an hour before 9 a.m. and half an hour after 7 p.m. [for meals]. In some cases they now allow an hour, or half an hour for dinner, insisting at the same time, that they are not bound to allow any part of the hour and a half in the course of the factory working day.”<sup>114</sup> The manufacturers maintained therefore that the scrupulously strict provisions of the Act of 1844 with regard to meal-times only gave the operatives permission to eat and drink before coming into, and after leaving the factory – i.e., at home. And why should not the workpeople eat their dinner before 9 in the morning? The crown lawyers, however, decided that the prescribed meal-times

“must be in the interval during the working-hours, and that it will not be lawful to work for 10 hours continuously, from 9 a.m. to 7 p.m., without any interval.”<sup>115</sup>

After these pleasant demonstrations, Capital precluded its revolt by a step which agreed with the letter of the law of 1844, and was therefore legal.

The Act of 1844 certainly prohibited the employment after 1 p.m. of such children, from 8 to 13, as had been employed before noon. But it did not regulate in any way the 6½ hours’ work of the children whose work-time began at 12 midday or later. Children of 8 might, if they began work at noon, be employed from 12 to 1, 1 hour; from 2 to 4 in the afternoon, 2 hours; from 5 to 8.30 in the evening, 3½ hours; in all, the legal 6½ hours. Or better still. In order to make their work coincide with that of the adult male labourers up to 8.30 p.m., the manufacturers only had to give them no work till 2 in the afternoon, they could then keep them in the factory without intermission till 8.30 in the evening.

“And it is now expressly admitted that the practice exists in England from the desire of mill-owners to have their machinery at work for more than 10 hours a-day, to keep the children at work with male adults after all the young persons and women have left, and until 8.30 p.m. if the factory-owners choose.”<sup>116</sup>

Workmen and factory inspectors protested on hygienic and moral grounds, but Capital answered:

“My deeds upon my head! I crave the law,  
The penalty and forfeit of my bond.”

In fact, according to statistics laid before the House of Commons on July 26th, 1850, in spite of all protests, on July 15th, 1850, 3,742 children were subjected to this “practice” in 257 factories.<sup>117</sup> Still, this was not enough. The Lynx eye of Capital discovered that the Act of 1844 did not allow 5 hours’ work before mid-day without a pause of at least 30 minutes for refreshment, but prescribed nothing of the kind for work after mid-day. Therefore, it claimed and obtained the enjoyment not only of making children of 8 drudge without intermission from 2 to 8.30 p.m., but also of making them hunger during that time.

“Ay, his breast.  
So says the bond.”

This Shylock-clinging<sup>118</sup> to the letter of the law of 1844, so far as it regulated children’s labour, was but to lead up to an open revolt against the same law, so far as it regulated the labour of “young persons and women.” It will be remembered that the abolition of the “false relay system” was the chief aim and object of that law. The masters began their revolt with the simple declaration that the sections of the Act of 1844 which prohibited the *ad libitum* use of young persons and women in such short fractions of the day of 15 hours as the employer chose, were “comparatively harmless” so long as the work-time was fixed at 12 hours. But under the Ten Hours’ Act they were a “grievous hardship.”<sup>119</sup> They informed the inspectors in the coolest manner that they should place themselves above the letter of the law, and re-introduce the old system on their own account.<sup>120</sup> They were acting in the interests of the ill-advised operatives themselves, “in order to be able to pay them higher wages.”

“This was the only possible plan by which to maintain, under the Ten Hours’ Act, the industrial supremacy of Great Britain.” “Perhaps it may be a little difficult to detect irregularities under the relay system; but what of that? Is the great manufacturing interest of this country to be treated as a secondary matter in order to save some little trouble to Inspectors and Sub-Inspectors of Factories?”<sup>121</sup>

All these shifts naturally were of no avail. The Factory Inspectors appealed to the Law Courts. But soon such a cloud of dust in the way of petitions from the masters overwhelmed the Home Secretary, Sir George Grey, that in a circular of August 5th, 1848, he recommends the inspectors not

“to lay informations against mill-owners for a breach of the letter of the Act, or for employment of young persons by relays in cases in which there is no reason to believe that such young persons have been actually employed for a longer period than that sanctioned by law.” Hereupon, Factory Inspector J. Stuart allowed the so-called relay system during the 15 hours of the factory day throughout Scotland, where it soon flourished again as of old. The English Factory Inspectors, on the other hand, declared that the Home Secretary had no power dictatorially to suspend the law, and continued their legal proceedings against the pro-slavery rebellion.

But what was the good of summoning the capitalists when the Courts in this case the country magistrates – Cobbett’s “Great Unpaid” – acquitted them? In these tribunals, the masters sat in judgment on themselves. An example. One Eskrigge, cotton-spinner, of the firm of Kershaw, Leese, & Co., had laid before the Factory Inspector of his district the scheme of a relay system intended for his mill. Receiving a refusal, he at first kept quiet. A few months later, an individual named Robinson, also a cotton-spinner, and if not his Man Friday, at all events related to Eskrigge, appeared before the borough magistrates of Stockport on a charge of introducing the identical plan of relays invented by Eskrigge. Four Justices sat, among them three cottonspinners, at their head this same inevitable Eskrigge. Eskrigge acquitted Robinson, and now was of opinion that what was right for Robinson was fair for Eskrigge. Supported by his own legal decision, he introduced the system at once into his own factory.<sup>122</sup> Of course, the composition of this tribunal was in itself a violation of the law.<sup>123</sup>

These judicial farces, exclaims Inspector Howell, “urgently call for a remedy – either that the law should be so altered as to be made to conform to these decisions, or that it should be administered by a less fallible tribunal, whose

decisions would conform to the law ... when these cases are brought forward. I long for a stipendiary magistrate.”<sup>124</sup>

The crown lawyers declared the masters’ interpretation of the Act of 1848 absurd. But the Saviours of Society would not allow themselves to be turned from their purpose. Leonard Horner reports,

“Having endeavoured to enforce the Act ... by ten prosecutions in seven magisterial divisions, and having been supported by the magistrates in one case only ... I considered it useless to prosecute more for this evasion of the law. That part of the Act of 1848 which was framed for securing uniformity in the hours of work, ... is thus no longer in force in my district (Lancashire). Neither have the sub-inspectors or myself any means of satisfying ourselves, when we inspect a mill working by shifts, that the young persons and women are not working more than 10 hours a-day.... In a return of the 30th April, ... of millowners working by shifts, the number amounts to 114, and has been for some time rapidly increasing. In general, the time of working the mill is extended to 13½ hours’ from 6 a.m. to 7½ p.m., .... in some instances it amounts to 15 hours, from 5½ a.m. to 8½ p.m.”<sup>125</sup>

Already, in December, 1848, Leonard Horner had a list of 65 manufacturers and 29 overlookers who unanimously declared that no system of supervision could, under this relay system, prevent enormous over-work.<sup>126</sup> Now, the same children and young persons were shifted from the spinning-room to the weaving-room, now, during 15 hours, from one factory to another.<sup>127</sup> How was it possible to control a system which,

“under the guise of relays, is some one of the many plans for shuffling ‘the hands’ about in endless variety, and shifting the hours of work and of rest for different individuals throughout the day, so that you may never have one complete set of hands working together in the same room at the same time.”<sup>128</sup>

But altogether independently of actual over-work, this so-called relay system was an offspring of capitalistic fantasy, such as Fourier, in his humorous sketches of “Courses Seances,” has never surpassed, except that the “attraction of labour” was changed into the attraction of capital. Look, for example, at those schemes of the masters which the “respectable” press praised as models of “what a reasonable degree of care and method can accomplish.” The *personnel* of the workpeople was sometimes divided into from 12 to 14 categories, which themselves constantly changed and recharged their constituent parts. During the 15 hours of the factory day, capital dragged in the labourer now for 30 minutes, now for an hour, and then pushed him out again, to drag him into the factory and to thrust him out afresh, hounding him hither and thither, in scattered shreds of time, without ever losing hold of him until the full 10 hours’ work was done. As on the stage, the same persons had to appear in turns in the different scenes of the different acts. But as an actor during the whole course of the play belongs to the stage, so the operatives, during 15 hours, belonged to the factory, without reckoning the time for going and coming. Thus the hours of rest were turned into hours of enforced idleness, which drove the youths to the pot-house, and the girls to the brothel. At every new trick that the capitalist, from day to day, hit upon for keeping his machinery going 12 or 15 hours without increasing the number of his hands, the worker had to swallow his meals now in this fragment of time, now in that. At the time of the 10 hours’ agitation, the masters cried out that the working mob petitioned in the hope of obtaining 12 hours’ wages for 10 hours’ work. Now they reversed the medal. They paid 10 hours’ wages for 12 or 15 hours’ lordship over labour-power.<sup>129</sup> This was the gist of the matter, this the masters’ interpretation of the 10 hours’ law! These were the same unctuous Free-traders, perspiring with

the love of humanity, who for full 10 years, during the Anti-Corn Law agitation, had preached to the operatives, by a reckoning of pounds, shillings, and pence, that with free importation of corn, and with the means possessed by English industry, 10 hours' labour would be quite enough to enrich the capitalists.<sup>130</sup> This revolt of capital, after two years was at last crowned with victory by a decision of one of the four highest Courts of Justice in England, the Court of Exchequer, which in a case brought before it on February 8th, 1850, decided that the manufacturers were certainly acting against the sense of the Act of 1844, but that this Act itself contained certain words that rendered it meaningless. "By this decision, the Ten Hours' Act was abolished."<sup>131</sup> A crowd of masters, who until then had been afraid of using the relay system for young persons and women, now took it up heart and soul.<sup>132</sup>

But on this apparently decisive victory of capital, followed at once a revulsion. The workpeople had hitherto offered a passive, although inflexible and unremitting resistance. They now protested in Lancashire and Yorkshire in threatening meetings. The pretended Ten Hours' Act was thus simple humbug, parliamentary cheating, had never existed! The Factory Inspectors urgently warned the Government that the antagonism of classes had arrived at an incredible tension. Some of the masters themselves murmured:

"On account of the contradictory decisions of the magistrates, a condition of things altogether abnormal and anarchical obtains. One law holds in Yorkshire, another in Lancashire, one law in one parish of Lancashire, another in its immediate neighbourhood. The manufacturer in large towns could evade the law, the manufacturer in country districts could not find the people necessary for the relay system, still less for the shifting of hands from one factory to another," &c.

And the first birthright of capital is equal exploitation of labour-power by all capitalists.

Under these circumstances a compromise between masters and men was effected that received the seal of Parliament in the additional Factory Act of August 5th, 1850. The working day for "young persons and women," was raised from 10 to 10½ hours for the first five days of the week, and shortened to 7½ on the Saturday. The work was to go on between 6 a.m. and 6 p.m.<sup>133</sup>, with pauses of not less than 1½ hours for meal-times, these meal-times to be allowed at one and the same time for all, and conformably to the conditions of 1844. By this an end was put to the relay system once for all.<sup>134</sup> For children's labour, the Act of 1844 remained in force.

One set of masters, this time as before, secured to itself special seigniorial rights over the children of the proletariat. These were the silk manufacturers. In 1833 they had howled out in threatening fashion, "if the liberty of working children of any age for 10 hours a day were taken away, it would stop their works."<sup>135</sup> It would be impossible for them to buy a sufficient number of children over 13. They extorted the privilege they desired. The pretext was shown on subsequent investigation to be a deliberate lie.<sup>136</sup> It did not, however, prevent them, during 10 years, from spinning silk 10 hours a day out of the blood of little children who had to be placed upon stools for the performance of their work.<sup>137</sup> The Act of 1844 certainly "robbed" them of the "liberty" of employing children under 11 longer than 6½ hours a day. But it secured to them, on the other hand, the privilege of working children between 11 and 13, 10 hours a day, and of annulling in their case the education made compulsory for all other factory children. This time the pretext was

"the delicate texture of the fabric in which they were employed, requiring a lightness of touch, only to be acquired by their early introduction to these factories."<sup>138</sup>

The children were slaughtered out-and-out for the sake of their delicate fingers, as in Southern Russia the horned cattle for the sake of their hide and tallow. At length, in 1850, the privilege

granted in 1844, was limited to the departments of silk-twisting and silk-winding. But here, to make amends to capital bereft of its “freedom,” the work-time for children from 11 to 13 was raised from 10 to 10½ hours. Pretext: “Labour in silk mills was lighter than in mills for other fabrics, and less likely in other respects also to be prejudicial to health.”<sup>139</sup> Official medical inquiries proved afterwards that, on the contrary,

“the average death-rate is exceedingly high in the silk districts and amongst the female part of the population is higher even than it is in the cotton districts of Lancashire.”<sup>140</sup>

Despite the protests of the Factory Inspector, renewed every 6 months, the mischief continues to this hour.<sup>141</sup>

The Act of 1850 changed the 15 hours’ time from 6 a.m. to 8.30 p.m., into the 12 hours from 6 a.m. to 6 p.m. for “young persons and women” only. It did not, therefore, affect children who could always be employed for half an hour before and 2½ hours after this period, provided the whole of their labour did not exceed 6½ hours. Whilst the bill was under discussion, the Factory Inspectors laid before Parliament statistics of the infamous abuses due to this anomaly. To no purpose. In the background lurked the intention of screwing up, during prosperous years, the working day of adult males to 15 hours by the aid of the children. The experience of the three following years showed that such an attempt must come to grief against the resistance of the adult male operatives. The Act of 1850 was therefore finally completed in 1853 by forbidding the “employment of children in the morning before and in the evening after young persons and women.” Henceforth with a few exceptions the Factory Act of 1850 regulated the working day of all workers in the branches of industry that come under it.<sup>142</sup> Since the passing of the first Factory Act half a century had elapsed.<sup>143</sup>

Factory legislation for the first time went beyond its original sphere in the “Printworks’ Act of 1845.” The displeasure with which capital received this new “extravagance” speaks through every line of the Act. It limits the working day for children from 8 to 13, and for women to 16 hours, between 6 a.m. and 10 p.m., without any legal pause for meal-times. It allows males over 13 to be worked at will day and night.<sup>144</sup> It is a Parliamentary abortion.<sup>145</sup>

However, the principle had triumphed with its victory in those great branches of industry which form the most characteristic creation of the modern mode of production. Their wonderful development from 1853 to 1860, hand-in-hand with the physical and moral regeneration of the factory workers, struck the most purblind. The masters from whom the legal limitation and regulation had been wrung step by step after a civil war of half a century, themselves referred ostentatiously to the contrast with the branches of exploitation still “free.”<sup>146</sup> The Pharisees of “Political Economy” now proclaimed the discernment of the necessity of a legally fixed working day as a characteristic new discovery of their “science.”<sup>147</sup> It will be easily understood that after the factory magnates had resigned themselves and become reconciled to the inevitable, the power of resistance of capital gradually weakened, whilst at the same time the power of attack of the working-class grew with the number of its allies in the classes of society not immediately interested in the question. Hence the comparatively rapid advance since 1860.

The dye-works and bleach-works all came under the Factory Act of 1850 in 1860;<sup>148</sup> lace and stocking manufactures in 1861.

In consequence of the first report of the Commission on the employment of children (1863) the same fate was shared by the manufacturers of all earthenwares (not merely pottery), Lucifer-matches, percussion caps, cartridges, carpets, fustian-cutting, and many processes included under the name of “finishing.” In the year 1863 bleaching in the open air<sup>149</sup> and baking were placed

under special Acts, by which, in the former, the labour of young persons and women during the night-time (from 8 in the evening to 6 in the morning), and in the latter, the employment of journeymen bakers under 18, between 9 in the evening and 5 in the morning were forbidden. We shall return to the later proposals of the same Commission, which threatened to deprive of their “freedom” all the important branches of English Industry, with the exception of agriculture, mines, and the means of transport.<sup>150</sup>

## **Section 7: The Struggle for a Normal Working Day. Reaction of the English Factory Acts on Other Countries**

The reader will bear in mind that the production of surplus-value, or the extraction of surplus labour, is the specific end and aim, the sum and substance, of capitalist production, quite apart from any changes in the mode of production, which may arise from the subordination of labour to capital. He will remember that as far as we have at present gone only the independent labourer, and therefore only the labourer legally qualified to act for himself, enters as a vendor of a commodity into a contract with the capitalist. If, therefore, in our historical sketch, on the one hand, modern industry, on the other, the labour of those who are physically and legally minors, play important parts, the former was to us only a special department, and the latter only a specially striking example of labour exploitation. Without, however, anticipating the subsequent development of our inquiry, from the mere connexion of the historic facts before us it follows:

*First.* The passion of capital for an unlimited and reckless extension of the working day, is first gratified in the industries earliest revolutionised by water-power, steam, and machinery, in those first creations of the modern mode of production, cotton, wool, flax, and silk spinning, and weaving. The changes in the material mode of production, and the corresponding changes in the social relations of the producers<sup>151</sup> gave rise first to an extravagance beyond all bounds, and then in opposition to this, called forth a control on the part of Society which legally limits, regulates, and makes uniform the working day and its pauses. This control appears, therefore, during the first half of the nineteenth century simply as exceptional legislation.<sup>152</sup> As soon as this primitive dominion of the new mode of production was conquered, it was found that, in the meantime, not only had many other branches of production been made to adopt the same factory system, but that manufactures with more or less obsolete methods, such as potteries, glass-making, &c., that old-fashioned handicrafts, like baking, and, finally, even that the so-called domestic industries, such as nail-making,<sup>153</sup> had long since fallen as completely under capitalist exploitation as the factories themselves. Legislation was, therefore, compelled to gradually get rid of its exceptional character, or where, as in England, it proceeds after the manner of the Roman Casuists, to declare any house in which work was done to be a factory.<sup>154</sup>

*Second.* The history of the regulation of the working day in certain branches of production, and the struggle still going on in others in regard to this regulation, prove conclusively that the isolated labourer, the labourer as “free” vendor of his labour-power, when capitalist production has once attained a certain stage, succumbs without any power of resistance. The creation of a normal working day is, therefore, the product of a protracted civil war, more or less dissembled, between the capitalist class and the working-class. As the contest takes place in the arena of modern industry, it first breaks out in the home of that industry – England.<sup>155</sup> The English factory workers were the champions, not only of the English, but of the modern working-class generally, as their theorists were the first to throw down the gauntlet to the theory of capital.<sup>156</sup> Hence, the philosopher of the Factory, Ure, denounces as an ineffable disgrace to the English working-class

that they inscribed “the slavery of the Factory Acts” on the banner which they bore against capital, manfully striving for “perfect freedom of labour.”<sup>157</sup>

France limps slowly behind England. The February revolution was necessary to bring into the world the 12 hours’ law,<sup>158</sup> which is much more deficient than its English original. For all that, the French revolutionary method has its special advantages. It once for all commands the same limit to the working day in all shops and factories without distinction, whilst English legislation reluctantly yields to the pressure of circumstances, now on this point, now on that, and is getting lost in a hopelessly bewildering tangle of contradictory enactments.<sup>159</sup> On the other hand, the French law proclaims as a principle that which in England was only won in the name of children, minors, and women, and has been only recently for the first time claimed as a general right.<sup>160</sup>

In the United States of North America, every independent movement of the workers was paralysed so long as slavery disfigured a part of the Republic. Labour cannot emancipate itself in the white skin where in the black it is branded. But out of the death of slavery a new life at once arose. The first fruit of the Civil War was the eight hours’ agitation, that ran with the seven-leagued boots of the locomotive from the Atlantic to the Pacific, from New England to California. The General Congress of labour at Baltimore (August 16th, 1866) declared:

“The first and great necessity of the present, to free the labour of this country from capitalistic slavery, is the passing of a law by which eight hours shall be the normal working day in all States of the American Union. We are resolved to put forth all our strength until this glorious result is attained.”<sup>161</sup>

At the same time, the Congress of the International Working Men’s Association at Geneva, on the proposition of the London General Council, resolved that “the limitation of the working day is a preliminary condition without which all further attempts at improvement and emancipation must prove abortive... the Congress proposes eight hours as the legal limit of the working day.”

Thus the movement of the working-class on both sides of the Atlantic, that had grown instinctively out of the conditions of production themselves, endorsed the words of the English Factory Inspector, R. J. Saunders

“Further steps towards a reformation of society can never be carried out with any hope of success, unless the hours of labour be limited, and the prescribed limit strictly enforced.”<sup>162</sup>

It must be acknowledged that our labourer comes out of the process of production other than he entered. In the market he stood as owner of the commodity “labour-power” face to face with other owners of commodities, dealer against dealer. The contract by which he sold to the capitalist his labour-power proved, so to say, in black and white that he disposed of himself freely. The bargain concluded, it is discovered that he was no “free agent,” that the time for which he is free to sell his labour-power is the time for which he is forced to sell it,<sup>163</sup> that in fact the vampire will not lose its hold on him “so long as there is a muscle, a nerve, a drop of blood to be exploited.”<sup>164</sup> For “protection” against “the serpent of their agonies,” the labourers must put their heads together, and, as a class, compel the passing of a law, an all-powerful social barrier that shall prevent the very workers from selling, by voluntary contract with capital, themselves and their families into slavery and death.<sup>165</sup> In place of the pompous catalogue of the “inalienable rights of man” comes the modest Magna Charta of a legally limited working day, which shall make clear “when the time which the worker sells is ended, and when his own begins.” *Quantum mutatus ab illo!* [What a great change from that time! – Virgil]<sup>166</sup>

<sup>1</sup> “A day’s labour is vague, it may be long or short.” (“An Essay on Trade and Commerce, Containing Observations on Taxes, &c.” London. 1770, p. 73.)

<sup>2</sup> This question is far more important than the celebrated question of Sir Robert Peel to the Birmingham Chamber of Commerce: What is a pound? A question that could only have been proposed, because Peel was as much in the dark as to the nature of money as the “little shilling men” of Birmingham.

<sup>3</sup> “It is the aim of the capitalist to obtain with his expended capital the greatest possible quantity of labour (d’obtenir du capital dépense la plus forte somme de travail possible).” J. G. Courcelle-Seneuil. “Traité théorique et pratique des entreprises industrielles.” 2nd ed. Paris, 1857, p. 63.

<sup>4</sup> “An hour’s labour lost in a day is a prodigious injury to a commercial State.... There is a very great consumption of luxuries among the labouring poor of this kingdom: particularly among the manufacturing populace, by which they also consume their time, the most fatal of consumptions.” “An Essay on Trade and Commerce, &c.,” p. 47, and 15

<sup>5</sup> “Si le manouvrier libre prend un instant de repos, l’économie sordide qui le suit des yeux avec inquiétude, prétend qu’il la vole.” [If the free labourer allows himself an instant of rest, the base and petty management, which follows him with wary eyes, claims he is stealing from it.] N. Linguet, “Théorie des Lois Civiles. &c.” London, 1767, t. II., p. 466.

<sup>6</sup> During the great strike of the London builders, 1860-61, for the reduction of the working day to 9 hours, their Committee published a manifesto that contained, to some extent, the plea of our worker. The manifesto alludes, not without irony, to the fact, that the greatest profit-monger amongst the building masters, a certain Sir M. Peto, was in the odour of sanctity (This same Peto, after 1867, came to an end a la Strousberg.)

<sup>7</sup> “Those who labour ... in reality feed both the pensioners ... [called the rich] and themselves.” (Edmund Burke, l.c., p. 2.)

<sup>8</sup> Niebuhr in his “Roman History” says very naively: “It is evident that works like the Etruscan, which in their ruins astound us, pre-suppose in little (!) states lords and vassals.” Sismondi says far more to the purpose that “Brussels lace” pre-supposes wage-lords and wage-slaves.

<sup>9</sup> “One cannot see these unfortunates (in the gold mines between Egypt, Ethiopia, and Arabia) who cannot even have their bodies clean, or their nakedness clothed, without pitying their miserable lot. There is no indulgence, no forbearance for the sick, the feeble, the aged, for woman’s weakness. All must, forced by blows, work on until death puts an end to their sufferings and their distress.” (“Diod. Sic. Bibl. Hist.,” lib. 2, c. 13.)

<sup>10</sup> That which follows refers to the situation in the Rumanian provinces before the change effected since the Crimean war.

<sup>11</sup> This holds likewise for Germany, and especially for Prussia east of the Elbe. In the 15th century the German peasant was nearly everywhere a man, who, whilst subject to certain rents paid in produce and labour was otherwise at least practically free. The German colonists in Brandenburg, Pomerania, Silesia, and Eastern Prussia, were even legally acknowledged as free men. The victory of the nobility in the peasants’ war put an end to that. Not only were the conquered South German peasants again enslaved. From the middle of the 16th century the peasants of Eastern Prussia, Brandenburg, Pomerania, and Silesia, and soon after the free peasants of Schleswig-Holstein were degraded to the condition of serfs. (Maurer, Fronhöfe iv. vol., — Meitzen, “Der Boden des preussischen Staats” — Hanssen, “Leibeigenschaft in Schleswig-Holstein.” — *F. E.*)

<sup>12</sup> Further details are to be found in E. Regnault’s “Histoire politique et sociale des Principautés Danubiennes,” Paris, 1855.

<sup>13</sup> “In general and within certain limits, exceeding the medium size of their kind, is evidence of the prosperity of organic beings. As to man, his bodily height lessens if his due growth is interfered with, either by physical or local conditions. In all European countries in which the conscription holds, since its introduction, the medium height of adult men, and generally their fitness for military service, has diminished. Before the revolution (1789), the minimum for the infantry in France was 165 centimetres; in 1818 (law of March 10th), 157; by the law of March 21, 1832, 156 cm.; on the average in France more than half are rejected on account of deficient height or bodily weakness. The military standard in Saxony was in 1780, 178 cm. It is now 155. In Prussia it is 157. According to the statement of Dr. Meyer in the Bavarian Gazette, May 9th, 1862, the result of an average of 9 years is, that in Prussia out of 1,000 conscripts 716 were unfit for military service, 317 because of deficiency in height, and 399 because of bodily defects.... Berlin in 1858 could not provide its contingent of recruits, it was 156 men short.” J. von Liebig: “Die Chemie in ihrer Anwendung auf Agrikultur und Physiologie. 1862,” 7th Ed., vol. 1, pp. 117, 118.

<sup>14</sup> The history of the Factory Act of 1850 will be found in the course of this chapter.

<sup>15</sup> I only touch here and there on the period from the beginning of modern industry in England to 1845. For this period I refer the reader to “Die Lage der arbeitenden Klasse in England,” [Condition of the Working Class in England] von Friedrich Engels, Leipzig, 1845. How completely Engels understood the nature of the capitalist mode of production is shown by the Factory Reports, Reports on Mines, &c., that have appeared since 1845, and how wonderfully he painted the circumstances in detail is seen on the most superficial comparison of his work with the official reports of the Children’s Employment Commission, published 18 to 20 years later (1863-1867). These deal especially with the branches of industry in which the Factory Acts had not, up to 1862, been introduced, in fact are not yet introduced. Here, then, little or no alteration had been enforced, by authority, in the conditions painted by Engels. I borrow my examples chiefly from the Free-trade period after 1848, that age of paradise, of which the commercial travellers for the great firm of Free-trade, blatant as ignorant, tell such fabulous tales. For the rest England figures here in the foreground because she is the classic representative of capitalist production, and she alone has a continuous set of official statistics of the things we are considering.

<sup>16</sup> “Suggestions, &c. by Mr. L. Horner, Inspector of Factories,” in Factories Regulation Acts. Ordered by the House of Commons to be printed, 9th August, 1859, pp. 4, 5.

<sup>17</sup> Reports of the Inspector of Factories for the half year. October, 1856, p. 35.

<sup>18</sup> Reports, &c., 30th April, 1858, p. 9.

<sup>19</sup> Reports, &c., l.c., p. 10.

<sup>20</sup> Reports &c., l.c., p. 25.

<sup>21</sup> Reports &c., for the half year ending 30th April, 1861. See Appendix No. 2; Reports, &c., 31st October, 1862, pp. 7, 52, 53. The violations of the Acts became more numerous during the last half year 1863. Cf Reports, &c., ending 31st October, 1863, p. 7.

<sup>22</sup> Reports, &c., October 31st, 1860, p. 23. With what fanaticism, according to the evidence of manufacturers given in courts of law, their hands set themselves against every interruption in factory labour, the following curious circumstance shows. In the beginning of June, 1836, information reached the magistrates of Dewsbury (Yorkshire) that the owners of 8 large mills in the neighbourhood of Batley had violated the Factory Acts. Some of these gentlemen were accused of having kept at work 5 boys between 12 and 15 years of age, from 6 a.m. on Friday to 4 p.m. on the following Saturday, not allowing them any respite except for meals and one hour for sleep at midnight. And these children had to do this ceaseless labour of 30 hours in the “shoddyhole,” as the hole is called, in which the woollen rags are pulled in pieces, and where a dense atmosphere of dust,

shreds, &c., forces even the adult workman to cover his mouth continually with handkerchiefs for the protection of his lungs! The accused gentlemen affirm in lieu of taking an oath — as quakers they were too scrupulously religious to take an oath — that they had, in their great compassion for the unhappy children, allowed them four hours for sleep, but the obstinate children absolutely would not go to bed. The quaker gentlemen were mulcted in £20. Dryden anticipated these gentry:

Fox full fraught in seeming sanctity,  
That feared an oath, but like the devil would lie,  
That look'd like Lent, and had the holy leer,  
And durst not sin! before he said his prayer!"

<sup>30</sup> This is the official expression both in the factories and in the reports.

<sup>31</sup> "The cupidity of mill-owners whose cruelties in the pursuit of gain have hardly been exceeded by those perpetrated by the Spaniards on the conquest of America in the pursuit of gold." John Wade, "History of the Middle and Working Classes," 3rd Ed. London, 1835, p. 114. The theoretical part of this book, a kind of hand-book of Political Economy, is, considering the time of its publication, original in some parts, *e.g.*, on commercial crises. The historical part is, to a great extent, a shameless plagiarism of Sir F. M. Eden's "The State of the Poor," London, 1797.

<sup>39</sup> l.c., p. liv.

<sup>40</sup> This is not to be taken in the same sense as our surplus labour time. These gentlemen consider 10½ hours of labour as the normal working day, which includes of course the normal surplus labour. After this begins "overtime" which is paid a little better. It will be seen later that the labour expended during the so-called normal day is paid below its value, so that the overtime is simply a capitalist trick in order to extort more surplus labour, which it would still be, even if the labour-power expended during the normal working day were properly paid.

<sup>41</sup> l.c., Evidence, pp. 123, 124, 125, 140, and 54.

<sup>42</sup> Alum finely powdered, or mixed with salt, is a normal article of commerce bearing the significant name of "bakers' stuff."

<sup>43</sup> Soot is a well-known and very energetic form of carbon, and forms a manure that capitalistic chimney-sweeps sell to English farmers. Now in 1862 the British juryman had in a law-suit to decide whether soot, with which, unknown to the buyer, 90% of dust and sand are mixed, is genuine soot in

the commercial sense or adulterated soot in the legal sense. The “amis du commerce” [friends of commerce] decided it to be genuine commercial soot, and non-suited the plaintiff farmer, who had in addition to pay the costs of the suit.

<sup>44</sup> The French chemist, Chevallier, in his treatise on the “sophistications” of commodities, enumerates for many of the 600 or more articles which he passes in review, 10, 20, 30 different methods of adulteration. He adds that he does not know all the methods and does not mention all that he knows. He gives 6 kinds of adulteration of sugar, 9 of olive oil, 10 of butter, 12 of salt, 19 of milk, 20 of bread, 23 of brandy, 24 of meal, 28 of chocolate, 30 of wine, 32 of coffee, etc. Even God Almighty does not escape this fate. <sup>50</sup> George Read, *l.c.* At the end of the 17th and the beginning of the 18th centuries the factors (agents) that crowded into every possible trade were still denounced as “public nuisances.” Thus the Grand Jury at the quarter session of the Justices of the Peace for the County of Somerset, addressed a presentment to the Lower House which, among other things, states, “that these factors of Blackwell Hall are a Public Nuisance and Prejudice to the Clothing Trade, and ought to be put down as a Nuisance.” “The Case of our English Wool., &c.,” London, 1685, pp. 6, 7.

<sup>51</sup> First Report, &c.

<sup>52</sup> Report of Committee on the Baking Trade in Ireland for 1861.

<sup>53</sup> *l.c.*

<sup>54</sup> Public meeting of agricultural labourers at Lasswade, near Edinburgh, January 5th, 1866. (See *Workman’s Advocate*, January 13th, 1866.) The formation since the close of 1865 of a Trades’ Union among the agricultural labourers at first in Scotland is a historic event. In one of the most oppressed agricultural districts of England, Buckinghamshire, the labourers, in March, 1867, made a great strike for the raising of their weekly wage from 9-10 shillings to 12 shillings. (It will be seen from the preceding passage that the movement of the English agricultural proletariat, entirely crushed since the suppression of its violent manifestations after 1830, and especially since the introduction of the new Poor Laws, begins again in the sixties, until it becomes finally epoch-making in 1872. I return to this in the 2nd volume, as well as to the Blue books that have appeared since 1867 on the position of the English land labourers. Addendum to the 3rd ed.)

<sup>55</sup> *Reynolds’ Newspaper*, January, 1866. — Every week this same paper has, under the sensational headings, “Fearful and fatal accidents,” “Appalling tragedies,” &c., a whole list of fresh railway catastrophes. On these an employee on the North Staffordshire line comments: “Everyone knows the consequences that may occur if the driver and fireman of a locomotive engine are not continually on the look-out. How can that be expected from a man who has been at such work for 29 or 30 hours, exposed to the weather, and without rest. The following is an example which is of very frequent occurrence: — One fireman commenced work on the Monday morning at a very early hour. When he had finished what is called a day’s work, he had been on duty 14 hours 50 minutes. Before he had time to get his tea, he was again called on for duty.... The next time he finished he had been on duty 14 hours 25 minutes, making a total of 29 hours 15 minutes without intermission. The rest of the week’s work was made up as follows: — Wednesday, 15 hours; Thursday, 15 hours 35 minutes; Friday, 14½

hours; Saturday, 14 hours 10 minutes, making a total for the week of 88 hours 30 minutes. Now, sir, fancy his astonishment on being paid 6 1/4 days for the whole. Thinking it was a mistake, he applied to the time-keeper,... and inquired what they considered a day's work, and was told 13 hours for a goods man (*i.e.*, 78 hours).... He then asked for what he had made over and above the 78 hours per week, but was refused. However, he was at last told they would give him another quarter, *i.e.*, 10d.," *l.c.*, 4th February. 1866.

<sup>56</sup> Cf F. Engels, *l.c.*, pp. 253, 254.

<sup>57</sup> Dr. Letheby, Consulting Physician of the Board of Health, declared: "The minimum of air for each adult ought to be in a sleeping room 300, and in a dwelling room 500 cubic feet." Dr. Richardson, Senior Physician to one of the London Hospitals: "With needlewomen of all kinds, including milliners, dressmakers, and ordinary seamstresses, there are three miseries — over-work, deficient air, and either deficient food or deficient digestion.... Needlework, in the main, ... is infinitely better adapted to women than to men. But the mischiefs of the trade, in the metropolis especially, are that it is monopolised by some twenty-six capitalists, who, under the advantages that spring from capital, can bring in capital to force economy out of labour. This power tells throughout the whole class. If a dressmaker can get a little circle of customers, such is the competition that, in her home, she must work to the death to hold together, and this same over-work she must of necessity inflict on any who may assist her. If she fail, or do not try independently, she must join an establishment, where her labour is not less, but where her money is safe. Placed thus, she becomes a mere slave, tossed about with the variations of society. Now at home, in one room, starving, or near to it, then engaged 15, 16, aye, even 18 hours out of the 24, in an air that is scarcely tolerable, and on food which, even if it be good, cannot be digested in the absence of pure air. On these victims, consumption, which is purely a disease of bad air, feeds." Dr. Richardson: "Work and Over-work," in "Social Science Review," 18th July, 1863.

<sup>58</sup> *Morning Star*, 23rd June, 1863. — *The Times* made use of the circumstance to defend the American slave-owners against Bright, &c. "Very many of us think," says a leader of July 2nd, 1863, "that, while we work our own young women to death, using the scourge of starvation, instead of the crack of the whip, as the instrument of compulsion, we have scarcely a right to hound on fire and slaughter against families who were born slave-owners, and who, at least, feed their slaves well, and work them lightly." In the same manner, the *Standard*, a Tory organ, fell foul of the Rev. Newman Hall: "He excommunicated the slave-owners, but prays with the fine folk who, without remorse, make the omnibus drivers and conductors of London, &c., work 16 hours a-day for the wages of a dog." Finally, spake the oracle, Thomas Carlyle, of whom I wrote, in 1850, "Zum Teufel ist der Genius, der Kultus ist geblieben." ["In the cult of genius ... The cult remains," paraphrasing Schiller] In a short parable, he reduces the one great event of contemporary history, the American Civil War, to this level, that the Peter of the North wants to break the head of the Paul of the South with all his might, because the Peter of the North hires his labour by the day, and the Paul of the South hires his by the life. (*Macmillan's Magazine*. Ilias Americana in nuce. August, 1863.) Thus, the bubble of Tory sympathy for the urban workers — by no means for the rural — has burst at last. The sum of all is — slavery!

<sup>59</sup> Dr. Richardson, *l.c.*

<sup>60</sup> Children's Employment Commission. Third Report. London, 1864, pp. iv., v., vi.

<sup>61</sup> "Both in Staffordshire and in South Wales young girls and women are employed on the pit banks and on the coke heaps, not only by day but also by night. This practice has been often noticed in Reports presented to Parliament, as being attended with great and notorious evils. These females employed with the men, hardly distinguished from them in their dress, and begrimed with dirt and smoke, are exposed to the deterioration of character, arising from the loss of self-respect, which can

hardly fail to follow from their unfeminine occupation.” (l. c., 194, p. xxvi. Cf. Fourth Report (1865), 61, p. xiii.) It is the same in glass-works.

<sup>62</sup> A steel manufacturer who employs children in night-labour remarked: “It seems but natural that boys who work at night cannot sleep and get proper rest by day, but will be running about.” (l.c., Fourth Report, 63, p. xiii.) On the importance of sunlight for the maintenance and growth of the body, a physician writes: “Light also acts upon the tissues of the body directly in hardening them and supporting their elasticity. The muscles of animals, when they are deprived of a proper amount of light, become soft and inelastic, the nervous power loses its tone from defective stimulation, and the elaboration of all growth seems to be perverted.... In the case of children, constant access to plenty of light during the day, and to the direct rays of the sun for a part of it, is most essential to health. Light assists in the elaboration of good plastic blood, and hardens the fibre after it has been laid down. It also acts as a stimulus upon the organs of sight, and by this means brings about more activity in the various cerebral functions.” Dr. W. Strange, Senior Physician of the Worcester General Hospital, from whose work on “Health” (1864) this passage is taken, writes in a letter to Mr. White, one of the commissioners: “I have had opportunities formerly, when in Lancashire, of observing the effects of nightwork upon children, and I have no hesitation in saying, contrary to what some employers were fond of asserting, those children who were subjected to it soon suffered in their health.” (l.c., 284., p. 55.) That such a question should furnish the material of serious controversy, shows plainly how capitalist production acts on the brain-functions of capitalists and their retainers.

<sup>63</sup> l.c., 57, p. xii.

<sup>64</sup> l.c.. Fourth Report (1865). 58. p. xii.

<sup>65</sup> l.c.

<sup>66</sup> l.c., p. xiii. The degree of culture of these “labour-powers” must naturally be such as appears in the following dialogues with one of the commissioners: Jeremiah Haynes, age 12 — “Four times four is 8; 4 fours are 16. A king is him that has all the money and gold. We have a king (told it is a Queen), they call her the Princess Alexandra. Told that she married the Queen’s son. The Queen’s son is the Princess Alexandra. A Princess is a man.” William Turner, age 12 — “Don’t live in England. Think it is a country, but didn’t know before.” John Morris, age 14 — “Have heard say that God made the world, and that all the people was drowned but one, heard say that one was a little bird.” William Smith age 15 — “God made man, man made woman.” Edward Taylor, age 15 — “Do not know of London.” Henry Matthewman, age 17 — “Had been to chapel, but missed a good many times lately. One name that they preached about was Jesus Christ, but I cannot say any others, and I cannot tell anything about him. He was not killed, but died like other people. He was not the same as other people in some ways, because he was religious in some ways and others isn’t.” (l.c., p. xv.) “The devil is a good person. I don’t know where he lives.” “Christ was a wicked man.” “This girl spelt God as dog, and did not know the name of the queen.” (“Ch. Employment Comm. V. Report, 1866” p. 55, n. 278.) The same system obtains in the glass and paper works as in the metallurgical, already cited. In the paper factories, where the paper is made by machinery, night-work is the rule for all processes, except rag-sorting. In some cases night-work, by relays, is carried on incessantly through the whole week, usually from Sunday night until midnight of the following Saturday. Those who are on day-work work 5 days of 12, and 1 day of 18 hours; those on night-work 5 nights of 12, and 1 of 6 hours in each week. In other cases each set works 24 hours consecutively on alternate days, one set working 6 hours on Monday, and 18 on Saturday to make up the 24 hours. In other cases an intermediate system prevails, by which all employed on the paper-making machinery work 15 or 16 hours every day in the week. This system, says Commissioner Lord, “seems to combine all the evils of both the 12 hours’ and the 24 hours’ relays.” Children under 13, young persons under 18, and women, work under this night system. Sometimes under the 12 hours’ system they are obliged, on account of the non-

appearance of those that ought to relieve them, to work a double turn of 24 hours. The evidence proves that boys and girls very often work overtime, which, not unfrequently, extends to 24 or even 36 hours of uninterrupted toil. In the continuous and unvarying process of glazing are found girls of 12 who work the whole month 14 hours a day, "without any regular relief or cessation beyond 2 or, at most, 3 breaks of half an hour each for meals." In some mills, where regular night-work has been entirely given up, over-work goes on to a terrible extent, "and that often in the dirtiest, and in the hottest, and in the most monotonous of the various processes." ("Ch. Employment Comm. Report IV., 1865," p. xxxviii, and xxxix.)

<sup>67</sup> Fourth Report, &c.. 1865, 79, p. xvi.

<sup>68</sup> l.c., 80. p. xvi.

<sup>69</sup> l.c., 82. p. xvii.

<sup>70</sup> In our reflecting and reasoning age a man is not worth much who cannot give a good reason for everything, no matter how bad or how crazy. Everything in the world that has been done wrong has been done wrong for the very best of reasons. (Hegel, l.c., p. 249 )

<sup>71</sup> l.c., 85, p. xvii. To similar tender scruples of the glass manufacturers that regular meal-times for the children are impossible because as a consequence a certain quantity of heat, radiated by the furnaces, would be "a pure loss" or "wasted," Commissioner White makes answer. His answer is unlike that of Ure, Senior, &c., and their puny German plagiarists à la Roscher who are touched by the "abstinence," "self-denial," "saving," of the capitalists in the expenditure of their gold, and by their Timur-Tamerlanish prodigality of human life! "A certain amount of heat beyond what is usual at present might also be going to waste, if meal-times were secured in these cases, but it seems likely not equal in money-value to the waste of animal power now going on in glass-houses throughout the kingdom from growing boys not having enough quiet time to eat their meals at ease, with a little rest afterwards for digestion." (l.c., p. xiv.) And this in the year of progress 1865! Without considering the expenditure of strength in lifting and carrying, such a child, in the sheds where bottle and flint glass are made, walks during the performance of his work 15-20 miles in every 6 hours! And the work often lasts 14 or 15 hours! In many of these glass works, as in the Moscow spinning mills, the system of 6 hours' relays is in force. "During the working part of the week six hours is the utmost unbroken period ever attained at any one time for rest, and out of this has to come the time spent in coming and going to and from work, washing, dressing, and meals, leaving a very short period indeed for rest, and none for fresh air and play, unless at the expense of the sleep necessary for young boys, especially at such hot and fatiguing work.... Even the short sleep is obviously liable to be broken by a boy having to wake himself if it is night, or by the noise, if it is day." Mr. White gives cases where a boy worked 36 consecutive hours; others where boys of 12 drudged on until 2 in the morning, and then slept in the works till 5 a.m. (3 hours!) only to resume their work. "The amount of work," say Tremeneere and Tufnell, who drafted the general report, "done by boys, youths, girls, and women, in the course of their daily or nightly spell of labour, is certainly extraordinary." (l.c., xliii. and xliv.) Meanwhile, late by night, self-denying Mr. Glass-Capital, primed with port-wine, reels out of his club homeward droning out idiotically. "Britons never, never shall be slaves!"

<sup>72</sup> In England even now occasionally in rural districts a labourer is condemned to imprisonment for desecrating the Sabbath, by working in his front garden. The same labourer is punished for breach of contract if he remains away from his metal, paper, or glass works on the Sunday, even if it be from a religious whim. The orthodox Parliament will hear nothing of Sabbath-breaking if it occurs in the process of expanding capital. A memorial (August 1863), in which the London day-labourers in fish and poultry shops asked for the abolition of Sunday labour, states that their work lasts for the first 6 days of the week on an average 15 hours a-day, and on Sunday 8-10 hours. From this same memorial we learn also that the delicate gourmards among the aristocratic hypocrites of Exeter Hall, especially

encourage this “Sunday labour.” These “holy ones,” so zealous *in cute curanda* [in attending to their bodily pleasures], show their Christianity by the humility with which they bear the overwork, the privations, and the hunger of others. *Obsequium ventris istis (the labourers) perniciosius est* [Gluttony is more ruinous to their stomachs – paraphrase of Horace].

<sup>73</sup> “We have given in our previous reports the statements of several experienced manufacturers to the effect that over-hours ... certainly tend prematurely to exhaust the working power of the men.” (l.c., 64. p. xiii.)

<sup>74</sup> Cairnes, “The Slave Power,” pp. 110. 111.

<sup>75</sup> John Ward: “The Borough of Stoke-upon-Trent,” London, 1843, p. 42.

<sup>76</sup> Ferrand’s Speech in the House of Commons, 27th April, 1863.

<sup>77</sup> “Those were the very words used by the cotton manufacturers.” l.c.

<sup>78</sup> l.c. Mr. Villiers, despite the best of intentions on his part, was “legally” obliged to refuse the requests of the manufacturers. These gentlemen, however, attained their end through the obliging nature of the local poor law boards. Mr. A. Redgrave, Inspector of Factories, asserts that this time the system under which orphans and pauper children were treated “legally” as apprentices “was not accompanied with the old abuses” (on these “abuses” see Engels, l.c.), although in one case there certainly was “abuse of this system in respect to a number of girls and young women brought from the agricultural districts of Scotland into Lancashire and Cheshire.” Under this system the manufacturer entered into a contract with the workhouse authorities for a certain period. He fed, clothed and lodged the children, and gave them a small allowance of money. A remark of Mr. Redgrave to be quoted directly seems strange, especially if we consider that even among the years of prosperity of the English cotton trade, the year 1860 stands unparalleled, and that, besides, wages were exceptionally high. For this extraordinary demand for work had to contend with the depopulation of Ireland, with unexampled emigration from the English and Scotch agricultural districts to Australia and America, with an actual diminution of the population in some of the English agricultural districts, in consequence partly of an actual breakdown of the vital force of the labourers, partly of the already effected dispersion of the disposable population through the dealers in human flesh. Despite all this Mr. Redgrave says: “This kind of labour, however, would only be sought after when none other could be procured, for it is a high-priced labour. The ordinary wages of a boy of 13 would be about 4s. per week, but to lodge, to clothe, to feed, and to provide medical attendance and proper superintendence for 50 or 100 of these boys, and to set aside some remuneration for them, could not be accomplished for 4s. a-head per week.” (Report of the Inspector of Factories for 30th April, 1860, p. 27.) Mr. Redgrave forgets to tell us how the labourer himself can do all this for his children out of their 4s. a-week wages, when the manufacturer cannot do it for the 50 or 100 children lodged, boarded, superintended all together. To guard against false conclusions from the text, I ought here to remark that the English cotton industry, since it was placed under the Factory Act of 1850 with its regulations of labour-time, &c., must be regarded as the model industry of England. The English cotton operative is in every respect better off than his Continental companion in misery. “The Prussian factory operative labours at least ten hours per week more than his English competitor, and if employed at his own loom in his own house, his labour is not restricted to even those additional hours. (“Rep. of Insp. of Fact.,” 31st October, 1855, p. 103.) Redgrave, the Factory Inspector mentioned above, after the Industrial Exhibition in 1851, travelled on the Continent, especially in France and Germany, for the purpose of inquiring into the conditions of the factories. Of the Prussian operative he says: “He receives a remuneration sufficient to procure the simple fare, and to supply the slender comforts to which he has been accustomed ... he lives upon his coarse fare, and works hard, wherein his position is subordinate to that of the English operative.” (“Rep. of Insp. of Fact.” 31st Oct., 1855, p. 85.)

<sup>79</sup> The over-worked “die off with strange rapidity; but the places of those who perish are instantly filled, and a frequent change of persons makes no alteration in the scene.” (“England and America.” London, 1833, vol. I, p. 55. By E. G. Wakefield.)

<sup>80</sup> See “Public Health. Sixth Report of the Medical Officer of the Privy Council, 1863.” Published in London 1864. This report deals especially with the agricultural labourers. “Sutherland ... is commonly represented as a highly improved county ... but ... recent inquiry has discovered that even there, in districts once famous for fine men and gallant soldiers, the inhabitants have degenerated into a meagre and stunted race. In the healthiest situations, on hill sides fronting the sea, the faces of their famished children are as pale as they could be in the foul atmosphere of a London alley.” (W. Th. Thornton. “Overpopulation and its Remedy.” l.c., pp. 74, 75.) They resemble in fact the 30,000 “gallant Highlanders” whom Glasgow pigs together in its wynds and closes, with prostitutes and thieves.

<sup>81</sup> “But though the health of a population is so important a fact of the national capital, we are afraid it must be said that the class of employers of labour have not been the most forward to guard and cherish this treasure.... The consideration of the health of the operatives was forced upon the mill-owners.” (*Times*, November 5th, 1861.) “The men of the West Riding became the clothiers of mankind ... the health of the workpeople was sacrificed, and the race in a few generations must have degenerated. But a reaction set in. Lord Shaftesbury’s Bill limited the hours of children’s labour,” &c. (“Report of the Registrar-General,” for October 1861.)

<sup>82</sup> We, therefore, find, e.g., that in the beginning of 1863, 26 firms owning extensive potteries in Staffordshire, amongst others, Josiah Wedgwood, & Sons, petition in a memorial for “some legislative enactment.” Competition with other capitalists permits them no voluntary limitation of working-time for children, &c. “Much as we deplore the evils before mentioned, it would not be possible to prevent them by any scheme of agreement between the manufacturers. ... Taking all these points into consideration, we have come to the conviction that some legislative enactment is wanted.” (“Children’s Employment Comm.” Rep. I, 1863, p. 322.) Most recently a much more striking example offers. The rise in the price of cotton during a period of feverish activity, had induced the manufacturers in Blackburn to shorten, by mutual consent, the working-time in their mills during a certain fixed period. This period terminated about the end of November, 1871. Meanwhile, the wealthier manufacturers, who combined spinning with weaving, used the diminution of production resulting from this agreement, to extend their own business and thus to make great profits at the expense of the small employers. The latter thereupon turned in their extremity to the operatives, urged them earnestly to agitate for the 9 hours’ system, and promised contributions in money to this end.

<sup>83</sup> The labour Statutes, the like of which were enacted at the same time in France, the Netherlands, and elsewhere, were first formally repealed in England in 1813, long after the changes in methods of production had rendered them obsolete.

<sup>84</sup> “No child under 12 years of age shall be employed in any manufacturing establishment more than 10 hours in one day.” General Statutes of Massachusetts, 63, ch. 12. (The various Statutes were passed between 1836 and 1858.) “Labour performed during a period of 10 hours on any day in all cotton, woollen, silk, paper, glass, and flax factories, or in manufactories of iron and brass, shall be considered a legal day’s labour. And be it enacted, that hereafter no minor engaged in any factory shall be holden or required to work more than 10 hours in any day, or 60 hours in any week; and that hereafter no minor shall be admitted as a worker under the age of 10 years in any factory within this State.” State of New Jersey. An Act to limit the hours of labour, &c., § 1 and 2. (Law of 18th March, 1851.) “No minor who has attained the age of 12 years, and is under the age of 15 years, shall be employed in any manufacturing establishment more than 11 hours in any one day, nor before 5 o’clock in the morning, nor after 7.30 in the evening.” (“Revised Statutes of the State of Rhode Island,” &c., ch. 139, § 23, 1st July, 1857.)

<sup>85</sup> “Sophisms of Free Trade.” 7th Ed. London, 1850, p. 205, 9th Ed., p. 253. This same Tory, moreover, admits that “Acts of Parliament regulating wages, but against the labourer and in favour of the master, lasted for the long period of 464 years. Population grew. These laws were then found, and really became, unnecessary and burdensome.” (l.c., p. 206.)

<sup>86</sup> In reference to this statute, J. Wade with truth remarks: “From the statement above (i.e., with regard to the statute) it appears that in 1496 the diet was considered equivalent to one-third of the income of an artificer and one-half the income of a labourer, which indicates a greater degree of independence among the working-classes than prevails at present; for the board, both of labourers and artificers, would now be reckoned at a much higher proportion of their wages.” (J. Wade, “History of the Middle and Working Classes,” pp. 24, 25, and 577.) The opinion that this difference is due to the difference in the price-relations between food and clothing then and now is refuted by the most cursory glance at “Chronicon Preciosum, &c.” By Bishop Fleetwood. 1st Ed., London, 1707; 2nd Ed., London, 1745.

<sup>87</sup> W. Petty. “Political Anatomy of Ireland, Verbum Sapienti,” 1672, Ed. 1691, p. 10.

<sup>88</sup> “A Discourse on the necessity of encouraging Mechanick Industry,” London, 1690, p. 13. Macaulay, who has falsified English history in the interests of the Whigs and the bourgeoisie, declares as follows: “The practice of setting children prematurely to work ... prevailed in the 17th century to an extent which, when compared with the extent of the manufacturing system, seems almost incredible. At Norwich, the chief seat of the clothing trade, a little creature of six years old was thought fit for labour. Several writers of that time, and among them some who were considered as eminently benevolent, mention with exultation the fact that in that single city, boys and girls of very tender age create wealth exceeding what was necessary for their own subsistence by twelve thousand pounds a year. The more carefully we examine the history of the past, the more reason shall we find to dissent from those who imagine that our age has been fruitful of new social evils.... That which is new is the intelligence and the humanity which remedies them.” (“History of England,” vol. 1., p. 417.) Macaulay might have reported further that “extremely well-disposed” *amis du commerce* in the 17th century, narrate with “exultation” how in a poorhouse in Holland a child of four was employed, and that this example of “*vertu mise en pratique*” [applied virtue] passes muster in all the humanitarian works, *à la* Macaulay, to the time of Adam Smith. It is true that with the substitution of manufacture for handicrafts, traces of the exploitation of children begin to appear. This exploitation existed always to a certain extent among peasants, and was the more developed, the heavier the yoke pressing on the husbandman. The tendency of capital is there unmistakably; but the facts themselves are still as isolated as the phenomena of two-headed children. Hence they were noted “with exultation” as especially worthy of remark and as wonders by the far-seeing “*amis du commerce*,” and recommended as models for their own time and for posterity. This same Scotch sycophant and fine talker, Macaulay, says: “We hear to-day only of retrogression and see only progress.” What eyes, and especially what ears!

<sup>89</sup> Among the accusers of the workpeople, the most angry is the anonymous author quoted in the text of “An Essay on Trade and Commerce, containing Observations on Taxes, &c.,” London, 1770. He had already dealt with this subject in his earlier work: “Considerations on Taxes.” London, 1765. On the same side follows Polonius Arthur Young, the unutterable statistical prattler. Among the defenders of the working-classes the foremost are: Jacob Vanderlint, in: “Money Answers all Things.” London, 1734, the Rev. Nathaniel Forster, D. D., in “An Enquiry into the Causes of the Present High Price of Provisions,” London, 1767; Dr. Price, and especially Postlethwayt, as well in the supplement to his “Universal Dictionary of Trade and Commerce,” as in his “Great Britain’s Commercial Interest explained and improved.” 2nd Edition, 1755. The facts themselves are confirmed by many other writers of the time, among others by Josiah Tucker.

<sup>90</sup> Postlethwayt, l.c., “First Preliminary Discourse,” p. 14.

<sup>91</sup> “An Essay,” &c. He himself relates on p. 96 wherein the “happiness” of the English agricultural labourer already in 1770 consisted. “Their powers are always upon the stretch, they cannot live cheaper than they do, nor work harder.”

<sup>92</sup> Protestantism, by changing almost all the traditional holidays into workdays, plays an important part in the genesis of capital.

<sup>93</sup> “An Essay,” 4c., pp. 15, 41, 96, 97, 55, 57, 69. — Jacob Vanderlint, as early as 1734, declared that the secret of the out-cry of the capitalists as to the laziness of the working people was simply that they claimed for the same wages 6 days’ labour instead of 4.

<sup>94</sup> l.c., p. 242.

<sup>95</sup> l.c. “The French,” he says, “laugh at our enthusiastic ideas of liberty.” l.c., p. 78.

<sup>96</sup> “They especially objected to work beyond the 12 hours per day, because the law which fixed those hours, is the only good which remains to them of the legislation of the Republic.” (“Rep. of Insp. of Fact.,” 31 st October, 1856, p. 80.) The French Twelve Hours’ Bill of September 5th, 1850, a bourgeois edition of the decree of the Provisional Government of March 2nd, 1848, holds in all workshops without exceptions. Before this law the working day in France was without definite limit. It lasted in the factories 14, 15, or more hours. See “Des classes ouvrières en France, pendant l’année 1848. Par M. Blanqui.” M. Blanqui the economist, not the Revolutionist, had been entrusted by the Government with an inquiry into the condition of the working-class.

<sup>97</sup> Belgium is the model bourgeois state in regard to the regulation of the working day. Lord Howard of Welden, English Plenipotentiary at Brussels, reports to the Foreign Office May 12th, 1862: “M. Rogier, the minister, informed me that children’s labour is limited neither by a general law nor by any local regulations; that the Government, during the last three years, intended in every session to propose a bill on the subject, but always found an insuperable obstacle in the jealous opposition to any legislation in contradiction with the principle of perfect freedom of labour.”

<sup>98</sup> “It is certainly much to be regretted that any class of persons should toil 12 hours a day, which, including the time for their meals and for going to and returning from their work, amounts, in fact, to 14 of the 24 hours.... Without entering into the question of health, no one will hesitate, I think, to admit that, *in a moral point of view*, so entire an absorption of the time of the working-classes, without intermission, from the early age of 13, and in trades not subject to restriction, much younger, must be extremely prejudicial, and is an evil greatly to be deplored.... For the sake, therefore, of public morals, of bringing up an orderly population, and of giving the great body of the people a reasonable enjoyment of life, it is much to be desired that in all trades some portion of every working day should be reserved for rest and leisure.” (Leonard Horner in “Reports of Insp. of Fact. for 31st Dec., 1841.”)

<sup>99</sup> See “Judgment of Mr. J. H. Otway, Belfast. Hilary Sessions, County Antrim, 1860.”

<sup>100</sup> It is very characteristic of the regime of Louis Philippe, the bourgeois king, that the one Factory Act passed during his reign, that of March 22nd, 1841, was never put in force. And this law only dealt with child-labour. It fixed 8 hours a day for children between 8 and 12, 12 hours for children between 12 and 16, &c., with many exceptions which allow night-work even for children 8 years old. The supervision and enforcement of this law are, in a country where every mouse is under police administration, left to the good-will of the *amis du commerce*. Only since 1853, in one single department — the Departement du Nord — has a paid government inspector been appointed. Not less characteristic of the development of French society, generally, is the fact, that Louis Philippe’s law stood solitary among the all-embracing mass of French laws, till the Revolution of 1848.

<sup>101</sup> “Report of Insp. of Fact.” 30th April, 1860, p. 50.

<sup>102</sup> “Rept. of Insp. of Fact.,” 31st October, 1849, p. 6

<sup>103</sup> “Rept. of Insp. of Fact.,” 31st October, 1848, p. 98.

<sup>104</sup> Leonard Horner uses the expression “nefarious practices” in his official reports. (“Report of Insp. of Fact.,” 31st October, 1859, p. 7.)

<sup>105</sup> “Rept.,” &c., 30th Sept., 1844, p. 15.

<sup>106</sup> The Act allows children to be employed for 10 hours if they do not work day after day, but only on alternate days. In the main, this clause remained inoperative.

<sup>107</sup> “As a reduction in their hours of work would cause a larger number (of children) to be employed, it was thought that the additional supply of children from 8 to 9 years of age would meet the increased demand” (l.c., p. 13 ).

<sup>108</sup> Rep. of Insp. of Fact.,” 31st Oct., 1848, p. 16.

<sup>109</sup> “I found that men who had been getting 10s. a week, had had 1s. taken off for a reduction in the rate of 10 per cent, and 1s. 6d. off the remaining 9s. for the reduction in time, together 2s. 6d.. and notwithstanding this, many of them said they would rather work 10 hours.” l.c.

<sup>110</sup> “‘Though I signed it [the petition], I said at the time I was putting my hand to a wrong thing.’ ‘Then why did you put your hand to it?’ ‘Because I should have been turned off if I had refused.’ Whence it would appear that this petitioner felt himself ‘oppressed,’ but not exactly by the Factory Act.” l.c., p. 102.

<sup>111</sup> p. 17, l.c. In Mr. Horner’s district 10,270 adult male labourers were thus examined in 181 factories. Their evidence is to be found in the appendix to the Factory Reports for the half-year ending October 1848. These examinations furnish valuable material in other connexions also.

<sup>112</sup> l.c. See the evidence collected by Leonard Horner himself, Nos. 69, 70, 71, 72, 92, 93, and that collected by Sub-Inspector A., Nos. 51, 52, 58, 59, 62, 70, of the Appendix. One manufacturer, too, tells the plain truth. See No. 14, and No. 265, l.c.

<sup>114</sup> Reports, &c., for 30th April, 1848, p. 47.

<sup>115</sup> Reports, &c., for 31st October, 1848, p. 130.

<sup>116</sup> Reports, &c., l.c., p. 142.

<sup>117</sup> Reports &c., for 31st October, 1850, pp. 5, 6.

<sup>118</sup> The nature of capital remains the same in its developed as in its undeveloped form. In the code which the influence of the slave-owners, shortly before the outbreak of the American Civil War, imposed on the territory of New Mexico, it is said that the labourer, in as much as the capitalist has bought his labour-power, “is his (the capitalist’s) money.” The same view was current among the Roman patricians. The money they had advanced to the plebeian debtor had been transformed via the means of subsistence into the flesh and blood of the debtor. This “flesh and blood” were, therefore, “their money.” Hence, the Shylock-law of the Ten Tables. Linguet’s hypothesis that the patrician creditors from time to time prepared, beyond the Tiber, banquets of debtors’ flesh, may remain as undecided as that of Daumer on the Christian Eucharist.

<sup>119</sup> Reports, &c.. for 30th April, 1848, p. 28.

<sup>120</sup> Thus, among others, Philanthropist Ashworth to Leonard Horner, in a disgusting Quaker letter. (Reports, &c., April, 1849, p. 4.)

<sup>129</sup> See Reports, &c., for 30th April, 1849, p. 6, and the detailed explanation of the “shifting system,” by Factory Inspectors Howell and Saunders, in “Reports, &c., for 31st October, 1848.” See also the petition to the Queen from the clergy of Ashton and vicinity, in the spring of 1849, against the “shift system.”

<sup>130</sup> Cf. for example, “The Factory Question and the Ten Hours’ Bill.”, By R. H. Greg, 1837.

<sup>131</sup> F. Engels: “The English Ten Hours’ Bill.” (In the “*Neue Rheinische Zeitung. Politisch-ökonomische Revue.*” Edited by K. Marx. April number, 1850, p. 13.) The same “high” Court of Justice discovered, during the American Civil War, a verbal ambiguity which exactly reversed the meaning of the law against the arming of pirate ships.

<sup>132</sup> Rep., &c., for 30th April, 1850.

<sup>133</sup> In winter, from 7 a.m. to 7 p.m. may be substituted.

<sup>134</sup> “The present law (of 1850) was a compromise whereby the employed surrendered the benefit of the Ten Hours’ Act for the advantage of one uniform period for the commencement and termination of the labour of those whose labour is restricted.” (Reports, &c., for 30th April, 1852, p. 14.)

<sup>135</sup> Reports, &c., for Sept., 1844, p. 13.

<sup>136</sup> I.c.

<sup>137</sup> I.c.

<sup>138</sup> “Reports, &c., for 31st Oct., 1846,” p. 20.

<sup>139</sup> Reports, &c., for 31st Oct., 1861, p. 26.

<sup>140</sup> I.c., p. 27. On the whole the working population, subject to the Factory Act, has greatly improved physically. All medical testimony agrees on this point, and personal observation at different times has convinced me of it. Nevertheless, and exclusive of the terrible death-rate of children in the first years of their life, the official reports of Dr. Greenhow show the unfavourable health condition of the manufacturing districts as compared with “agricultural districts of normal health.” As evidence, take the following table from his 1861 report: —

|   |      |      |      |      |      |      |      |      |     |
|---|------|------|------|------|------|------|------|------|-----|
| <b>Percentage of Adult Males Engaged in Manufactures</b>      | 14.9 | 42.6 | 37.3 | 41.9 | 31.0 | 14.9 | 36.6 | 30.4 | —   |
| <b>Death-rate from Pulmonary Affections per 100,000 Males</b> | 598  | 708  | 547  | 611  | 691  | 588  | 721  | 726  | 305 |

| Name of District   | Wigan  | Blackburn | Halifax | Bradford | Macclesfield | Leek | Stoke-upon-Trent | Woolstanton | Eight healthy agricultural districts |
|--|--------|-----------|---------|----------|--------------|------|------------------|-------------|--------------------------------------|
| Death-rate from Pulmonary Affections per 100,000 Females | 644    | 734       | 564     | 603      | 804          | 705  | 665              | 727         | 340                                  |
| Percentage of Adult Females Engaged in Manufactures      | 18.0   | 34.9      | 20.4    | 30.0     | 26.0         | 17.2 | 19.3             | 13.9        | —                                    |
| Kind of Female Occupation                                | Cotton | Do.       | Worsted | Do.      | Silk         | Do.  | Earthenware      | Do.         | —                                    |

<sup>141</sup> It is well known with what reluctance the English “Free-traders” gave up the protective duty on the silk manufacture. Instead of the protection against French importation, the absence of protection to English factory children now serves their turn.

<sup>142</sup> During 1859 and 1860, the zenith years of the English cotton industry, some manufacturers tried, by the decoy bait of higher wages for over-time, to reconcile the adult male operatives to an extension of the working day. The hand-mule spinners and self-actor mincers put an end to the experiment by a petition to their employers in which they say, “Plainly speaking, our lives are to us a burthen; and, while we are confined to the mills *nearly two days a week more* than the other operatives of the country, we feel like helots in the land, and that we are perpetuating a system injurious to ourselves and future generations.... This, therefore, is to give you most respectful notice that when we commence work again after the Christmas and New Year’s holidays, we shall work 60 hours per week, and no more, or from six to six, with one hour and a half out.” (Reports, &c., for 30th April, 1860, p. 30.)

<sup>143</sup> On the means that the wording of this Act afforded for its violation of the Parliamentary Return “Factories Regulation Act” (6th August, 1859), and in it Leonard Horner’s “Suggestions for amending the Factory Acts to enable the Inspectors to prevent illegal working, now becoming very prevalent.”

<sup>144</sup> Children of the age of 8 years and upwards, have, indeed, been employed from 6 a.m. to 9 p.m. during the last half year in my district.” (Reports, &c., for 31st October, 1857, p. 39.)

<sup>145</sup> “The Printworks’ Act is admitted to be a failure both with reference to its educational and protective provisions.” (Reports, &c., for 31st October, 1862, p. 52.)

<sup>146</sup> Thus, *e.g.*, E. Potter in a letter to the *Times* of March 24th, 1863. The *Times* reminded him of the maufacturers’ revolt against the Ten Hours’ Bill.

<sup>147</sup> Thus, among others, Mr. W. Newmarch, collaborator and editor of Tooke’s “History of Prices.” Is it a scientific advance to make cowardly concessions to public opinion?

<sup>148</sup> The Act passed in 1860, determined that, in regard to dye and bleachworks, the working day should be fixed on August 1st, 1861, provisionally at 12 hours, and definitely on August 1st, 1862, at

10 hours, *i.e.*, at 10½ hours for ordinary days, and 7½ for Saturday. Now, when the fatal year, 1862, came, the old farce was repeated. Besides, the manufacturers petitioned Parliament to allow the employment of young persons and women for 12 hours during one year longer. “In the existing condition of the trade (the time of the cotton famine), it was greatly to the advantage of the operatives to work 12 hours per day, and make wages when they could.” A bill to this effect had been brought in, “and it was mainly due to the action of the operative bleachers in Scotland that the bill was abandoned.” (Reports, &c., for 31st October, 1862, pp. 14-15.) Thus defeated by the very workpeople, in whose name it pretended to speak, Capital discovered, with the help of lawyer spectacles, that the Act of 1860, drawn up, like all the Acts of Parliament for the “protection of labour,” in equivocal phrases, gave them a pretext to exclude from its working the calenderers and finishers. English jurisprudence, ever the faithful servant of capital, sanctioned in the Court of Common Pleas this piece of pettifoggery. “The operatives have been greatly disappointed ... they have complained of over-work, and it is greatly to be regretted that the clear intention of the legislature should have failed by reason of a faulty definition.” (*l.c.*, p. 18.)

<sup>149</sup> The “open-air bleachers” had evaded the law of 1860, by means of the lie that no women worked at it in the night. The lie was exposed by the Factory Inspectors, and at the same time Parliament was, by petitions from the operatives, bereft of its notions as to the cool meadow-fragrance, in which bleaching in the open-air was reported to take place. In this aerial bleaching, drying-rooms were used at temperatures of from 90° to 100° Fahrenheit, in which the work was done for the most part by girls. “Cooling” is the technical expression for their occasional escape from the drying-rooms into the fresh air. “Fifteen girls in stoves. Heat from 80° to 90° for linens, and 100° and upwards for cambrics. Twelve girls ironing and doing-up in a small room about 10 feet square, in the centre of which is a close stove. The girls stand round the stove, which throws out a terrific heat, and dries the cambrics rapidly for the ironers. The hours of work for these hands are unlimited. If busy, they work till 9 or 12 at night for successive nights.” (Reports, &c., for 31st October, 1862, p. 56.) A medical man states: “No special hours are allowed for cooling, but if the temperature gets too high, or the workers’ hands get soiled from perspiration, they are allowed to go out for a few minutes.... My experience, which is considerable, in treating the diseases of stove workers, compels me to express the opinion that their sanitary condition is by no means so high as that of the operatives in a spinning factory (and Capital, in its memorials to Parliament, had painted them as floridly healthy after the manner of Rubens.) The diseases most observable amongst them are phthisis, bronchitis, irregularity of uterine functions, hysteria in its most aggravated forms, and rheumatism. All of these, I believe, are either directly or indirectly induced by the impure, overheated air of the apartments in which the hands are employed and the want of sufficient comfortable clothing to protect them from the cold, damp atmosphere, in winter, when going to their homes.” (*l.c.*, pp. 56-57.) The Factory Inspectors remarked on the supplementary law of 1860, torn from these open-air bleachers: “The Act has not only failed to afford that protection to the workers which it appears to offer, but contains a clause ... apparently so worded that, unless persons are detected working after 8 o’clock at night they appear to come under no protective provisions at all, and if they do so work the mode of proof is so doubtful that a conviction can scarcely follow.” (*l.c.*, p. 52.) “To all intents and purposes, therefore, as an Act for any benevolent or educational purpose, it is a failure; since it can scarcely be called benevolent to permit, which is tantamount to compelling, women and children to work 14 hours a day with or without meals, as the case may be, and perhaps for longer hours than these, without limit as to age, without reference to sex, and without regard to the social habits of the families of the neighbourhood, in which such works (bleaching and dyeing) are situated.” (Reports, &c., for 30th April, 1863, p. 40.)

<sup>150</sup> *Note to the 2nd Ed.* Since 1866, when I wrote the above passages, a reaction has again set in.

<sup>151</sup> “The conduct of each of these classes (capitalists and workmen) has been the result of the relative situation in which they have been placed.” (Reports, &c., for 31st October, 1848, p. 113.)

<sup>152</sup> “The employments, placed under restriction, were connected with the manufacture of textile fabrics by the aid of steam or water-power. There were two conditions to which an employment must be subject to cause it to be inspected, viz., the use of steam or waterpower, and the manufacture of certain specified fibre.” (Reports, &c., for 31st October, 1864, p. 8.)

<sup>153</sup> On the condition of so-called domestic industries, specially valuable materials are to be found in the latest reports of the Children’s Employment Commission.

<sup>154</sup> “The Acts of last Session (1864) ... embrace a diversity of occupations, the customs in which differ greatly, and the use of mechanical power to give motion to machinery is no longer one of the elements necessary, as formerly, to constitute, in legal phrase, a ‘Factory.’” (Reports, &c., for 31st October, 1864, p. 8.)

<sup>155</sup> Belgium, the paradise of Continental Liberalism, shows no trace of this movement. Even in the coal and metal mines labourers of both sexes, and all ages, are consumed, in perfect “freedom” at any period and through any length of time. Of every 1,000 persons employed there, 733 are men, 88 women, 135 boys, and 44 girls under 16; in the blast furnaces, &c., of every 1,000, 668 are men, 149 women, 98 boys, and 85 girls under 16. Add to this the low wages for the enormous exploitation of mature and immature labour-power. The average daily pay for a man is 2s. 8d., for a woman, 1s. 8d., for a boy, 1s. 2½d. As a result, Belgium had in 1863, as compared with 1850, nearly doubled both the amount and the value of its exports of coal, iron, &c.

<sup>156</sup> Robert Owen, soon after 1810, not only maintained the necessity of a limitation of the working day in theory, but actually introduced the 10 hours’ day into his factory at New Lanark. This was laughed at as a communistic Utopia; so were his “Combination of children’s education with productive labour and the Co-operative Societies of Workingmen”, first called into being by him. To-day, the first Utopia is a Factory Act, the second figures as an official phrase in all Factory Acts, the third is already being used as a cloak for reactionary humbug.

<sup>157</sup> Ure: “French translation, Philosophie des Manufactures.” Paris, 1836, Vol. II, pp. 39, 40, 67, 77, &c.

<sup>158</sup> In the *Compte Rendu* of the International Statistical Congress at Paris, 1855, it is stated: “The French law, which limits the length of daily labour in factories and workshops to 12 hours, does not confine this work to definite fixed hours. For children’s labour only the work-time is prescribed as between 5 a.m. and 9 p.m. Therefore, some of the masters use the right which this fatal silence gives them to keep their works going, without intermission, day in, day out, possibly with the exception of Sunday. For this purpose they use two different sets of workers, of whom neither is in the workshop more than 12 hours at a time, but the work of the establishment lasts day and night. The law is satisfied, but is humanity?” Besides “the destructive influence of night-labour on the human organism,” stress is also laid upon “the fatal influence of the association of the two sexes by night in the same badly-lighted workshops.”

<sup>159</sup> “For instance, there is within my district one occupier who, within the same curtilage, is at the same time a bleacher and dyer under the Bleaching and Dyeing Works Act, a printer under the Print Works Act, and a finisher under the Factory Act.” (Report of Mr. Baker, in Reports, lic., for October 31st, 1861, p. 20.) After enumerating the different provisions of these Acts, and the complications arising from them, Mr. Baker says: “It will hence appear that it must be very difficult to secure the execution of these three Acts of Parliament where the occupier chooses to evade the law.” But what is assured to the lawyers by this is law-suits.

<sup>160</sup> Thus the Factory Inspectors at last venture to say: “These objections (of capital to the legal limitation of the working day) must succumb before the broad principle of the rights of labour.... There is a time when the master’s right in his workman’s labour ceases, and his time becomes his own, even if there were no exhaustion in the question.” (Reports, &c., for 31 st Oct., 1862, p. 54.)

<sup>161</sup> “We, the workers of Dunkirk, declare that the length of time of labour required under the present system is too great, and that, far from leaving the worker time for rest and education, it plunges him into a condition of servitude but little better than slavery. That is why we decide that 8 hours are enough for a working day, and ought to be legally recognised as enough; why we call to our help that powerful lever, the press; ... and why we shall consider all those that refuse us this help as enemies of the reform of labour and of the rights of the labourer.” (Resolution of the Working Men of Dunkirk, New York State, 1866.)

<sup>162</sup> Reports, &c., for Oct., 1848, p. 112.

<sup>163</sup> “The proceedings (the manoeuvres of capital, e.g., from 1848-50) have afforded, moreover, incontrovertible proof of the fallacy of the assertion so often advanced, that operatives need no protection, but may be considered as free agents in the disposal of the only property which they possess — the labour of their hands and the sweat of their brows.” (Reports, &c., for April 30th, 1850, p. 45.) “Free labour (if so it may be termed) even in a free country, requires the strong arm of the law to protect it.” (Reports, &c., for October 31st, 1864, p. 34.) “To permit, which is tantamount to compelling ... to work 14 hours a day with or without meals,” &c. (Repts., &c., for April 30th, 1863, p. 40.)

<sup>164</sup> Friedrich Engels, *l.c.*, p. 5.

<sup>165</sup> The 10 Hours’ Act has, in the branches of industry that come under it, “put an end to the premature decrepitude of the former long-hour workers.” (Reports, &c., for 31st Oct., 1859, p. 47.) “Capital (in factories) can never be employed in keeping the machinery in motion beyond a limited time, without certain injury to the health and morals of the labourers employed; and they are not in a position to protect themselves.” (*l.c.*, p. 8)

<sup>166</sup> “A still greater boon is the distinction at last made clear between the worker’s own time and his master’s. The worker knows now when that which he sells is ended, and when his own begins; and by possessing a sure foreknowledge of this, is enabled to prearrange his own minutes for his own purposes.” (*l.c.*, p. 52.) “By making them masters of their own time (the Factory Acts) have given them a moral energy which is directing them to the eventual possession of political power” (*l.c.*, p. 47). With suppressed irony, and in very well weighed words, the Factory Inspectors hint that the actual law also frees the capitalist from some of the brutality natural to a man who is a mere embodiment of capital, and that it has given him time for a little “culture.” “Formerly the master had no time for anything but money; the servant had no time for anything but labour” (*l.c.*, p. 48).

## Chapter 11: Rate and Mass of Surplus-Value

In this chapter, as hitherto, the value of labour-power, and therefore the part of the working day necessary for the reproduction or maintenance of that labour-power, are supposed to be given, constant magnitudes.

This premised, with the rate, the mass is at the same time given of the surplus-value that the individual labourer furnishes to the capitalist in a definite period of time. If, *e.g.*, the necessary labour amounts to 6 hours daily, expressed in a quantum of gold = 3 shillings, then 3s. is the daily value of one labour-power or the value of the capital advanced in the buying of one labour-power. If, further, the rate of surplus-value be = 100%, this variable capital of 3s. produces a mass of surplus-value of 3s., or the labourer supplies daily a mass of surplus labour equal to 6 hours.

But the variable capital of a capitalist is the expression in money of the total value of all the labour-powers that he employs simultaneously. Its value is, therefore, equal to the average value of one labour-power, multiplied by the number of labour-powers employed. With a given value of labour-power, therefore, the magnitude of the variable capital varies directly as the number of labourers employed simultaneously. If the daily value of one labour-power = 3s., then a capital of 300s. must be advanced in order to exploit daily 100 labour-powers, of  $n$  times 3s., in order to exploit daily  $n$  labour-powers.

In the same way, if a variable capital of 3s., being the daily value of one labour-power, produce a daily surplus-value of 3s., a variable capital of 300s. will produce a daily surplus-value of 300s., and one of  $n$  times 3s. a daily surplus-value of  $n \times 3s.$  The mass of the surplus-value produced is therefore equal to the surplus-value which the working day of one labourer supplies multiplied by the number of labourers employed. But as further the mass of surplus-value which a single labourer produces, the value of labour-power being given, is determined by the rate of the surplus-value, this law follows: the mass of the surplus-value produced is equal to the amount of the variable capital advanced, multiplied by the rate of surplus-value, in other words: it is determined by the compound ratio between the number of labour-powers exploited simultaneously by the same capitalist and the degree of exploitation of each individual labour-power.

Let the mass of the surplus-value be  $S$ , the surplus-value supplied by the individual labourer in the average day  $s$  the variable capital daily advanced in the purchase of one individual labour-power  $v$ , the sum total of the variable capital  $V$ , the value of an average labour-power  $P$ , its degree of exploitation ( $a/a$ ) (surplus labour/necessary-labour) and the number of labourers employed  $n$ ; we would have:

$$S = \begin{cases} (s/v) \times V \\ P \times (a/a) \times n \end{cases}$$

It is always supposed, not only that the value of an average labour-power is constant, but that the labourers employed by a capitalist are reduced to average labourers. There are exceptional cases in which the surplus-value produced does not increase in proportion to the number of labourers exploited, but then the value of the labour-power does not remain constant.

In the production of a definite mass of surplus-value, therefore the decrease of one factor may be compensated by the increase of the other. If the variable capital diminishes, and at the same time

the rate of surplus-value increases in the same ratio, the mass of surplus-value produced remains unaltered. If on our earlier assumption the capitalist must advance 300s., in order to exploit 100 labourers a day, and if the rate of surplus-value amounts to 50%, this variable capital of 300s. yields a surplus-value of 150s. or of  $100 \times 3$  working hours. If the rate of surplus-value doubles, or the working day, instead of being extended from 6 to 9, is extended from 6 to 12 hours and at the same time variable capital is lessened by half, and reduced to 150s., it yields also a surplus-value of 150s. or  $50 \times 6$  working hours. Diminution of the variable capital may therefore be compensated by a proportionate rise in the degree of exploitation of labour-power, or the decrease in the number of the labourers employed by a proportionate extension of the working day. Within certain limits therefore the supply of labour exploitable by capital is independent of the supply of labourers.<sup>1</sup> On the contrary, a fall in the rate of surplus-value leaves unaltered the mass of the surplus-value produced, if the amount of the variable capital, or number of the labourers employed, increases in the same proportion.

Nevertheless, the compensation of a decrease in the number of labourers employed, or of the amount of variable capital advanced by a rise in the rate of surplus-value, or by the lengthening of the working day, has impassable limits. Whatever the value of labour-power may be, whether the working time necessary for the maintenance of the labourer is 2 or 10 hours, the total value that a labourer can produce, day in, day out, is always less than the value in which 24 hours of labour are embodied, less than 12s., if 12s. is the money expression for 24 hours of realised labour. In our former assumption, according to which 6 working hours are daily necessary in order to reproduce the labour-power itself or to replace the value of the capital advanced in its purchase, a variable capital of 1,500s., that employs 500 labourers at a rate of surplus-value of 100% with a 12 hours' working day, produces daily a surplus-value of 1,500s. or of  $6 \times 500$  working hours. A capital of 300s. that employs 100 labourers a day with a rate of surplus-value of 200% or with a working day of 18 hours, produces only a mass of surplus-value of 600s. or  $12 \times 100$  working hours; and its total value-product, the equivalent of the variable capital advanced plus the surplus-value, can, day in, day out, never reach the sum of 1,200s. or  $24 \times 100$  working hours. The absolute limit of the average working day – this being by nature always less than 24 hours – sets an absolute limit to the compensation of a reduction of variable capital by a higher rate of surplus-value, or of the decrease of the number of labourers exploited by a higher degree of exploitation of labour-power. This palpable law is of importance for the clearing up of many phenomena, arising from a tendency (to be worked out later on) of capital to reduce as much as possible the number of labourers employed by it, or its variable constituent transformed into labour-power, in contradiction to its other tendency to produce the greatest possible mass of surplus-value. On the other hand, if the mass of labour-power employed, or the amount of variable capital, increases, but not in proportion to the fall in the rate of surplus-value, the mass of the surplus-value produced, falls.

A third law results from the determination, of the mass of the surplus-value produced, by the two factors: rate of surplus-value and amount of variable capital advanced. The rate of surplus-value, or the degree of exploitation of labour-power, and the value of labour-power, or the amount of necessary working time being given, it is self evident that the greater the variable capital, the greater would be the mass of the value produced and of the surplus-value. If the limit of the working day is given, and also the limit of its necessary constituent, the mass of value and surplus-value that an individual capitalist produces, is clearly exclusively dependent on the mass of labour that he sets in motion. But this, under the conditions supposed above, depends on the mass of labour-power, or the number of labourers whom he exploits, and this number in its turn is determined by the amount of the variable capital advanced. With a given rate of surplus-value,

and a given value of labour-power, therefore, the masses of surplus-value produced vary directly as the amounts of the variable capitals advanced. Now we know that the capitalist divides his capital into two parts. One part he lays out in means of production. This is the constant part of his capital. The other part he lays out in living labour-power. This part forms his variable capital. On the basis of the same mode of social production, the division of capital into constant and variable differs in different branches of production, and within the same branch of production, too, this relation changes with changes in the technical conditions and in the social combinations of the processes of production. But in whatever proportion a given capital breaks up into a constant and a variable part, whether the latter is to the former as 1:2 or 1:10 or 1:x, the law just laid down is not affected by this. For, according to our previous analysis, the value of the constant capital reappears in the value of the product, but does not enter into the newly produced value, the newly created value product. To employ 1,000 spinners, more raw material, spindles, &c., are, of course, required, than to employ 100. The value of these additional means of production however may rise, fall, remain unaltered, be large or small; it has no influence on the process of creation of surplus-value by means of the labour-powers that put them in motion. The law demonstrated above now, therefore, takes this form: the masses of value and of surplus-value produced by different capitals – the value of labour-power being given and its degree of exploitation being equal – vary directly as the amounts of the variable constituents of these capitals, *i.e.*, as their constituents transformed into living labour-power.

This law clearly contradicts all experience based on appearance. Everyone knows that a cotton spinner, who, reckoning the percentage on the whole of his applied capital, employs much constant and little variable capital, does not, on account of this, pocket less profit or surplus-value than a baker, who relatively sets in motion much variable and little constant capital. For the solution of this apparent contradiction, many intermediate terms are as yet wanted, as from the standpoint of elementary algebra many intermediate terms are wanted to understand that 0/0 may represent an actual magnitude. Classical economy, although not formulating the law, holds instinctively to it, because it is a necessary consequence of the general law of value. It tries to rescue the law from collision with contradictory phenomena by a violent abstraction. It will be seen later<sup>2</sup> how the school of Ricardo has come to grief over this stumbling block. Vulgar economy which, indeed, “has really learnt nothing,” here as everywhere sticks to appearances in opposition to the law which regulates and explains them. In opposition to Spinoza, it believes that “ignorance is a sufficient reason.”

The labour which is set in motion by the total capital of a society, day in, day out, may be regarded as a single collective working day. If, *e.g.*, the number of labourers is a million, and the average working day of a labourer is 10 hours, the social working day consists of ten million hours. With a given length of this working day, whether its limits are fixed physically or socially, the mass of surplus-value can only be increased by increasing the number of labourers, *i.e.*, of the labouring population. The growth of population here forms the mathematical limit to the production of surplus-value by the total social capital. On the contrary, with a given amount of population, this limit is formed by the possible lengthening of the workingday.<sup>3</sup> It will, however, be seen in the following chapter that this law only holds for the form of surplus-value dealt with up to the present.

From the treatment of the production of surplus-value, so far, it follows that not every sum of money, or of value, is at pleasure transformable into capital. To effect this transformation, in fact, a certain minimum of money or of exchange-value must be presupposed in the hands of the individual possessor of money or commodities. The minimum of variable capital is the cost price of a single labour-power, employed the whole year through, day in, day out, for the production of

surplus-value. If this labourer were in possession of his own means of production, and were satisfied to live as a labourer, he need not work beyond the time necessary for the reproduction of his means of subsistence, say 8 hours a day. He would, besides, only require the means of production sufficient for 8 working hours. The capitalist, on the other hand, who makes him do, besides these 8 hours, say 4 hours' surplus labour, requires an additional sum of money for furnishing the additional means of production. On our supposition, however, he would have to employ two labourers in order to live, on the surplus-value appropriated daily, as well as, and no better than a labourer, *i.e.*, to be able to satisfy his necessary wants. In this case the mere maintenance of life would be the end of his production, not the increase of wealth; but this latter is implied in capitalist production. That he may live only twice as well as an ordinary labourer, and besides turn half of the surplus-value produced into capital, he would have to raise, with the number of labourers, the minimum of the capital advanced 8 times. Of course he can, like his labourer, take to work himself, participate directly in the process of production, but he is then only a hybrid between capitalist and labourer, a "small master." A certain stage of capitalist production necessitates that the capitalist be able to devote the whole of the time during which he functions as a capitalist, *i.e.*, as personified capital, to the appropriation and therefore control of the labour of others, and to the selling of the products of this labour.<sup>4</sup> The guilds of the middle ages therefore tried to prevent by force the transformation of the master of a trade into a capitalist, by limiting the number of labourers that could be employed by one master within a very small maximum. The possessor of money or commodities actually turns into a capitalist in such cases only where the minimum sum advanced for production greatly exceeds the maximum of the middle ages. Here, as in natural science, is shown the correctness of the law discovered by Hegel (in his "Logic"), that merely quantitative differences beyond a certain point pass into qualitative changes.<sup>5</sup>

The minimum of the sum of value that the individual possessor of money or commodities must command, in order to metamorphose himself into a capitalist, changes with the different stages of development of capitalist production, and is at given stages different in different spheres of production, according to their special and technical conditions. Certain spheres of production demand, even at the very outset of capitalist production, a minimum of capital that is not as yet found in the hands of single individuals. This gives rise partly to state subsidies to private persons, as in France in the time of Clobber, and as in many German states up to our own epoch, partly to the formation of societies with legal monopoly for the exploitation of certain branches of industry and commerce, the forerunners of our modern joint stock companies.<sup>6</sup>

Within the process of production, as we have seen, capital acquired the command over labour, *i.e.*, over functioning labour-power or the labourer himself. Personified capital, the capitalist takes care that the labourer does his work regularly and with the proper degree of intensity.

Capital further developed into a coercive relation, which compels the working class to do more work than the narrow round of its own life-wants prescribes. As a producer of the activity of others, as a pumper-out of surplus labour and exploiter of labour-power, it surpasses in energy, disregard of bounds, recklessness and efficiency, all earlier systems of production based on directly compulsory labour.

At first, capital subordinates labour on the basis of the technical conditions in which it historically finds it. It does not, therefore, change immediately the mode of production. The production of surplus-value – in the form hitherto considered by us – by means of simple extension of the working day, proved, therefore, to be independent of any change in the mode of production itself. It was not less active in the old-fashioned bakeries than in the modern cotton factories.

If we consider the process of production from the point of view of the simple labour process, the labourer stands in relation to the means of production, not in their quality as capital, but as the mere means and material of his own intelligent productive activity. In tanning, *e.g.*, he deals with the skins as his simple object of labour. It is not the capitalist whose skin he tans. But it is different as soon as we deal with the process of production from the point of view of the process of creation of surplus-value. The means of production are at once changed into means for the absorption of the labour of others. It is now no longer the labourer that employs the means of production, but the means of production that employ the labourer. Instead of being consumed by him as material elements of his productive activity, they consume him as the ferment necessary to their own life-process, and the life-process of capital consists only in its movement as value constantly expanding, constantly multiplying itself. Furnaces and workshops that stand idle by night, and absorb no living labour, are “a mere loss” to the capitalist. Hence, furnaces and workshops constitute lawful claims upon the night-labour of the work-people. The simple transformation of money into the material factors of the process of production, into means of production, transforms the latter into a title and a right to the labour and surplus labour of others. An example will show, in conclusion, how this sophistication, peculiar to and characteristic of capitalist production, this complete inversion of the relation between dead and living labour, between value and the force that creates value, mirrors itself in the consciousness of capitalists. During the revolt of the English factory lords between 1848 and 1850, “the head of one of the oldest and most respectable houses in the West of Scotland, Messrs. Carlile Sons & Co., of the linen and cotton thread factory at Paisley, a company which has now existed for about a century, which was in operation in 1752, and four generations of the same family have conducted it” ... this “very intelligent gentleman” then wrote a letter<sup>7</sup> in the *Glasgow Daily Mail* of April 25th, 1849, with the title, “The relay system,” in which among other things the following grotesquely naïve passage occurs: “Let us now ... see what evils will attend the limiting to 10 hours the working of the factory.... They amount to the most serious damage to the millowner’s prospects and property. If he (i.e., his “hands”) worked 12 hours before, and is limited to 10, then every 12 machines or spindles in his establishment shrink to 10, and should the works be disposed of, they will be valued only as 10, so that a sixth part would thus be deducted from the value of every factory in the country.”<sup>8</sup>

To this West of Scotland bourgeois brain, inheriting the accumulated capitalistic qualities of “four generations,” the value of the means of production, spindles, &c., is so inseparably mixed up with their property, as capital, to expand their own value, and to swallow up daily a definite quantity of the unpaid labour of others, that the head of the firm of Carlile & Co. actually imagines that if he sells his factory, not only will the value of the spindles be paid to him, but, in addition, their power of annexing surplus-value, not only the labour which is embodied in them, and is necessary to the production of spindles of this kind, but also the surplus labour which they help to pump out daily from the brave Scots of Paisley, and for that very reason he thinks that with the shortening of the working day by 2 hours, the selling-price of 12 spinning machines dwindles to that of 10!

---

<sup>1</sup>This elementary law appears to be unknown to the vulgar economists, who, upside-down Archimedes, in the determination of the market-price of labour by supply and demand, imagine they have found the fulcrum by means of which, not to move the world, but to stop its motion.

<sup>2</sup> Further particulars will be given in Book IV.

<sup>3</sup> “The Labour, that is the economic time, of society, is a given portion, say ten hours a day of a million of people, or ten million hours.... Capital has its boundary of increase. This boundary may, at

any given period, be attained in the actual extent of economic time employed.” (“An Essay on the Political Economy of Nations.” London, 1821, pp. 47, 49.)

<sup>4</sup> “The farmer cannot rely on his own labour, and if he does, I will maintain that he is a loser by it. His employment should be a general attention to the whole: his thresher must be watched, or he will soon lose his wages in corn not threshed out, his mowers, reapers, &c., must be looked after; he must constantly go round his fences; he must see there is no neglect; which would be the case if he was confined to any one spot.” (“An Inquiry into the Connexion between the Present Price of Provisions and the Size of Farms, &c. By a Farmer.” London, 1773, p. 12.) This book is very interesting. In it the genesis of the “capitalist farmer” or “merchant farmer,” as he is explicitly called, may be studied, and his self-glorification at the expense of the small farmer who has only to do with bare subsistence, be noted. “The class of capitalists are from the first partially, and they become ultimately completely, discharged from the necessity of the manual labour.” (“Textbook of Lectures on the Political Economy of Nations. By the Rev. Richard Jones.” Hertford 1852. Lecture III., p. 39.)

<sup>5</sup> The molecular theory of modern chemistry first scientifically worked out by Laurent and Gerhardt rests on no other law. (Addition to 3rd Edition.) For the explanation of this statement, which is not very clear to non-chemists, we remark that the author speaks here of the homologous series of carbon compounds, first so named by C. Gerhardt in 1843, each series of which has its own general algebraic formula. Thus the series of paraffins:  $C_nH_{2n+2}$ , that of the normal alcohols:  $C_nH_{2n+2}O$ ; of the normal fatty acids:  $C_nH_{2n}O_2$  and many others. In the above examples, by the simply quantitative addition of  $CH_2$  to the molecular formula, a qualitatively different body is each time formed. On the share (overestimated by Marx) of Laurent and Gerhardt in the determination of this important fact see Kopp, “Entwicklung der Chemie.” Munchen, 1873, pp. 709, 716, and Schorkmmer, “The Rise and Development of Organic Chemistry.” London, 1879, p. 54. — *F. E.* See Letter from Marx to Engels, 22 June 1867

For Hegel’s formulation of the idea in the *Logic*, see Remark: Examples of Such Nodal Lines; the Maxim, ‘Nature Does Not Make Leaps’.

<sup>6</sup> Martin Luther calls these kinds of institutions: “The Company Monopolia.”

<sup>7</sup> Reports of Insp. of Fact., April 30th, 1849, p. 59.

<sup>8</sup> *l.c.*, p. 60. Factory Inspector Stuart, himself a Scotchman, and in contrast to the English Factory Inspectors, quite taken captive by the capitalistic method of thinking, remarks expressly on this letter which he incorporates in his report that it is “the most useful of the communications which any of the factory-owners working with relays have given to those engaged in the same trade, and which is the most calculated to remove the prejudices of such of them as have scruples respecting any change of the arrangement of the hours of work.”

# **Part 4: Production of Relative Surplus-Value**

## Chapter 12: The Concept of Relative Surplus-Value

That portion of the working day which merely produces an equivalent for the value paid by the capitalist for his labour-power, has, up to this point, been treated by us as a constant magnitude, and such in fact it is, under given conditions of production and at a given stage in the economic development of society. Beyond this, his necessary labour-time, the labourer, we saw, could continue to work for 2, 3, 4, 6, &c., hours. The rate of surplus-value and the length of the working day depended on the magnitude of this prolongation. Though the necessary labour-time was constant, we saw, on the other hand, that the total working day was variable. Now suppose we have a working day whose length, and whose apportionment between necessary labour and surplus labour, are given. Let the whole line  $a\ c$ ,  $a\ b\ c$  represent, for example, a working day of 12 hours; the portion of  $a\ b$  10 hours of necessary labour, and the portion  $b\ c$  2 hours of surplus labour. How now can the production of surplus-value be increased, i.e., how can the surplus labour be prolonged, without, or independently of, any prolongation of  $a\ c$ ?

Although the length of  $a\ c$  is given,  $b\ c$  appears to be capable of prolongation, if not by extension beyond its end  $c$ , which is also the end of the working day  $a\ c$ , yet, at all events, by pushing back its starting-point  $b$  in the direction of  $a$ . Assume that  $b'\ b$  in the line  $a\ b'c$  is equal to half of  $b\ c$

$$a\ \text{---}\ b'\ \text{---}\ b\ \text{---}\ c$$

or to one hour's labour-time. If now, in  $a\ c$ , the working day of 12 hours, we move the point  $b$  to  $b'$ ,  $b\ c$  becomes  $b'\ c$ ; the surplus labour increases by one half, from 2 hours to 3 hours, although the working day remains as before at 12 hours. This extension of the surplus labour-time from  $b\ c$  to  $b'\ c$ , from 2 hours to 3 hours, is, however, evidently impossible, without a simultaneous contraction of the necessary labour-time from  $a\ b$  into  $a\ b'$ , from 10 hours to 9 hours. The prolongation of the surplus labour would correspond to a shortening of the necessary labour; or a portion of the labour-time previously consumed, in reality, for the labourer's own benefit, would be converted into labour-time for the benefit of the capitalist. There would be an alteration, not in the length of the working day, but in its division into necessary labour-time and surplus labour-time.

On the other hand, it is evident that the duration of the surplus labour is given, when the length of the working day, and the value of labour-power, are given. The value of labour-power, i.e., the labour-time requisite to produce labour-power, determines the labour-time necessary for the reproduction of that value. If one working-hour be embodied in sixpence, and the value of a day's labour-power be five shillings, the labourer must work 10 hours a day, in order to replace the value paid by capital for his labour-power, or to produce an equivalent for the value of his daily necessary means of subsistence. Given the value of these means of subsistence, the value of his labour-power is given;<sup>1</sup> and given the value of his labour-power, the duration of his necessary labour-time is given. The duration of the surplus labour, however, is arrived at, by subtracting the necessary labour-time from the total working day. Ten hours subtracted from twelve, leave two, and it is not easy to see, how, under the given conditions, the surplus labour can possibly be prolonged beyond two hours. No doubt, the capitalist can, instead of five shillings, pay the labourer four shillings and sixpence or even less. For the reproduction of this value of four shillings and sixpence, nine hours' labour-time would suffice; and consequently three hours of surplus labour, instead of two, would accrue to the capitalist, and the surplus-value would rise from one shilling to eighteen-pence. This result, however, would be obtained only by lowering

the wages of the labourer below the value of his labour-power. With the four shillings and sixpence which he produces in nine hours, he commands one-tenth less of the necessaries of life than before, and consequently the proper reproduction of his labour-power is crippled. The surplus labour would in this case be prolonged only by an overstepping of its normal limits; its domain would be extended only by a usurpation of part of the domain of necessary labour-time. Despite the important part which this method plays in actual practice, we are excluded from considering it in this place, by our assumption, that all commodities, including labour-power, are bought and sold at their full value. Granted this, it follows that the labour-time necessary for the production of labour-power, or for the reproduction of its value, cannot be lessened by a fall in the labourer's wages below the value of his labour-power, but only by a fall in this value itself. Given the length of the working day, the prolongation of the surplus labour must of necessity originate in the curtailment of the necessary labour-time; the latter cannot arise from the former. In the example we have taken, it is necessary that the value of labour-power should actually fall by one-tenth, in order that the necessary labour-time may be diminished by one-tenth, i.e., from ten hours to nine, and in order that the surplus labour may consequently be prolonged from two hours to three.

Such a fall in the value of labour-power implies, however, that the same necessaries of life which were formerly produced in ten hours, can now be produced in nine hours. But this is impossible without an increase in the productiveness of labour. For example, suppose a shoe-maker, with given tools, makes in one working day of twelve hours, one pair of boots. If he must make two pairs in the same time, the productiveness of his labour must be doubled; and this cannot be done, except by an alteration in his tools or in his mode of working, or in both. Hence, the conditions of production, i.e., his mode of production, and the labour-process itself, must be revolutionised. By increase in the productiveness of labour, we mean, generally, an alteration in the labour-process, of such a kind as to shorten the labour-time socially necessary for the production of a commodity, and to endow a given quantity of labour with the power of producing a greater quantity of use-value.<sup>2</sup> Hitherto in treating of surplus-value, arising from a simple prolongation of the working day, we have assumed the mode of production to be given and invariable. But when surplus-value has to be produced by the conversion of necessary labour into surplus labour, it by no means suffices for capital to take over the labour-process in the form under which it has been historically handed down, and then simply to prolong the duration of that process. The technical and social conditions of the process, and consequently the very mode of production must be revolutionised, before the productiveness of labour can be increased. By that means alone can the value of labour-power be made to sink, and the portion of the working day necessary for the reproduction of that value, be shortened.

The surplus-value produced by prolongation of the working day, I call *absolute surplus-value*. On the other hand, the surplus-value arising from the curtailment of the necessary labour-time, and from the corresponding alteration in the respective lengths of the two components of the working day, I call *relative surplus-value*.

In order to effect a fall in the value of labour-power, the increase in the productiveness of labour must seize upon those branches of industry whose products determine the value of labour-power, and consequently either belong to the class of customary means of subsistence, or are capable of supplying the place of those means. But the value of a commodity is determined, not only by the quantity of labour which the labourer directly bestows upon that commodity, but also by the labour contained in the means of production. For instance, the value of a pair of boots depends not only on the cobbler's labour, but also on the value of the leather, wax, thread, &c. Hence, a fall in the value of labour-power is also brought about by an increase in the productiveness of

labour, and by a corresponding cheapening of commodities in those industries which supply the instruments of labour and the raw material, that form the material elements of the constant capital required for producing the necessaries of life. But an increase in the productiveness of labour in those branches of industry which supply neither the necessaries of life, nor the means of production for such necessaries, leaves the value of labour-power undisturbed.

The cheapened commodity, of course, causes only a pro tanto fall in the value of labour-power, a fall proportional to the extent of that commodity's employment in the reproduction of labour-power. Shirts, for instance, are a necessary means of subsistence, but are only one out of many. The totality of the necessaries of life consists, however, of various commodities, each the product of a distinct industry; and the value of each of those commodities enters as a component part into the value of labour-power. This latter value decreases with the decrease of the labour-time necessary for its reproduction; the total decrease being the sum of all the different curtailments of labour-time effected in those various and distinct industries. This general result is treated, here, as if it were the immediate result directly aimed at in each individual case. Whenever an individual capitalist cheapens shirts, for instance, by increasing the productiveness of labour he by no means necessarily aims at reducing the value of labour-power and shortening, pro tanto the necessary labour-time. But it is only in so far as he ultimately contributes to this result, that he assists in raising the general rate of surplus-value.<sup>3</sup> The general and necessary tendencies of capital must be distinguished from their forms of manifestation.

It is not our intention to consider, here, the way in which the laws, immanent in capitalist production, manifest themselves in the movements of individual masses of capital, where they assert themselves as coercive laws of competition, and are brought home to the mind and consciousness of the individual capitalist as the directing motives of his operations. But this much is clear; a scientific analysis of competition is not possible, before we have a conception of the inner nature of capital, just as the apparent motions of the heavenly bodies are not intelligible to any but him, who is acquainted with their real motions, motions which are not directly perceptible by the senses. Nevertheless, for the better comprehension of the production of relative surplus-value, we may add the following remarks, in which we assume nothing more than the results we have already obtained.

If one hour's labour is embodied in sixpence, a value of six shillings will be produced in a working day of 12 hours. Suppose, that with the prevailing productiveness of labour, 12 articles are produced in these 12 hours. Let the value of the means of production used up in each article be sixpence. Under these circumstances, each article costs one shilling: sixpence for the value of the means of production, and sixpence for the value newly added in working with those means. Now let some one capitalist contrive to double the productiveness of labour, and to produce in the working day of 12 hours, 24 instead of 12 such articles. The value of the means of production remaining the same, the value of each article will fall to ninepence, made up of sixpence for the value of the means of production and threepence for the value newly added by the labour. Despite the doubled productiveness of labour, the day's labour creates, as before, a new value of six shillings and no more, which, however, is now spread over twice as many articles. Of this value each article now has embodied in it 1/24th, instead of 1/12th, threepence instead of sixpence; or, what amounts to the same thing, only half an hour's instead of a whole hour's labour-time, is now added to the means of production while they are being transformed into each article. The individual value of these articles is now below their social value; in other words, they have cost less labour-time than the great bulk of the same article produced under the average social conditions. Each article costs, on an average, one shilling, and represents 2 hours of social labour; but under the altered mode of production it costs only ninepence, or contains only 1½ hours'

labour. The real value of a commodity is, however, not its individual value, but its social value; that is to say, the real value is not measured by the labour-time that the article in each individual case costs the producer, but by the labour-time socially required for its production. If therefore, the capitalist who applies the new method, sells his commodity at its social value of one shilling, he sells it for threepence above its individual value, and thus realises an extra surplus-value of threepence. On the other hand, the working day of 12 hours is, as regards him, now represented by 24 articles instead of 12. Hence, in order to get rid of the product of one working day, the demand must be double what it was, i.e., the market must become twice as extensive. Other things being equal, his commodities can command a more extended market only by a diminution of their prices. He will therefore sell them above their individual but under their social value, say at tenpence each. By this means he still squeezes an extra surplus-value of one penny out of each. This augmentation of surplus-value is pocketed by him, whether his commodities belong or not to the class of necessary means of subsistence that participate in determining the general value of labour-power. Hence, independently of this latter circumstance, there is a motive for each individual capitalist to cheapen his commodities, by increasing the productiveness of labour.

Nevertheless, even in this case, the increased production of surplus-value arises from the curtailment of the necessary labour-time, and from the corresponding prolongation of the surplus labour.<sup>4</sup> Let the necessary labour-time amount to 10 hours, the value of a day's labour-power to five shillings, the surplus labour-time to 2 hours, and the daily surplus-value to one shilling. But the capitalist now produces 24 articles, which he sells at tenpence a-piece, making twenty shillings in all. Since the value of the means of production is twelve shillings,  $14 \frac{2}{5}$  of these articles merely replace the constant capital advanced. The labour of the 12 hours' working day is represented by the remaining  $9 \frac{3}{5}$  articles. Since the price of the labour-power is five shillings, 6 articles represent the necessary labour-time, and  $3 \frac{3}{5}$  articles the surplus labour. The ratio of the necessary labour to the surplus labour, which under average social conditions was 5:1, is now only 5:3. The same result may be arrived at in the following way. The value of the product of the working day of 12 hours is twenty shillings. Of this sum, twelve shillings belong to the value of the means of production, a value that merely re-appears. There remain eight shillings, which are the expression in money, of the value newly created during the working day. This sum is greater than the sum in which average social labour of the same kind is expressed: twelve hours of the latter labour are expressed by six shillings only. The exceptionally productive labour operates as intensified labour; it creates in equal periods of time greater values than average social labour of the same kind. (See Ch. I. Sect 2. p. 44.) But our capitalist still continues to pay as before only five shillings as the value of a day's labour-power. Hence, instead of 10 hours, the labourer need now work only  $7 \frac{1}{2}$  hours, in order to reproduce this value. His surplus labour is, therefore, increased by  $2 \frac{1}{2}$  hours, and the surplus-value he produces grows from one, into three shillings. Hence, the capitalist who applies the improved method of production, appropriates to surplus labour a greater portion of the working day, than the other capitalists in the same trade. He does individually, what the whole body of capitalists engaged in producing relative surplus-value, do collectively. On the other hand, however, this extra surplus-value vanishes, so soon as the new method of production has become general, and has consequently caused the difference between the individual value of the cheapened commodity and its social value to vanish. The law of the determination of value by labour-time, a law which brings under its sway the individual capitalist who applies the new method of production, by compelling him to sell his goods under their social value, this same law, acting as a coercive law of competition, forces his competitors to adopt the new method.<sup>5</sup> The general rate of surplus-value is, therefore, ultimately affected by the whole process, only when the increase in the productiveness of labour, has seized upon those branches

of production that are connected with, and has cheapened those commodities that form part of, the necessary means of subsistence, and are therefore elements of the value of labour-power.

The value of commodities is in inverse ratio to the productiveness of labour. And so, too, is the value of labour-power, because it depends on the values of commodities. Relative surplus-value is, on the contrary, directly proportional to that productiveness. It rises with rising and falls with falling productiveness. The value of money being assumed to be constant, an average social working day of 12 hours always produces the same new value, six shillings, no matter how this sum may be apportioned between surplus-value and wages. But if, in consequence of increased productiveness, the value of the necessaries of life fall, and the value of a day's labour-power be thereby reduced from five shillings to three, the surplus-value increases from one shilling to three. Ten hours were necessary for the reproduction of the value of the labour-power; now only six are required. Four hours have been set free, and can be annexed to the domain of surplus labour. Hence there is immanent in capital an inclination and constant tendency, to heighten the productiveness of labour, in order to cheapen commodities, and by such cheapening to cheapen the labourer himself.<sup>6</sup>

The value of a commodity is, in itself, of no interest to the capitalist. What alone interests him, is the surplus-value that dwells in it, and is realisable by sale. Realisation of the surplus-value necessarily carries with it the refunding of the value that was advanced. Now, since relative surplus-value increases in direct proportion to the development of the productiveness of labour, while, on the other hand, the value of commodities diminishes in the same proportion; since one and the same process cheapens commodities, and augments the surplus-value contained in them; we have here the solution of the riddle: why does the capitalist, whose sole concern is the production of exchange-value, continually strive to depress the exchange-value of commodities? A riddle with which Quesnay, one of the founders of Political Economy, tormented his opponents, and to which they could give him no answer.

“You acknowledge,” he says, “that the more expenses and the cost of labour can, in the manufacture of industrial products, be reduced without injury to production, the more advantageous is such reduction, because it diminishes the price of the finished article. And yet, you believe that the production of wealth, which arises from the labour of the workpeople, consists in the augmentation of the exchange-value of their products.”<sup>7</sup>

The shortening of the working day is, therefore, by no means what is aimed at, in capitalist production, when labour is economised by increasing its productiveness.<sup>8</sup> It is only the shortening of the labour-time, necessary for the production of a definite quantity of commodities, that is aimed at. The fact that the workman, when the productiveness of his labour has been increased, produces, say 10 times as many commodities as before, and thus spends one-tenth as much labour-time on each, by no means prevents him from continuing to work 12 hours as before, nor from producing in those 12 hours 1,200 articles instead of 120. Nay, more, his working day may be prolonged at the same time, so as to make him produce, say 1,400 articles in 14 hours. In the treatises, therefore, of economists of the stamp of MacCulloch, Ure, Senior, and *tutti quanti* [the like], we may read upon one page, that the labourer owes a debt of gratitude to capital for developing his productiveness, because the necessary labour-time is thereby shortened, and on the next page, that he must prove his gratitude by working in future for 15 hours instead of 10. The object of all development of the productiveness of labour, within the limits of capitalist production, is to shorten that part of the working day, during which the workman must labour for his own benefit, and by that very shortening, to lengthen the other part of the day, during which he is at liberty to work gratis for the capitalist. How far this result is also attainable, without

cheapening commodities, will appear from an examination of the particular modes of producing relative surplus-value, to which examination we now proceed.

---

<sup>1</sup> The value of his average daily wages is determined by what the labourer requires “so as to live, labour, and generate.” (Wm. Petty: “Political Anatomy of Ireland,” 1672, p. 64.) “The price of Labour is always constituted of the price of necessaries ... whenever ... the labouring man’s wages will not, suitably to his low rank and station, as a labouring man, support such a family as is often the lot of many of them to have,” he does not receive proper wages. (J. Vanderlint, l.c., p. 15.) “Le simple ouvrier, qui n’a que ses bras et son industrie, n’a rien qu’autant qu’il parvient à vendre à d’autres sa peine... En tout genre de travail il doit arriver, et il arrive en effet, que le salaire de l’ouvrier se borne à ce qui lui est nécessaire pour lui procurer sa subsistance.” [The mere workman, who has only his arms and his industry, has nothing unless he succeeds in selling his labour to others ... In every kind of work it cannot fail to happen, as a matter of fact it does happen, that the wages of the workman are limited to what is necessary to procure him his subsistence.] (Turgot, “Réflexions, &c.,” *Oeuvres*, éd. Daire t. I, p. 10.) “The price of the necessaries of life is, in fact, the cost of producing labour.” (Malthus, “Inquiry into, &c., Rent,” London, 1815, p. 48, note.)

<sup>2</sup> Quando si perfezionano le arti, che non è altro che la scoperta di nuove vie, onde si possa compiere una manifattura con meno gente o (che è lo stesso) in minor tempo di prima.” (Galiani, l.c., p. 159.) “L’économie sur les frais de production ne peut donc être autre chose que l’économie sur la quantité de travail employé pour produire.” [Perfection of the crafts means nothing other than the discovery of new ways of making a product with fewer people, or (which is the same thing) in less time than previously] (Sismondi, “Études,” t. I. p. 22.)

<sup>3</sup> “Let us suppose ... the products ... of the manufacturer are doubled by improvement in machinery ... he will be able to clothe his workmen by means of a smaller proportion of the entire return ... and thus his profit will be raised. But in no other way will it be influenced.” (Ramsay, l.c., pp. 168, 169.)

<sup>4</sup> “A man’s profit does not depend upon his command of the produce of other men’s labour, but upon his command of labour itself. If he can sell his goods at a higher price, while his workmen’s wages remain unaltered, he is clearly benefited... A smaller proportion of what he produces is sufficient to put that labour into motion, and a larger proportion consequently remains for himself.” (“Outlines of Pol. Econ.” London, 1832, pp. 49, 50.)

<sup>5</sup> “If my neighbour by doing much with little labour, can sell cheap, I must contrive to sell as cheap as he. So that every art, trade, or engine, doing work with labour of fewer hands, and consequently cheaper, begets in others a kind of necessity and emulation, either of using the same art, trade, or engine, or of inventing something like it, that every man may be upon the square, that no man may be able to undersell his neighbour.” (“The Advantages of the East India Trade to England,” London, 1720, p. 67.)

<sup>6</sup> “In whatever proportion the expenses of a labourer are diminished, in the same proportion will his wages be diminished, if the restraints upon industry are at the same time taken off.” (“Considerations Concerning Taking off the Bounty on Corn Exported,” &c., London, 1753, p. 7.) “The interest of trade requires, that corn and all provisions should be as cheap as possible; for whatever makes them dear, must make labour dear also ... in all countries, where industry is not restrained, the price of provisions must affect the price of labour. This will always be diminished when the necessaries of life grow cheaper.” (I. c., p. 3.) “Wages are decreased in the same proportion as the powers of production increase. Machinery, it is true, cheapens the necessaries of life, but it also cheapens the labourer.” (“A Prize Essay on the Comparative Merits of Competition and Co-operation.” London, 1834, p. 27.)

<sup>7</sup> “Ils conviennent que plus on peut, sans préjudice, épargner de frais ou de travaux dispendieux dans la fabrication des ouvrages des artisans, plus cette épargne est profitable par la diminution des prix de ces ouvrages. Cependant ils croient que la production de richesse qui résulte des travaux des artisans

---

consiste dans l'augmentation de la valeur vénale de leurs ouvrages." (Quesnay: "Dialogues sur le Commerce et les Travaux des Artisans." pp. 188, 189.)

<sup>8</sup> "Ces spéculateurs si économes du travail des ouvriers qu'il faudrait qu'ils payassent." [These speculators, who are so economical of the labour of workers they would have to pay] (J. N. Bidaut: "Du Monopole qui s'établit dans les arts industriels et le commerce." Paris, 1828, p. 13.) "The employer will be always on the stretch to economise time and labour." (Dugald Stewart: Works ed. by Sir W. Hamilton, Edinburgh, v., viii., 1855. "Lectures on Polit. Econ.," p. 318.) "Their (the capitalists') interest is that the productive powers of the labourers they employ should be the greatest possible. On promoting that power their attention is fixed and almost exclusively fixed." (R. Jones: l.c., Lecture III.)

## Chapter 13: Co-operation

Capitalist production only then really begins, as we have already seen, when each individual capital employs simultaneously a comparatively large number of labourers; when consequently the labour-process is carried on on an extensive scale and yields, relatively, large quantities of products. A greater number of labourers working together, at the same time, in one place (or, if you will, in the same field of labour), in order to produce the same sort of commodity under the mastership of one capitalist, constitutes, both historically and logically, the starting-point of capitalist production. With regard to the mode of production itself, manufacture, in its strict meaning, is hardly to be distinguished, in its earliest stages, from the handicraft trades of the guilds, otherwise than by the greater number of workmen simultaneously employed by one and the same individual capital. The workshop of the medieval master handicraftsman is simply enlarged.

At first, therefore, the difference is purely quantitative. We have shown that the surplus-value produced by a given capital is equal to the surplus-value produced by each workman multiplied by the number of workmen simultaneously employed. The number of workmen in itself does not affect, either the rate of surplus-value, or the degree of exploitation of labour-power. If a working day of 12 hours be embodied in six shillings, 1,200 such days will be embodied in 1,200 times 6 shillings. In one case  $12 \times 1,200$  working-hours, and in the other 12 such hours are incorporated in the product. In the production of value a number of workmen rank merely as so many individual workmen; and it therefore makes no difference in the value produced whether the 1,200 men work separately, or united under the control of one capitalist.

Nevertheless, within certain limits, a modification takes place. The labour realised in value, is labour of an average social quality; is consequently the expenditure of average labour-power. Any average magnitude, however, is merely the average of a number of separate magnitudes all of one kind, but differing as to quantity. In every industry, each individual labourer, be he Peter or Paul, differs from the average labourer. These individual differences, or “errors” as they are called in mathematics, compensate one another, and vanish, whenever a certain minimum number of workmen are employed together. The celebrated sophist and sycophant, Edmund Burke, goes so far as to make the following assertion, based on his practical observations as a farmer; viz., that “in so small a platoon” as that of five farm labourers, all individual differences in the labour vanish, and that consequently any given five adult farm labourers taken together, will in the same time do as much work as any other five.<sup>1</sup> But, however that may be, it is clear, that the collective working day of a large number of workmen simultaneously employed, divided by the number of these workmen, gives one day of average social labour. For example, let the working day of each individual be 12 hours. Then the collective working day of 12 men simultaneously employed, consists of 144 hours; and although the labour of each of the dozen men may deviate more or less from average social labour, each of them requiring a different time for the same operation, yet since the working day of each is one-twelfth of the collective working day of 144 hours, it possesses the qualities of an average social working day. From the point of view, however, of the capitalist who employs these 12 men, the working day is that of the whole dozen. Each individual man’s day is an aliquot part of the collective working day, no matter whether the 12 men assist one another in their work, or whether the connexion between their operations consists merely in the fact, that the men are all working for the same capitalist. But if the 12 men are employed in six pairs, by as many different small masters, it will be quite a matter of chance, whether each of these masters produces the same value, and consequently whether he realises the general rate of

surplus-value. Deviations would occur in individual cases. If one workman required considerably more time for the production of a commodity than is socially necessary, the duration of the necessary labour-time would, in his case, sensibly deviate from the labour-time socially necessary on an average; and consequently his labour would not count as average labour, nor his labour-power as average labour-power. It would either be not saleable at all, or only at something below the average value of labour-power. A fixed minimum of efficiency in all labour is therefore assumed, and we shall see, later on, that capitalist production provides the means of fixing this minimum. Nevertheless, this minimum deviates from the average, although on the other hand the capitalist has to pay the average value of labour-power. Of the six small masters, one would therefore squeeze out more than the average rate of surplus-value, another less. The inequalities would be compensated for the society at large, but not for the individual masters. Thus the laws of the production of value are only fully realised for the individual producer, when he produces as a capitalist, and employs a number of workmen together, whose labour, by its collective nature, is at once stamped as average social labour.<sup>2</sup>

Even without an alteration in the system of working, the simultaneous employment of a large number of labourers effects a revolution in the material conditions of the labour-process. The buildings in which they work, the store-houses for the raw material, the implements and utensils used simultaneously or in turns by the workmen; in short, a portion of the means of production, are now consumed in common. On the one hand, the exchange-value of these means of production is not increased; for the exchange-value of a commodity is not raised by its use-value being consumed more thoroughly and to greater advantage. On the other hand, they are used in common, and therefore on a larger scale than before. A room where twenty weavers work at twenty looms must be larger than the room of a single weaver with two assistants. But it costs less labour to build one workshop for twenty persons than to build ten to accommodate two weavers each; thus the value of the means of production that are concentrated for use in common on a large scale does not increase in direct proportion to the expansion and to the increased useful effect of those means. When consumed in common, they give up a smaller part of their value to each single product; partly because the total value they part with is spread over a greater quantity of products, and partly because their value, though absolutely greater, is, having regard to their sphere of action in the process, relatively less than the value of isolated means of production. Owing to this, the value of a part of the constant capital falls, and in proportion to the magnitude of the fall, the total value of the commodity also falls. The effect is the same as if the means of production had cost less. The economy in their application is entirely owing to their being consumed in common by a large number of workmen. Moreover, this character of being necessary conditions of social labour, a character that distinguishes them from the dispersed and relatively more costly means of production of isolated, independent labourers, or small masters, is acquired even when the numerous workmen assembled together do not assist one another, but merely work side by side. A portion of the instruments of labour acquires this social character before the labour-process itself does so.

Economy in the use of the means of production has to be considered under two aspects. First, as cheapening commodities, and thereby bringing about a fall in the value of labour-power. Secondly, as altering the ratio of the surplus-value to the total capital advanced, i.e., to the sum of the values of the constant and variable capital. The latter aspect will not be considered until we come to the third book, to which, with the object of treating them in their proper connexion, we also relegate many other points that relate to the present question. The march of our analysis compels this splitting up of the subject-matter, a splitting up that is quite in keeping with the spirit of capitalist production. For since, in this mode of production, the workman finds the instruments

of labour existing independently of him as another man's property, economy in their use appears, with regard to him, to be a distinct operation, one that does not concern him, and which, therefore, has no connexion with the methods by which his own personal productiveness is increased.

When numerous labourers work together side by side, whether in one and the same process, or in different but connected processes, they are said to co-operate, or to work in co-operation.<sup>3</sup>

Just as the offensive power of a squadron of cavalry, or the defensive power of a regiment of infantry is essentially different from the sum of the offensive or defensive powers of the individual cavalry or infantry soldiers taken separately, so the sum total of the mechanical forces exerted by isolated workmen differs from the social force that is developed, when many hands take part simultaneously in one and the same undivided operation, such as raising a heavy weight, turning a winch, or removing an obstacle.<sup>4</sup> In such cases the effect of the combined labour could either not be produced at all by isolated individual labour, or it could only be produced by a great expenditure of time, or on a very dwarfed scale. Not only have we here an increase in the productive power of the individual, by means of co-operation, but the creation of a new power, namely, the collective power of masses.<sup>5</sup>

Apart from the new power that arises from the fusion of many forces into one single force, mere social contact begets in most industries an emulation and a stimulation of the animal spirits that heighten the efficiency of each individual workman. Hence it is that a dozen persons working together will, in their collective working day of 144 hours, produce far more than twelve isolated men each working 12 hours, or than one man who works twelve days in succession.<sup>6</sup> The reason of this is that man is, if not as Aristotle contends, a political,<sup>7</sup> at all events a social animal.

Although a number of men may be occupied together at the same time on the same, or the same kind of work, yet the labour of each, as a part of the collective labour, may correspond to a distinct phase of the labour-process, through all whose phases, in consequence of co-operation, the subject of their labour passes with greater speed. For instance, if a dozen masons place themselves in a row, so as to pass stones from the foot of a ladder to its summit, each of them does the same thing; nevertheless, their separate acts form connected parts of one total operation; they are particular phases, which must be gone through by each stone; and the stones are thus carried up quicker by the 24 hands of the row of men than they could be if each man went separately up and down the ladder with his burden.<sup>8</sup> The object is carried over the same distance in a shorter time. Again, a combination of labour occurs whenever a building, for instance, is taken in hand on different sides simultaneously; although here also the co-operating masons are doing the same, or the same kind of work. The 12 masons, in their collective working day of 144 hours, make much more progress with the building than one mason could make working for 12 days, or 144 hours. The reason is, that a body of men working in concert has hands and eyes both before and behind, and is, to a certain degree, omnipresent. The various parts of the work progress simultaneously.

In the above instances we have laid stress upon the point that the men do the same, or the same kind of work, because this, the most simple form of labour in common, plays a great part in co-operation, even in its most fully developed stage. If the work be complicated, then the mere number of the men who co-operate allows of the various operations being apportioned to different hands, and, consequently, of being carried on simultaneously. The time necessary for the completion of the whole work is thereby shortened.<sup>9</sup>

In many industries, there are critical periods, determined by the nature of the process, during which certain definite results must be obtained. For instance, if a flock of sheep has to be shorn, or a field of wheat to be cut and harvested, the quantity and quality of the product depends on the

work being begun and ended within a certain time. In these cases, the time that ought to be taken by the process is prescribed, just as it is in herring fishing. A single person cannot carve a working day of more than, say 12 hours, out of the natural day, but 100 men co-operating extend the working day to 1,200 hours. The shortness of the time allowed for the work is compensated for by the large mass of labour thrown upon the field of production at the decisive moment. The completion of the task within the proper time depends on the simultaneous application of numerous combined working days; the amount of useful effect depends on the number of labourers; this number, however, is always smaller than the number of isolated labourers required to do the same amount of work in the same period.<sup>10</sup> It is owing to the absence of this kind of co-operation that, in the western part of the United States, quantities of corn, and in those parts of East India where English rule has destroyed the old communities, quantities of cotton, are yearly wasted.<sup>11</sup>

On the one hand, co-operation allows of the work being carried on over an extended space; it is consequently imperatively called for in certain undertakings, such as draining, constructing dykes, irrigation works, and the making of canals, roads and railways. On the other hand, while extending the scale of production, it renders possible a relative contraction of the arena. This contraction of arena simultaneous with, and arising from, extension of scale, whereby a number of useless expenses are cut down, is owing to the conglomeration of labourers, to the aggregation of various processes, and to the concentration of the means of production.<sup>12</sup>

The combined working day produces, relatively to an equal sum of isolated working days, a greater quantity of use-values, and, consequently, diminishes the labour-time necessary for the production of a given useful effect. Whether the combined working day, in a given case, acquires this increased productive power, because it heightens the mechanical force of labour, or extends its sphere of action over a greater space, or contracts the field of production relatively to the scale of production, or at the critical moment sets large masses of labour to work, or excites emulation between individuals and raises their animal spirits, or impresses on the similar operations carried on by a number of men the stamp of continuity and many-sidedness, or performs simultaneously different operations, or economises the means of production by use in common, or lends to individual labour the character of average social labour whichever of these be the cause of the increase, the special productive power of the combined working day is, under all circumstances, the social productive power of labour, or the productive power of social labour. This power is due to co-operation itself. When the labourer co-operates systematically with others, he strips off the fetters of his individuality, and develops the capabilities of his species.<sup>13</sup>

As a general rule, labourers cannot co-operate without being brought together: their assemblage in one place is a necessary condition of their co-operation. Hence wage-labourers cannot co-operate, unless they are employed simultaneously by the same capital, the same capitalist, and unless therefore their labour-powers are bought simultaneously by him. The total value of these labour-powers, or the amount of the wages of these labourers for a day, or a week, as the case may be, must be ready in the pocket of the capitalist, before the workmen are assembled for the process of production. The payment of 300 workmen at once, though only for one day, requires a greater outlay of capital, than does the payment of a smaller number of men, week by week, during a whole year. Hence the number of the labourers that co-operate, or the scale of co-operation, depends, in the first instance, on the amount of capital that the individual capitalist can spare for the purchase of labour-power; in other words, on the extent to which a single capitalist has command over the means of subsistence of a number of labourers.

And as with the variable, so it is with the constant capital. For example, the outlay on raw material is 30 times as great, for the capitalist who employs 300 men, as it is for each of the 30

capitalists who employ 10 men. The value and quantity of the instruments of labour used in common do not, it is true, increase at the same rate as the number of workmen, but they do increase very considerably. Hence, concentration of large masses of the means of production in the hands of individual capitalists, is a material condition for the co-operation of wage-labourers, and the extent of the co-operation or the scale of production, depends on the extent of this concentration.

We saw in a former chapter, that a certain minimum amount of capital was necessary, in order that the number of labourers simultaneously employed, and, consequently, the amount of surplus-value produced, might suffice to liberate the employer himself from manual labour, to convert him from a small master into a capitalist, and thus formally to establish capitalist production. We now see that a certain minimum amount is a necessary condition for the conversion of numerous isolated and independent processes into one combined social process.

We also saw that at first, the subjection of labour to capital was only a formal result of the fact, that the labourer, instead of working for himself, works for and consequently under the capitalist. By the co-operation of numerous wage-labourers, the sway of capital develops into a requisite for carrying on the labour-process itself, into a real requisite of production. That a capitalist should command on the field of production, is now as indispensable as that a general should command on the field of battle.

All combined labour on a large scale requires, more or less, a directing authority, in order to secure the harmonious working of the individual activities, and to perform the general functions that have their origin in the action of the combined organism, as distinguished from the action of its separate organs. A single violin player is his own conductor; an orchestra requires a separate one. The work of directing, superintending, and adjusting, becomes one of the functions of capital, from the moment that the labour under the control of capital, becomes co-operative. Once a function of capital, it acquires special characteristics.

The directing motive, the end and aim of capitalist production, is to extract the greatest possible amount of surplus-value,<sup>14</sup> and consequently to exploit labour-power to the greatest possible extent. As the number of the co-operating labourers increases, so too does their resistance to the domination of capital, and with it, the necessity for capital to overcome this resistance by counterpressure. The control exercised by the capitalist is not only a special function, due to the nature of the social labour-process, and peculiar to that process, but it is, at the same time, a function of the exploitation of a social labour-process, and is consequently rooted in the unavoidable antagonism between the exploiter and the living and labouring raw material he exploits.

Again, in proportion to the increasing mass of the means of production, now no longer the property of the labourer, but of the capitalist, the necessity increases for some effective control over the proper application of those means.<sup>15</sup> Moreover, the co-operation of wage labourers is entirely brought about by the capital that employs them. Their union into one single productive body and the establishment of a connexion between their individual functions, are matters foreign and external to them, are not their own act, but the act of the capital that brings and keeps them together. Hence the connexion existing between their various labours appears to them, ideally, in the shape of a preconceived plan of the capitalist, and practically in the shape of the authority of the same capitalist, in the shape of the powerful will of another, who subjects their activity to his aims. If, then, the control of the capitalist is in substance two-fold by reason of the two-fold nature of the process of production itself, which, on the one hand, is a social process for producing use-values, on the other, a process for creating surplus-value in form that control is despotic. As co-operation extends its scale, this despotism takes forms peculiar to itself. Just as at

first the capitalist is relieved from actual labour so soon as his capital has reached that minimum amount with which capitalist production, as such, begins, so now, he hands over the work of direct and constant supervision of the individual workmen, and groups of workmen, to a special kind of wage-labourer. An industrial army of workmen, under the command of a capitalist, requires, like a real army, officers (managers), and sergeants (foremen, overlookers), who, while the work is being done, command in the name of the capitalist. The work of supervision becomes their established and exclusive function. When comparing the mode of production of isolated peasants and artisans with production by slave-labour, the political economist counts this labour of superintendence among the *faux frais* of production.<sup>16</sup> But, when considering the capitalist mode of production, he, on the contrary, treats the work of control made necessary by the co-operative character of the labour-process as identical with the different work of control, necessitated by the capitalist character of that process and the antagonism of interests between capitalist and labourer.<sup>17</sup> It is not because he is a leader of industry that a man is a capitalist; on the contrary, he is a leader of industry because he is a capitalist. The leadership of industry is an attribute of capital, just as in feudal times the functions of general and judge, were attributes of landed property.<sup>18</sup>

The labourer is the owner of his labour-power until he has done bargaining for its sale with the capitalist; and he can sell no more than what he has i.e., his individual, isolated labour-power. This state of things is in no way altered by the fact that the capitalist, instead of buying the labour-power of one man, buys that of 100, and enters into separate contracts with 100 unconnected men instead of with one. He is at liberty to set the 100 men to work, without letting them co-operate. He pays them the value of 100 independent labour-powers, but he does not pay for the combined labour-power of the hundred. Being independent of each other, the labourers are isolated persons, who enter into relations with the capitalist, but not with one another. This co-operation begins only with the labour-process, but they have then ceased to belong to themselves. On entering that process, they become incorporated with capital. As co-operators, as members of a working organism, they are but special modes of existence of capital. Hence, the productive power developed by the labourer when working in co-operation, is the productive power of capital. This power is developed gratuitously, whenever the workmen are placed under given conditions, and it is capital that places them under such conditions. Because this power costs capital nothing, and because, on the other hand, the labourer himself does not develop it before his labour belongs to capital, it appears as a power with which capital is endowed by Nature - a productive power that is immanent in capital.

The colossal effects of simple co-operation are to be seen in the gigantic structures of the ancient Asiatics, Egyptians, Etruscans, &c.

“It has happened in times past that these Oriental States, after supplying the expenses of their civil and military establishments, have found themselves in possession of a surplus which they could apply to works of magnificence or utility and in the construction of these their command over the hands and arms of almost the entire non-agricultural population has produced stupendous monuments which still indicate their power. The teeming valley of the Nile ... produced food for a swarming non-agricultural population, and this food, belonging to the monarch and the priesthood, afforded the means of erecting the mighty monuments which filled the land.... In moving the colossal statues and vast masses of which the transport creates wonder, human labour almost alone, was prodigally used.... The number of the labourers and the concentration of their efforts sufficed. We see mighty coral reefs rising from the depths of the ocean into islands and firm land,

yet each individual depositor is puny, weak, and contemptible. The non-agricultural labourers of an Asiatic monarchy have little but their individual bodily exertions to bring to the task, but their number is their strength, and the power of directing these masses gave rise to the palaces and temples, the pyramids, and the armies of gigantic statues of which the remains astonish and perplex us. It is that confinement of the revenues which feed them, to one or a few hands, which makes such undertakings possible.”<sup>19</sup>

This power of Asiatic and Egyptian kings, Etruscan theocrats, &c., has in modern society been transferred to the capitalist, whether he be an isolated, or as in joint-stock companies, a collective capitalist.

Co-operation, such as we find it at the dawn of human development, among races who live by the chase,<sup>20</sup> or, say, in the agriculture of Indian communities, is based, on the one hand, on ownership in common of the means of production, and on the other hand, on the fact, that in those cases, each individual has no more torn himself off from the navel-string of his tribe or community, than each bee has freed itself from connexion with the hive. Such co-operation is distinguished from capitalistic co-operation by both of the above characteristics. The sporadic application of co-operation on a large scale in ancient times, in the middle ages, and in modern colonies, reposes on relations of dominion and servitude, principally on slavery. The capitalistic form, on the contrary, pre-supposes from first to last, the free wage-labourer, who sells his labour-power to capital. Historically, however, this form is developed in opposition to peasant agriculture and to the carrying on of independent handicrafts whether in guilds or not.<sup>21</sup> From the standpoint of these, capitalistic co-operation does not manifest itself as a particular historical form of co-operation, but co-operation itself appears to be a historical form peculiar to, and specifically distinguishing, the capitalist process of production.

Just as the social productive power of labour that is developed by co-operation, appears to be the productive power of capital, so co-operation itself, contrasted with the process of production carried on by isolated independent labourers, or even by small employers, appears to be a specific form of the capitalist process of production. It is the first change experienced by the actual labour-process, when subjected to capital. This change takes place spontaneously. The simultaneous employment of a large number of wage-labourers, in one and the same process, which is a necessary condition of this change, also forms the starting-point of capitalist production. This point coincides with the birth of capital itself. If then, on the one hand, the capitalist mode of production presents itself to us historically, as a necessary condition to the transformation of the labour-process into a social process, so, on the other hand, this social form of the labour-process presents itself, as a method employed by capital for the more profitable exploitation of labour, by increasing that labour's productiveness.

In the elementary form, under which we have hitherto viewed it, co-operation is a necessary concomitant of all production on a large scale, but it does not, in itself, represent a fixed form characteristic of a particular epoch in the development of the capitalist mode of production. At the most it appears to do so, and that only approximately, in the handicraft-like beginnings of manufacture,<sup>22</sup> and in that kind of agriculture on a large scale, which corresponds to the epoch of manufacture, and is distinguished from peasant agriculture, mainly by the number of the labourers simultaneously employed, and by the mass of the means of production concentrated for their use. Simple co-operation is always the prevailing form, in those branches of production in which capital operates on a large scale, and division of labour and machinery play but a subordinate part.

Co-operation ever constitutes the fundamental form of the capitalist mode of production, nevertheless the elementary form of co-operation continues to subsist as a particular form of capitalist production side by side with the more developed forms of that mode of production.

---

<sup>1</sup> “Unquestionably, there is a good deal of difference between the value of one man’s labour and that of another from strength, dexterity, and honest application. But I am quite sure, from my best observation, that any given five men will, in their total, afford a proportion of labour equal to any other five within the periods of life I have stated; that is, that among such five men there will be one possessing all the qualifications of a good workman, one bad, and the other three middling, and approximating to the first, and the last. So that in so small a platoon as that of even five, you will find the full complement of all that five men can earn.” (E. Burke, 1. c., pp. 15, 16.) Compare Quételet on the average individual.

<sup>2</sup> Professor Roscher claims to have discovered that one needlewoman employed by Mrs. Roscher during two days, does more work than two needlewomen employed together during one day. The learned professor should not study the capitalist process of production in the nursery, nor under circumstances where the principal personage, the capitalist, is wanting.

<sup>3</sup> “Concours de forces.” (Destutt de Tracy, l.c., p. 80.)

<sup>4</sup> “There are numerous operations of so simple a kind as not to admit a division into parts, which cannot be performed without the co-operation of many pairs of hands. I would instance the lifting of a large tree on to a wain ... everything, in short, which cannot be done unless a great many pairs of hands help each other in the same undivided employment and at the same time.” (E. G. Wakefield: “A View of the Art of Colonisation.” London, 1849, p. 168.)

<sup>5</sup> “As one man cannot, and ten men must strain to lift a ton of weight, yet 100 men can do it only by the strength of a finger of each of them.” (John Betters: “Proposals for Raising a Colledge of Industry.” London, 1696, p. 21.)

<sup>6</sup> “There is also” (when the same number of men are employed by one farmer on 300 acres, instead of by ten farmers with 30 acres a piece) “an advantage in the proportion of servants, which will not so easily be understood but by practical men; for it is natural to say, as 1 is to 4, so are 3 to 12; but this will not hold good in practice; for in harvest time and many other operations which require that kind of despatch by the throwing many hands together, the work is better and more expeditiously done: f i. in harvest, 2 drivers, 2 loaders, 2 pitchers, 2 rakers, and the rest at the rick, or in the barn, will despatch double the work that the same number of hands would do if divided into different gangs on different farms.” (“An Inquiry into the Connexion between the Present Price of Provisions and the Size of Farms.” By a Farmer. London, 1773, pp. 7, 8.)

<sup>7</sup> Strictly, Aristotle’s definition is that man is by nature a town-citizen. This is quite as characteristic of ancient classical society as Franklin’s definition of man, as a tool-making animal, is characteristic of Yankeedom.

<sup>8</sup> “On doit encore remarquer que cette division partielle de travail peut se faire quand même les ouvriers sont occupés d’une même besogne. Des maçons par exemple, occupés à faire passer de mains en mains des briques à un échafaudage supérieur, font tous la même besogne, et pourtant il existe parmi eux une espèce de division de travail, qui consiste en ce que chacun d’eux fait passer la brique par un espace donné, et que tous ensemble la font parvenir beaucoup plus promptement à l’endroit marqué qu’ils ne le feraient si chacun d’eux portait sa brique séparément jusqu’à l’échafaudage supérieur.” [It should be noted further that this partial division of labour can occur even when the

workers are engaged in the same task. Masons, for example, engaged in passing bricks from hand to hand to a higher stage of the building, are all performing the same task, and yet there does exist amongst them a sort of division of labour. This consists in the fact that each of them passes the brick through a given space, and, taken together, they make it arrive much more quickly at the required spot than they would do if each of them carried his brick separately to the upper storey] (F. Skarbek: "Théorie des richesses sociales." Paris, 1839, t. I, pp. 97, 98.)

<sup>9</sup> "Est-il question d'exécuter un travail compliqué, plusieurs choses doivent être faites simultanément. L'un en fait une pendant que l'autre en fait une autre, et tous contribuent à l'effet qu'un seul homme n'aurait pu produire. L'un rame pendant que l'autre tient le gouvernail, et qu'un troisième jette le filet on harponne le poisson, et la pêche a un succès impossible sans ce concours." [Is it a question of undertaking a complex piece of labour? Many things must be done simultaneously. One person does one thing, while another does something else, and they all contribute to an effect that a single man would be unable to produce. One rows while the other holds the rudder, and a third casts the net or harpoons the fish; in this way fishing enjoys a success that would be impossible without this co-operation] (Destutt de Tracy, l.c.)

<sup>10</sup> "The doing of it (agricultural work) at the critical juncture is of so much the greater consequence." ("An Inquiry into the Connexion between the Present Price," &c., p. 9.) "In agriculture, there is no more important factor than that of time." (Liebig: "Ueber Theorie und Praxis in der Landwirtschaft." 1856, p. 23.)

<sup>11</sup> "The next evil is one which one would scarcely expect to find in a country which exports more labour than any other in the world, with the exception, perhaps, of China and England – the impossibility of procuring a sufficient number of hands to clean the cotton. The consequence of this is that large quantities of the crop are left unpicked, while another portion is gathered from the ground when it has fallen, and is of course discoloured and partially rotted, so that for want of labour at the proper season the cultivator is actually forced to submit to the loss of a large part of that crop for which England is so anxiously looking." ("Bengal Hurkaru." Bi-Monthly Overland Summary of News, 22nd July, 1861.)

<sup>12</sup> In the progress of culture "all, and perhaps more than all, the capital and labour which once loosely occupied 500 acres, are now concentrated for the more complete tillage of 100." Although "relatively to the amount of capital and labour employed, space is concentrated, it is an enlarged sphere of production, as compared to the sphere of production formerly occupied or worked upon by one single independent agent of production." (R. Jones: "An Essay on the Distribution of Wealth," part I. On Rent. London, 1831. p. 191.)

<sup>13</sup> "La forza di ciascuno uomo è minima, ma la riunione delle minime forze forma una forza totale maggiore anche della somma delle forze medesime fino a che le forze per essere riunite possono diminuire il tempo ed accrescere lo spazio della loro azione." (G. R. Carli, Note to P. Verri, l.c., t. xv., p. 196.)

<sup>14</sup> "Profits ... is the sole end of trade." (J. Vanderlint, l.c., p. 11.)

<sup>15</sup> That Philistine paper, the *Spectator*, states that after the introduction of a sort of partnership between capitalist and workmen in the "Wirework Company of Manchester," "the first result was a sudden decrease in waste, the men not seeing why they should waste their own property any more than any other master's, and waste is, perhaps, next to bad debts, the greatest source of manufacturing loss." The same paper finds that the main defect in the Rochdale co-operative experiments is this: "They showed that associations of workmen could manage shops, mills, and almost all forms of industry with success, and they immediately improved the condition of the men; but then they did not leave a clear place for masters." Quelle horreur!

---

<sup>16</sup> Professor Cairnes, after stating that the superintendence of labour is a leading feature of production by slaves in the Southern States of North America, continues: "The peasant proprietor (of the North), appropriating the whole produce of his toil, needs no other stimulus to exertion. Superintendence is here completely dispensed with." (Cairnes, *l.c.*, pp. 48, 49.)

<sup>17</sup> Sir James Steuart, a writer altogether remarkable for his quick eye for the characteristic social distinctions between different modes of production, says: "Why do large undertakings in the manufacturing way ruin private industry, but by coming nearer to the simplicity of slaves?" ("Prin. of Pol. Econ.," London, 1767, v. I., pp. 167, 168.)

<sup>18</sup> Auguste Comte and his school might therefore have shown that feudal lords are an eternal necessity in the same way that they have done in the case of the lords of capital.

<sup>19</sup> R. Jones. "Textbook of Lectures," &c., pp. 77, 78. The ancient Assyrian, Egyptian, and other collections in London, and in other European capitals, make us eye-witnesses of the modes of carrying on that co-operative labour.

<sup>20</sup> Linguet is improbably right, when in his "Théorie des Lois Civiles," he declares hunting to be the first form of co-operation, and man-hunting (war) one of the earliest forms of hunting.

<sup>21</sup> Peasant agriculture on a small scale, and the carrying on of independent handicrafts, which together form the basis of the feudal mode of production, and after the dissolution of that system, continue side by side with the capitalist mode, also form the economic foundation of the classical communities at their best, after the primitive form of ownership of land in common had disappeared, and before slavery had seized on production in earnest.

<sup>22</sup> "Whether the united skill, industry, and emulation of many together on the same work be not the way to advance it? And whether it had been otherwise possible for England, to have carried on her Woollen Manufacture to so great a perfection?" (Berkeley. "The Querist." London, 1751, p. 56, par. 521.)

# Chapter 14: Division of Labour and Manufacture

## Section 1: Two-Fold Origin of Manufacture

That co-operation which is based on division of labour, assumes its typical form in manufacture, and is the prevalent characteristic form of the capitalist process of production throughout the manufacturing period properly so called. That period, roughly speaking, extends from the middle of the 16th to the last third of the 18th century.

Manufacture takes its rise in two ways:

(1.) By the assemblage, in one workshop under the control of a single capitalist, of labourers belonging to various independent handicrafts, but through whose hands a given article must pass on its way to completion. A carriage, for example, was formerly the product of the labour of a great number of independent artificers, such as wheelwrights, harness-makers, tailors, locksmiths, upholsterers, turners, fringe-makers, glaziers, painters, polishers, gilders, &c. In the manufacture of carriages, however, all these different artificers are assembled in one building where they work into one another's hands. It is true that a carriage cannot be gilt before it has been made. But if a number of carriages are being made simultaneously, some may be in the hands of the gilders while others are going through an earlier process. So far, we are still in the domain of simple co-operation, which finds its materials ready to hand in the shape of men and things. But very soon an important change takes place. The tailor, the locksmith, and the other artificers, being now exclusively occupied in carriage-making, each gradually loses, through want of practice, the ability to carry on, to its full extent, his old handicraft. But, on the other hand, his activity now confined in one groove, assumes the form best adapted to the narrowed sphere of action. At first, carriage manufacture is a combination of various independent handicrafts. By degrees, it becomes the splitting up of carriage-making into its various detail processes, each of which crystallises into the exclusive function of a particular workman, the manufacture, as a whole, being carried on by the men in conjunction. In the same way, cloth manufacture, as also a whole series of other manufactures, arose by combining different handicrafts together under the control of a single capitalist.<sup>1</sup>

(2.) Manufacture also arises in a way exactly the reverse of this - namely, by one capitalist employing simultaneously in one workshop a number of artificers, who all do the same, or the same kind of work, such as making paper, type, or needles. This is co-operation in its most elementary form. Each of these artificers (with the help, perhaps, of one or two apprentices), makes the entire commodity, and he consequently performs in succession all the operations necessary for its production. He still works in his old handicraft-like way. But very soon external circumstances cause a different use to be made of the concentration of the workmen on one spot, and of the simultaneousness of their work. An increased quantity of the article has perhaps to be delivered within a given time. The work is therefore re-distributed. Instead of each man being allowed to perform all the various operations in succession, these operations are changed into disconnected, isolated ones, carried on side by side; each is assigned to a different artificer, and the whole of them together are performed simultaneously by the co-operating workmen. This accidental repartition gets repeated, develops advantages of its own, and gradually ossifies into a systematic division of labour. The commodity, from being the individual product of an independent artificer, becomes the social product of a union of artificers, each of whom performs one, and only one, of the constituent partial operations. The same operations which, in the case of a papermaker belonging to a German Guild, merged one into the other as the successive acts of one artificer, became in the Dutch paper manufacture so many partial operations carried on side

by side by numerous co-operating labourers. The needlemaker of the Nuremberg Guild was the cornerstone on which the English needle manufacture was raised. But while in Nuremberg that single artificer performed a series of perhaps 20 operations one after another, in England it was not long before there were 20 needlemakers side by side, each performing one alone of those 20 operations, and in consequence of further experience, each of those 20 operations was again split up, isolated, and made the exclusive function of a separate workman.

The mode in which manufacture arises, its growth out of handicrafts, is therefore two-fold. On the one hand, it arises from the union of various independent handicrafts, which become stripped of their independence and specialised to such an extent as to be reduced to mere supplementary partial processes in the production of one particular commodity. On the other hand, it arises from the co-operation of artificers of one handicraft; it splits up that particular handicraft into its various detail operations, isolating, and making these operations independent of one another up to the point where each becomes the exclusive function of a particular labourer. On the one hand, therefore, manufacture either introduces division of labour into a process of production, or further develops that division; on the other hand, it unites together handicrafts that were formerly separate. But whatever may have been its particular starting-point, its final form is invariably the same - a productive mechanism whose parts are human beings.

For a proper understanding of the division of labour in manufacture, it is essential that the following points be firmly grasped. First, the decomposition of a process of production into its various successive steps coincides, here, strictly with the resolution of a handicraft into its successive manual operations. Whether complex or simple, each operation has to be done by hand, retains the character of a handicraft, and is therefore dependent on the strength, skill, quickness, and sureness, of the individual workman in handling his tools. The handicraft continues to be the basis. This narrow technical basis excludes a really scientific analysis of any definite process of industrial production, since it is still a condition that each detail process gone through by the product must be capable of being done by hand and of forming, in its way, a separate handicraft. It is just because handicraft skill continues, in this way, to be the foundation of the process of production, that each workman becomes exclusively assigned to a partial function, and that for the rest of his life, his labour-power is turned into the organ of this detail function.

Secondly, this division of labour is a particular sort of co-operation, and many of its disadvantages spring from the general character of co-operation, and not from this particular form of it.

## **Section 2: The Detail Labourer and his Implements**

If we now go more into detail, it is, in the first place, clear that a labourer who all his life performs one and the same simple operation, converts his whole body into the automatic, specialised implement of that operation. Consequently, he takes less time in doing it, than the artificer who performs a whole series of operations in succession. But the collective labourer, who constitutes the living mechanism of manufacture, is made up solely of such specialised detail labourers. Hence, in comparison with the independent handicraft, more is produced in a given time, or the productive power of labour is increased.<sup>2</sup> Moreover, when once this fractional work is established as the exclusive function of one person, the methods it employs become perfected. The workman's continued repetition of the same simple act, and the concentration of his attention on it, teach him by experience how to attain the desired effect with the minimum of exertion. But since there are always several generations of labourers living at one time, and working together at

the manufacture of a given article, the technical skill, the tricks of the trade thus acquired, become established, and are accumulated and handed down.<sup>3</sup>

Manufacture, in fact, produces the skill of the detail labourer, by reproducing, and systematically driving to an extreme within the workshop, the naturally developed differentiation of trades which it found ready to hand in society at large. On the other hand, the conversion of fractional work into the life-calling of one man, corresponds to the tendency shown by earlier societies, to make trades hereditary; either to petrify them into castes, or whenever definite historical conditions beget in the individual a tendency to vary in a manner incompatible with the nature of castes, to ossify them into guilds. Castes and guilds arise from the action of the same natural law, that regulates the differentiation of plants and animals into species and varieties, except that, when a certain degree of development has been reached, the heredity of castes and the exclusiveness of guilds are ordained as a law of society.<sup>4</sup>

“The muslins of Dakka in fineness, the calicoes and other piece goods of Coromandel in brilliant and durable colours, have never been surpassed. Yet they are produced without capital, machinery, division of labour, or any of those means which give such facilities to the manufacturing interest of Europe. The weaver is merely a detached individual, working a web when ordered of a customer, and with a loom of the rudest construction, consisting sometimes of a few branches or bars of wood, put roughly together. There is even no expedient for rolling up the warp; the loom must therefore be kept stretched to its full length, and becomes so inconveniently large, that it cannot be contained within the hut of the manufacturer, who is therefore compelled to ply his trade in the open air, where it is interrupted by every vicissitude of the weather.”<sup>5</sup>

It is only the special skill accumulated from generation to generation, and transmitted from father to son, that gives to the Hindu, as it does to the spider, this proficiency. And yet the work of such a Hindu weaver is very complicated, compared with that of a manufacturing labourer.

An artificer, who performs one after another the various fractional operations in the production of a finished article, must at one time change his place, at another his tools. The transition from one operation to another interrupts the flow of his labour, and creates, so to say, gaps in his working day. These gaps close up so soon as he is tied to one and the same operation all day long; they vanish in proportion as the changes in his work diminish. The resulting increased productive power is owing either to an increased expenditure of labour-power in a given time i.e., to increased intensity of labour or to a decrease in the amount of labour-power unproductively consumed. The extra expenditure of power, demanded by every transition from rest to motion, is made up for by prolonging the duration of the normal velocity when once acquired. On the other hand, constant labour of one uniform kind disturbs the intensity and flow of a man's animal spirits, which find recreation and delight in mere change of activity.

The productiveness of labour depends not only on the proficiency of the workman, but on the perfection of his tools. Tools of the same kind, such as knives, drills, gimlets, hammers, &c., may be employed in different processes; and the same tool may serve various purposes in a single process. But so soon as the different operations of a labour-process are disconnected the one from the other, and each fractional operation acquires in the hands of the detail labourer a suitable and peculiar form, alterations become necessary in the implements that previously served more than one purpose. The direction taken by this change is determined by the difficulties experienced in consequence of the unchanged form of the implement. Manufacture is characterised by the differentiation of the instruments of labour - a differentiation whereby implements of a given sort acquire fixed shapes, adapted to each particular application, and by the specialisation of those

instruments, giving to each special implement its full play only in the hands of a specific detail labourer. In Birmingham alone 500 varieties of hammers are produced, and not only is each adapted to one particular process, but several varieties often serve exclusively for the different operations in one and the same process. The manufacturing period simplifies, improves, and multiplies the implements of labour, by adapting them to the exclusively special functions of each detail labourer.<sup>6</sup> It thus creates at the same time one of the material conditions for the existence of machinery, which consists of a combination of simple instruments.

The detail labourer and his implements are the simplest elements of manufacture. Let us now turn to its aspect as a whole.

### **Section 3: The Two Fundamental Forms of Manufacture: Heterogeneous Manufacture, Serial Manufacture**

The organisation of manufacture has two fundamental forms which, in spite of occasional blending, are essentially different in kind, and, moreover, play very distinct parts in the subsequent transformation of manufacture into modern industry carried on by machinery. This double character arises from the nature of the article produced. This article either results from the mere mechanical fitting together of partial products made independently, or owes its completed shape to a series of connected processes and manipulations.

A locomotive, for instance, consists of more than 5,000 independent parts. It cannot, however, serve as an example of the first kind of genuine manufacture, for it is a structure produced by modern mechanical industry. But a watch can; and William Petty used it to illustrate the division of labour in manufacture. Formerly the individual work of a Nuremberg artificer, the watch has been transformed into the social product of an immense number of detail labourers, such as mainspring makers, dial makers, spiral spring makers, jewelled hole makers, ruby lever makers, hand makers, case makers, screw makers, gilders, with numerous subdivisions, such as wheel makers (brass and steel separate), pin makers, movement makers, *acheveur de pignon* (fixes the wheels on the axles, polishes the facets, &c.), pivot makers, *planteur de finissage* (puts the wheels and springs in the works), *finisseur de barillet* (cuts teeth in the wheels, makes the holes of the right size, &c.), escapement makers, cylinder makers for cylinder escapements, escapement wheel makers, balance wheel makers, *raquette makers* (apparatus for regulating the watch), the *planteur d'échappement* (escapement maker proper); then the *repasseur de barillet* (finishes the box for the spring, &c.), steel polishers, wheel polishers, screw polishers, figure painters, dial enamellers (melt the enamel on the copper), *fabricant de pendants* (makes the ring by which the case is hung), *finisseur de charnière* (puts the brass hinge in the cover, &c.), *faiseur de secret* (puts in the springs that open the case), *graveur*, *ciseleur*, *polisseur de boîte*, &c., &c., and last of all the *repasseur*, who fits together the whole watch and hands it over in a going state. Only a few parts of the watch pass through several hands; and all these *membra disjecta* come together for the first time in the hand that binds them into one mechanical whole. This external relation between the finished product, and its various and diverse elements makes it, as well in this case as in the case of all similar finished articles, a matter of chance whether the detail labourers are brought together in one workshop or not. The detail operations may further be carried on like so many independent handicrafts, as they are in the Cantons of Vaud and Neuchâtel; while in Geneva there exist large watch manufactories where the detail labourers directly co-operate under the control of a single capitalist. And even in the latter case the dial, the springs, and the case, are seldom made in the factory itself. To carry on the trade as a manufacture, with concentration of workmen, is, in the watch trade, profitable only under exceptional conditions, because

competition is greater between the labourers who desire to work at home, and because the splitting up of the work into a number of heterogeneous processes, permits but little use of the instruments of labour in common, and the capitalist, by scattering the work, saves the outlay on workshops, &c.<sup>7</sup> Nevertheless the position of this detail labourer who, though he works at home, does so for a capitalist (manufacturer, *établisseur*), is very different from that of the independent artificer, who works for his own customers.<sup>8</sup>

The second kind of manufacture, its perfected form, produces articles that go through connected phases of development, through a series of processes step by step, like the wire in the manufacture of needles, which passes through the hands of 72 and sometimes even 92 different detail workmen.

In so far as such a manufacture, when first started, combines scattered handicrafts, it lessens the space by which the various phases of production are separated from each other. The time taken in passing from one stage to another is shortened, so is the labour that effectuates this passage.<sup>9</sup> In comparison with a handicraft, productive power is gained, and this gain is owing to the general co-operative character of manufacture. On the other hand, division of labour, which is the distinguishing principle of manufacture, requires the isolation of the various stages of production and their independence of each other. The establishment and maintenance of a connexion between the isolated functions necessitates the incessant transport of the article from one hand to another, and from one process to another. From the standpoint of modern mechanical industry, this necessity stands forth as a characteristic and costly disadvantage, and one that is immanent in the principle of manufacture.<sup>10</sup>

If we confine our attention to some particular lot of raw materials, of rags, for instance, in paper manufacture, or of wire in needle manufacture, we perceive that it passes in succession through a series of stages in the hands of the various detail workmen until completion. On the other hand, if we look at the workshop as a whole, we see the raw material in all the stages of its production at the same time. The collective labourer, with one set of his many hands armed with one kind of tools, draws the wire, with another set, armed with different tools, he, at the same time, straightens it, with another, he cuts it, with another, points it, and so on. The different detail processes, which were successive in time, have become simultaneous, go on side by side in space. Hence, production of a greater quantum of finished commodities in a given time.<sup>11</sup> This simultaneity, it is true, is due to the general co-operative form of the process as a whole; but Manufacture not only finds the conditions for co-operation ready to hand, it also, to some extent, creates them by the sub-division of handicraft labour. On the other hand, it accomplishes this social organisation of the labour-process only by riveting each labourer to a single fractional detail.

Since the fractional product of each detail labourer is, at the same time, only a particular stage in the development of one and the same finished article, each labourer, or each group of labourers, prepares the raw material for another labourer or group. The result of the labour of the one is the starting-point for the labour of the other. The one workman therefore gives occupation directly to the other. The labour-time necessary in each partial process, for attaining the desired effect, is learnt by experience; and the mechanism of Manufacture, as a whole, is based on the assumption that a given result will be obtained in a given time. It is only on this assumption that the various supplementary labour-processes can proceed uninterruptedly, simultaneously, and side by side. It is clear that this direct dependence of the operations, and therefore of the labourers, on each other, compels each one of them to spend on his work no more than the necessary time, and thus a continuity, uniformity, regularity, order,<sup>12</sup> and even intensity of labour, of quite a different kind, is begotten than is to be found in an independent handicraft or even in simple co-operation. The

rule, that the labour-time expended on a commodity should not exceed that which is socially necessary for its production, appears, in the production of commodities generally, to be established by the mere effect of competition; since, to express ourselves superficially, each single producer is obliged to sell his commodity at its market-price. In Manufacture, on the contrary, the turning out of a given quantum of product in a given time is a technical law of the process of production itself.<sup>13</sup>

Different operations take, however, unequal periods, and yield therefore, in equal times unequal quantities of fractional products. If, therefore, the same labourer has, day after day, to perform the same operation, there must be a different number of labourers for each operation; for instance, in type manufacture, there are four founders and two breakers to one rubber: the founder casts 2,000 type an hour, the breaker breaks up 4,000, and the rubber polishes 8,000. Here we have again the principle of co-operation in its simplest form, the simultaneous employment of many doing the same thing; only now, this principle is the expression of an organic relation. The division of labour, as carried out in Manufacture, not only simplifies and multiplies the qualitatively different parts of the social collective labourer, but also creates a fixed mathematical relation or ratio which regulates the quantitative extent of those parts i.e., the relative number of labourers, or the relative size of the group of labourers, for each detail operation. It develops, along with the qualitative sub-division of the social labour-process, a quantitative rule and proportionality for that process.

When once the most fitting proportion has been experimentally established for the numbers of the detail labourers in the various groups when producing on a given scale, that scale can be extended only by employing a multiple of each particular group.<sup>14</sup> There is this to boot, that the same individual can do certain kinds of work just as well on a large as on a small scale; for instance, the labour of superintendence, the carriage of the fractional product from one stage to the next, &c. The isolation of such functions, their allotment to a particular labourer, does not become advantageous till after an increase in the number of labourers employed; but this increase must affect every group proportionally.

The isolated group of labourers to whom any particular detail function is assigned, is made up of homogeneous elements, and is one of the constituent parts of the total mechanism. In many manufactures, however, the group itself is an organised body of labour, the total mechanism being a repetition or multiplication of these elementary organisms. Take, for instance, the manufacture of glass bottles. It may be resolved into three essentially different stages. First, the preliminary stage, consisting of the preparation of the components of the glass, mixing the sand and lime, &c., and melting them into a fluid mass of glass.<sup>15</sup> Various detail labourers are employed in this first stage, as also in the final one of removing the bottles from the drying furnace, sorting and packing them, &c. In the middle, between these two stages, comes the glass melting proper, the manipulation of the fluid mass. At each mouth of the furnace, there works a group, called "the hole," consisting of one bottlemaker or finisher, one blower, one gatherer, one putter-up or whetter-off, and one taker-in. These five detail workers are so many special organs of a single working organism that acts only as a whole, and therefore can operate only by the direct co-operation of the whole five. The whole body is paralysed if but one of its members be wanting. But a glass furnace has several openings (in England from 4 to 6), each of which contains an earthenware melting-pot full of molten glass, and employs a similar five-membered group of workers. The organisation of each group is based on division of labour, but the bond between the different groups is simple co-operation, which, by using in common one of the means of production, the furnace, causes it to be more economically consumed. Such a furnace, with its 4-6 groups, constitutes a glass house; and a glass manufactory comprises a number of

such glass houses, together with the apparatus and workmen requisite for the preparatory and final stages.

Finally, just as Manufacture arises in part from the combination of various handicrafts, so, too, it develops into a combination of various manufactures. The larger English glass manufacturers, for instance, make their own earthenware melting-pots, because, on the quality of these depends, to a great extent, the success or failure of the process. The manufacture of one of the means of production is here united with that of the product. On the other hand, the manufacture of the product may be united with other manufactures, of which that product is the raw material, or with the products of which it is itself subsequently mixed. Thus, we find the manufacture of flint glass combined with that of glass cutting and brass founding; the latter for the metal settings of various articles of glass. The various manufactures so combined form more or less separate departments of a larger manufacture, but are at the same time independent processes, each with its own division of labour. In spite of the many advantages offered by this combination of manufactures, it never grows into a complete technical system on its own foundation. That happens only on its transformation into an industry carried on by machinery.

Early in the manufacturing period, the principle of lessening the necessary labour-time in the production of commodities<sup>16</sup>, was accepted and formulated: and the use of machines, especially for certain simple first processes that have to be conducted on a very large scale, and with the application of great force, sprang up here and there. Thus, at an early period in paper manufacture, the tearing up of the rags was done by paper-mills; and in metal works, the pounding of the ores was effected by stamping mills.<sup>17</sup> The Roman Empire had handed down the elementary form of all machinery in the water-wheel.<sup>18</sup>

The handicraft period bequeathed to us the great inventions of the compass, of gunpowder, of type-printing, and of the automatic clock. But, on the whole, machinery played that subordinate part which Adam Smith assigns to it in comparison with division of labour.<sup>19</sup> The sporadic use of machinery in the 17th century was of the greatest importance, because it supplied the great mathematicians of that time with a practical basis and stimulant to the creation of the science of mechanics.

The collective labourer, formed by the combination of a number of detail labourers, is the machinery specially characteristic of the manufacturing period. The various operations that are performed in turns by the producer of a commodity, and coalesce one with another during the progress of production, lay claim to him in various ways. In one operation he must exert more strength, in another more skill, in another more attention; and the same individual does not possess all these qualities in an equal degree. After Manufacture has once separated, made independent, and isolated the various operations, the labourers are divided, classified, and grouped according to their predominating qualities. If their natural endowments are, on the one hand, the foundation on which the division of labour is built up, on the other hand, Manufacture, once introduced, develops in them new powers that are by nature fitted only for limited and special functions. The collective labourer now possesses, in an equal degree of excellence, all the qualities requisite for production, and expends them in the most economical manner, by exclusively employing all his organs, consisting of particular labourers, or groups of labourers, in performing their special functions.<sup>20</sup> The one-sidedness and the deficiencies of the detail labourer become perfections when he is a part of the collective labourer.<sup>21</sup> The habit of doing only one thing converts him into a never failing instrument, while his connexion with the whole mechanism compels him to work with the regularity of the parts of a machine.<sup>22</sup>

Since the collective labourer has functions, both simple and complex, both high and low, his members, the individual labour-powers, require different degrees of training, and must therefore

have different values. Manufacture, therefore, develops a hierarchy of labour-powers, to which there corresponds a scale of wages. If, on the one hand, the individual labourers are appropriated and annexed for life by a limited function; on the other hand, the various operations of the hierarchy are parcelled out among the labourers according to both their natural and their acquired capabilities.<sup>23</sup> Every process of production, however, requires certain simple manipulations, which every man is capable of doing. They too are now severed from their connexion with the more pregnant moments of activity, and ossified into exclusive functions of specially appointed labourers. Hence, Manufacture begets, in every handicraft that it seizes upon, a class of so-called unskilled labourers, a class which handicraft industry strictly excluded. If it develops a one-sided speciality into a perfection, at the expense of the whole of a man's working capacity, it also begins to make a speciality of the absence of all development. Alongside of the hierarchic gradation there steps the simple separation of the labourers into skilled and unskilled. For the latter, the cost of apprenticeship vanishes; for the former, it diminishes, compared with that of artificers, in consequence of the functions being simplified. In both cases the value of labour-power falls.<sup>24</sup> An exception to this law holds good whenever the decomposition of the labour-process begets new and comprehensive functions, that either had no place at all, or only a very modest one, in handicrafts. The fall in the value of labour-power, caused by the disappearance or diminution of the expenses of apprenticeship, implies a direct increase of surplus-value for the benefit of capital; for everything that shortens the necessary labour-time required for the reproduction of labour-power, extends the domain of surplus labour.

#### **Section 4: Division of Labour in Manufacture, and Division of Labour in Society**

We first considered the origin of Manufacture, then its simple elements, then the detail labourer and his implements, and finally, the totality of the mechanism. We shall now lightly touch upon the relation between the division of labour in manufacture, and the social division of labour, which forms the foundation of all production of commodities.

If we keep labour alone in view, we may designate the separation of social production into its main divisions or *genera* – viz., agriculture, industries, &c., as division of labour in general, and the splitting up of these families into species and sub-species, as division of labour in particular, and the division of labour within the workshop as division of labour in singular or in detail.<sup>25</sup>

Division of labour in a society, and the corresponding tying down of individuals to a particular calling, develops itself, just as does the division of labour in manufacture, from opposite starting-points. Within a family,<sup>26</sup> and after further development within a tribe, there springs up naturally a division of labour, caused by differences of sex and age, a division that is consequently based on a purely physiological foundation, which division enlarges its materials by the expansion of the community, by the increase of population, and more especially, by the conflicts between different tribes, and the subjugation of one tribe by another. On the other hand, as I have before remarked, the exchange of products springs up at the points where different families, tribes, communities, come in contact; for, in the beginning of civilisation, it is not private individuals but families, tribes, &c., that meet on an independent footing. Different communities find different means of production, and different means of subsistence in their natural environment. Hence, their modes of production, and of living, and their products are different. It is this spontaneously developed difference which, when different communities come in contact, calls forth the mutual exchange of products, and the consequent gradual conversion of those products into commodities. Exchange does not create the differences between the spheres of production, but brings what are

already different into relation, and thus converts them into more or less inter-dependent branches of the collective production of an enlarged society. In the latter case, the social division of labour arises from the exchange between spheres of production, that are originally distinct and independent of one another. In the former, where the physiological division of labour is the starting-point, the particular organs of a compact whole grow loose, and break off, principally owing to the exchange of commodities with foreign communities, and then isolate themselves so far, that the sole bond, still connecting the various kinds of work, is the exchange of the products as commodities. In the one case, it is the making dependent what was before independent; in the other case, the making independent what was before dependent.

The foundation of every division of labour that is well developed, and brought about by the exchange of commodities, is the separation between town and country.<sup>27</sup> It may be said, that the whole economic history of society is summed up in the movement of this antithesis. We pass it over, however, for the present.

Just as a certain number of simultaneously employed labourers are the material pre-requisites for division of labour in manufacture, so are the number and density of the population, which here correspond to the agglomeration in one workshop, a necessary condition for the division of labour in society.<sup>28</sup> Nevertheless, this density is more or less relative. A relatively thinly populated country, with well-developed means of communication, has a denser population than a more numerous country, with badly-developed means of communication; and in this sense the Northern States of the American Union, for instance, are more thickly populated than India.<sup>29</sup>

Since the production and the circulation of commodities are the general pre-requisites of the capitalist mode of production, division of labour in manufacture demands, that division of labour in society at large should previously have attained a certain degree of development. Inversely, the former division reacts upon and develops and multiplies the latter. Simultaneously, with the differentiation of the instruments of labour, the industries that produce these instruments, become more and more differentiated.<sup>30</sup> If the manufacturing system seize upon an industry, which, previously, was carried on in connexion with others, either as a chief or as a subordinate industry, and by one producer, these industries immediately separate their connexion, and become independent. If it seize upon a particular stage in the production of a commodity, the other stages of its production become converted into so many independent industries. It has already been stated, that where the finished article consists merely of a number of parts fitted together, the detail operations may re-establish themselves as genuine and separate handicrafts. In order to carry out more perfectly the division of labour in manufacture, a single branch of production is, according to the varieties of its raw material, or the various forms that one and the same raw material may assume, split up into numerous, and to some extent, entirely new manufactures. Accordingly, in France alone, in the first half of the 18th century, over 100 different kinds of silk stuffs were woven, and, in Avignon, it was law, that "every apprentice should devote himself to only one sort of fabrication, and should not learn the preparation of several kinds of stuff at once." The territorial division of labour, which confines special branches of production to special districts of a country, acquires fresh stimulus from the manufacturing system, which exploits every special advantage.<sup>31</sup> The Colonial system and the opening out of the markets of the world, both of which are included in the general conditions of existence of the manufacturing period, furnish rich material for developing the division of labour in society. It is not the place, here, to go on to show how division of labour seizes upon, not only the economic, but every other sphere of society, and everywhere lays the foundation of that all engrossing system of specialising and sorting men, that development in a man of one single faculty at the expense of all other faculties,

which caused A. Ferguson, the master of Adam Smith, to exclaim: “We make a nation of Helots, and have no free citizens.”<sup>32</sup>

But, in spite of the numerous analogies and links connecting them, division of labour in the interior of a society, and that in the interior of a workshop, differ not only in degree, but also in kind. The analogy appears most indisputable where there is an invisible bond uniting the various branches of trade. For instance the cattle-breeder produces hides, the tanner makes the hides into leather, and the shoemaker, the leather into boots. Here the thing produced by each of them is but a step towards the final form, which is the product of all their labours combined. There are, besides, all the various industries that supply the cattle-breeder, the tanner, and the shoemaker with the means of production. Now it is quite possible to imagine, with Adam Smith, that the difference between the above social division of labour, and the division in manufacture, is merely subjective, exists merely for the observer, who, in a manufacture, can see with one glance, all the numerous operations being performed on one spot, while in the instance given above, the spreading out of the work over great areas, and the great number of people employed in each branch of labour, obscure the connexion.<sup>33</sup> But what is it that forms the bond between the independent labours of the cattle-breeder, the tanner, and the shoemaker? It is the fact that their respective products are commodities. What, on the other hand, characterises division of labour in manufactures? The fact that the detail labourer produces no commodities.<sup>34</sup> It is only the common product of all the detail labourers that becomes a commodity.<sup>35</sup> Division of labour in society is brought about by the purchase and sale of the products of different branches of industry, while the connexion between the detail operations in a workshop, is due to the sale of the labour-power of several workmen to one capitalist, who applies it as combined labour-power. The division of labour in the workshop implies concentration of the means of production in the hands of one capitalist; the division of labour in society implies their dispersion among many independent producers of commodities. While within the workshop, the iron law of proportionality subjects definite numbers of workmen to definite functions, in the society outside the workshop, chance and caprice have full play in distributing the producers and their means of production among the various branches of industry. The different spheres of production, it is true, constantly tend to an equilibrium: for, on the one hand, while each producer of a commodity is bound to produce a use-value, to satisfy a particular social want, and while the extent of these wants differs quantitatively, still there exists an inner relation which settles their proportions into a regular system, and that system one of spontaneous growth; and, on the other hand, the law of the value of commodities ultimately determines how much of its disposable working-time society can expend on each particular class of commodities. But this constant tendency to equilibrium, of the various spheres of production, is exercised, only in the shape of a reaction against the constant upsetting of this equilibrium. The *a priori* system on which the division of labour, within the workshop, is regularly carried out, becomes in the division of labour within the society, an *a posteriori*, nature-imposed necessity, controlling the lawless caprice of the producers, and perceptible in the barometrical fluctuations of the market-prices. Division of labour within the workshop implies the undisputed authority of the capitalist over men, that are but parts of a mechanism that belongs to him. The division of labour within the society brings into contact independent commodity-producers, who acknowledge no other authority but that of competition, of the coercion exerted by the pressure of their mutual interests; just as in the animal kingdom, the *bellum omnium contra omnes* [war of all against all – Hobbes] more or less preserves the conditions of existence of every species. The same bourgeois mind which praises division of labour in the workshop, life-long annexation of the labourer to a partial operation, and his complete subjection to capital, as being an organisation of labour that increases its productiveness - that same bourgeois mind denounces with equal vigour every conscious attempt to socially control and regulate the process

of production, as an inroad upon such sacred things as the rights of property, freedom and unrestricted play for the bent of the individual capitalist. It is very characteristic that the enthusiastic apologists of the factory system have nothing more damning to urge against a general organisation of the labour of society, than that it would turn all society into one immense factory.

If, in a society with capitalist production, anarchy in the social division of labour and despotism in that of the workshop are mutual conditions the one of the other, we find, on the contrary, in those earlier forms of society in which the separation of trades has been spontaneously developed, then crystallised, and finally made permanent by law, on the one hand, a specimen of the organisation of the labour of society, in accordance with an approved and authoritative plan, and on the other, the entire exclusion of division of labour in the workshop, or at all events a mere dwarflike or sporadic and accidental development of the same.<sup>36</sup>

Those small and extremely ancient Indian communities, some of which have continued down to this day, are based on possession in common of the land, on the blending of agriculture and handicrafts, and on an unalterable division of labour, which serves, whenever a new community is started, as a plan and scheme ready cut and dried. Occupying areas of from 100 up to several thousand acres, each forms a compact whole producing all it requires. The chief part of the products is destined for direct use by the community itself, and does not take the form of a commodity. Hence, production here is independent of that division of labour brought about, in Indian society as a whole, by means of the exchange of commodities. It is the surplus alone that becomes a commodity, and a portion of even that, not until it has reached the hands of the State, into whose hands from time immemorial a certain quantity of these products has found its way in the shape of rent in kind. The constitution of these communities varies in different parts of India. In those of the simplest form, the land is tilled in common, and the produce divided among the members. At the same time, spinning and weaving are carried on in each family as subsidiary industries. Side by side with the masses thus occupied with one and the same work, we find the "chief inhabitant," who is judge, police, and tax-gatherer in one; the book-keeper, who keeps the accounts of the tillage and registers everything relating thereto; another official, who prosecutes criminals, protects strangers travelling through and escorts them to the next village; the boundary man, who guards the boundaries against neighbouring communities; the water-overseer, who distributes the water from the common tanks for irrigation; the Brahmin, who conducts the religious services; the schoolmaster, who on the sand teaches the children reading and writing; the calendar-Brahmin, or astrologer, who makes known the lucky or unlucky days for seed-time and harvest, and for every other kind of agricultural work; a smith and a carpenter, who make and repair all the agricultural implements; the potter, who makes all the pottery of the village; the barber, the washerman, who washes clothes, the silversmith, here and there the poet, who in some communities replaces the silversmith, in others the schoolmaster. This dozen of individuals is maintained at the expense of the whole community. If the population increases, a new community is founded, on the pattern of the old one, on unoccupied land. The whole mechanism discloses a systematic division of labour; but a division like that in manufactures is impossible, since the smith and the carpenter, &c., find an unchanging market, and at the most there occur, according to the sizes of the villages, two or three of each, instead of one.<sup>37</sup> The law that regulates the division of labour in the community acts with the irresistible authority of a law of Nature, at the same time that each individual artificer, the smith, the carpenter, and so on, conducts in his workshop all the operations of his handicraft in the traditional way, but independently, and without recognising any authority over him. The simplicity of the organisation for production in these self-sufficing communities that constantly reproduce themselves in the same form, and when accidentally destroyed, spring up again on the spot and with the same name<sup>38</sup> - this

simplicity supplies the key to the secret of the unchangeableness of Asiatic societies, an unchangeableness in such striking contrast with the constant dissolution and refounding of Asiatic States, and the never-ceasing changes of dynasty. The structure of the economic elements of society remains untouched by the storm-clouds of the political sky.

The rules of the guilds, as I have said before, by limiting most strictly the number of apprentices and journeymen that a single master could employ, prevented him from becoming a capitalist. Moreover, he could not employ his journeymen in many other handicrafts than the one in which he was a master. The guilds zealously repelled every encroachment by the capital of merchants, the only form of free capital with which they came in contact. A merchant could buy every kind of commodity, but labour as a commodity he could not buy. He existed only on sufferance, as a dealer in the products of the handicrafts. If circumstances called for a further division of labour, the existing guilds split themselves up into varieties, or founded new guilds by the side of the old ones; all this, however, without concentrating various handicrafts in a single workshop. Hence, the guild organisation, however much it may have contributed by separating, isolating, and perfecting the handicrafts, to create the material conditions for the existence of manufacture, excluded division of labour in the workshop. On the whole, the labourer and his means of production remained closely united, like the snail with its shell, and thus there was wanting the principal basis of manufacture, the separation of the labourer from his means of production, and the conversion of these means into capital.

While division of labour in society at large, whether such division be brought about or not by exchange of commodities, is common to economic formations of society the most diverse, division of labour in the workshop, as practised by manufacture, is a special creation of the capitalist mode of production alone.

## Section 5: The Capitalistic Character of Manufacture

An increased number of labourers under the control of one capitalist is the natural starting-point, as well of co-operation generally, as of manufacture in particular. But the division of labour in manufacture makes this increase in the number of workmen a technical necessity. The minimum number that any given capitalist is bound to employ is here prescribed by the previously established division of labour. On the other hand, the advantages of further division are obtainable only by adding to the number of workmen, and this can be done only by adding multiples of the various detail groups. But an increase in the variable component of the capital employed necessitates an increase in its constant component, too, in the workshops, implements, &c., and, in particular, in the raw material, the call for which grows quicker than the number of workmen. The quantity of it consumed in a given time, by a given amount of labour, increases in the same ratio as does the productive power of that labour in consequence of its division. Hence, it is a law, based on the very nature of manufacture, that the minimum amount of capital, which is bound to be in the hands of each capitalist, must keep increasing; in other words, that the transformation into capital of the social means of production and subsistence must keep extending.<sup>39</sup>

In manufacture, as well as in simple co-operation, the collective working organism is a form of existence of capital. The mechanism that is made up of numerous individual detail labourers belongs to the capitalist. Hence, the productive power resulting from a combination of labours appears to be the productive power of capital. Manufacture proper not only subjects the previously independent workman to the discipline and command of capital, but, in addition, creates a hierarchic gradation of the workmen themselves. While simple co-operation leaves the mode of working by the individual for the most part unchanged, manufacture thoroughly

revolutionises it, and seizes labour-power by its very roots. It converts the labourer into a crippled monstrosity, by forcing his detail dexterity at the expense of a world of productive capabilities and instincts; just as in the States of La Plata they butcher a whole beast for the sake of his hide or his tallow. Not only is the detail work distributed to the different individuals, but the individual himself is made the automatic motor of a fractional operation,<sup>40</sup> and the absurd fable of Menenius Agrippa, which makes man a mere fragment of his own body, becomes realised.<sup>41</sup> If, at first, the workman sells his labour-power to capital, because the material means of producing a commodity fail him, now his very labour-power refuses its services unless it has been sold to capital. Its functions can be exercised only in an environment that exists in the workshop of the capitalist after the sale. By nature unfitted to make anything independently, the manufacturing labourer develops productive activity as a mere appendage of the capitalist's workshop.<sup>42</sup> As the chosen people bore in their features the sign manual of Jehovah, so division of labour brands the manufacturing workman as the property of capital.

The knowledge, the judgement, and the will, which, though in ever so small a degree, are practised by the independent peasant or handicraftsman, in the same way as the savage makes the whole art of war consist in the exercise of his personal cunning these faculties are now required only for the workshop as a whole. Intelligence in production expands in one direction, because it vanishes in many others. What is lost by the detail labourers, is concentrated in the capital that employs them.<sup>43</sup> It is a result of the division of labour in manufactures, that the labourer is brought face to face with the intellectual potencies of the material process of production, as the property of another, and as a ruling power. This separation begins in simple co-operation, where the capitalist represents to the single workman, the oneness and the will of the associated labour. It is developed in manufacture which cuts down the labourer into a detail labourer. It is completed in modern industry, which makes science a productive force distinct from labour and presses it into the service of capital.<sup>44</sup>

In manufacture, in order to make the collective labourer, and through him capital, rich in social productive power, each labourer must be made poor in individual productive powers.

“Ignorance is the mother of industry as well as of superstition. Reflection and fancy are subject to err; but a habit of moving the hand or the foot is independent of either. Manufactures, accordingly, prosper most where the mind is least consulted, and where the workshop may ... be considered as an engine, the parts of which are men.”<sup>45</sup>

As a matter of fact, some few manufacturers in the middle of the 18th century preferred, for certain operations that were trade secrets, to employ half-idiotic persons.<sup>46</sup>

“The understandings of the greater part of men,” says Adam Smith, “are necessarily formed by their ordinary employments. The man whose whole life is spent in performing a few simple operations ... has no occasion to exert his understanding... He generally becomes as stupid and ignorant as it is possible for a human creature to become.”

After describing the stupidity of the detail labourer he goes on:

“The uniformity of his stationary life naturally corrupts the courage of his mind... It corrupts even the activity of his body and renders him incapable of exerting his strength with vigour and perseverance in any other employments than that to which he has been bred. His dexterity at his own particular trade seems in this manner to be acquired at the expense of his intellectual, social, and martial

virtues. But in every improved and civilised society, this is the state into which the labouring poor, that is, the great body of the people, must necessarily fall."<sup>47</sup>

For preventing the complete deterioration of the great mass of the people by division of labour, A. Smith recommends education of the people by the State, but prudently, and in homeopathic doses. G. Garnier, his French translator and commentator, who, under the first French Empire, quite naturally developed into a senator, quite as naturally opposes him on this point. Education of the masses, he urges, violates the first law of the division of labour, and with it

“our whole social system would be proscribed.” “Like all other divisions of labour,” he says, “that between hand labour and head labour<sup>48</sup> is more pronounced and decided in proportion as society (he rightly uses this word, for capital, landed property and their State) becomes richer. This division of labour, like every other, is an effect of past, and a cause of future progress... ought the government then to work in opposition to this division of labour, and to hinder its natural course? Ought it to expend a part of the public money in the attempt to confound and blend together two classes of labour, which are striving after division and separation?”<sup>49</sup>

Some crippling of body and mind is inseparable even from division of labour in society as a whole. Since, however, manufacture carries this social separation of branches of labour much further, and also, by its peculiar division, attacks the individual at the very roots of his life<sup>50</sup>, it is the first to afford the materials for, and to give a start to, industrial pathology.

“To subdivide a man is to execute him, if he deserves the sentence, to assassinate him if he does not... The subdivision of labour is the assassination of a people.”<sup>51</sup>

Co-operation based on division of labour, in other words, manufacture, commences as a spontaneous formation. So soon as it attains some consistence and extension, it becomes the recognised methodical and systematic form of capitalist production. History shows how the division of labour peculiar to manufacture, strictly so called, acquires the best adapted form at first by experience, as it were behind the backs of the actors, and then, like the guild handicrafts, strives to hold fast that form when once found, and here and there succeeds in keeping it for centuries. Any alteration in this form, except in trivial matters, is solely owing to a revolution in the instruments of labour. Modern manufacture wherever it arises - I do not here allude to modern industry based on machinery - either finds the *disjecta membra poetae* ready to hand, and only waiting to be collected together, as is the case in the manufacture of clothes in large towns, or it can easily apply the principle of division, simply by exclusively assigning the various operations of a handicraft (such as book-binding) to particular men. In such cases, a week's experience is enough to determine the proportion between the numbers of the hands necessary for the various functions.<sup>52</sup>

By decomposition of handicrafts, by specialisation of the instruments of labour, by the formation of detail labourers, and by grouping and combining the latter into a single mechanism, division of labour in manufacture creates a qualitative gradation, and a quantitative proportion in the social process of production; it consequently creates a definite organisation of the labour of society, and thereby develops at the same time new productive forces in the society. In its specific capitalist form - and under the given conditions, it could take no other form than a capitalistic one - manufacture is but a particular method of begetting relative surplus-value, or of augmenting at the expense of the labourer the self-expansion of capital - usually called social wealth, “Wealth of Nations,” &c. It increases the social productive power of labour, not only for the benefit of the capitalist instead of for that of the labourer, but it does this by crippling the individual labourers. It creates new conditions for the lordship of capital over labour. If, therefore, on the one hand, it

presents itself historically as a progress and as a necessary phase in the economic development of society, on the other hand, it is a refined and civilised method of exploitation.

Political Economy, which as an independent science, first sprang into being during the period of manufacture, views the social division of labour only from the standpoint of manufacture,<sup>53</sup> and sees in it only the means of producing more commodities with a given quantity of labour, and, consequently, of cheapening commodities and hurrying on the accumulation of capital. In most striking contrast with this accentuation of quantity and exchange-value, is the attitude of the writers of classical antiquity, who hold exclusively by quality and use-value.<sup>54</sup> In consequence of the separation of the social branches of production, commodities are better made, the various bents and talents of men select a suitable field,<sup>55</sup> and without some restraint no important results can be obtained anywhere.<sup>56</sup> Hence both product and producer are improved by division of labour. If the growth of the quantity produced is occasionally mentioned, this is only done with reference to the greater abundance of use-values. There is not a word alluding to exchange-value or to the cheapening of commodities. This aspect, from the standpoint of use-value alone, is taken as well by Plato,<sup>57</sup> who treats division of labour as the foundation on which the division of society into classes is based, as by Xenophon<sup>58</sup>, who with characteristic bourgeois instinct, approaches more nearly to division of labour within the workshop. Plato's Republic, in so far as division of labour is treated in it, as the formative principle of the State, is merely the Athenian idealisation of the Egyptian system of castes, Egypt having served as the model of an industrial country to many of his contemporaries also, amongst others to Isocrates,<sup>59</sup> and it continued to have this importance to the Greeks of the Roman Empire.<sup>60</sup>

During the manufacturing period proper, i.e., the period during which manufacture is the predominant form taken by capitalist production, many obstacles are opposed to the full development of the peculiar tendencies of manufacture. Although manufacture creates, as we have already seen, a simple separation of the labourers into skilled and unskilled, simultaneously with their hierarchic arrangement in classes, yet the number of the unskilled labourers, owing to the preponderating influence of the skilled, remains very limited. Although it adapts the detail operations to the various degrees of maturity, strength, and development of the living instruments of labour, thus conducing to exploitation of women and children, yet this tendency as a whole is wrecked on the habits and the resistance of the male labourers. Although the splitting up of handicrafts lowers the cost of forming the workman, and thereby lowers his value, yet for the more difficult detail work, a longer apprenticeship is necessary, and, even where it would be superfluous, is jealously insisted upon by the workmen. In England, for instance, we find the laws of apprenticeship, with their seven years' probation, in full force down to the end of the manufacturing period; and they are not thrown on one side till the advent of Modern Industry. Since handicraft skill is the foundation of manufacture, and since the mechanism of manufacture as a whole possesses no framework, apart from the labourers themselves, capital is constantly compelled to wrestle with the insubordination of the workmen.

“By the infirmity of human nature,” says friend Ure, “it happens that the more skilful the workman, the more self-willed and intractable he is apt to become, and of course the less fit a component of a mechanical system in which ... he may do great damage to the whole”<sup>61</sup>

Hence throughout the whole manufacturing period there runs the complaint of want of discipline among the workmen<sup>62</sup>. And had we not the testimony of contemporary writers, the simple facts, that during the period between the 16th century and the epoch of Modern Industry, capital failed to become the master of the whole disposable working-time of the manufacturing labourers, that manufactures are short-lived, and change their locality from one country to another with the

emigrating or immigrating workmen, these facts would speak volumes. "Order must in one way or another be established," exclaims in 1770 the oft-cited author of the "Essay on Trade and Commerce." "Order," re-echoes Dr. Andrew Ure 66 years later, "Order" was wanting in manufacture based on "the scholastic dogma of division of labour," and "Arkwright created order."

At the same time manufacture was unable, either to seize upon the production of society to its full extent, or to revolutionise that production to its very core. It towered up as an economic work of art, on the broad foundation of the town handicrafts, and of the rural domestic industries. At a given stage in its development, the narrow technical basis on which manufacture rested, came into conflict with requirements of production that were created by manufacture itself.

One of its most finished creations was the workshop for the production of the instruments of labour themselves, including especially the complicated mechanical apparatus then already employed.

A machine-factory, says Ure, "displayed the division of labour in manifold gradations - the file, the drill, the lathe, having each its different workman in the order of skill." (P. 21.)

This workshop, the product of the division of labour in manufacture, produced in its turn - machines. It is they that sweep away the handicraftsman's work as the regulating principle of social production. Thus, on the one hand, the technical reason for the life-long annexation of the workman to a detail function is removed. On the other hand, the fetters that this same principle laid on the dominion of capital, fall away.

---

<sup>1</sup> To give a more modern instance: The silk spinning and weaving of Lyon and Nîmes "est toute patriarcale; elle emploie beaucoup de femmes et d'enfants, mais sans les épuiser ni les corrompre; elle les laisse dans leur belles valises de la Drôme, du Var, de l'Isère, de Vaucluse, pour y élever des vers et dévider leurs cocons; jamais elle n'entre dans une véritable fabrique. Pour être aussi bien observé ... le principe de la division du travail s'y revêt d'un caractère spécial. Il y a bien des dévideuses, des moulineurs, des teinturiers, des encolleurs, puis des tisserands; mais ils ne sont pas réunis dans un même établissement, ne dépendent pas d'un même maître, tous ils sont indépendants" [... is entirely patriarchal; it employs a large number of women and children, but without exhausting or ruining them; it allows them to stay in their beautiful valleys of the Drôme, the Var, the Isère, the Vaucluse, cultivating their silkworms and unwinding their cocoons; it never becomes a true factory industry. However, the principle of the division of labour takes on a special character here. There do indeed exist winders, throwsters, dyers, sizers, and finally weavers; but they are not assembled in the same workshop, nor are they dependent on a single master; they are all independent] (A. Blanqui: "Cours, d'Econ. Industrielle." Recueilli par A. Blaise. Paris, 1838-39, p. 79.) Since Blanqui wrote this, the various independent labourers have, to some extent, been united in factories. [And since Marx wrote the above, the power-loom has invaded these factories, and is now 1886 rapidly superseding the hand-loom. (Added in the 4th German edition. The Krefeld silk industry also has its tale to tell anent this subject.) F. E.]

<sup>2</sup> "The more any manufacture of much variety shall be distributed and assigned to different artists, the same must needs be better done and with greater expedition, with less loss of time and labour." ("The Advantages of the East India Trade," Lond., 1720, p. 71.)

<sup>3</sup> "Easy labour is transmitted skill." (Th. Hodgskin, "Popular Political Economy," p. 48.)

<sup>4</sup> "The arts also have ... in Egypt reached the requisite degree of perfection. For it is the only country where artificers may not in any way meddle with the affairs of another class of citizens, but must follow that calling alone which by law is hereditary in their clan.... In other countries it is found that

tradesmen divide their attention between too many objects. At one time they try agriculture, at another they take to commerce, at another they busy themselves with two or three occupations at once. In free countries, they mostly frequent the assemblies of the people.... In Egypt, on the contrary, every artificer is severely punished if he meddles with affairs of State, or carries on several trades at once. Thus there is nothing to disturb their application to their calling.... Moreover, since, they inherit from their forefathers numerous rules, they are eager to discover fresh advantages” (Diodorus Siculus: *Bibl. Hist. I. 1. c.*, 74.)

<sup>5</sup> “Historical and descriptive account of Brit. India, &c.,” by Hugh Murray and James Wilson, &c., Edinburgh 1832, v. II., p. 449. The Indian loom is upright, i.e., the warp is stretched vertically.

<sup>6</sup> Darwin in his epoch-making work on the origin of species, remarks, with reference to the natural organs of plants and animals: “So long as one and the same organ has different kinds of work to perform, a ground for its changeability may possibly be found in this, that natural selection preserves or suppresses each small variation of form less carefully than if that organ were destined for one special purpose alone. Thus, knives that are adapted to cut all sorts of things, may, on the whole, be of one shape; but an implement destined to be used exclusively in one way must have a different shape for every different use.”

<sup>7</sup> In the year 1854 Geneva produced 80,000 watches, which is not one-fifth of the production in the Canton of Neuchâtel. La Chaux-de-Fond alone, which we may look upon as a huge watch manufactory, produces yearly twice as many as Geneva. From 1850-61 Geneva produced 720,000 watches. See “Report from Geneva on the Watch Trade” in “Reports by H. M.’s Secretaries of Embassy and Legation on the Manufactures, Commerce, &c., No. 6, 1863.” The want of connexion alone, between the processes into which the production of articles that merely consist of parts fitted together is split up, makes it very difficult to convert such a manufacture into a branch of modern industry carried on by machinery; but in the case of a watch there are two other impediments in addition, the minuteness and delicacy of its parts, and its character as an article of luxury. Hence their variety, which is such, that in the best London houses scarcely a dozen watches are made alike in the course of a year. The watch manufactory of Messrs. Vacheron & Constantin, in which machinery has been employed with success, produces at the most three or four different varieties of size and form.

<sup>8</sup> In watchmaking, that classical example of heterogeneous manufacture, we may study with great accuracy the above-mentioned differentiation and specialisation of the instruments of labour caused by the sub-division of handicrafts.

<sup>9</sup> “In so close a cohabitation of the people, the carriage must needs be less.” (“The Advantages of the East India Trade,” p. 106.)

<sup>10</sup> “The isolation of the different stages of manufacture, consequent upon the employment of manual labour, adds immensely to the cost of production, the loss mainly arising from the mere removals from one process to another.” (“The Industry of Nations.” Lond., 1855, Part II, p. 200.)

<sup>11</sup> “It (the division of labour) produces also an economy of time by separating the work into its different branches, all of which may be carried on into execution at the same moment.... By carrying on all the different processes at once, which an individual must have executed separately, it becomes possible to produce a multitude of pins completely finished in the same time as a single pin might have been either cut or pointed.” (Dugald Stewart, *l.c.*, p. 319.)

<sup>12</sup> “The more variety of artists to every manufacture... the greater the order and regularity of every work, the same must needs be done in less time, the labour must be less.” (“The Advantages,” &c., p. 68.)

<sup>13</sup> Nevertheless, the manufacturing system, in many branches of industry, attains this result but very imperfectly, because it knows not how to control with certainty the general chemical and physical conditions of the process of production.

<sup>14</sup> “When (from the peculiar nature of the produce of each manufactory), the number of processes into which it is most advantageous to divide it is ascertained, as well as the number of individuals to be employed, then all other manufactories which do not employ a direct multiple of this number will produce the article at a greater cost.... Hence arises one of the causes of the great size of manufacturing establishments.” (C. Babbage. “On the Economy of Machinery,” 1st ed. London. 1832. Ch. xxi, pp. 172-73.)

<sup>15</sup> In England, the melting-furnace is distinct from the glass-furnace in which the glass is manipulated. In Belgium, one and the same furnace serves for both processes.

<sup>16</sup> This can be seen from W. Petty, John Bellers, Andrew Yarranton, “The Advantages of the East India Trade,” and J. Vanderlint, not to mention others.

<sup>17</sup> Towards the end of the 16th century, mortars and sieves were still used in France for pounding and washing ores.

<sup>18</sup> The whole history of the development of machinery can be traced in the history of the corn mill. The factory in England is still a “mill.” In German technological works of the first decade of this century, the term “Mühle” is still found in use, not only for all machinery driven by the forces of Nature, but also for all manufactures where apparatus in the nature of machinery is applied.

<sup>19</sup> As will be seen more in detail in the fourth book of this work, Adam Smith has not established a single new proposition relating to division of labour. What, however, characterises him as the political economist par excellence of the period of Manufacture, is the stress he lays on division of labour. The subordinate part which he assigns to machinery gave occasion in the early days of modern mechanical industry to the polemic of Lauderdale, and, at a later period, to that of Ure. A. Smith also confounds differentiation of the instruments of labour, in which the detail labourers themselves took an active part, with the invention of machinery; in this latter, it is not the workmen in manufactories, but learned men, handicraftsman, and even peasants (Brindley), who play a part.

<sup>20</sup> “The master manufacturer, by dividing the work to be executed into different processes, each requiring different degrees of skill or of force, can purchase exactly that precise quantity of both which is necessary for each process; whereas, if the whole work were executed by one workman, that person must possess sufficient skill to perform the most difficult, and sufficient strength to execute the most laborious of the operations into which the article is divided.” (Ch. Babbage, *l.c.*, ch. xix.)

<sup>21</sup> For instance, abnormal development of some muscles, curvature of bones, &c.

<sup>22</sup> The question put by one of the Inquiry Commissioners, How the young persons are kept steadily to their work, is very correctly answered by Mr. Wm. Marshall, the general manager of a glass manufactory: “They cannot well neglect their work; when they once begin, they must go on; they are just the same as parts of a machine.” (“Children’s Empl. Comm.,” 4th Rep., 1865, p. 247.)

<sup>23</sup> Dr. Ure, in his apotheosis of Modern Mechanical Industry, brings out the peculiar character of manufacture more sharply than previous economists, who had not his polemical interest in the matter, and more sharply even than his contemporaries Babbage, e.g., who, though much his superior as a mathematician and mechanic, treated mechanical industry from the standpoint of manufacture alone. Ure says, “This appropriation ... to each, a workman of appropriate value and cost was naturally assigned, forms the very essence of division of labour.” On the other hand, he describes this division as “adaptation of labour to the different talents of men,” and lastly, characterises the whole manufacturing system as “a system for the division or gradation of labour,” as “the division of labour into degrees of skill,” &c. (Ure, *l.c.*, pp. 19-23 *passim*.)

<sup>24</sup> “Each handicraftsman being ... enabled to perfect himself by practice in one point, became ... a cheaper workman.” (Ure, l.c., p. 19.)

<sup>25</sup> “Division of labour proceeds from the separation of professions the most widely different to that division, where several labourers divide between them the preparation of one and the same product, as in manufacture.” (Storch: “Cours d’Econ. Pol.,” Paris Edn. t. I., p. 173.) “Nous rencontrons chez les peuples parvenus à un certain degré de civilisation trois genres de divisions d’industrie: la première, que nous nommerons générale, amène la distinction des producteurs en agriculteurs, manufacturiers et commerçants, elle se rapporte aux trois principales branches d’industrie nationale; la seconde qu’on pourrait appeler spéciale, est la division de chaque genre d’industrie en espèces ... la troisième division d’industrie, celle enfin qu’on devrait qualifier de division de la besogne ou de travail proprement dit, est celle qui s’établit dans les arts et les métiers séparés ... qui s’établit dans la plupart des manufactures et des ateliers.” [Among peoples which have reached a certain level of civilisation, we meet with three kinds of division of labour: the first, which we shall call general, brings about the division of the producers into agriculturalists, manufacturers, and traders, it corresponds to the three main branches of the nation’s labour; the second, which one could call particular, is the division of labour of each branch into species. ... The third division of labour, which one could designate as a division of tasks, or of labour properly so called, is that which grows up in the individual crafts and trades ... which is established in the majority of the manufactories and workshops] (Skarbek, l.c., pp. 84, 85.)

<sup>26</sup> *Note to the third edition.* Subsequent very searching study of the primitive condition of man, led the author to the conclusion, that it was not the family that originally developed into the tribe, but that, on the contrary, the tribe was the primitive and spontaneously developed form of human association, on the basis of blood relationship, and that out of the first incipient loosening of the tribal bonds, the many and various forms of the family were afterwards developed. [F. E.]

<sup>27</sup> Sir James Steuart is the economist who has handled this subject best. How little his book, which appeared ten years before the “Wealth of Nations,” is known, even at the present time, may be judged from the fact that the admirers of Malthus do not even know that the first edition of the latter’s work on population contains, except in the purely declamatory part, very little but extracts from Steuart, and in a less degree, from Wallace and Townsend.

<sup>28</sup> “There is a certain density of population which is convenient, both for social intercourse, and for that combination of powers by which the produce of labour is increased.” (James Mill, l.c., p. 50.) “As the number of labourers increases, the productive power of society augments in the compound ratio of that increase, multiplied by the effects of the division of labour.” (Th. Hodgskin, l.c., pp. 125, 126.)

<sup>29</sup> In consequence of the great demand for cotton after 1861, the production of cotton, in some thickly populated districts of India, was extended at the expense of rice cultivation. In consequence there arose local famines, the defective means of communication not permitting the failure of rice in one district to be compensated by importation from another.

<sup>30</sup> Thus the fabrication of shuttles formed as early as the 17th century, a special branch of industry in Holland.

<sup>31</sup> Whether the woollen manufacture of England is not divided into several parts or branches appropriated to particular places, where they are only or principally manufactured; fine cloths in Somersetshire, coarse in Yorkshire, long ells at Exeter, soies at Sudbury, crapes at Norwich, linseys at Kendal, blankets at Whitney, and so forth.” (Berkeley: “The Querist,” 1751, § 520.)

<sup>32</sup> A. Ferguson: “History of Civil Society.” Edinburgh, 1767; Part iv, sect. ii., p. 285.

<sup>33</sup> In manufacture proper, he says, the division of labour appears to be greater, because “those employed in every different branch of the work can often be collected into the same workhouse, and

placed at once under the view of the spectator. In those great manufactures, (!) on the contrary, which are destined to supply the great wants of the great body of the people, every different branch of the work employs so great a number of workmen, that it is impossible to collect them all into the same workhouse ... the division is not near so obvious." (A. Smith: "Wealth of Nations," bk. i, ch. i.) The celebrated passage in the same chapter that begins with the words, "Observe the accommodation of the most common artificer or day-labourer in a civilised and thriving country," &c., and then proceeds to depict what an enormous number and variety of industries contribute to the satisfaction of the wants of an ordinary labourer, is copied almost word for word from B. de Mandeville's Remarks to his "Fable of the Bees, or Private Vices, Publick Benefits." (First ed., without the remarks, 1706; with the remarks, 1714.)

<sup>34</sup> "There is no longer anything which we can call the natural reward of individual labour. Each labourer produces only some part of a whole, and each part, having no value or utility in itself, there is nothing on which the labourer can seize, and say: It is my product, this I will keep to myself." ("Labour Defended against the Claims of Capital." Lond., 1825, p. 25.) The author of this admirable work is the Th. Hodgskin I have already cited.

<sup>35</sup> This distinction between division of labour in society and in manufacture, was practically illustrated to the Yankees. One of the new taxes devised at Washington during the civil war, was the duty of 6% "on all industrial products." Question: What is an industrial product? Answer of the legislature: A thing is produced "when it is made," and it is made when it is ready for sale. Now, for one example out of many. The New York and Philadelphia manufacturers had previously been in the habit of "making" umbrellas with all their belongings. But since an umbrella is a *mixtum compositum* of very heterogeneous parts, by degrees these parts became the products of various separate industries, carried on independently in different places. They entered as separate commodities into the umbrella manufactory, where they were fitted together. The Yankees have given to articles thus fitted together, the name of "assembled articles," a name they deserve, for being an assemblage of taxes. Thus the umbrella "assembles," first, 6% on the price of each of its elements, and a further 6% on its own total price.

<sup>36</sup> "On peut... établir en règle générale, que moins l'autorité préside à la division du travail dans l'intérieur de la société, plus la division du travail se développe dans l'intérieur de l'atelier, et plus elle y est soumise à l'autorité d'un seul. Ainsi l'autorité dans l'atelier et celle dans la société, par rapport à la division du travail, sont en raison inverse l'une de l'autre." [It can ... be laid down as a general rule that the less authority presides over the division of labour inside society, the more the division of labour develops inside the workshop, and the more it is subjected there to the authority of a single person. Thus authority in the workshop and authority in society in relation to the division of labour, are in inverse ratio to each other] (Karl Marx, "Misère," &c., pp. 130-131.)

<sup>37</sup> Lieut.-Col. Mark Wilks: "Historical Sketches of the South of India." Lond., 1810-17, v. I., pp. 118-20. A good description of the various forms of the Indian communities is to be found in George Campbell's "Modern India." Lond., 1852.

<sup>38</sup> "Under this simple form ... the inhabitants of the country have lived from time immemorial. The boundaries of the villages have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated by war, famine, and disease, the same name, the same limits, the same interests, and even the same families, have continued for ages. The inhabitants give themselves no trouble about the breaking up and division of kingdoms; while the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves; its internal economy remains unchanged." (Th. Stamford Raffles, late Lieut. Gov. of Java: "The History of Java." Lond., 1817, Vol. I., p. 285.)

<sup>39</sup> “It is not sufficient that the capital” (the writer should have said the necessary means of subsistence and of production) “required for the subdivision of handicrafts should be in readiness in the society: it must also be accumulated in the hands of the employers in sufficiently large quantities to enable them to conduct their operations on a large scale.... The more the division increases, the more does the constant employment of a given number of labourers require a greater outlay of capital in tools, raw material, &c.” (Storch: “Cours d’Econ. Polit.” Paris Ed., t. I., pp. 250, 251.) “La concentration des instruments de production et la division du travail sont aussi inséparables l’une de l’autre que le sont, dans le régime politique, la concentration des pouvoirs publics et la division des intérêts privés.” [The concentration of the instruments of production and the division of labour are as inseparable one from the other, as are, in the political sphere, the concentration of public powers and the division of private interests.] (Karl Marx, *l.c.*, p. 134.)

<sup>40</sup> Dugald Stewart calls manufacturing labourers “living automatons ... employed in the details of the work.” (*l.c.*, p. 318.)

<sup>41</sup> In corals, each individual is, in fact, the stomach of the whole group; but it supplies the group with nourishment, instead of, like the Roman patrician, withdrawing it.

<sup>42</sup> “L’ouvrier qui porte dans ses bras tout un métier, peut aller partout exercer son industrie et trouver des moyens de subsister: l’autre (the manufacturing labourer) n’est qu’un accessoire qui, séparé de ses confrères, n’a plus ni capacité, ni indépendance, et qui se trouve forcé d’accepter la loi qu’on juge à propos de lui imposer.” [The worker who is the master of a whole craft can work and find the means of subsistence anywhere; the other (the manufacturing labourer) is only an appendage who, when he is separated from his fellows, possesses neither capability nor independence, and finds himself forced to accept any law it is thought fit to impose] (Storch, *l.c.*, Petersb. edit., 1815, t. I., p. 204.)

<sup>43</sup> A. Ferguson, *l.c.*, p. 281: “The former may have gained what the other has lost.”

<sup>44</sup> “The man of knowledge and the productive labourer come to be widely divided from each other, and knowledge, instead of remaining the handmaid of labour in the hand of the labourer to increase his productive powers ... has almost everywhere arrayed itself against labour ... systematically deluding and leading them (the labourers) astray in order to render their muscular powers entirely mechanical and obedient.” (W. Thompson: “An Inquiry into the Principles of the Distribution of Wealth.” London, 1824, p. 274.)

<sup>45</sup> A. Ferguson, *l.c.*, p. 280.

<sup>46</sup> J. D. Tuckett: “A History of the Past and Present State of the Labouring Population.” Lond., 1846.

<sup>47</sup> A. Smith: “Wealth of Nations,” Bk. v., ch. i, art. ii. Being a pupil of A. Ferguson who showed the disadvantageous effects of division of labour, Adam Smith was perfectly clear on this point. In the introduction to his work, where he *ex professo* praises division of labour, he indicates only in a cursory manner that it is the source of social inequalities. It is not till the 5th Book, on the Revenue of the State, that he reproduces Ferguson. In my “*Misère de la Philosophie*,” I have sufficiently explained the historical connexion between Ferguson, A. Smith, Lemontey, and Say, as regards their criticisms of Division of Labour, and have shown, for the first time, that Division of Labour as practised in manufactures, is a specific form of the capitalist mode of production.

<sup>48</sup> Ferguson had already said, *l.c.*, p. 281: “And thinking itself, in this age of separations, may become a peculiar craft.”

<sup>49</sup> G. Garnier, vol. V. of his translation of A. Smith, pp. 4-5.

<sup>50</sup> Ramazzini, professor of practical medicine at Padua, published in 1713 his work “*De morbis artificum*,” which was translated into French 1781, reprinted 1841 in the “*Encyclopédie des Sciences Médicales*. 7me Dis. Auteurs Classiques.” The period of Modern Mechanical Industry has, of course, very much enlarged his catalogue of labour’s diseases. See “*Hygiène physique et morale de l’ouvrier*”

dans les grandes villes en général et dans la ville de Lyon en particulier. Par le Dr. A. L. Fonteret, Paris, 1858,” and “Die Krankheiten, welche verschiedenen Ständen, Altern und Geschlechtern eigenthümlich sind. 6 Vols. Ulm, 1860,” and others. In 1854 the Society of Arts appointed a Commission of Inquiry into industrial pathology. The list of documents collected by this commission is to be seen in the catalogue of the “Twickenham Economic Museum.” Very important are the official “Reports on Public Health.” See also Eduard Reich, M. D. “Ueber die Entartung des Menschen,” Erlangen, 1868.

<sup>51</sup> (D. Urquhart: “Familiar Words.” Lond., 1855, p. 119.) Hegel held very heretical views on division of labour. In his “Rechtsphilosophie” he says: “By well educated men we understand in the first instance, those who can do everything that others do.”

<sup>52</sup> The simple belief in the inventive genius exercised a priori by the individual capitalist in division of labour, exists now-a-days only among German professors, of the stamp of Herr Roscher, who, to recompense the capitalist from whose Jovian head division of labour sprang ready formed, dedicates to him “various wages” (diverse *Arbeitslöhne*). The more or less extensive application of division of labour depends on length of purse, not on greatness of genius.

<sup>53</sup> The older writers, like Petty and the anonymous author of “Advantages of the East India Trade,” bring out the capitalist character of division of labour as applied in manufacture more than A. Smith does.

<sup>54</sup> Amongst the moderns may be excepted a few writers of the 18th century, like Beccaria and James Harris, who with regard to division of labour almost entirely follow the ancients. Thus, Beccaria: “Ciascuno prova coll’esperienza, che applicando la mano e l’ingegno sempre allo stesso genere di opere e di prodotte, egli più facili, più abbondanti e migliori ne traca risultati, di quello che se ciascuno isolatamente le cose tutte a se necessarie soltanto facesse.... Dividendosi in tal maniera per la comune e privata utilità gli uomini in varie classi e condizioni.” [Everyone knows from experience that if the hands and the intelligence are always applied to the same kind of work and the same products, these will be produced more easily, in greater abundance, and in higher quality, than if each individual makes for himself all the things he needs ... In this way, men are divided up into various classes and conditions, to their own advantage and to that of the commodity.](Cesare Beccaria: “Elementi di Econ: Pubblica,” ed. Custodi, Parte Moderna, t. xi, p. 29.) James Harris, afterwards Earl of Malmesbury, celebrated for the “Diaries” of his embassy at St. Petersburg, says in a note to his “Dialogue Concerning Happiness,” Lond., 1741, reprinted afterwards in “Three Treatises, 3 Ed., Lond., 1772: “The whole argument to prove society natural (i.e., by division of employments) ... is taken from the second book of Plato’s Republic.”

<sup>55</sup> Thus, in the Odyssey xiv., 228, [“Ἄλλος γὰρ ταλλοισιν ἀνερ ἐπιτερπεται ἐργοῖς” For different men take joy in different works] and Archilochus in Sextus Empiricus, [“ἄλλος ἀλλῶ ἐπ ἐργο καρδίην αἰνεται.” men differ as to things cheer their hearts]

<sup>56</sup> [“Πολλ ἠπιστᾶιο ἐργα, χαχῶς δ ἠπιστᾶνο παντᾶ.” He could do many works, but all of them badly – Homer] Every Athenian considered himself superior as a producer of commodities to a Spartan; for the latter in time of war had men enough at his disposal but could not command money, as Thucydides makes Pericles say in the speech inciting the Athenians to the Peloponnesian war: [“σωμασι τε ετοιμοτεροι οι αυτονργοι των ἀντηρωπων η χρημασι πολεμειν” people producing for their own consumption will rather let war have their bodies than their money] (Thuc.: 1, I. c. 41.) Nevertheless, even with regard to material production, [autarceia self-sufficiency], as opposed to division of labour remained their ideal, [“παρων γαρ το, ευ, παρα τουτων χαι το αυταρεσς.” For with the latter there is well-being, but with the former

there is independence.] It should be mentioned here that at the date of the fall of the 30 Tyrants there were still not 5,000 Athenians without landed property.

<sup>57</sup> With Plato, division of labour within the community is a development from the multifarious requirements, and the limited capacities of individuals. The main point with him is, that the labourer must adapt himself to the work, not the work to the labourer; which latter is unavoidable, if he carries on several trades at once, thus making one or the other of them subordinate. [“Ου γαρ ετηλει το πραττομενον τεν του πραττονιος σχηολεν περιμενειν, αλλ αναγκε το ν πραττοντα το πραττομενο επακολοοτηειν με εν παρεργου μερει. Αναγκε. Εκ δε τουτον πλειο τε εκαστα γιγνεται και καλλιον και ραον, οταν εις εν καια πηψισιν και εν καιρο σχηολεν τον αλλον αγον, πραττε.”] [For the workman must wait upon the work; it will not wait upon his leisure and allow itself to be done in a spare moment. — Yes, he must,— So the conclusion is that more will be produced of every thing and the work will be more easily and better done, when every man is set free from all other occupations to do, at the right time, the one thing for which he is naturally fitted.] (Rep. 1. 2. Ed. Baiter, Orelli, &c.) So in Thucydides, l.c., c. 142: “Seafaring is an art like any other, and cannot, as circumstances require, be carried on as a subsidiary occupation; nay, other subsidiary occupations cannot be carried on alongside of this one.” If the work, says Plato, has to wait for the labourer, the critical point in the process is missed and the article spoiled, “εργου χαιρον διολλυται.” [If someone lets slip ...] The same Platonic idea is found recurring in the protest of the English bleachers against the clause in the Factory Act that provides fixed mealtimes for all operatives. Their business cannot wait the convenience of the workmen, for “in the various operations of singeing, washing, bleaching, mangling, calendering, and dyeing, none of them can be stopped at a given moment without risk of damage ... to enforce the same dinner hour for all the workpeople might occasionally subject valuable goods to the risk of danger by incomplete operations.” *Le platonisme où va-t-il se nicher!* [Where will Platonism be found next!]

<sup>58</sup> Xenophon says, it is not only an honour to receive food from the table of the King of Persia, but such food is much more tasty than other food. “And there is nothing wonderful in this, for as the other arts are brought to special perfection in the great towns, so the royal food is prepared in a special way. For in the small towns the same man makes bedsteads, doors, ploughs, and tables: often, too, he builds houses into the bargain, and is quite content if he finds custom sufficient for his sustenance. It is altogether impossible for a man who does so many things to do them all well. But in the great towns, where each can find many buyers, one trade is sufficient to maintain the man who carries it on. Nay, there is often not even need of one complete trade, but one man makes shoes for men, another for women. Here and there one man gets a living by sewing, another by cutting out shoes; one does nothing but cut out clothes, another nothing but sew the pieces together. It follows necessarily then, that he who does the simplest kind of work, undoubtedly does it better than anyone else. So it is with the art of cooking.” (Xen. Cyrop. I. viii., c. 2.) Xenophon here lays stress exclusively upon the excellence to be attained in use-value, although he well knows that the gradations of the division of labour depend on the extent of the market.

<sup>59</sup> He (Busiris) divided them all into special castes ... commanded that the same individuals should always carry on the same trade, for he knew that they who change their occupations become skilled in none; but that those who constantly stick to one occupation bring it to the highest perfection. In truth, we shall also find that in relation to the arts and handicrafts, they have outstripped their rivals more than a master does a bungler; and the contrivances for maintaining the monarchy and the other institutions of their State are so admirable that the most celebrated philosophers who treat of this subject praise the constitution of the Egyptian State above all others. (Isocrates, Busiris, c. 8.)

<sup>62</sup> This is more the case in England than in France, and more in France than in Holland.

# Chapter 15: Machinery and Modern Industry

## Section 1 : The Development of Machinery

John Stuart Mill says in his "Principles of Political Economy":

"It is questionable if all the mechanical inventions yet made have lightened the day's toil of any human being."<sup>1</sup>

That is, however, by no means the aim of the capitalistic application of machinery. Like every other increase in the productiveness of labour, machinery is intended to cheapen commodities, and, by shortening that portion of the working day, in which the labourer works for himself, to lengthen the other portion that he gives, without an equivalent, to the capitalist. In short, it is a means for producing surplus-value.

In manufacture, the revolution in the mode of production begins with the labour-power, in modern industry it begins with the instruments of labour. Our first inquiry then is, how the instruments of labour are converted from tools into machines, or what is the difference between a machine and the implements of a handicraft? We are only concerned here with striking and general characteristics; for epochs in the history of society are no more separated from each other by hard and fast lines of demarcation, than are geological epochs.

Mathematicians and mechanics, and in this they are followed by a few English economists, call a tool a simple machine, and a machine a complex tool. They see no essential difference between them, and even give the name of machine to the simple mechanical powers, the lever, the inclined plane, the screw, the wedge, &c.<sup>2</sup> As a matter of fact, every machine is a combination of those simple powers, no matter how they may be disguised. From the economic standpoint this explanation is worth nothing, because the historical element is wanting. Another explanation of the difference between tool and machine is that in the case of a tool, man is the motive power, while the motive power of a machine is something different from man, as, for instance, an animal, water, wind, and so on.<sup>3</sup> According to this, a plough drawn by oxen, which is a contrivance common to the most different epochs, would be a machine, while Claussen's circular loom, which, worked by a single labourer, weaves 96,000 picks per minute, would be a mere tool. Nay, this very loom, though a tool when worked by hand, would, if worked by steam, be a machine. And since the application of animal power is one of man's earliest inventions, production by machinery would have preceded production by handicrafts. When in 1735, John Wyatt brought out his spinning machine, and began the industrial revolution of the 18th century, not a word did he say about an ass driving it instead of a man, and yet this part fell to the ass. He described it as a machine "to spin without fingers."<sup>4</sup>

All fully developed machinery consists of three essentially different parts, the motor mechanism, the transmitting mechanism, and finally the tool or working machine. The motor mechanism is that which puts the whole in motion. It either generates its own motive power, like the steam-engine, the caloric engine, the electromagnetic machine, &c., or it receives its impulse from some already existing natural force, like the water-wheel from a head of water, the wind-mill from wind, &c. The transmitting mechanism, composed of fly-wheels, shafting, toothed wheels, pullies, straps, ropes, bands, pinions, and gearing of the most varied kinds, regulates the motion, changes its form where necessary, as for instance, from linear to circular, and divides and distributes it among the working machines. These two first parts of the whole mechanism are there, solely for putting the working machines in motion, by means of which motion the subject

of labour is seized upon and modified as desired. The tool or working machine is that part of the machinery with which the industrial revolution of the 18th century started. And to this day it constantly serves as such a starting-point, whenever a handicraft, or a manufacture, is turned into an industry carried on by machinery.

On a closer examination of the working machine proper, we find in it, as a general rule, though often, no doubt, under very altered forms, the apparatus and tools used by the handicraftsman or manufacturing workman; with this difference, that instead of being human implements, they are the implements of a mechanism, or mechanical implements. Either the entire machine is only a more or less altered mechanical edition of the old handicraft tool, as, for instance, the power-loom,<sup>5</sup> or the working parts fitted in the frame of the machine are old acquaintances, as spindles are in a mule, needles in a stocking-loom, saws in a sawing-machine, and knives in a chopping machine. The distinction between these tools and the body proper of the machine, exists from their very birth; for they continue for the most part to be produced by handicraft, or by manufacture, and are afterwards fitted into the body of the machine, which is the product of machinery.<sup>6</sup> The machine proper is therefore a mechanism that, after being set in motion, performs with its tools the same operations that were formerly done by the workman with similar tools. Whether the motive power is derived from man, or from some other machine, makes no difference in this respect. From the moment that the tool proper is taken from man, and fitted into a mechanism, a machine takes the place of a mere implement. The difference strikes one at once, even in those cases where man himself continues to be the prime mover. The number of implements that he himself can use simultaneously, is limited by the number of his own natural instruments of production, by the number of his bodily organs. In Germany, they tried at first to make one spinner work two spinning-wheels, that is, to work simultaneously with both hands and both feet. This was too difficult. Later, a treddle spinning-wheel with two spindles was invented, but adepts in spinning, who could spin two threads at once, were almost as scarce as two-headed men. The Jenny, on the other hand, even at its very birth, spun with 12-18 spindles, and the stocking-loom knits with many thousand needles at once. The number of tools that a machine can bring into play simultaneously, is from the very first emancipated from the organic limits that hedge in the tools of a handicraftsman.

In many manual implements the distinction between man as mere motive power, and man as the workman or operator properly so called, is brought into striking contrast. For instance, the foot is merely the prime mover of the spinning-wheel, while the hand, working with the spindle, and drawing and twisting, performs the real operation of spinning. It is this last part of the handicraftsman's implement that is first seized upon by the industrial revolution, leaving to the workman, in addition to his new labour of watching the machine with his eyes and correcting its mistakes with his hands, the merely mechanical part of being the moving power. On the other hand, implements, in regard to which man has always acted as a simple motive power, as, for instance, by turning the crank of a mill,<sup>7</sup> by pumping, by moving up and down the arm of a bellows, by pounding with a mortar, &c., such implements soon call for the application of animals, water<sup>8</sup> and wind as motive powers. Here and there, long before the period of manufacture, and also, to some extent, during that period, these implements pass over into machines, but without creating any revolution in the mode of production. It becomes evident, in the period of modern industry, that these implements, even under their form of manual tools, are already machines. For instance, the pumps with which the Dutch, in 1836-7, emptied the Lake of Harlem, were constructed on the principle of ordinary pumps; the only difference being, that their pistons were driven by cyclopean steam-engines, instead of by men. The common and very imperfect bellows of the blacksmith is, in England, occasionally converted into a blowing-engine,

by connecting its arm with a steam-engine. The steam-engine itself, such as it was at its invention, during the manufacturing period at the close of the 17th century, and such as it continued to be down to 1780,<sup>9</sup> did not give rise to any industrial revolution. It was, on the contrary, the invention of machines that made a revolution in the form of steam-engines necessary. As soon as man, instead of working with an implement on the subject of his labour, becomes merely the motive power of an implement-machine, it is a mere accident that motive power takes the disguise of human muscle; and it may equally well take the form of wind, water or steam. Of course, this does not prevent such a change of form from producing great technical alterations in the mechanism that was originally constructed to be driven by man alone. Now-a-days, all machines that have their way to make, such as sewing-machines, bread-making machines, &c., are, unless from their very nature their use on a small scale is excluded, constructed to be driven both by human and by purely mechanical motive power.

The machine, which is the starting-point of the industrial revolution, supersedes the workman, who handles a single tool, by a mechanism operating with a number of similar tools, and set in motion by a single motive power, whatever the form of that power may be.<sup>10</sup> Here we have the machine, but only as an elementary factor of production by machinery.

Increase in the size of the machine, and in the number of its working tools, calls for a more massive mechanism to drive it; and this mechanism requires, in order to overcome its resistance, a mightier moving power than that of man, apart from the fact that man is a very imperfect instrument for producing uniform continued motion. But assuming that he is acting simply as a motor, that a machine has taken the place of his tool, it is evident that he can be replaced by natural forces. Of all the great motors handed down from the manufacturing period, horse-power is the worst, partly because a horse has a head of his own, partly because he is costly, and the extent to which he is applicable in factories is very restricted.<sup>11</sup> Nevertheless the horse was extensively used during the infancy of modern industry. This is proved, as well by the complaints of contemporary agriculturists, as by the term "horse-power," which has survived to this day as an expression for mechanical force.

Wind was too inconstant and uncontrollable, and besides, in England, the birthplace of modern industry, the use of water power preponderated even during the manufacturing period. In the 17th century attempts had already been made to turn two pairs of millstones with a single water-wheel. But the increased size of the gearing was too much for the water power, which had now become insufficient, and this was one of the circumstances that led to a more accurate investigation of the laws of friction. In the same way the irregularity caused by the motive power in mills that were put in motion by pushing and pulling a lever, led to the theory, and the application, of the fly-wheel, which afterwards plays so important a part in modern industry.<sup>12</sup> In this way, during the manufacturing period, were developed the first scientific and technical elements of Modern Mechanical Industry. Arkwright's throstle spinning mill was from the very first turned by water. But for all that, the use of water, as the predominant motive power, was beset with difficulties. It could not be increased at will, it failed at certain seasons of the year, and, above all, it was essentially local.<sup>13</sup> Not till the invention of Watt's second and so-called double-acting steam-engine, was a prime mover found, that begot its own force by the consumption of coal and water, whose power was entirely under man's control, that was mobile and a means of locomotion, that was urban and not, like the waterwheel, rural, that permitted production to be concentrated in towns instead of, like the water-wheels, being scattered up and down the country,<sup>14</sup> that was of universal technical application, and, relatively speaking, little affected in its choice of residence by local circumstances. The greatness of Watt's genius showed itself in the specification of the patent that he took out in April, 1784. In that specification his steam-engine is described, not as

an invention for a specific purpose, but as an agent universally applicable in Mechanical Industry. In it he points out applications, many of which, as for instance, the steam-hammer, were not introduced till half a century later. Nevertheless he doubted the use of steam-engines in navigation. His successors, Boulton and Watt, sent to the exhibition of 1851 steam-engines of colossal size for ocean steamers.

As soon as tools had been converted from being manual implements of man into implements of a mechanical apparatus, of a machine, the motive mechanism also acquired an independent form, entirely emancipated from the restraints of human strength. Thereupon the individual machine, that we have hitherto been considering, sinks into a mere factor in production by machinery. One motive mechanism was now able to drive many machines at once. The motive mechanism grows with the number of the machines that are turned simultaneously, and the transmitting mechanism becomes a wide-spreading apparatus.

We now proceed to distinguish the co-operation of a number of machines of one kind from a complex system of machinery.

In the one case, the product is entirely made by a single machine, which performs all the various operations previously done by one handicraftsman with his tool; as, for instance, by a weaver with his loom; or by several handicraftsman successively, either separately or as members of a system of Manufacture.<sup>15</sup> For example, in the manufacture of envelopes, one man folded the paper with the folder, another laid on the gum, a third turned the flap over, on which the device is impressed, a fourth embossed the device, and so on; and for each of these operations the envelope had to change hands. One single envelope machine now performs all these operations at once, and makes more than 3,000 envelopes in an hour. In the London exhibition of 1862, there was an American machine for making paper cornets. It cut the paper, pasted, folded, and finished 300 in a minute. Here, the whole process, which, when carried on as Manufacture, was split up into, and carried out by, a series of operations, is completed by a single machine, working a combination of various tools. Now, whether such a machine be merely a reproduction of a complicated manual implement, or a combination of various simple implements specialised by Manufacture, in either case, in the factory, *i.e.*, in the workshop in which machinery alone is used, we meet again with simple co-operation; and, leaving the workman out of consideration for the moment, this co-operation presents itself to us, in the first instance, as the conglomeration in one place of similar and simultaneously acting machines. Thus, a weaving factory is constituted of a number of power-looms, working side by side, and a sewing factory of a number of sewing-machines all in the same building. But there is here a technical oneness in the whole system, owing to all the machines receiving their impulse simultaneously, and in an equal degree, from the pulsations of the common prime mover, by the intermediary of the transmitting mechanism; and this mechanism, to a certain extent, is also common to them all, since only particular ramifications of it branch off to each machine. Just as a number of tools, then, form the organs of a machine, so a number of machines of one kind constitute the organs of the motive mechanism.

A real machinery system, however, does not take the place of these independent machines, until the subject of labour goes through a connected series of detail processes, that are carried out by a chain of machines of various kinds, the one supplementing the other. Here we have again the co-operation by division of labour that characterises Manufacture; only now, it is a combination of detail machines. The special tools of the various detail workmen, such as those of the beaters, cambers, spinners, &c., in the woollen manufacture, are now transformed into the tools of specialised machines, each machine constituting a special organ, with a special function, in the system. In those branches of industry in which the machinery system is first introduced, Manufacture itself furnishes, in a general way, the natural basis for the division, and consequent

organisation, of the process of production.<sup>16</sup> Nevertheless an essential difference at once manifests itself. In Manufacture it is the workmen who, with their manual implements, must, either singly or in groups, carry on each particular detail process. If, on the one hand, the workman becomes adapted to the process, on the other, the process was previously made suitable to the workman. This subjective principle of the division of labour no longer exists in production by machinery. Here, the process as a whole is examined objectively, in itself, that is to say, without regard to the question of its execution by human hands, it is analysed into its constituent phases; and the problem, how to execute each detail process, and bind them all into a whole, is solved by the aid of machines, chemistry, &c.<sup>17</sup> But, of course, in this case also, theory must be perfected by accumulated experience on a large scale. Each detail machine supplies raw material to the machine next in order; and since they are all working at the same time, the product is always going through the various stages of its fabrication, and is also constantly in a state of transition, from one phase to another. Just as in Manufacture, the direct co-operation of the detail labourers establishes a numerical proportion between the special groups, so in an organised system of machinery, where one detail machine is constantly kept employed by another, a fixed relation is established between their numbers, their size, and their speed. The collective machine, now an organised system of various kinds of single machines, and of groups of single machines, becomes more and more perfect, the more the process as a whole becomes a continuous one, i.e., the less the raw material is interrupted in its passage from its first phase to its last; in other words, the more its passage from one phase to another is effected, not by the hand of man, but by the machinery itself. In Manufacture the isolation of each detail process is a condition imposed by the nature of division of labour, but in the fully developed factory the continuity of those processes is, on the contrary, imperative.

A system of machinery, whether it reposes on the mere co-operation of similar machines, as in weaving, or on a combination of different machines, as in spinning, constitutes in itself a huge automaton, whenever it is driven by a self-acting prime mover. But although the factory as a whole be driven by its steam-engine, yet either some of the individual machines may require the aid of the workman for some of their movements (such aid was necessary for the running in of the mule carriage, before the invention of the self-acting mule, and is still necessary in fine-spinning mills); or, to enable a machine to do its work, certain parts of it may require to be handled by the workman like a manual tool; this was the case in machine-makers' workshops, before the conversion of the slide rest into a self-actor. As soon as a machine executes, without man's help, all the movements requisite to elaborate the raw material, needing only attendance from him, we have an automatic system of machinery, and one that is susceptible of constant improvement in its details. Such improvements as the apparatus that stops a drawing frame, whenever a sliver breaks, and the self-acting stop, that stops the power-loom so soon as the shuttle bobbin is emptied of weft, are quite modern inventions. As an example, both of continuity of production, and of the carrying out of the automatic principle, we may take a modern paper mill. In the paper industry generally, we may advantageously study in detail not only the distinctions between modes of production based on different means of production, but also the connexion of the social conditions of production with those modes: for the old German paper-making furnishes us with a sample of handicraft production; that of Holland in the 17th and of France in the 18th century with a sample of manufacturing in the strict sense; and that of modern England with a sample of automatic fabrication of this article. Besides these, there still exist, in India and China, two distinct antique Asiatic forms of the same industry.

An organised system of machines, to which motion is communicated by the transmitting mechanism from a central automaton, is the most developed form of production by machinery.

Here we have, in the place of the isolated machine, a mechanical monster whose body fills whole factories, and whose demon power, at first veiled under the slow and measured motions of his giant limbs, at length breaks out into the fast and furious whirl of his countless working organs.

There were mules and steam-engines before there were any labourers, whose exclusive occupation it was to make mules and steam-engines; just as men wore clothes before there were such people as tailors. The inventions of Vaucanson, Arkwright, Watt, and others, were, however, practicable, only because those inventors found, ready to hand, a considerable number of skilled mechanical workmen, placed at their disposal by the manufacturing period. Some of these workmen were independent handicraftsmen of various trades, others were grouped together in manufactures, in which, as before-mentioned, division of labour was strictly carried out. As inventions increased in number, and the demand for the newly discovered machines grew larger, the machine-making industry split up, more and more, into numerous independent branches, and division of labour in these manufactures was more and more developed. Here, then, we see in Manufacture the immediate technical foundation of modern industry. Manufacture produced the machinery, by means of which modern industry abolished the handicraft and manufacturing systems in those spheres of production that it first seized upon. The factory system was therefore raised, in the natural course of things, on an inadequate foundation. When the system attained to a certain degree of development, it had to root up this ready-made foundation, which in the meantime had been elaborated on the old lines, and to build up for itself a basis that should correspond to its methods of production. Just as the individual machine retains a dwarfish character, so long as it is worked by the power of man alone, and just as no system of machinery could be properly developed before the steam-engine took the place of the earlier motive powers, animals, wind, and even water; so, too, modern industry was crippled in its complete development, so long as its characteristic instrument of production, the machine, owed its existence to personal strength and personal skill, and depended on the muscular development, the keenness of sight, and the cunning of hand, with which the detail workmen in manufactures, and the manual labourers in handicrafts, wielded their dwarfish implements. Thus, apart from the dearness of the machines made in this way, a circumstance that is ever present to the mind of the capitalist, the expansion of industries carried on by means of machinery, and the invasion by machinery of fresh branches of production, were dependent on the growth of a class of workmen, who, owing to the almost artistic nature of their employment, could increase their numbers only gradually, and not by leaps and bounds. But besides this, at a certain stage of its development, modern industry became technologically incompatible with the basis furnished for it by handicraft and Manufacture. The increasing size of the prime movers, of the transmitting mechanism, and of the machines proper, the greater complication, multifariousness and regularity of the details of these machines, as they more and more departed from the model of those originally made by manual labour, and acquired a form, untrammelled except by the conditions under which they worked,<sup>18</sup> the perfecting of the automatic system, and the use, every day more unavoidable, of a more refractory material, such as iron instead of wood - the solution of all these problems, which sprang up by the force of circumstances, everywhere met with a stumbling-block in the personal restrictions, which even the collective labourer of Manufacture could not break through, except to a limited extent. Such machines as the modern hydraulic press, the modern power-loom, and the modern carding engine, could never have been furnished by Manufacture.

A radical change in the mode of production in one sphere of industry involves a similar change in other spheres. This happens at first in such branches of industry as are connected together by being separate phases of a process, and yet are isolated by the social division of labour, in such a way, that each of them produces an independent commodity. Thus spinning by machinery made

weaving by machinery a necessity, and both together made the mechanical and chemical revolution that took place in bleaching, printing, and dyeing, imperative. So too, on the other hand, the revolution in cotton-spinning called forth the invention of the gin, for separating the seeds from the cotton fibre; it was only by means of this invention, that the production of cotton became possible on the enormous scale at present required.<sup>19</sup> But more especially, the revolution in the modes of production of industry and agriculture made necessary a revolution in the general conditions of the social process of production, i.e., in the means of communication and of transport. In a society whose pivot, to use an expression of Fourier, was agriculture on a small scale, with its subsidiary domestic industries, and the urban handicrafts, the means of communication and transport were so utterly inadequate to the productive requirements of the manufacturing period, with its extended division of social labour, its concentration of the instruments of labour, and of the workmen, and its colonial markets, that they became in fact revolutionised. In the same way the means of communication and transport handed down from the manufacturing period soon became unbearable trammels on modern industry, with its feverish haste of production, its enormous extent, its constant flinging of capital and labour from one sphere of production into another, and its newly-created connexions with the markets of the whole world. Hence, apart from the radical changes introduced in the construction of sailing vessels, the means of communication and transport became gradually adapted to the modes of production of mechanical industry, by the creation of a system of river steamers, railways, ocean steamers, and telegraphs. But the huge masses of iron that had now to be forged, to be welded, to be cut, to be bored, and to be shaped, demanded, on their part, cyclopean machines, for the construction of which the methods of the manufacturing period were utterly inadequate.

Modern Industry had therefore itself to take in hand the machine, its characteristic instrument of production, and to construct machines by machines. It was not till it did this, that it built up for itself a fitting technical foundation, and stood on its own feet. Machinery, simultaneously with the increasing use of it, in the first decades of this century, appropriated, by degrees, the fabrication of machines proper. But it was only during the decade preceding 1866, that the construction of railways and ocean steamers on a stupendous scale called into existence the cyclopean machines now employed in the construction of prime movers.

The most essential condition to the production of machines by machines was a prime mover capable of exerting any amount of force, and yet under perfect control. Such a condition was already supplied by the steam-engine. But at the same time it was necessary to produce the geometrically accurate straight lines, planes, circles, cylinders, cones, and spheres, required in the detail parts of the machines. This problem Henry Maudsley solved in the first decade of this century by the invention of the slide rest, a tool that was soon made automatic, and in a modified form was applied to other constructive machines besides the lathe, for which it was originally intended. This mechanical appliance replaces, not some particular tool, but the hand itself, which produces a given form by holding and guiding the cutting tool along the iron or other material operated upon. Thus it became possible to produce the forms of the individual parts of machinery

“with a degree of ease, accuracy, and speed, that no accumulated experience of the hand of the most skilled workman could give.”<sup>20</sup>

If we now fix our attention on that portion of the machinery employed in the construction of machines, which constitutes the operating tool, we find the manual implements re-appearing, but on a cyclopean scale. The operating part of the boring machine is an immense drill driven by a steam-engine; without this machine, on the other hand, the cylinders of large steam-engines and of hydraulic presses could not be made. The mechanical lathe is only a cyclopean reproduction of the ordinary foot-lathe; the planing machine, an iron carpenter, that works on iron with the same

tools that the human carpenter employs on wood; the instrument that, on the London wharves, cuts the veneers, is a gigantic razor; the tool of the shearing machine, which shears iron as easily as a tailor's scissors cut cloth, is a monster pair of scissors; and the steam-hammer works with an ordinary hammer head, but of such a weight that not Thor himself could wield it.<sup>21</sup> These steam-hammers are an invention of Nasmyth, and there is one that weighs over 6 tons and strikes with a vertical fall of 7 feet, on an anvil weighing 36 tons. It is mere child's-play for it to crush a block of granite into powder, yet it is no less capable of driving, with a succession of light taps, a nail into a piece of soft wood.<sup>22</sup>

The implements of labour, in the form of machinery, necessitate the substitution of natural forces for human force, and the conscious application of science, instead of rule of thumb. In Manufacture, the organisation of the social labour-process is purely subjective; it is a combination of detail labourers; in its machinery system, modern industry has a productive organism that is purely objective, in which the labourer becomes a mere appendage to an already existing material condition of production. In simple co-operation, and even in that founded on division of labour, the suppression of the isolated, by the collective, workman still appears to be more or less accidental. Machinery, with a few exceptions to be mentioned later, operates only by means of associated labour, or labour in common. Hence the co-operative character of the labour-process is, in the latter case, a technical necessity dictated by the instrument of labour itself.

## **Section 2: The Value Transferred by Machinery to the Product**

We saw that the productive forces resulting from co-operation and division of labour cost capital nothing. They are natural forces of social labour. So also physical forces, like steam, water, &c., when appropriated to productive processes, cost nothing. But just as a man requires lungs to breathe with, so he requires something that is work of man's hand, in order to consume physical forces productively. A water-wheel is necessary to exploit the force of water, and a steam-engine to exploit the elasticity of steam. Once discovered, the law of the deviation of the magnetic needle in the field of an electric current, or the law of the magnetisation of iron, around which an electric current circulates, cost never a penny.<sup>23</sup> But the exploitation of these laws for the purposes of telegraphy, &c., necessitates a costly and extensive apparatus. The tool, as we have seen, is not exterminated by the machine. From being a dwarf implement of the human organism, it expands and multiplies into the implement of a mechanism created by man. Capital now sets the labourer to work, not with a manual tool, but with a machine which itself handles the tools. Although, therefore, it is clear at the first glance that, by incorporating both stupendous physical forces, and the natural sciences, with the process of production, modern industry raises the productiveness of labour to an extraordinary degree, it is by no means equally clear, that this increased productive force is not, on the other hand, purchased by an increased expenditure of labour. Machinery, like every other component of constant capital, creates no new value, but yields up its own value to the product that it serves to beget. In so far as the machine has value, and, in consequence, parts with value to the product, it forms an element in the value of that product. Instead of being cheapened, the product is made dearer in proportion to the value of the machine. And it is clear as noon-day, that machines and systems of machinery, the characteristic instruments of labour of Modern Industry, are incomparably more loaded with value than the implements used in handicrafts and manufactures.

In the first place, it must be observed that the machinery, while always entering as a whole into the labour-process, enters into the value-begetting process only by bits. It never adds more value than it loses, on an average, by wear and tear. Hence there is a great difference between the value of a machine, and the value transferred in a given time by that machine to the product. The longer

the life of the machine in the labour-process, the greater is that difference. It is true, no doubt, as we have already seen, that every instrument of labour enters as a whole into the labour-process, and only piece-meal, proportionally to its average daily loss by wear and tear, into the value-begetting process. But this difference between the instrument as a whole and its daily wear and tear, is much greater in a machine than in a tool, because the machine, being made from more durable material, has a longer life; because its employment, being regulated by strictly scientific laws, allows of greater economy in the wear and tear of its parts, and in the materials it consumes; and lastly, because its field of production is incomparably larger than that of a tool. After making allowance, both in the case of the machine and of the tool, for their average daily cost, that is for the value they transmit to the product by their average daily wear and tear, and for their consumption of auxiliary substance, such as oil, coal, and so on, they each do their work gratuitously, just like the forces furnished by Nature without the help of man. The greater the productive power of the machinery compared with that of the tool, the greater is the extent of its gratuitous service compared with that of the tool. In modern industry man succeeded for the first time in making the product of his past labour work on a large scale gratuitously, like the forces of Nature.<sup>24</sup>

In treating of Co-operation and Manufacture, it was shown that certain general factors of production, such as buildings, are, in comparison with the scattered means of production of the isolated workman, economised by being consumed in common, and that they therefore make the product cheaper. In a system of machinery, not only is the framework of the machine consumed in common by its numerous operating implements, but the prime mover, together with a part of the transmitting mechanism, is consumed in common by the numerous operative machines.

Given the difference between the value of the machinery, and the value transferred by it in a day to the product, the extent to which this latter value makes the product dearer, depends in the first instance, upon the size of the product; so to say, upon its area. Mr. Baynes, of Blackburn, in a lecture published in 1858, estimates that

“each real mechanical horse-power<sup>25</sup> will drive 450 self-acting mule spindles, with preparation, or 200 throstle spindles, or 15 looms for 40 inch cloth with the appliances for warping, sizing, &c.”

In the first case, it is the day's produce of 450 mule spindles, in the second, of 200 throstle spindles, in the third, of 15 power-looms, over which the daily cost of one horse-power, and the wear and tear of the machinery set in motion by that power, are spread; so that only a very minute value is transferred by such wear and tear to a pound of yarn or a yard of cloth. The same is the case with the steam-hammer mentioned above. Since its daily wear and tear, its coal-consumption, &c., are spread over the stupendous masses of iron hammered by it in a day, only a small value is added to a hundred weight of iron; but that value would be very great, if the cyclopean instrument were employed in driving in nails.

Given a machine's capacity for work, that is, the number of its operating tools, or, where it is a question of force, their mass, the amount of its product will depend on the velocity of its working parts, on the speed, for instance, of the spindles, or on the number of blows given by the hammer in a minute. Many of these colossal hammers strike seventy times in a minute, and Ryder's patent machine for forging spindles with small hammers gives as many as 700 strokes per minute.

Given the rate at which machinery transfers its value to the product, the amount of value so transferred depends on the total value of the machinery.<sup>26</sup> The less labour it contains, the less value it imparts to the product. The less value it gives up, so much the more productive it is, and so much the more its services approximate to those of natural forces. But the production of machinery by machinery lessens its value relatively to its extension and efficacy.

An analysis and comparison of the prices of commodities produced by handicrafts or manufactures, and of the prices of the same commodities produced by machinery, shows generally, that, in the product of machinery, the value due to the instruments of labour increases relatively, but decreases absolutely. In other words, its absolute amount decreases, but its amount, relatively to the total value of the product, of a pound of yarn, for instance, increases.<sup>27</sup>

It is evident that whenever it costs as much labour to produce a machine as is saved by the employment of that machine, there is nothing but a transposition of labour; consequently the total labour required to produce a commodity is not lessened or the productiveness of labour is not increased. It is clear, however, that the difference between the labour a machine costs, and the labour it saves, in other words, that the degree of its productiveness does not depend on the difference between its own value and the value of the implement it replaces. As long as the labour spent on a machine, and consequently the portion of its value added to the product, remains smaller than the value added by the workman to the product with his tool, there is always a difference of labour saved in favour of the machine. The productiveness of a machine is therefore measured by the human labour-power it replaces. According to Mr. Baynes, 2 operatives are required for the 450 mule spindles, inclusive of preparation machinery,<sup>28</sup> that are driven by one-horse power; each self-acting mule spindle, working ten hours, produces 13 ounces of yarn (average number of thickness); consequently  $2\frac{1}{2}$  operatives spin weekly 365  $\frac{5}{8}$  lbs. of yarn. Hence, leaving waste on one side, 366 lbs. of cotton absorb, during their conversion into yarn, only 150 hours' labour, or fifteen days' labour of ten hours each. But with a spinning-wheel, supposing the hand-spinner to produce thirteen ounces of yarn in sixty hours, the same weight of cotton would absorb 2,700 days' labour of ten hours each, or 27,000 hours' labour.<sup>29</sup> Where blockprinting, the old method of printing calico by hand, has been superseded by machine printing, a single machine prints, with the aid of one man or boy, as much calico of four colours in one hour, as it formerly took 200 men to do.<sup>30</sup> Before Eli Whitney invented the cotton gin in 1793, the separation of the seed from a pound of cotton cost an average day's labour. By means of his invention one negress was enabled to clean 100 lbs. daily; and since then, the efficacy of the gin has been considerably increased. A pound of cotton wool, previously costing 50 cents to produce, included after that invention more unpaid labour, and was consequently sold with greater profit, at 10 cents. In India they employ for separating the wool from the seed, an instrument, half machine, half tool, called a churka; with this one man and a woman can clean 28 lbs. daily. With the churka invented some years ago by Dr. Forbes, one man and a boy produce 250 lbs. daily. If oxen, steam, or water, be used for driving it, only a few boys and girls as feeders are required. Sixteen of these machines driven by oxen do as much work in a day as formerly 750 people did on an average.<sup>31</sup>

As already stated, a steam-plough does as much work in one hour at a cost of three-pence, as 66 men at a cost of 15 shillings. I return to this example in order to clear up an erroneous notion. The 15 shillings are by no means the expression in money of all the labour expended in one hour by the 66 men. If the ratio of surplus labour to necessary labour were 100%, these 66 men would produce in one hour a value of 30 shillings, although their wages, 15 shillings, represent only their labour for half an hour. Suppose, then, a machine cost as much as the wages for a year of the 150 men it displaces, say £3,000; this £3,000 is by no means the expression in money of the labour added to the object produced by these 150 men before the introduction of the machine, but only of that portion of their year's labour which was expended for themselves and represented by their wages. On the other hand, the £3,000, the money-value of the machine, expresses all the labour expended on its production, no matter in what proportion this labour constitutes wages for the workman, and surplus-value for the capitalist. Therefore, though a machine cost as much as

the labour-power displaced by it costs, yet the labour materialised in it is even then much less than the living labour it replaces.<sup>32</sup>

The use of machinery for the exclusive purpose of cheapening the product, is limited in this way, that less labour must be expended in producing the machinery than is displaced by the employment of that machinery, For the capitalist, however, this use is still more limited. Instead of paying for the labour, he only pays the value of the labour-power employed; therefore, the limit to his using a machine is fixed by the difference between the value of the machine and the value of the labour-power replaced by it. Since the division of the day's work into necessary and surplus labour differs in different countries, and even in the same country at different periods, or in different branches of industry; and further, since the actual wage of the labourer at one time sinks below the value of his labour-power, at another rises above it, it is possible for the difference between the price of the machinery and the price of the labour-power replaced by that machinery to vary very much, although the difference between the quantity of labour requisite to produce the machine and the total quantity replaced by it, remain constant.<sup>33</sup> But it is the former difference alone that determines the cost, to the capitalist, of producing a commodity, and, through the pressure of competition, influences his action. Hence the invention now-a-days of machines in England that are employed only in North America; just as in the sixteenth and seventeenth centuries, machines were invented in Germany to be used only in Holland, and just as many a French invention of the eighteenth century was exploited in England alone. In the older countries, machinery, when employed in some branches of industry, creates such a redundancy of labour in other branches that in these latter the fall of wages below the value of labour-power impedes the use of machinery, and, from the standpoint of the capitalist, whose profit comes, not from a diminution of the labour employed, but of the labour paid for, renders that use superfluous and often impossible. In some branches of the woollen manufacture in England the employment of children has during recent years been considerably diminished, and in some cases has been entirely abolished. Why? Because the Factory Acts made two sets of children necessary, one working six hours, the other four, or each working five hours. But the parents refused to sell the "half-timers" cheaper than the "full-timers." Hence the substitution of machinery for the "half-timers."<sup>34</sup> Before the labour of women and of children under 10 years of age was forbidden in mines, capitalists considered the employment of naked women and girls, often in company with men, so far sanctioned by their moral code, and especially by their ledgers, that it was only after the passing of the Act that they had recourse to machinery. The Yankees have invented a stone-breaking machine. The English do not make use of it, because the "wretch"<sup>35</sup> who does this work gets paid for such a small portion of his labour, that machinery would increase the cost of production to the capitalist.<sup>36</sup> In England women are still occasionally used instead of horses for hauling canal boats<sup>37</sup>, because the labour required to produce horses and machines is an accurately known quantity, while that required to maintain the women of the surplus-population is below all calculation. Hence nowhere do we find a more shameful squandering of human labour-power for the most despicable purposes than in England, the land of machinery.

### **Section 3: The Proximate Effects of Machinery on the Workman**

The starting-point of modern industry is, as we have shown, the revolution in the instruments of labour, and this revolution attains its most highly developed form in the organised system of machinery in a factory. Before we inquire how human material is incorporated with this objective organism, let us consider some general effects of this revolution on the labourer himself.

## A. Appropriation of Supplementary Labour-Power by Capital. The Employment of Women and Children

In so far as machinery dispenses with muscular power, it becomes a means of employing labourers of slight muscular strength, and those whose bodily development is incomplete, but whose limbs are all the more supple. The labour of women and children was, therefore, the first thing sought for by capitalists who used machinery. That mighty substitute for labour and labourers was forthwith changed into a means for increasing the number of wage-labourers by enrolling, under the direct sway of capital, every member of the workman's family, without distinction of age or sex. Compulsory work for the capitalist usurped the place, not only of the children's play, but also of free labour at home within moderate limits for the support of the family.<sup>38</sup>

The value of labour-power was determined, not only by the labour-time necessary to maintain the individual adult labourer, but also by that necessary to maintain his family. Machinery, by throwing every member of that family on to the labour-market, spreads the value of the man's labour-power over his whole family. It thus depreciates his labour-power. To purchase the labour-power of a family of four workers may, perhaps, cost more than it formerly did to purchase the labour-power of the head of the family, but, in return, four days' labour takes the place of one, and their price falls in proportion to the excess of the surplus labour of four over the surplus labour of one. In order that the family may live, four people must now, not only labour, but expend surplus labour for the capitalist. Thus we see, that machinery, while augmenting the human material that forms the principal object of capital's exploiting power,<sup>39</sup> at the same time raises the degree of exploitation.

Machinery also revolutionises out and out the contract between the labourer and the capitalist, which formally fixes their mutual relations. Taking the exchange of commodities as our basis, our first assumption was that capitalist and labourer met as free persons, as independent owners of commodities; the one possessing money and means of production, the other labour-power. But now the capitalist buys children and young persons under age. Previously, the workman sold his own labour-power, which he disposed of nominally as a free agent. Now he sells wife and child. He has become a slave-dealer.<sup>40</sup> The demand for children's labour often resembles in form the inquiries for negro slaves, such as were formerly to be read among the advertisements in American journals.

“My attention,” says an English factory inspector, “was drawn to an advertisement in the local paper of one of the most important manufacturing towns of my district, of which the following is a copy: Wanted, 12 to 20 young persons, not younger than what can pass for 13 years. Wages, 4 shillings a week. Apply &c.”<sup>41</sup>

The phrase “what can pass for 13 years,” has reference to the fact, that by the Factory Act, children under 13 years may work only 6 hours. A surgeon officially appointed must certify their age. The manufacturer, therefore, asks for children who look as if they were already 13 years old. The decrease, often by leaps and bounds in the number of children under 13 years employed in factories, a decrease that is shown in an astonishing manner by the English statistics of the last 20 years, was for the most part, according to the evidence of the factory inspectors themselves, the work of the certifying surgeons, who overstated the age of the children, agreeably to the capitalist's greed for exploitation, and the sordid trafficking needs of the parents. In the notorious district of Bethnal Green, a public market is held every Monday and Tuesday morning, where children of both sexes from 9 years of age upwards, hire themselves out to the silk manufacturers. “The usual terms are 1s. 8d. a week (this belongs to the parents) and ‘2d. for myself and tea.’ The

contract is binding only for the week. The scene and language while this market is going on are quite disgraceful.”<sup>42</sup> It has also occurred in England, that women have taken “children from the workhouse and let any one have them out for 2s. 6d. a week.”<sup>43</sup> In spite of legislation, the number of boys sold in Great Britain by their parents to act as live chimney-sweeping machines (although there exist plenty of machines to replace them) exceeds 2,000.<sup>44</sup> The revolution effected by machinery in the juridical relations between the buyer and the seller of labour-power, causing the transaction as a whole to lose the appearance of a contract between free persons, afforded the English Parliament an excuse, founded on juridical principles, for the interference of the state with factories. Whenever the law limits the labour of children to 6 hours in industries not before interfered with, the complaints of the manufacturers are always renewed. They allege that numbers of the parents withdraw their children from the industry brought under the Act, in order to sell them where “freedom of labour” still rules, i.e., where children under 13 years are compelled to work like grown-up people, and therefore can be got rid of at a higher price. But since capital is by nature a leveller, since it exacts in every sphere of production equality in the conditions of the exploitation of labour, the limitation by law of children’s labour, in one branch of industry, becomes the cause of its limitation in others.

We have already alluded to the physical deterioration as well of the children and young-persons as of the women, whom machinery, first directly in the factories that shoot up on its basis, and then indirectly in all the remaining branches of industry, subjects to the exploitation of capital. In this place, therefore, we dwell only on one point, the enormous mortality, during the first few years of their life, of the children of the operatives. In sixteen of the registration districts into which England is divided, there are, for every 100,000 children alive under the age of one year, only 9,000 deaths in a year on an average (in one district only 7,047); in 24 districts the deaths are over 10,000, but under 11,000; in 39 districts, over 11,000, but under 12,000; in 48 districts over 12,000, but under 13,000; in 22 districts over 20,000; in 25 districts over 21,000; in 17 over 22,000; in 11 over 23,000; in Hoo, Wolverhampton, Ashton-under-Lyne, and Preston, over 24,000; in Nottingham, Stockport, and Bradford, over 25,000; in Wisbeach, 16,000; and in Manchester, 26,125.<sup>45</sup> As was shown by an official medical inquiry in the year 1861, the high death-rates are, apart from local causes, principally due to the employment of the mothers away from their homes, and to the neglect and maltreatment, consequent on her absence, such as, amongst others, insufficient nourishment, unsuitable food, and dosing with opiates; besides this, there arises an unnatural estrangement between mother and child, and as a consequence intentional starving and poisoning of the children.<sup>46</sup> In those agricultural districts, “where a minimum in the employment of women exists, the death-rate is on the other hand very low.”<sup>47</sup> The Inquiry Commission of 1861 led, however, to the unexpected result, that in some purely agricultural districts bordering on the North Sea, the death-rate of children under one year old almost equalled that of the worst factory districts. Dr. Julian Hunter was therefore commissioned to investigate this phenomenon on the spot. His report is incorporated with the “Sixth Report on Public Health.”<sup>48</sup> Up to that time it was supposed, that the children were decimated by malaria, and other diseases peculiar to low-lying and marshy districts. But the inquiry showed the very opposite, namely, that the same cause which drove away malaria, the conversion of the land, from a morass in winter and a scanty pasture in summer, into fruitful corn land, created the exceptional death-rate of the infants.<sup>49</sup> The 70 medical men, whom Dr. Hunter examined in that district, were “wonderfully in accord” on this point. In fact, the revolution in the mode of cultivation had led to the introduction of the industrial system.

Married women, who work in gangs along with boys and girls, are, for a stipulated sum of money, placed at the disposal of the farmer, by a man called the “undertaker,” who contracts for

the whole gang. "These gangs will sometimes travel many miles from their own village; they are to be met morning and evening on the roads, dressed in short petticoats, with suitable coats and boots, and sometimes trousers, looking wonderfully strong and healthy, but tainted with a customary immorality and heedless of the fatal results which their love of this busy and independent life is bringing on their unfortunate offspring who are pining at home."<sup>50</sup>

Every phenomenon of the factory districts is here reproduced, including, but to a greater extent, ill-disguised infanticide, and dosing children with opiates.<sup>51</sup>

"My knowledge of such evils," says Dr. Simon, the medical officer of the Privy Council and editor in chief of the Reports on Public Health, "may excuse the profound misgiving with which I regard any large industrial employment of adult women."<sup>52</sup>

"Happy indeed," exclaims Mr. Baker, the factory inspector, in his official report, "happy indeed will it be for the manufacturing districts of England, when every married woman having a family is prohibited from working in any textile works at all."<sup>53</sup>

The moral degradation caused by the capitalistic exploitation of women and children has been so exhaustively depicted by F. Engels in his "Lage der Arbeitenden Klasse Englands," and other writers, that I need only mention the subject in this place. But the intellectual desolation artificially produced by converting immature human beings into mere machines for the fabrication of surplus-value, a state of mind clearly distinguishable from that natural ignorance which keeps the mind fallow without destroying its capacity for development, its natural fertility, this desolation finally compelled even the English Parliament to make elementary education a compulsory condition to the "productive" employment of children under 14 years, in every industry subject to the Factory Acts. The spirit of capitalist production stands out clearly in the ludicrous wording of the so-called education clauses in the Factory Acts, in the absence of an administrative machinery, an absence that again makes the compulsion illusory, in the opposition of the manufacturers themselves to these education clauses, and in the tricks and dodges they put in practice for evading them.

"For this the legislature is alone to blame, by having passed a delusive law, which, while it would seem to provide that the children employed in factories shall be *educated*, contains no enactment by which that professed end can be secured. It provides nothing more than that the children shall on certain days of the week, and for a certain number of hours (three) in each day, be inclosed within the four walls of a place called a school, and that the employer of the child shall receive weekly a certificate to that effect signed by a person designated by the subscriber as a schoolmaster or schoolmistress."<sup>54</sup>

Previous to the passing of the amended Factory Act, 1844, it happened, not unfrequently, that the certificates of attendance at school were signed by the schoolmaster or schoolmistress with a cross, as they themselves were unable to write.

"On one occasion, on visiting a place called a school, from which certificates of school attendance, had issued, I was so struck with the ignorance of the master, that I said to him: 'Pray, sir, can you read?' His reply was: 'Aye, summat!' and as a justification of his right to grant certificates, he added: 'At any rate, I am before my scholars.'"

The inspectors, when the Bill of 1844 was in preparation, did not fail to represent the disgraceful state of the places called schools, certificates from which they were obliged to admit as a

compliance with the laws, but they were successful only in obtaining thus much, that since the passing of the Act of 1845,

the figures in the school certificate must be filled up in the handwriting of the schoolmaster, who must also sign his Christian and surname in full.”<sup>55</sup>

Sir John Kincaid, factory inspector for Scotland, relates experiences of the same kind.

“The first school we visited was kept by a Mrs. Ann Killin. Upon asking her to spell her name, she straightway made a mistake, by beginning with the letter C, but correcting herself immediately, she said her name began with a K. On looking at her signature, however, in the school certificate books, I noticed that she spelt it in various ways, while her handwriting left no doubt as to her unfitness to teach. She herself also acknowledged that she could not keep the register ... In a second school I found the schoolroom 15 feet long, and 10 feet wide, and counted in this space 75 children, who were gabbling something unintelligible”<sup>56</sup> But it is not only in the miserable places above referred to that the children obtain certificates of school attendance without having received instruction of any value, for in many schools where there is a competent teacher, his efforts are of little avail from the distracting crowd of children of all ages, from infants of 3 years old and upwards; his livelihood, miserable at the best, depending on the pence received from the greatest number of children whom it is possible to cram into the space. To this is to be added scanty school furniture, deficiency of books, and other materials for teaching, and the depressing effect upon the poor children themselves of a close, noisome atmosphere. I have been in many such schools, where I have seen rows of children doing absolutely nothing; and this is certified as school attendance, and, in statistical returns, such children are set down as being educated.”<sup>57</sup>

In Scotland the manufacturers try all they can to do without the children that are obliged to attend school.

“It requires no further argument to prove that the educational clauses of the Factory Act, being held in such disfavour among mill-owners, tend in a great measure to exclude that class of children alike from the employment and the benefit of education contemplated by this Act.”<sup>58</sup>

Horribly grotesque does this appear in print works, which are regulated by a special Act. By that Act,

“every child, before being employed in a print work must have attended school for at least 30 days, and not less than 150 hours, during the six months immediately preceding such first day of employment, and during the continuance of its employment in the print works, it must attend for a like period of 30 days, and 150 hours during every successive period of six months.... The attendance at school must be between 8 a.m. and 6 p.m. No attendance of less than 2½ hours, nor more than 5 hours on any one day, shall be reckoned as part of the 150 hours. Under ordinary circumstances the children attend school morning and afternoon for 30 days, for at least 5 hours each day, and upon the expiration of the 30 days, the statutory total of 150 hours having been attained, having, in their language, made up their book, they return to the print work, where they continue until the six months have expired, when another instalment of school attendance becomes due, and they again seek the school until the book is again made up.... Many boys having attended school for the required number of hours, when they return to

school after the expiration of their six months' work in the print work, are in the same condition as when they first attended school as print-work boys, that they have lost all they gained by their previous school attendance.... In other print works the children's attendance at school is made to depend altogether upon the exigencies of the work in the establishment. The requisite number of hours is made up each six months, by instalments consisting of from 3 to 5 hours at a time, spreading over, perhaps, the whole six months.... For instance, the attendance on one day might be from 8 to 11 a.m., on another day from 1 p.m. to 4 p.m., and the child might not appear at school again for several days, when it would attend from 3 p.m. to 6 p.m.; then it might attend for 3 or 4 days consecutively, or for a week, then it would not appear in school for 3 weeks or a month, after that upon some odd days at some odd hours when the operative who employed it chose to spare it; and thus the child was, as it were, buffeted from school to work, from work to school, until the tale of 150 hours was told."<sup>59</sup>

By the excessive addition of women and children to the ranks of the workers, machinery at last breaks down the resistance which the male operatives in the manufacturing period continued to oppose to the despotism of capital.<sup>60</sup>

## B. Prolongation of the Working day

If machinery be the most powerful means for increasing the productiveness of labour – i.e., for shortening the working-time required in the production of a commodity, it becomes in the hands of capital the most powerful means, in those industries first invaded by it, for lengthening the working day beyond all bounds set by human nature. It creates, on the one hand, new conditions by which capital is enabled to give free scope to this its constant tendency, and on the other hand, new motives with which to whet capital's appetite for the labour of others.

In the first place, in the form of machinery, the implements of labour become automatic, things moving and working independent of the workman. They are thenceforth an industrial *perpetuum mobile*, that would go on producing forever, did it not meet with certain natural obstructions in the weak bodies and the strong wills of its human attendants. The automaton, as capital, and because it is capital, is endowed, in the person of the capitalist, with intelligence and will; it is therefore animated by the longing to reduce to a minimum the resistance offered by that repellent yet elastic natural barrier, man.<sup>61</sup> This resistance is moreover lessened by the apparent lightness of machine work, and by the more pliant and docile character of the women and children employed on it.<sup>62</sup>

The productiveness of machinery is, as we saw, inversely proportional to the value transferred by it to the product. The longer the life of the machine, the greater is the mass of the products over which the value transmitted by the machine is spread, and the less is the portion of that value added to each single commodity. The active lifetime of a machine is, however, clearly dependent on the length of the working day, or on the duration of the daily labour-process multiplied by the number of days for which the process is carried on.

The wear and tear of a machine is not exactly proportional to its working-time. And even if it were so, a machine working 16 hours daily for 7½ years, covers as long a working period as, and transmits to the total product no more value than, the same machine would if it worked only 8 hours daily for 15 years. But in the first case the value of the machine would be reproduced twice as quickly as in the latter, and the capitalist would, by this use of the machine, absorb in 7½ years as much surplus-value as in the second case he would in 15.

The material wear and tear of a machine is of two kinds. The one arises from use, as coins wear away by circulating, the other from non-use, as a sword rusts when left in its scabbard. The latter kind is due to the elements. The former is more or less directly proportional, the latter to a certain extent inversely proportional, to the use of the machine.<sup>63</sup>

But in addition to the material wear and tear, a machine also undergoes, what we may call a moral depreciation. It loses exchange-value, either by machines of the same sort being produced cheaper than it, or by better machines entering into competition with it.<sup>64</sup> In both cases, be the machine ever so young and full of life, its value is no longer determined by the labour actually materialised in it, but by the labour-time requisite to reproduce either it or the better machine. It has, therefore, lost value more or less. The shorter the period taken to reproduce its total value, the less is the danger of moral depreciation; and the longer the working day, the shorter is that period. When machinery is first introduced into an industry, new methods of reproducing it more cheaply follow blow upon blow<sup>65</sup>, and so do improvements, that not only affect individual parts and details of the machine, but its entire build. It is, therefore, in the early days of the life of machinery that this special incentive to the prolongation of the working day makes itself felt most acutely.<sup>66</sup>

Given the length of the working day, all other circumstances remaining the same, the exploitation of double the number of workmen demands, not only a doubling of that part of constant capital which is invested in machinery and buildings, but also of that part which is laid out in raw material and auxiliary substances. The lengthening of the working day, on the other hand, allows of production on an extended scale without any alteration in the amount of capital laid out on machinery and buildings.<sup>67</sup> Not only is there, therefore, an increase of surplus-value, but the outlay necessary to obtain it diminishes. It is true that this takes place, more or less, with every lengthening of the working day; but in the case under consideration, the change is more marked, because the capital converted into the instruments of labour preponderates to a greater degree.<sup>68</sup> The development of the factory system fixes a constantly increasing portion of the capital in a form, in which, on the one hand, its value is capable of continual self-expansion, and in which, on the other hand, it loses both use-value and exchange-value whenever it loses contact with living labour. "When a labourer," said Mr. Ashworth, a cotton magnate, to Professor Nassau W. Senior, "lays down his spade, he renders useless, for that period, a capital worth eighteen-pence. When one of our people leaves the mill, he renders useless a capital that has cost £100,000."<sup>69</sup> Only fancy! making "useless" for a single moment, a capital that has cost £100,000! It is, in truth, monstrous, that a single one of our people should ever leave the factory! The increased use of machinery, as Senior after the instruction he received from Ashworth clearly perceives, makes a constantly increasing lengthening of the working day "desirable."<sup>70</sup>

Machinery produces relative surplus-value; not only by directly depreciating the value of labour-power, and by indirectly cheapening the same through cheapening the commodities that enter into its reproduction, but also, when it is first introduced sporadically into an industry, by converting the labour employed by the owner of that machinery, into labour of a higher degree and greater efficacy, by raising the social value of the article produced above its individual value, and thus enabling the capitalist to replace the value of a day's labour-power by a smaller portion of the value of a day's product. During this transition period, when the use of machinery is a sort of monopoly, the profits are therefore exceptional, and the capitalist endeavours to exploit thoroughly "the sunny time of this his first love," by prolonging the working day as much as possible. The magnitude of the profit whets his appetite for more profit.

As the use of machinery becomes more general in a particular industry, the social value of the product sinks down to its individual value, and the law that surplus-value does not arise from the

labour-power that has been replaced by the machinery, but from the labour-power actually employed in working with the machinery, asserts itself. Surplus-value arises from variable capital alone, and we saw that the amount of surplus-value depends on two factors, viz., the rate of surplus-value and the number of the workmen simultaneously employed. Given the length of the working day, the rate of surplus-value is determined by the relative duration of the necessary labour and of the surplus labour in a day. The number of the labourers simultaneously employed depends, on its side, on the ratio of the variable to the constant capital. Now, however much the use of machinery may increase the surplus labour at the expense of the necessary labour by heightening the productiveness of labour, it is clear that it attains this result, only by diminishing the number of workmen employed by a given amount of capital. It converts what was formerly variable capital, invested in labour-power, into machinery which, being constant capital, does not produce surplus-value. It is impossible, for instance, to squeeze as much surplus-value out of 2 as out of 24 labourers. If each of these 24 men gives only one hour of surplus labour in 12, the 24 men give together 24 hours of surplus labour, while 24 hours is the total labour of the two men. Hence, the application of machinery to the production of surplus-value implies a contradiction which is immanent in it, since of the two factors of the surplus-value created by a given amount of capital, one, the rate of surplus-value, cannot be increased, except by diminishing the other, the number of workmen. This contradiction comes to light, as soon as by the general employment of machinery in a given industry, the value of the machine-produced commodity regulates the value of all commodities of the same sort; and it is this contradiction, that in its turn, drives the capitalist, without his being conscious of the fact,<sup>71</sup> to excessive lengthening of the working day, in order that he may compensate the decrease in the relative number of labourers exploited, by an increase not only of the relative, but of the absolute surplus labour.

If, then, the capitalistic employment of machinery, on the one hand, supplies new and powerful motives to an excessive lengthening of the working day, and radically changes, as well the methods of labour, as also the character of the social working organism, in such a manner as to break down all opposition to this tendency, on the other hand it produces, partly by opening out to the capitalist new strata of the working-class, previously inaccessible to him, partly by setting free the labourers it supplants, a surplus working population,<sup>72</sup> which is compelled to submit to the dictation of capital. Hence that remarkable phenomenon in the history of modern industry, that machinery sweeps away every moral and natural restriction on the length of the working day. Hence, too, the economic paradox, that the most powerful instrument for shortening labour-time, becomes the most unfailing means for placing every moment of the labourer's time and that of his family, at the disposal of the capitalist for the purpose of expanding the value of his capital. "If," dreamed Aristotle, the greatest thinker of antiquity, "if every tool, when summoned, or even of its own accord, could do the work that befits it, just as the creations of Daedalus moved of themselves, or the tripods of Hephaestos went of their own accord to their sacred work, if the weavers' shuttles were to weave of themselves, then there would be no need either of apprentices for the master workers, or of slaves for the lords."<sup>73</sup> And Antipatros, a Greek poet of the time of Cicero, hailed the invention of the water-wheel for grinding corn, an invention that is the elementary form of all machinery, as the giver of freedom to female slaves, and the bringer back of the golden age.<sup>74</sup> Oh! those heathens! They understood, as the learned Bastiat, and before him the still wiser MacCulloch have discovered, nothing of Political Economy and Christianity. They did not, for example, comprehend that machinery is the surest means of lengthening the working day. They perhaps excused the slavery of one on the ground that it was a means to the full development of another. But to preach slavery of the masses, in order that a few crude and half-educated parvenus, might become "eminent spinners," "extensive sausage-makers," and "influential shoe-black dealers," to do this, they lacked the bump of Christianity.

### C. Intensification of Labour

The immoderate lengthening of the working day, produced by machinery in the hands of capital, leads to a reaction on the part of society, the very sources of whose life are menaced; and, thence, to a normal working day whose length is fixed by law. Thenceforth a phenomenon that we have already met with, namely, the intensification of labour, develops into great importance. Our analysis of absolute surplus-value had reference primarily to the extension or duration of the labour, its intensity being assumed as given. We now proceed to consider the substitution of a more intensified labour for labour of more extensive duration, and the degree of the former.

It is self-evident, that in proportion as the use of machinery spreads, and the experience of a special class of workmen habituated to machinery accumulates, the rapidity and intensity of labour increase as a natural consequence. Thus in England, during half a century, lengthening of the working day went hand in hand with increasing intensity of factory labour. Nevertheless the reader will clearly see, that where we have labour, not carried on by fits and starts, but repeated day after day with unvarying uniformity, a point must inevitably be reached, where extension of the working day and intensity of the labour mutually exclude one another, in such a way that lengthening of the working day becomes compatible only with a lower degree of intensity, and a higher degree of intensity, only with a shortening of the working day. So soon as the gradually surging revolt of the working-class compelled Parliament to shorten compulsorily the hours of labour, and to begin by imposing a normal working day on factories proper, so soon consequently as an increased production of surplus-value by the prolongation of the working day was once for all put a stop to, from that moment capital threw itself with all its might into the production of relative surplus-value, by hastening on the further improvement of machinery. At the same time a change took place in the nature of relative surplus-value. Generally speaking, the mode of producing relative surplus-value consists in raising the productive power of the workman, so as to enable him to produce more in a given time with the same expenditure of labour. Labour-time continues to transmit as before the same value to the total product, but this unchanged amount of exchange-value is spread over more use-value; hence the value of each single commodity sinks. Otherwise, however, so soon as the compulsory shortening of the hours of labour takes place. The immense impetus it gives the development of productive power, and to economy in the means of production, imposes on the workman increased expenditure of labour in a given time, heightened tension of labour-power, and closer filling up of the pores of the working day, or condensation of labour to a degree that is attainable only within the limits of the shortened working day. This condensation of a greater mass of labour into a given period thenceforward counts for what it really is, a greater quantity of labour. In addition to a measure of its extension, i.e., duration, labour now acquires a measure of its intensity or of the degree of its condensation or density.<sup>75</sup> The denser hour of the ten hours' working day contains more labour, i.e., expended labour-power than the more porous hour of the twelve hours' working day. The product therefore of one of the former hours has as much or more value than has the product of  $1 \frac{1}{5}$  of the latter hours. Apart from the increased yield of relative surplus-value through the heightened productiveness of labour, the same mass of value is now produced for the capitalist say by  $3 \frac{1}{3}$  hours of surplus labour, and  $6 \frac{2}{3}$  hours of necessary labour, as was previously produced by four hours of surplus labour and eight hours of necessary labour.

We now come to the question: How is the labour intensified?

The first effect of shortening the working day results from the self-evident law, that the efficiency of labour-power is in an inverse ratio to the duration of its expenditure. Hence, within certain limits what is lost by shortening the duration is gained by the increasing tension of labour-power. That the workman moreover really does expend more labour-power, is ensured by the mode in

which the capitalist pays him.<sup>76</sup> In those industries, such as potteries, where machinery plays little or no part, the introduction of the Factory Acts has strikingly shown that the mere shortening of the working day increases to a wonderful degree the regularity, uniformity, order, continuity, and energy of the labour.<sup>77</sup> It seemed, however, doubtful whether this effect was produced in the factory proper, where the dependence of the workman on the continuous and uniform motion of the machinery had already created the strictest discipline. Hence, when in 1844 the reduction of the working day to less than twelve hours was being debated, the masters almost unanimously declared

“that their overlookers in the different rooms took good care that the hands lost no time,” that “the extent of vigilance and attention on the part of the workmen was hardly capable of being increased,” and, therefore, that the speed of the machinery and other conditions remaining unaltered, “to expect in a well-managed factory any important result from increased attention of the workmen was an absurdity.”<sup>78</sup>

This assertion was contradicted by experiments. Mr. Robert Gardner reduced the hours of labour in his two large factories at Preston, on and after the 20th April, 1844, from twelve to eleven hours a day. The result of about a year’s working was that “the same amount of product for the same cost was received, and the workpeople as a whole earned in eleven hours as much wages as they did before in twelve.”<sup>79</sup> I pass over the experiments made in the spinning and carding rooms, because they were accompanied by an increase of 2% in the speed of the machines. But in the weaving department, where, moreover, many sorts of figured fancy articles were woven, there was not the slightest alteration in the conditions of the work. The result was: “From 6th January to 20th April, 1844, with a twelve hours’ day, average weekly wages of each hand 10s. 1½d., from 20th April to 29th June, 1844, with day of eleven hours, average weekly wages 10s. 3½d.”<sup>80</sup> Here we have more produced in eleven hours than previously in twelve, and entirely in consequence of more steady application and economy of time by the workpeople. While they got the same wages and gained one hour of spare time, the capitalist got the same amount produced and saved the cost of coal, gas, and other such items, for one hour. Similar experiments, and with the like success, were carried out in the mills of Messrs. Horrocks and Jacson.<sup>81</sup>

The shortening of the hours of labour creates, to begin with, the subjective conditions for the condensation of labour, by enabling the workman to exert more strength in a given time. So soon as that shortening becomes compulsory, machinery becomes in the hands of capital the objective means, systematically employed for squeezing out more labour in a given time. This is effected in two ways: by increasing the speed of the machinery, and by giving the workman more machinery to tent. Improved construction of the machinery is necessary, partly because without it greater pressure cannot be put on the workman, and partly because the shortened hours of labour force the capitalist to exercise the strictest watch over the cost of production. The improvements in the steam-engine have increased the piston speed, and at the same time have made it possible, by means of a greater economy of power, to drive with the same or even a smaller consumption of coal more machinery with the same engine. The improvements in the transmitting mechanism have lessened friction, and, what so strikingly distinguishes modern from the older machinery, have reduced the diameter and weight of the shafting to a constantly decreasing minimum. Finally, the improvements in the operative machines have, while reducing their size, increased their speed and efficiency, as in the modern power-loom; or, while increasing the size of their framework, have also increased the extent and number of their working parts, as in spinning-mules, or have added to the speed of these working parts by imperceptible alterations of detail, such as those which ten years ago increased the speed of the spindles in self-acting mules by one-fifth.

The reduction of the working day to 12 hours dates in England from 1832. In 1836 a manufacturer stated:

“The labour now undergone in the factories is much greater than it used to be ... compared with thirty or forty years ago ... owing to the greater attention and activity required by the greatly increased speed which is given to the machinery.”<sup>82</sup>

In the year 1844, Lord Ashley, now Lord Shaftesbury, made in the House of Commons the following statements, supported by documentary evidence:

“The labour performed by those engaged in the processes of manufacture, is three times as great as in the beginning of such operations. Machinery has executed, no doubt, the work that would demand the sinews of millions of men; but it has also prodigiously multiplied the labour of those who are governed by its fearful movements.... In 1815, the labour of following a pair of mules spinning cotton of No. 40 – reckoning 12 hours to the working day – involved a necessity of walking 8 miles. In 1832, the distance travelled in following a pair of mules, spinning cotton yarn of the same number, was 20 miles, and frequently more. In 1835” (query – 1815 or 1825?) “the spinner put up daily, on each of these mules, 820 stretches, making a total of 1,640 stretches in the course of the day. In 1832, the spinner put up on each mule 2,200 stretches, making a total of 4,400. In 1844, 2,400 stretches, making a total of 4,800; and in some cases the amount of labour required is even still greater.... I have another document sent to me in 1842, stating that the labour is progressively increasing - increasing not only because the distance to be travelled is greater, but because the quantity of goods produced is multiplied, while the hands are fewer in proportion than before; and, moreover, because an inferior species of cotton is now often spun, which it is more difficult to work.... In the carding-room there has also been a great increase of labour. One person there does the work formerly divided between two. In the weaving-room, where a vast number of persons are employed, and principally females ... the labour has increased within the last few years fully 10 per cent., owing to the increased speed of the machinery in spinning. In 1838, the number of hanks spun per week was 18,000, in 1843 it amounted to 21,000. In 1819, the number of picks in power-loom-weaving per minute was 60 – in 1842 it was 140, showing a vast increase of labour.”<sup>83</sup>

In the face of this remarkable intensity of labour which had already been reached in 1844 under the Twelve Hours’ Act, there appeared to be a justification for the assertion made at that time by the English manufacturers, that any further progress in that direction was impossible, and therefore that every further reduction of the hours of labour meant a lessened production. The apparent correctness of their reasons will be best shown by the following contemporary statement by Leonard Horner, the factory inspector, their ever watchful censor.

“Now, as the quantity produced must, in the main, be regulated by the speed of the machinery, it must be the interest of the mill-owner to drive it at the utmost rate of speed consistent with these following conditions, viz., the preservation of the machinery from too rapid deterioration; the preservation of the quality of the article manufactured; and the capability of the workman to follow the motion without a greater exertion than he can sustain for a constancy. One of the most important problems, therefore, which the owner of a factory has to solve is to find out the maximum speed at which he can run, with a due regard to the above

conditions. It frequently happens that he finds he has gone too fast, that breakages and bad work more than counterbalance the increased speed, and that he is obliged to slacken his pace. I therefore concluded, that as an active and intelligent mill-owner would find out the safe maximum, it would not be possible to produce as much in eleven hours as in twelve. I further assumed that the operative paid by piecework, would exert himself to the utmost consistent with the power of continuing at the same rate.”<sup>84</sup>

Horner, therefore, came to the conclusion that a reduction of the working hours below twelve would necessarily diminish production.<sup>85</sup> He himself, ten years later, cites his opinion of 1845 in proof of how much he under-estimated in that year the elasticity of machinery, and of man’s labour-power, both of which are simultaneously stretched to an extreme by the compulsory shortening of the working day.

We now come to the period that follows the introduction of the Ten Hours’ Act in 1847 into the English cotton, woollen, silk, and flax mills.

“The speed of the spindles has increased upon throstles 500, and upon mules 1,000 revolutions a minute, i.e., the speed of the throstle spindle, which in 1839 was 4,500 times a minute, is now (1862) 5,000; and of the mule spindle, that was 5,000, is now 6,000 times a minute, amounting in the former case to one-tenth, and in the second case to one-fifth additional increase.”<sup>86</sup>

James Nasmyth, the eminent civil engineer of Patricroft, near Manchester, explained in a letter to Leonard Horner, written in 1852, the nature of the improvements in the steam-engine that had been made between the years 1848 and 1852. After remarking that the horse-power of steam-engines, being always estimated in the official returns according to the power of similar engines in 1828<sup>87</sup>, is only nominal, and can serve only as an index of their real power, he goes on to say:

“I am confident that from the same weight of steam-engine machinery, we are now obtaining at least 50 per cent. more duty or work performed on the average, and that in many cases the identical steam-engines which in the days of the restricted speed of 220 feet per minute, yielded 50 horsepower, are now yielding upwards of 100...” “The modern steam-engine of 100 horse-power is capable of being driven at a much greater force than formerly, arising from improvements in its construction, the capacity and construction of the boilers, &c....” “Although the same number of hands are employed in proportion to the horse-power as at former periods, there are fewer hands employed in proportion to the machinery.”<sup>88</sup> “In the year 1850, the factories of the United Kingdom employed 134,217 nominal horse-power to give motion to 25,638,716 spindles and 301,445 looms. The number of spindles and looms in 1856 was respectively 33,503,580 of the former, and 369,205 of the latter, which, reckoning the force of the nominal horse-power required to be the same as in 1850, would require a force equal to 175,000 horses, but the actual power given in the return for 1856 is 161,435, less by above 10,000 horses than, calculating upon the basis of the return of 1850, the factories ought to have required in 1856.”<sup>89</sup> “The facts thus brought out by the Return (of 1856) appear to be that the factory system is increasing rapidly; that although the same number of hands are employed in proportion to the horse-power as at former periods, there are fewer hands employed in proportion to the machinery; that the steam-engine is enabled to drive an increased weight of machinery by economy of force and other methods, and that an increased quantity of work can be turned off

by improvements in machinery, and in methods of manufacture, by increase of speed of the machinery, and by a variety of other causes.”<sup>90</sup>

“The great improvements made in machines of every kind have raised their productive power very much. Without any doubt, the shortening of the hours of labour... gave the impulse to these improvements. The latter, combined with the more intense strain on the workman, have had the effect, that at least as much is produced in the shortened (by two hours or one-sixth) working day as was previously produced during the longer one.”<sup>91</sup>

One fact is sufficient to show how greatly the wealth of the manufacturers increased along with the more intense exploitation of labour-power. From 1838 to 1850, the average proportional increase in English cotton and other factories was 32%, while from 1850 to 1856 it amounted to 86%.

But however great the progress of English industry had been during the 8 years from 1848 to 1856 under the influence of a working day of 10 hours, it was far surpassed during the next period of 6 years from 1856 to 1862. In silk factories, for instance, there were in 1856, spindles 1,093,799; in 1862, 1,388,544; in 1856, looms 9,260; in 1862, 10,709. But the number of operatives was, in 1856, 56,131; in 1862, 52,429. The increase in the spindles was therefore 26.9% and in the looms 15.6%, while the number of the operatives decreased 7%. In the year 1850 there were employed in worsted mills 875,830 spindles; in 1856, 1,324,549 (increase 51.2%), and in 1862, 1,289,172 (decrease 2.7%). But if we deduct the doubling spindles that figure in the numbers for 1856, but not in those for 1862, it will be found that after 1856 the number of spindles remained nearly stationary. On the other hand, after 1850, the speed of the spindles and looms was in many cases doubled. The number of power-looms in worsted mills was, in 1850, 32,617; in 1856, 38,956; in 1862, 43,048. The number of the operatives was, in 1850, 79,737; in 1856, 87,794; in 1862, 86,063; included in these, however, the children under 14 years of age were, in 1850, 9,956; in 1856, 11,228; in 1862, 13,178. In spite, therefore, of the greatly increased number of looms in 1862, compared with 1856, the total number of the workpeople employed decreased, and that of the children exploited increased.<sup>92</sup>

On the 27th April, 1863, Mr. Ferrand said in the House of Commons:

“I have been informed by delegates from 16 districts of Lancashire and Cheshire, in whose behalf I speak, that the work in the factories is, in consequence of the improvements in machinery, constantly on the increase. Instead of as formerly one person with two helps tending two looms, one person now tends three looms without helps, and it is no uncommon thing for one person to tend four. Twelve hours’ work, as is evident from the facts adduced, is now compressed into less than 10 hours. It is therefore self-evident, to what an enormous extent the toil of the factory operative has increased during the last 10 years.”<sup>93</sup>

Although, therefore, the Factory Inspectors unceasingly and with justice, commend the results of the Acts of 1844 and 1850, yet they admit that the shortening of the hours of labour has already called forth such an intensification of the labour as is injurious to the health of the workman and to his capacity for work.

“In most of the cotton, worsted, and silk mills, an exhausting state of excitement necessary to enable the workers satisfactorily to mind the machinery, the motion of which has been greatly accelerated within the last few years, seems to me not unlikely to be one of the causes of that excess of mortality from lung disease, which Dr. Greenhow has pointed out in his recent report on this subject.”<sup>94</sup>

There cannot be the slightest doubt that the tendency that urges capital, so soon as a prolongation of the hours of labour is once for all forbidden, to compensate itself, by a systematic heightening of the intensity of labour, and to convert every improvement in machinery into a more perfect means of exhausting the workman, must soon lead to a state of things in which a reduction of the hours of labour will again be inevitable.<sup>95</sup> On the other hand, the rapid advance of English industry between 1848 and the present time, under the influence of a day of 10 hours, surpasses the advance made between 1833 and 1847, when the day was 12 hours long, by far more than the latter surpasses the advance made during the half century after the first introduction of the factory system, when the working day was without limits.<sup>96</sup>

## Section 4: The Factory

At the commencement of this chapter we considered that which we may call the body of the factory, i.e., machinery organised into a system. We there saw how machinery, by annexing the labour of women and children, augments the number of human beings who form the material for capitalistic exploitation, how it confiscates the whole of the workman's disposable time, by immoderate extension of the hours of labour, and how finally its progress, which allows of enormous increase of production in shorter and shorter periods, serves as a means of systematically getting more work done in a shorter time, or of exploiting labour-power more intensely. We now turn to the factory as a whole, and that in its most perfect form.

Dr. Ure, the Pindar of the automatic factory, describes it, on the one hand, as

“Combined co-operation of many orders of workpeople, adult and young, in tending with assiduous skill, a system of productive machines, continuously impelled by a central power” (the prime mover); on the other hand, as “a vast automaton, composed of various mechanical and intellectual organs, acting in uninterrupted concert for the production of a common object, all of them being subordinate to a self-regulated moving force.”

These two descriptions are far from being identical. In one, the collective labourer, or social body of labour, appears as the dominant subject, and the mechanical automaton as the object; in the other, the automaton itself is the subject, and the workmen are merely conscious organs, co-ordinate with the unconscious organs of the automaton, and together with them, subordinated to the central moving-power. The first description is applicable to every possible employment of machinery on a large scale, the second is characteristic of its use by capital, and therefore of the modern factory system. Ure prefers therefore, to describe the central machine, from which the motion comes, not only as an automaton, but as an autocrat. “In these spacious halls the benignant power of steam summons around him his myriads of willing menials.”<sup>97</sup>

Along with the tool, the skill of the workman in handling it passes over to the machine. The capabilities of the tool are emancipated from the restraints that are inseparable from human labour-power. Thereby the technical foundation on which is based the division of labour in Manufacture, is swept away. Hence, in the place of the hierarchy of specialised workmen that characterises manufacture, there steps, in the automatic factory, a tendency to equalise and reduce to one and the same level every kind of work that has to be done by the minders of the machines;<sup>98</sup> in the place of the artificially produced differentiations of the detail workmen, step the natural differences of age and sex.

So far as division of labour re-appears in the factory, it is primarily a distribution of the workmen among the specialised machines; and of masses of workmen, not however organised into groups, among the various departments of the factory, in each of which they work at a number of similar

machines placed together; their co-operation, therefore, is only simple. The organised group, peculiar to manufacture, is replaced by the connexion between the head workman and his few assistants. The essential division is, into workmen who are actually employed on the machines (among whom are included a few who look after the engine), and into mere attendants (almost exclusively children) of these workmen. Among the attendants are reckoned more or less all "Feeders" who supply the machines with the material to be worked. In addition to these two principal classes, there is a numerically unimportant class of persons, whose occupation it is to look after the whole of the machinery and repair it from time to time; such as engineers, mechanics, joiners, &c. This is a superior class of workmen, some of them scientifically educated, others brought up to a trade; it is distinct from the factory operative class, and merely aggregated to it.<sup>99</sup> This division of labour is purely technical.

To work at a machine, the workman should be taught from childhood, in order that he may learn to adapt his own movements to the uniform and unceasing motion of an automaton. When the machinery, as a whole, forms a system of manifold machines, working simultaneously and in concert, the co-operation based upon it, requires the distribution of various groups of workmen among the different kinds of machines. But the employment of machinery does away with the necessity of crystallising this distribution after the manner of Manufacture, by the constant annexation of a particular man to a particular function.<sup>100</sup> Since the motion of the whole system does not proceed from the workman, but from the machinery, a change of persons can take place at any time without an interruption of the work. The most striking proof of this is afforded by the *relays system*, put into operation by the manufacturers during their revolt from 1848-1850. Lastly, the quickness with which machine work is learnt by young people, does away with the necessity of bringing up for exclusive employment by machinery, a special class of operatives.<sup>101</sup> With regard to the work of the mere attendants, it can, to some extent, be replaced in the mill by machines,<sup>102</sup> and owing to its extreme simplicity, it allows of a rapid and constant change of the individuals burdened with this drudgery.

Although then, technically speaking, the old system of division of labour is thrown overboard by machinery, it hangs on in the factory, as a traditional habit handed down from Manufacture, and is afterwards systematically re-moulded and established in a more hideous form by capital, as a means of exploiting labour-power. The life-long speciality of handling one and the same tool, now becomes the life-long speciality of serving one and the same machine. Machinery is put to a wrong use, with the object of transforming the workman, from his very childhood, into a part of a detail-machine.<sup>103</sup> In this way, not only are the expenses of his reproduction considerably lessened, but at the same time his helpless dependence upon the factory as a whole, and therefore upon the capitalist, is rendered complete. Here as everywhere else, we must distinguish between the increased productiveness due to the development of the social process of production, and that due to the capitalist exploitation of that process. In handicrafts and manufacture, the workman makes use of a tool, in the factory, the machine makes use of him. There the movements of the instrument of labour proceed from him, here it is the movements of the machine that he must follow. In manufacture the workmen are parts of a living mechanism. In the factory we have a lifeless mechanism independent of the workman, who becomes its mere living appendage.

"The miserable routine of endless drudgery and toil in which the same mechanical process is gone through over and over again, is like the labour of Sisyphus. The burden of labour, like the rock, keeps ever falling back on the worn-out labourer."<sup>104</sup>

At the same time that factory work exhausts the nervous system to the uttermost, it does away with the many-sided play of the muscles, and confiscates every atom of freedom, both in bodily

and intellectual activity.<sup>105</sup> The lightening of the labour, even, becomes a sort of torture, since the machine does not free the labourer from work, but deprives the work of all interest. Every kind of capitalist production, in so far as it is not only a labour-process, but also a process of creating surplus-value, has this in common, that it is not the workman that employs the instruments of labour, but the instruments of labour that employ the workman. But it is only in the factory system that this inversion for the first time acquires technical and palpable reality. By means of its conversion into an automaton, the instrument of labour confronts the labourer, during the labour-process, in the shape of capital, of dead labour, that dominates, and pumps dry, living labour-power. The separation of the intellectual powers of production from the manual labour, and the conversion of those powers into the might of capital over labour, is, as we have already shown, finally completed by modern industry erected on the foundation of machinery. The special skill of each individual insignificant factory operative vanishes as an infinitesimal quantity before the science, the gigantic physical forces, and the mass of labour that are embodied in the factory mechanism and, together with that mechanism, constitute the power of the “master.” This “master,” therefore, in whose brain the machinery and his monopoly of it are inseparably united, whenever he falls out with his “hands,” contemptuously tells them:

“The factory operatives should keep in wholesome remembrance the fact that theirs is really a low species of skilled labour; and that there is none which is more easily acquired, or of its quality more amply remunerated, or which by a short training of the least expert can be more quickly, as well as abundantly, acquired.... The master’s machinery really plays a far more important part in the business of production than the labour and the skill of the operative, which six months’ education can teach, and a common labourer can learn.”<sup>106</sup>

The technical subordination of the workman to the uniform motion of the instruments of labour, and the peculiar composition of the body of workpeople, consisting as it does of individuals of both sexes and of all ages, give rise to a barrack discipline, which is elaborated into a complete system in the factory, and which fully develops the before mentioned labour of overlooking, thereby dividing the workpeople into operatives and overlookers, into private soldiers and sergeants of an industrial army. “The main difficulty [in the automatic factory] ... lay ... above all in training human beings to renounce their desultory habits of work, and to identify themselves with the unvarying regularity of the complex automaton. To devise and administer a successful code of factory discipline, suited to the necessities of factory diligence, was the Herculean enterprise, the noble achievement of Arkwright! Even at the present day, when the system is perfectly organised and its labour lightened to the utmost, it is found nearly impossible to convert persons past the age of puberty, into useful factory hands.”<sup>107</sup> The factory code in which capital formulates, like a private legislator, and at his own good will, his autocracy over his workpeople, unaccompanied by that division of responsibility, in other matters so much approved of by the bourgeoisie, and unaccompanied by the still more approved representative system, this code is but the capitalistic caricature of that social regulation of the labour-process which becomes requisite in co-operation on a great scale, and in the employment in common, of instruments of labour and especially of machinery. The place of the slave-driver’s lash is taken by the overlooker’s book of penalties. All punishments naturally resolve themselves into fines and deductions from wages, and the law-giving talent of the factory Lycurgus so arranges matters, that a violation of his laws is, if possible, more profitable to him than the keeping of them.<sup>108</sup> We shall here merely allude to the material conditions under which factory labour is carried on. Every organ of sense is injured in an equal degree by artificial elevation of the temperature, by the dust-laden atmosphere, by the deafening noise, not to mention danger to life and limb among the

thickly crowded machinery, which, with the regularity of the seasons, issues its list of the killed and wounded in the industrial battle.<sup>109</sup> Economy of the social means of production, matured and forced as in a hothouse by the factory system, is turned, in the hands of capital, into systematic robbery of what is necessary for the life of the workman while he is at work, robbery of space, light, air, and of protection to his person against the dangerous and unwholesome accompaniments of the productive process, not to mention the robbery of appliances for the comfort of the workman.<sup>110</sup> Is Fourier wrong when he calls factories “tempered bagnos”?<sup>111</sup>

## Section 5: The Strife Between Workman and Machine

The contest between the capitalist and the wage-labourer dates back to the very origin of capital. It raged on throughout the whole manufacturing period.<sup>112</sup> But only since the introduction of machinery has the workman fought against the instrument of labour itself, the material embodiment of capital. He revolts against this particular form of the means of production, as being the material basis of the capitalist mode of production.

In the 17th century nearly all Europe experienced revolts of the workpeople against the ribbon-loom, a machine for weaving ribbons and trimmings, called in Germany Bandmühle, Schnurmühle, and Mühlenstuhl. These machines were invented in Germany. Abbé Lancellotti, in a work that appeared in Venice in 1636, but which was written in 1579, says as follows:

“Anthony Müller of Danzig saw about 50 years ago in that town, a very ingenious machine, which weaves 4 to 6 pieces at once. But the Mayor being apprehensive that this invention might throw a large number of workmen on the streets, caused the inventor to be secretly strangled or drowned.”

In Leyden, this machine was not used till 1629; there the riots of the ribbon-weavers at length compelled the Town Council to prohibit it.

“In hac urbe,” says Boxhorn (Inst. Pol., 1663), referring to the introduction of this machine into Leyden, “ante hos viginti circiter annos instrumentum quidam invenerunt textorium, quo solus plus panni et facilius conficere poterat, quam plures aequali tempore. Hinc turbæ ortæ et querulæ textorum, tandemque usus hujus instrumenti a magistratu prohibitus est.”

[In this town, about twenty years ago certain people invented an instrument for weaving, with which a single person could weave more cloth, and more easily, than many others in the same length of time. As a result there arose disturbances and complaints from the weavers, until the Town Council finally prohibited the use of this instrument.]

After making various decrees more or less prohibitive against this loom in 1632, 1639, &c., the States General of Holland at length permitted it to be used, under certain conditions, by the decree of the 15th December, 1661. It was also prohibited in Cologne in 1676, at the same time that its introduction into England was causing disturbances among the workpeople. By an imperial Edict of 19th Feb., 1685, its use was forbidden throughout all Germany. In Hamburg it was burnt in public by order of the Senate. The Emperor Charles VI., on 9th Feb., 1719, renewed the edict of 1685, and not till 1765 was its use openly allowed in the Electorate of Saxony. This machine, which shook Europe to its foundations, was in fact the precursor of the mule and the power-loom, and of the industrial revolution of the 18th century. It enabled a totally inexperienced boy, to set the whole loom with all its shuttles in motion, by simply moving a rod backwards and forwards, and in its improved form produced from 40 to 50 pieces at once.

About 1630, a wind-sawmill, erected near London by a Dutchman, succumbed to the excesses of the populace. Even as late as the beginning of the 18th century, sawmills driven by water overcame the opposition of the people, supported as it was by Parliament, only with great difficulty. No sooner had Everet in 1758 erected the first wool-shearing machine that was driven by water-power, than it was set on fire by 100,000 people who had been thrown out of work. Fifty thousand workpeople, who had previously lived by carding wool, petitioned Parliament against Arkwright's scribbling mills and carding engines. The enormous destruction of machinery that occurred in the English manufacturing districts during the first 15 years of this century, chiefly caused by the employment of the power-loom, and known as the Luddite movement, gave the anti-Jacobin governments of a Sidmouth, a Castlereagh, and the like, a pretext for the most reactionary and forcible measures. It took both time and experience before the workpeople learnt to distinguish between machinery and its employment by capital, and to direct their attacks, not against the material instruments of production, but against the mode in which they are used.<sup>113</sup>

The contests about wages in Manufacture, pre-suppose manufacture, and are in no sense directed against its existence. The opposition against the establishment of new manufactures, proceeds from the guilds and privileged towns, not from the workpeople. Hence the writers of the manufacturing period treat the division of labour chiefly as a means of virtually supplying a deficiency of labourers, and not as a means of actually displacing those in work. This distinction is self-evident. If it be said that 100 millions of people would be required in England to spin with the old spinning-wheel the cotton that is now spun with mules by 500,000 people, this does not mean that the mules took the place of those millions who never existed. It means only this, that many millions of workpeople would be required to replace the spinning machinery. If, on the other hand, we say, that in England the power-loom threw 800,000 weavers on the streets, we do not refer to existing machinery, that would have to be replaced by a definite number of workpeople, but to a number of weavers in existence who were actually replaced or displaced by the looms. During the manufacturing period, handicraft labour, altered though it was by division of labour, was yet the basis. The demands of the new colonial markets could not be satisfied owing to the relatively small number of town operatives handed down from the middle ages, and the manufactures proper opened out new fields of production to the rural population, driven from the land by the dissolution of the feudal system. At that time, therefore, division of labour and co-operation in the workshops, were viewed more from the positive aspect, that they made the workpeople more productive.<sup>114</sup> Long before the period of modern industry, co-operation and the concentration of the instruments of labour in the hands of a few, gave rise, in numerous countries where these methods were applied in agriculture, to great, sudden and forcible revolutions in the modes of production, and consequentially, in the conditions of existence, and the means of employment of the rural populations. But this contest at first takes place more between the large and the small landed proprietors, than between capital and wage labour; on the other hand, when the labourers are displaced by the instruments of labour, by sheep, horses, &c., in this case force is directly resorted to in the first instance as the prelude to the industrial revolution. The labourers are first driven from the land, and then come the sheep. Land grabbing on a great scale, such as was perpetrated in England, is the first step in creating a field for the establishment of agriculture on a great scale.<sup>115</sup> Hence this subversion of agriculture puts on, at first, more the appearance of a political revolution.

The instrument of labour, when it takes the form of a machine, immediately becomes a competitor of the workman himself.<sup>116</sup> The self-expansion of capital by means of machinery is thenceforward directly proportional to the number of the workpeople, whose means of livelihood have been destroyed by that machinery. The whole system of capitalist production is based on the

fact that the workman sells his labour-power as a commodity. Division of labour specialises this labour-power, by reducing it to skill in handling a particular tool. So soon as the handling of this tool becomes the work of a machine, then, with the use-value, the exchange-value too, of the workman's labour-power vanishes; the workman becomes unsaleable, like paper money thrown out of currency by legal enactment. That portion of the working-class, thus by machinery rendered superfluous, i.e., no longer immediately necessary for the self-expansion of capital, either goes to the wall in the unequal contest of the old handicrafts and manufactures with machinery, or else floods all the more easily accessible branches of industry, swamps the labour-market, and sinks the price of labour-power below its value. It is impressed upon the workpeople, as a great consolation, first, that their sufferings are only temporary ("a temporary inconvenience"), secondly, that machinery acquires the mastery over the whole of a given field of production, only by degrees, so that the extent and intensity of its destructive effect is diminished. The first consolation neutralises the second. When machinery seizes on an industry by degrees, it produces chronic misery among the operatives who compete with it. Where the transition is rapid, the effect is acute and felt by great masses. History discloses no tragedy more horrible than the gradual extinction of the English hand-loom weavers, an extinction that was spread over several decades, and finally sealed in 1838. Many of them died of starvation, many with families vegetated for a long time on 2½ d. a day.<sup>117</sup> On the other hand, the English cotton machinery produced an acute effect in India. The Governor General reported 1834-35:

"The misery hardly finds a parallel in the history of commerce. The bones of the cotton-weavers are bleaching the plains of India."

No doubt, in turning them out of this "temporal" world, the machinery caused them no more than "a temporary inconvenience." For the rest, since machinery is continually seizing upon new fields of production, its temporary effect is really permanent. Hence, the character of independence and estrangement which the capitalist mode of production as a whole gives to the instruments of labour and to the product, as against the workman, is developed by means of machinery into a thorough antagonism.<sup>118</sup> Therefore, it is with the advent of machinery, that the workman for the first time brutally revolts against the instruments of labour.

The instrument of labour strikes down the labourer. This direct antagonism between the two comes out most strongly, whenever newly introduced machinery competes with handicrafts or manufactures, handed down from former times. But even in modern industry the continual improvement of machinery, and the development of the automatic system, has an analogous effect.

"The object of improved machinery is to diminish manual labour, to provide for the performance of a process or the completion of a link in a manufacture by the aid of an iron instead of the human apparatus."<sup>119</sup> "The adaptation of power to machinery heretofore moved by hand, is almost of daily occurrence ... the minor improvements in machinery having for their object economy of power, the production of better work, the turning off more work in the same time, or in supplying the place of a child, a female, or a man, are constant, and although sometimes apparently of no great moment, have somewhat important results."<sup>120</sup> "Whenever a process requires peculiar dexterity and steadiness of hand, it is withdrawn, as soon as possible, from the cunning workman, who is prone to irregularities of many kinds, and it is placed in charge of a peculiar mechanism, so self-regulating that a child can superintend it."<sup>121</sup> "On the automatic plan skilled labour gets progressively superseded."<sup>122</sup> "The effect of improvements in machinery, not merely in superseding the necessity for the employment of the

same quantity of adult labour as before, in order to produce a given result, but in substituting one description of human labour for another, the less skilled for the more skilled, juvenile for adult, female for male, causes a fresh disturbance in the rate of wages.”<sup>123</sup> “The effect of substituting the self-acting mule for the common mule, is to discharge the greater part of the men spinners, and to retain adolescents and children.”<sup>124</sup>

The extraordinary power of expansion of the factory system owing to accumulated practical experience, to the mechanical means at hand, and to constant technical progress, was proved to us by the giant strides of that system under the pressure of a shortened working day. But who, in 1860, the Zenith year of the English cotton industry, would have dreamt of the galloping improvements in machinery, and the corresponding displacement of working people, called into being during the following 3 years, under the stimulus of the American Civil War? A couple of examples from the Reports of the Inspectors of Factories will suffice on this point. A Manchester manufacturer states:

“We formerly had 75 carding engines, now we have 12, doing the same quantity of work... We are doing with fewer hands by 14, at a saving in wages of £10 a-week. Our estimated saving in waste is about 10% in the quantity of cotton consumed.” “In another fine-spinning mill in Manchester, I was informed that through increased speed and the adoption of some self-acting processes, a reduction had been made, in number, of a fourth in one department, and of above half in another, and that the introduction of the combing machine in place of the second carding, had considerably reduced, the number of hands formerly employed in the carding-room.”

Another spinning-mill is estimated to effect a saving of labour of 10%. The Messrs. Gilmour, spinners at Manchester, state: “In our blowing-room department we consider our expense with new machinery is fully one-third less in wages and hands ... in the jack-frame and drawing-frame room, about one-third less in expense, and likewise one-third less in hands; in the spinning room about one-third less in expenses. But this is not all; when our yarn goes to the manufacturers, it is so much better by the application of our new machinery, that they will produce a greater quantity of cloth, and cheaper than from the yarn produced by old machinery.”<sup>125</sup> Mr. Redgrave further remarks in the same Report:

“The reduction of hands against increased production is, in fact, constantly taking place, in woollen mills the reduction commenced some time since, and is continuing; a few days since, the master of a school in the neighbourhood of Rochdale said to me, that the great falling off in the girls’ school is not only caused by the distress, but by the changes of machinery in the woollen mills, in consequence of which a reduction of 70 short-timers had taken place.”<sup>126</sup>

The following table shows the total result of the mechanical improvements in the English cotton industry due to the American Civil War.

|                       |         |         |         |
|-----------------------|---------|---------|---------|
| Number of Factories   | 1857    | 1861    | 1868    |
| England and Wales     | 2,046   | 2,715   | 2,405   |
| Scotland              | 152     | 163     | 131     |
| Ireland               | 12      | 9       | 13      |
| United Kingdom        | 2,210   | 2,887   | 2,549   |
| Number of Power Looms | 1857    | 1861    | 1868    |
| England and Wales     | 275,590 | 368,125 | 344,719 |

|                            |            |            |            |
|----------------------------|------------|------------|------------|
| Scotland                   | 21,624     | 30,110     | 31,864     |
| Ireland                    | 1,633      | 1,757      | 2,746      |
| United Kingdom             | 298,847    | 399,992    | 379,329    |
| Number of Spindles         | 1857       | 1861       | 1868       |
| England and Wales          | 25,818,576 | 28,352,125 | 30,478,228 |
| Scotland                   | 2,041,129  | 1,915,398  | 1,397,546  |
| Ireland                    | 150,512    | 119,944    | 124,240    |
| United Kingdom             | 28,010,217 | 30,387,467 | 32,000,014 |
| Number of Persons Employed | 1857       | 1861       | 1868       |
| England and Wales          | 341,170    | 407,598    | 357,052    |
| Scotland                   | 34,698     | 41,237     | 39,809     |
| Ireland                    | 3,345      | 2,734      | 4,203      |
| United Kingdom             | 379,213    | 452,569    | 401,064    |

Hence, between 1861 and 1868, 338 cotton factories disappeared, in other words more productive machinery on a larger scale was concentrated in the hands of a smaller number of capitalists. The number of power-looms decreased by 20,663; but since their product increased in the same period, an improved loom must have yielded more than an old one. Lastly the number of spindles increased by 1,612,541, while the number of operatives decreased by 50,505. The “temporary” misery inflicted on the workpeople by the cotton-crisis, was heightened, and from being temporary made permanent, by the rapid and persistent progress of machinery.

But machinery not only acts as a competitor who gets the better of the workman, and is constantly on the point of making him superfluous. It is also a power inimical to him, and as such capital proclaims it from the roof tops and as such makes use of it. It is the most powerful weapon for repressing strikes, those periodical revolts of the working-class against the autocracy of capital.<sup>127</sup> According to Gaskell, the steam-engine was from the very first an antagonist of human power, an antagonist that enabled the capitalist to tread under foot the growing claims of the workmen, who threatened the newly born factory system with a crisis.<sup>128</sup> It would be possible to write quite a history of the inventions, made since 1830, for the sole purpose of supplying capital with weapons against the revolts of the working-class. At the head of these in importance, stands the self-acting mule, because it opened up a new epoch in the automatic system.<sup>129</sup>

Nasmyth, the inventor of the steam-hammer, gives the following evidence before the Trades’ Union Commission, with regard to the improvements made by him in machinery and introduced in consequence of the wide-spread and long strikes of the engineers in 1851.

“The characteristic feature of our modern mechanical improvements, is the introduction of self-acting tool machinery. What every mechanical workman has now to do, and what every boy can do, is not to work himself but to superintend the beautiful labour of the machine. The whole class of workmen that depend exclusively on their skill, is now done away with. Formerly, I employed four boys to every mechanic. Thanks to these new mechanical combinations, I have reduced the number of grown-up men from 1,500 to 750. The result was a considerable increase in my profits.”

Ure says of a machine used in calico printing:

“At length capitalists sought deliverance from this intolerable bondage” [namely the, in their eyes, burdensome terms of their contracts with the workmen] “in the

resources of science, and were speedily re-instated in their legitimate rule, that of the head over the inferior members.”

Speaking of an invention for dressing warps:

“Then the combined malcontents, who fancied themselves impregably entrenched behind the old lines of division of labour, found their flanks turned and their defences rendered useless by the new mechanical tactics, and were obliged to surrender at discretion.”

With regard to the invention of the self-acting mule, he says:

“A creation destined to restore order among the industrious classes.... This invention confirms the great doctrine already propounded, that when capital enlists science into her service, the refractory hand of labour will always be taught docility.”<sup>130</sup>

Although Ure’s work appeared 30 years ago, at a time when the factory system was comparatively but little developed, it still perfectly expresses the spirit of the factory, not only by its undisguised cynicism, but also by the naïveté with which it blurts out the stupid contradictions of the capitalist brain. For instance, after propounding the “doctrine” stated above, that capital, with the aid of science taken into its pay, always reduces the refractory hand of labour to docility, he grows indignant because

“it (physico-mechanical science) has been accused of lending itself to the rich capitalist as an instrument for harassing the poor.”

After preaching a long sermon to show how advantageous the rapid development of machinery is to the working-classes, he warns them, that by their obstinacy and their strikes they hasten that development.

“Violent revulsions of this nature,” he says, “display short-sighted man in the contemptible character of a self-tormentor.”

A few pages before he states the contrary.

“Had it not been for the violent collisions and interruptions resulting from erroneous views among the factory operatives, the factory system would have been developed still more rapidly and beneficially for all concerned.” Then he exclaims again: “Fortunately for the state of society in the cotton districts of Great Britain, the improvements in machinery are gradual.” “It” (improvement in machinery) “is said to lower the rate of earnings of adults by displacing a portion of them, and thus rendering their number superabundant as compared with the demand for their labour. It certainly augments the demand for the labour of children and increases the rate of *their* wages.”

On the other hand, this same dispenser of consolation defends the lowness of the children’s wages on the ground that it prevents parents from sending their children at too early an age into the factory. The whole of his book is a vindication of a working day of unrestricted length; that Parliament should forbid children of 13 years to be exhausted by working 12 hours a day, reminds his liberal soul of the darkest days of the Middle Ages. This does not prevent him from calling upon the factory operatives to thank Providence, who by means of machinery has given them the leisure to think of their “immortal interests.”<sup>131</sup>

## Section 6: The Theory of Compensation as Regards the Workpeople Displaced by Machinery

James Mill, MacCulloch, Torrens, Senior, John Stuart Mill, and a whole series besides, of bourgeois political economists, insist that all machinery that displaces workmen, simultaneously and necessarily sets free an amount of capital adequate to employ the same identical workmen.<sup>132</sup>

Suppose a capitalist to employ 100 workmen, at £30 a year each, in a carpet factory. The variable capital annually laid out amounts, therefore, to £3,000. Suppose, also, that he discharges 50 of his workmen, and employs the remaining 50 with machinery that costs him £1,500. To simplify matters, we take no account of buildings, coal, &c. Further suppose that the raw material annually consumed costs £3,000, both before and after the change.<sup>133</sup> Is any capital set free by this metamorphosis? Before the change, the total sum of £6,000 consisted half of constant, and half of variable capital. After the change it consists of £4,500 constant ( £3,000 raw material and £1,500 machinery), and £1,500 variable capital. The variable capital, instead of being one half, is only one quarter, of the total capital. Instead of being set free, a part of the capital is here locked up in such a way as to cease to be exchanged against labour-power: variable has been changed into constant capital. Other things remaining unchanged, the capital of £6,000, can, in future, employ no more than 50 men. With each improvement in the machinery, it will employ fewer. If the newly introduced machinery had cost less than did the labour-power and implements displaced by it, if, for instance, instead of costing £1,500, it had cost only £1,000, a variable capital of £1,000 would have been converted into constant capital, and locked up; and a capital of £500 would have been set free. The latter sum, supposing wages unchanged, would form a fund sufficient to employ about 16 out of the 50 men discharged; nay, less than 16, for, in order to be employed as capital, a part of this £500 must now become constant capital, thus leaving only the remainder to be laid out in labour-power.

But, suppose, besides, that the making of the new machinery affords employment to a greater number of mechanics, can that be called compensation to the carpet-makers, thrown on the streets? At the best, its construction employs fewer men than its employment displaces. The sum of £1,500 that formerly represented the wages of the discharged carpet-makers, now represents in the shape of machinery: (1) the value of the means of production used in the construction of that machinery, (2) the wages of the mechanics employed in its construction, and (3) the surplus-value falling to the share of their “master.” Further, the machinery need not be renewed till it is worn out. Hence, in order to keep the increased number of mechanics in constant employment, one carpet manufacturer after another must displace workmen by machines.

As a matter of fact the apologists do not mean this sort of setting free.

They have in their minds the means of subsistence of the liberated work-people. It cannot be denied, in the above instance, that the machinery not only liberates 50 men, thus placing them at others' disposal, but, at the same time, it withdraws from their consumption, and sets free, means of subsistence to the value of £1,500. The simple fact, by no means a new one, that machinery cuts off the workmen from their means of subsistence is, therefore, in economic parlance tantamount to this, that machinery liberates means of subsistence for the workman, or converts those means into capital for his employment. The mode of expression, you see, is everything. *Nominibus mollire licet mala.*

This theory implies that the £1,500 worth of means of subsistence was capital that was being expanded by the labour of the 50 men discharged. That, consequently, this capital falls out of employment so soon as they commence their forced holidays, and never rests till it has found a fresh investment, where it can again be productively consumed by these same 50 men. That

sooner or later, therefore, the capital and the workmen must come together again, and that, then, the compensation is complete. That the sufferings of the workmen displaced by machinery are therefore as transient as are the riches of this world.

In relation to the discharged workmen, the £1,500 worth of means of subsistence never was capital. What really confronted them as capital, was the sum of £1,500, afterwards laid out in machinery. On looking closer it will be seen that this sum represented part of the carpets produced in a year by the 50 discharged men, which part they received as wages from their employer in money instead of in kind. With the carpets in the form of money, they bought means of subsistence to the value of £1,500. These means, therefore, were to them, not capital, but commodities, and they, as regards these commodities, were not wage-labourers, but buyers. The circumstance that they were “freed” by the machinery, from the means of purchase, changed them from buyers into non-buyers. Hence a lessened demand for those commodities – voilà tout. If this diminution be not compensated by an increase from some other quarter, the market price of the commodities falls. If this state of things lasts for some time, and extends, there follows a discharge of workmen employed in the production of these commodities. Some of the capital that was previously devoted to production of necessary means of subsistence, has to become reproduced in another form. While prices fall, and capital is being displaced, the labourers employed in the production of necessary means of subsistence are in their turn “freed” from a part of their wages. Instead, therefore, of proving that, when machinery frees the workman from his means of subsistence, it simultaneously converts those means into capital for his further employment, our apologists, with their cut-and-dried law of supply and demand, prove, on the contrary, that machinery throws workmen on the streets, not only in that branch of production in which it is introduced, but also in those branches in which it is not introduced.

The real facts, which are travestied by the optimism of economists, are as follows: The labourers, when driven out of the workshop by the machinery, are thrown upon the labour market, and there add to the number of workmen at the disposal of the capitalists. In Part VII of this book it will be seen that this effect of machinery, which, as we have seen, is represented to be a compensation to the working class, is on the contrary a most frightful scourge. For the present I will only say this: The labourers that are thrown out of work in any branch of industry, can no doubt seek for employment in some other branch. If they find it, and thus renew the bond between them and the means of subsistence, this takes place only by the intermediary of a new and additional capital that is seeking investment; not at all by the intermediary of the capital that formerly employed them and was afterwards converted into machinery. And even should they find employment, what a poor look-out is theirs! Crippled as they are by division of labour, these poor devils are worth so little outside their old trade, that they cannot find admission into any industries, except a few of inferior kind, that are over-supplied with underpaid workmen.<sup>134</sup> Further, every branch of industry attracts each year a new stream of men, who furnish a contingent from which to fill up vacancies, and to draw a supply for expansion. So soon as machinery sets free a part of the workmen employed in a given branch of industry, the reserve men are also diverted into new channels of employment, and become absorbed in other branches; meanwhile the original victims, during the period of transition, for the most part starve and perish.

It is an undoubted fact that machinery, as such, is not responsible for “setting free” the workman from the means of subsistence. It cheapens and increases production in that branch which it seizes on, and at first makes no change in the mass of the means of subsistence produced in other branches. Hence, after its introduction, the society possesses as much, if not more, of the necessaries of life than before, for the labourers thrown out of work; and that quite apart from the enormous share of the annual produce wasted by the non-workers. And this is the point relied on

by our apologists! The contradictions and antagonisms inseparable from the capitalist employment of machinery, do not exist, they say, since they do not arise out of machinery, as such, but out of its capitalist employment! Since therefore machinery, considered alone, shortens the hours of labour, but, when in the service of capital, lengthens them; since in itself it lightens labour, but when employed by capital, heightens the intensity of labour; since in itself it is a victory of man over the forces of Nature, but in the hands of capital, makes man the slave of those forces; since in itself it increases the wealth of the producers, but in the hands of capital, makes them paupers - for all these reasons and others besides, says the bourgeois economist without more ado, it is clear as noon-day that all these contradictions are a mere semblance of the reality, and that, as a matter of fact, they have neither an actual nor a theoretical existence. Thus he saves himself from all further puzzling of the brain, and what is more, implicitly declares his opponent to be stupid enough to contend against, not the capitalistic employment of machinery, but machinery itself.

No doubt he is far from denying that temporary inconvenience may result from the capitalist use of machinery. But where is the medal without its reverse! Any employment of machinery, except by capital, is to him an impossibility. Exploitation of the workman by the machine is therefore, with him, identical with exploitation of the machine by the workman. Whoever, therefore, exposes the real state of things in the capitalistic employment of machinery, is against its employment in any way, and is an enemy of social progress!<sup>135</sup> Exactly the reasoning of the celebrated Bill Sykes. "Gentlemen of the jury, no doubt the throat of this commercial traveller has been cut. But that is not my fault, it is the fault of the knife. Must we, for such a temporary inconvenience, abolish the use of the knife? Only consider! where would agriculture and trade be without the knife? Is it not as salutary in surgery, as it is knowing in anatomy? And in addition a willing help at the festive board? If you abolish the knife - you hurl us back into the depths of barbarism."<sup>136</sup>

Although machinery necessarily throws men out of work in those industries into which it is introduced, yet it may, notwithstanding this, bring about an increase of employment in other industries. This effect, however, has nothing in common with the so-called theory of compensation. Since every article produced by a machine is cheaper than a similar article produced by hand, we deduce the following infallible law: If the total quantity of the article produced by machinery, be equal to the total quantity of the article previously produced by a handicraft or by manufacture, and now made by machinery, then the total labour expended is diminished. The new labour spent on the instruments of labour, on the machinery, on the coal, and so on, must necessarily be less than the labour displaced by the use of the machinery; otherwise the product of the machine would be as dear, or dearer, than the product of the manual labour. But, as a matter of fact, the total quantity of the article produced by machinery with a diminished number of workmen, instead of remaining equal to, by far exceeds the total quantity of the hand-made article that has been displaced. Suppose that 400,000 yards of cloth have been produced on power-looms by fewer weavers than could weave 100,000 yards by hand. In the quadrupled product there lies four times as much raw material. Hence the production of raw material must be quadrupled. But as regards the instruments of labour, such as buildings, coal, machinery, and so on, it is different; the limit up to which the additional labour required for their production can increase, varies with the difference between the quantity of the machine-made article, and the quantity of the same article that the same number of workmen could make by hand.

Hence, as the use of machinery extends in a given industry, the immediate effect is to increase production in the other industries that furnish the first with means of production. How far

employment is thereby found for an increased number of men, depends, given the length of the working day and the intensity of labour, on the composition of the capital employed, i.e., on the ratio of its constant to its variable component. This ratio, in its turn, varies considerably with the extent to which machinery has already seized on, or is then seizing on, those trades. The number of the men condemned to work in coal and metal mines increased enormously owing to the progress of the English factory system; but during the last few decades this increase of number has been less rapid, owing to the use of new machinery in mining.<sup>137</sup> A new type of workman springs into life along with the machine, namely, its maker. We have already learnt that machinery has possessed itself even of this branch of production on a scale that grows greater every day.<sup>138</sup> As to raw material,<sup>139</sup> there is not the least doubt that the rapid strides of cotton spinning, not only pushed on with tropical luxuriance the growth of cotton in the United States, and with it the African slave trade, but also made the breeding of slaves the chief business of the border slave-states. When, in 1790, the first census of slaves was taken in the United States, their number was 697,000; in 1861 it had nearly reached four millions. On the other hand, it is no less certain that the rise of the English woollen factories, together with the gradual conversion of arable land into sheep pasture, brought, about the superfluity of agricultural labourers that led to their being driven in masses into the towns. Ireland, having during the last twenty years reduced its population by nearly one half, is at this moment undergoing the process of still further reducing the number of its inhabitants, so as exactly to suit the requirements of its landlords and of the English woollen manufacturers.

When machinery is applied to any of the preliminary or intermediate stages through which the subject of labour has to pass on its way to completion, there is an increased yield of material in those stages, and simultaneously an increased demand for labour in the handicrafts or manufactures supplied by the produce of the machines. Spinning by machinery, for example, supplied yarn so cheaply and so abundantly that the hand-loom weavers were, at first, able to work full time without increased outlay. Their earnings accordingly rose.<sup>140</sup> Hence a flow of people into the cotton-weaving trade, till at length the 800,000 weavers, called into existence by the Jenny, the throstle and the mule, were overwhelmed by the power-loom. So also, owing to the abundance of clothing materials produced by machinery, the number of tailors, seamstresses and needlewomen, went on increasing until the appearance of the sewing-machine.

In proportion as machinery, with the aid of a relatively small number of workpeople, increases the mass of raw materials, intermediate products, instruments of labour, &c., the working-up of these raw materials and intermediate products becomes split up into numberless branches; social production increases in diversity. The factory system carries the social division of labour immeasurably further than does manufacture, for it increases the productiveness of the industries it seizes upon, in a far higher degree.

The immediate result of machinery is to augment surplus-value and the mass of products in which surplus-value is embodied. And, as the substances consumed by the capitalists and their dependents become more plentiful, so too do these orders of society. Their growing wealth, and the relatively diminished number of workmen required to produce the necessaries of life beget, simultaneously with the rise of new and luxurious wants, the means of satisfying those wants. A larger portion of the produce of society is changed into surplus-produce, and a larger part of the surplus-produce is supplied for consumption in a multiplicity of refined shapes. In other words, the production of luxuries increases.<sup>141</sup> The refined and varied forms of the products are also due to new relations with the markets of the world, relations that are created by modern industry. Not only are greater quantities of foreign articles of luxury exchanged for home products, but a greater mass of foreign raw materials, ingredients, and intermediate products, are used as means

of production in the home industries. Owing to these relations with the markets of the world, the demand for labour increases in the carrying trades, which split up into numerous varieties.<sup>142</sup>

The increase of the means of production and subsistence, accompanied by a relative diminution in the number of labourers, causes an increased demand for labour in making canals, docks, tunnels, bridges, and so on, works that can only bear fruit in the far future. Entirely new branches of production, creating new fields of labour, are also formed, as the direct result either of machinery or of the general industrial changes brought about by it. But the place occupied by these branches in the general production is, even in the most developed countries, far from important. The number of labourers that find employment in them is directly proportional to the demand, created by those industries, for the crudest form of manual labour. The chief industries of this kind are, at present, gas-works, telegraphs, photography, steam navigation, and railways. According to the census of 1861 for England and Wales, we find in the gas industry (gas-works, production of mechanical apparatus, servants of the gas companies, &c), 15,211 persons; in telegraphy, 2,399; in photography, 2,366; steam navigation, 3,570; and in railways, 70,599, of whom the unskilled “navvies,” more or less permanently employed, and the whole administrative and commercial staff, make up about 28,000. The total number of persons, therefore, employed in these five new industries amounts to 94,145.

Lastly, the extraordinary productiveness of modern industry, accompanied as it is by both a more extensive and a more intense exploitation of labour-power in all other spheres of production, allows of the unproductive employment of a larger and larger part of the working-class, and the consequent reproduction, on a constantly extending scale, of the ancient domestic slaves under the name of a servant class, including men-servants, women-servants, lackeys, &c. According to the census of 1861, the population of England and Wales was 20,066,244; of these, 9,776,259 males, and 10,289,965 females. If we deduct from this population all who are too old or too young for work, all unproductive women, young persons and children, the “ideological” classes, such as government officials, priests, lawyers, soldiers, &c.; further, all who have no occupation but to consume the labour of others in the form of rent, interest, &c.; and, lastly, paupers, vagabonds, and criminals, there remain in round numbers eight millions of the two sexes of every age, including in that number every capitalist who is in any way engaged in industry, commerce, or finance. Among these 8 millions are:

#### **PERSONS**

|   |                        |
|---|------------------------|
| Agricultural labourers (including shepherds, farm servants, and maidservants living in the houses of farmers)                           | 1,098,261              |
| All who are employed in cotton, woollen, worsted, flax, hemp, silk, and jute factories, in stocking making and lace making by machinery | <sup>143</sup> 642,607 |
| All who are employed in coal mines and metal mines  | 565,835                |
| All who are employed in metal works (blastfurnaces, rolling mills, &c.), and metal manufactures of every kind                           | <sup>144</sup> 396,998 |

The servant class

<sup>145</sup>1,208,648

All the persons employed in textile factories and in mines, taken together, number 1,208,442; those employed in textile factories and metal industries, taken together, number 1,039,605; in both cases less than the number of modern domestic slaves. What a splendid result of the capitalist exploitation of machinery!

## **Section 7: Repulsion and Attraction of Workpeople by the Factory System. Crises in the Cotton Trade**

All political economists of any standing admit that the introduction of new machinery has a baneful effect on the workmen in the old handicrafts and manufactures with which this machinery at first competes. Almost all of them bemoan the slavery of the factory operative. And what is the great trump-card that they play? That machinery, after the horrors of the period of introduction and development have subsided, instead of diminishing, in the long run increases the number of the slaves of labour! Yes, Political Economy revels in the hideous theory, hideous to every "philanthropist" who believes in the eternal Nature-ordained necessity for capitalist production, that after a period of growth and transition, even its crowning success, the factory system based on machinery, grinds down more workpeople than on its first introduction it throws on the streets.<sup>146</sup>

It is true that in some cases, as we saw from instances of English worsted and silk factories, an extraordinary extension of the factory system may, at a certain stage of its development, be accompanied not only by a relative, but by an absolute decrease in the number of operatives employed. In the year 1860, when a special census of all the factories in the United Kingdom was taken by order of Parliament, the factories in those parts of Lancashire, Cheshire, and Yorkshire, included in the district of Mr. Baker, the factory inspector, numbered 652; 570 of these contained 85,622 power-looms, 6,819,146 spindles (exclusive of doubling spindles), employed 27,439 horse-power (steam), and 1,390 (water), and 94,119 persons. In the year 1865, the same factories contained, looms 95,163, spindles 7,025,031, had a steam-power of 28,925 horses, and a water-power of 1,445 horses, and employed 88,913 persons. Between 1860 and 1865, therefore, the increase in looms was 11%, in spindles 3%, and in engine-power 3%, while the number of persons employed decreased 5½%.<sup>147</sup> Between 1852 and 1862, considerable extension of the English woollen manufacture took place, while the number of hands employed in it remained almost stationary,

"showing how greatly the introduction of new machines had superseded the labour of preceding periods."<sup>148</sup>

In certain cases, the increase in the number of hands employed is only apparent; that is, it is not due to the extension of the factories already established, but to the gradual annexation of connected trades; for instance, the increase in power-looms, and in the hands employed by them between 1838 and 1856, was, in the cotton trade, simply owing to the extension of this branch of industry; but in the other trades to the application of steam-power to the carpet-loom, to the ribbon-loom, and to the linen-loom, which previously had been worked by the power of men.<sup>149</sup> Hence the increase of the hands in these latter trades was merely a symptom of a diminution in the total number employed. Finally, we have considered this question entirely apart from the fact, that everywhere, except in the metal industries, young persons (under 18), and women and children form the preponderating element in the class of factory hands.

Nevertheless, in spite of the mass of hands actually displaced and virtually replaced by machinery, we can understand how the factory operatives, through the building of more mills and the extension of old ones in a given industry, may become more numerous than the manufacturing workmen and handicraftsman that have been displaced. Suppose, for example, that in the old mode of production, a capital of £500 is employed weekly, two-fifths being constant and three-fifths variable capital, *i.e.*, £200 being laid out in means of production, and £300, say £1 per man, in labour-power. On the introduction of machinery the composition of this capital becomes altered. We will suppose it to consist of four-fifths constant and one-fifth variable, which means that only £100 is now laid out in labour-power. Consequently, two-thirds of the workmen are discharged. If now the business extends, and the total capital employed grows to £1,500 under unchanged conditions, the number of operatives employed will increase to 300, just as many as before the introduction of the machinery. If the capital further grows to £2,000, 400 men will be employed, or one-third more than under the old system. Their numbers have, in point of fact, increased by 100, but relatively, *i.e.*, in proportion to the total capital advanced, they have diminished by 800, for the £2,000 capital would, in the old state of things, have employed 1,200 instead of 400 men. Hence, a relative decrease in the number of hands is consistent with an actual increase. We assumed above that while the total capital increases, its composition remains the same, because the conditions of production remain constant. But we have already seen that, with every advance in the use of machinery, the constant component of capital, that part which consists of machinery, raw material, &c., increases, while the variable component, the part laid out in labour-power, decreases. We also know that in no other system of production is improvement so continuous, and the composition of the capital employed so constantly changing as in the factory system. These changes are, however, continually interrupted by periods of rest, during which there is a mere quantitative extension of the factories on the existing technical basis. During such periods the operatives increase in number. Thus, in 1835, the total number of operatives in the cotton, woollen, worsted, flax, and silk factories of the United Kingdom was only 354,684; while in 1861 the number of the power-loom weavers alone (of both sexes and of all ages, from eight years upwards), amounted to 230,654. Certainly, this growth appears less important when we consider that in 1838 the hand-loom weavers with their families still numbered 800,000,<sup>150</sup> not to mention those thrown out of work in Asia, and on the Continent of Europe.

In the few remarks I have still to make on this point, I shall refer to some actually existing relations, the existence of which our theoretical investigation has not yet disclosed.

So long as, in a given branch of industry, the factory system extends itself at the expense of the old handicrafts or of manufacture, the result is as sure as is the result of an encounter between an army furnished with breach-loaders, and one armed with bows and arrows. This first period, during which machinery conquers its field of action, is of decisive importance owing to the extraordinary profits that it helps to produce. These profits not only form a source of accelerated accumulation, but also attract into the favoured sphere of production a large part of the additional social capital that is being constantly created, and is ever on the look-out for new investments. The special advantages of this first period of fast and furious activity are felt in every branch of production that machinery invades. So soon, however, as the factory system has gained a certain breadth of footing and a definite degree of maturity, and, especially, so soon as its technical basis, machinery, is itself produced by machinery; so soon as coal mining and iron mining, the metal industries, and the means of transport have been revolutionised; so soon, in short, as the general conditions requisite for production by the modern industrial system have been established, this mode of production acquires an elasticity, a capacity for sudden extension by leaps and bounds

that finds no hindrance except in the supply of raw material and in the disposal of the produce. On the one hand, the immediate effect of machinery is to increase the supply of raw material in the same way, for example, as the cotton gin augmented the production of cotton.<sup>151</sup> On the other hand, the cheapness of the articles produced by machinery, and the improved means of transport and communication furnish the weapons for conquering foreign markets. By ruining handicraft production in other countries, machinery forcibly converts them into fields for the supply of its raw material. In this way East India was compelled to produce cotton, wool, hemp, jute, and indigo for Great Britain.<sup>152</sup> By constantly making a part of the hands “supernumerary,” modern industry, in all countries where it has taken root, gives a spur to emigration and to the colonisation of foreign lands, which are thereby converted into settlements for growing the raw material of the mother country; just as Australia, for example, was converted into a colony for growing wool.<sup>153</sup> A new and international division of labour, a division suited to the requirements of the chief centres of modern industry springs up, and converts one part of the globe into a chiefly agricultural field of production, for supplying the other part which remains a chiefly industrial field. This revolution hangs together with radical changes in agriculture which we need not here further inquire into.<sup>154</sup>

On the motion of Mr. Gladstone, the House of Commons ordered, on the 17th February, 1867, a return of the total quantities of grain, corn, and flour, of all sorts, imported into, and exported from, the United Kingdom, between the years 1831 and 1866. I give below a summary of the result. The flour is given in quarters of corn. (See the Table on p. 426.)

| QUINQUENNIAL PERIODS AND THE YEAR 1866  |            |            |            |            |            |            |            |            |
|---|------------|------------|------------|------------|------------|------------|------------|------------|
| ANNUAL AVERAGE  | 1831-1835  | 1836-1840  | 1841-1845  | 1846-1850  | 1851-1855  | 1856-1860  | 1861-1865  | 1866       |
| Import  | 1,096,373  | 2,389,729  | 2,843,865  | 8,776,552  | 8,345,237  | 10,913,612 | 15,009,871 | 16,457,340 |
| Export  | 225,263    | 251,770    | 139,056    | 155,461    | 307,491    | 341,150    | 302,754    | 216,218    |
| Excess of import over export  | 871,110    | 2,137,959  | 2,704,809  | 8,621,091  | 8,037,746  | 10,572,462 | 14,707,117 | 16,241,122 |
| POPULATION  |            |            |            |            |            |            |            |            |
| Yearly average in each period   | 24,621,107 | 25,929,507 | 27,262,569 | 27,797,598 | 27,572,923 | 28,391,544 | 29,381,460 | 29,935,404 |
| Average quantity of corn etc., in qrs., consumed annually per head over and above the home produce consumed | 0.036      | 0.082      | 0.099      | 0.310      | 0.291      | 0.372      | 0.501      | 0.543      |

The enormous power, inherent in the factory system, of expanding by jumps, and the dependence of that system on the markets of the world, necessarily beget feverish production, followed by over-filling of the markets, whereupon contraction of the markets brings on crippling of production. The life of modern industry becomes a series of periods of moderate activity, prosperity, over-production, crisis and stagnation. The uncertainty and instability to which machinery subjects the employment, and consequently the conditions of existence, of the operatives become normal, owing to these periodic changes of the industrial cycle. Except in the periods of prosperity, there rages between the capitalists the most furious combat for the share of each in the markets. This share is directly proportional to the cheapness of the product. Besides the rivalry that this struggle begets in the application of improved machinery for replacing labour-power, and of new methods of production, there also comes a time in every industrial cycle, when a forcible reduction of wages beneath the value of labour-power, is attempted for the purpose of cheapening commodities.<sup>155</sup>

A necessary condition, therefore, to the growth of the number of factory hands, is a proportionally much more rapid growth of the amount of capital invested in mills. This growth, however, is conditioned by the ebb and flow of the industrial cycle. It is, besides, constantly interrupted by the technical progress that at one time virtually supplies the place of new workmen, at another, actually displaces old ones. This qualitative change in mechanical industry continually discharges hands from the factory, or shuts its doors against the fresh stream of recruits, while the purely quantitative extension of the factories absorbs not only the men thrown out of work, but also fresh contingents. The workpeople are thus continually both repelled and attracted, hustled from pillar to post, while, at the same time, constant changes take place in the sex, age, and skill of the levies.

The lot of the factory operatives will be best depicted by taking a rapid survey of the course of the English cotton industry.

From 1770 to 1815 this trade was depressed or stagnant for 5 years only. During this period of 45 years the English manufacturers had a monopoly of machinery and of the markets of the world. From 1815 to 1821 depression; 1822 and 1823 prosperity; 1824 abolition of the laws against Trades' Unions, great extension of factories everywhere; 1825 crisis; 1826 great misery and riots among the factory operatives; 1827 slight improvement; 1828 great increase in power-loom, and in exports; 1829 exports, especially to India, surpass all former years; 1830 glutted markets, great distress; 1831 to 1833 continued depression, the monopoly of the trade with India and China withdrawn from the East India Company; 1834 great increase of factories and machinery, shortness of hands. The new poor law furthers the migration of agricultural labourers into the factory districts. The country districts swept of children. White slave trade; 1835 great prosperity, contemporaneous starvation of the hand-loom weavers; 1836 great prosperity; 1837 and 1838 depression and crisis; 1839 revival; 1840 great depression, riots, calling out of the military; 1841 and 1842 frightful suffering among the factory operatives; 1842 the manufacturers lock the hands out of the factories in order to enforce the repeal of the Corn Laws. The operatives stream in thousands into the towns of Lancashire and Yorkshire, are driven back by the military, and their leaders brought to trial at Lancaster; 1843 great misery; 1844 revival; 1845 great prosperity; 1846 continued improvement at first, then reaction. Repeal of the Corn Laws; 1847 crisis, general reduction of wages by 10 and more per cent. in honour of the "big loaf"; 1848 continued depression; Manchester under military protection; 1849 revival; 1850 prosperity; 1851 falling prices, low wages, frequent strikes; 1852 improvement begins, strikes continue, the manufacturers threaten to import foreign hands; 1853 increasing exports. Strike for 8 months, and great misery at Preston; 1854 prosperity, glutted markets; 1855 news of failures stream in from

the United States, Canada, and the Eastern markets; 1856 great prosperity; 1857 crisis; 1858 improvement; 1859 great prosperity, increase in factories; 1860 Zenith of the English cotton trade, the Indian, Australian, and other markets so glutted with goods that even in 1863 they had not absorbed the whole lot; the French Treaty of Commerce, enormous growth of factories and machinery; 1861 prosperity continues for a time, reaction, the American Civil War, cotton famine: 1862 to 1863 complete collapse.

The history of the cotton famine is too characteristic to dispense with dwelling upon it for a moment. From the indications as to the condition of the markets of the world in 1860 and 1861, we see that the cotton famine came in the nick of time for the manufacturers, and was to some extent advantageous to them, a fact that was acknowledged in the reports of the Manchester Chamber of Commerce, proclaimed in Parliament by Palmerston and Derby, and confirmed by events.<sup>156</sup> No doubt, among the 2,887 cotton mills in the United Kingdom in 1861, there were many of small size. According to the report of Mr. A. Redgrave, out of the 2,109 mills included in his district, 392, or 19% employed less than ten horse-power each; 345, or 16% employed 10 H. P., and less than 20 H. P.; while 1,372 employed upwards of 20 H. P.<sup>157</sup> The majority of the small mills were weaving sheds, built during the period of prosperity after 1858, for the most part by speculators, of whom one supplied the yarn, another the machinery, a third the buildings, and were worked by men who had been overlookers, or by other persons of small means. These small manufacturers mostly went to the wall. The same fate would have overtaken them in the commercial crisis that was staved off only by the cotton famine. Although they formed one-third of the total number of manufacturers, yet their mills absorbed a much smaller part of the capital invested in the cotton trade. As to the extent of the stoppage, it appears from authentic estimates, that in October 1862, 60.3% of the spindles, and 58% of the looms were standing. This refers to the cotton trade as a whole, and, of course, requires considerable modification for individual districts. Only very few mills worked full time (60 hours a week), the remainder worked at intervals. Even in those few cases where full time was worked, and at the customary rate of piece-wage, the weekly wages of the operatives necessarily shrank, owing to good cotton being replaced by bad, Sea Island by Egyptian (in fine spinning mills), American and Egyptian by Surat, and pure cotton by mixings of waste and Surat. The shorter fibre of the Surat cotton and its dirty condition, the greater fragility of the thread, the substitution of all sorts of heavy ingredients for flour in sizing the warps, all these lessened the speed of the machinery, or the number of the looms that could be superintended by one weaver, increased the labour caused by defects in the machinery, and reduced the piece-wage by reducing the mass of the product turned off. Where Surat cotton was used, the loss to the operatives when on full time, amounted to 20, 30, and more per cent. But besides this, the majority of the manufacturers reduced the rate of piece-wage by 5, 7½, and 10 per cent. We can therefore conceive the situation of those hands who were employed for only 3, 3½ or 4 days a week, or for only 6 hours a day. Even in 1863, after a comparative improvement had set in, the weekly wages of spinners and of weavers were 3s. 4d., 3s. 10d., 4s. 6d. and 5s. 1d.<sup>158</sup> Even in this miserable state of things, however, the inventive spirit of the master never stood still, but was exercised in making deductions from wages. These were to some extent inflicted as a penalty for defects in the finished article that were really due to his bad cotton and to his unsuitable machinery. Moreover, where the manufacturer owned the cottages of the workpeople, he paid himself his rents by deducting the amount from these miserable wages. Mr. Redgrave tells us of self-acting minders (operatives who manage a pair of self-acting mules)

“earning at the end of a fortnight’s full work 8s. 11d., and that from this sum was deducted the rent of the house, the manufacturer, however, returning half the rent as a gift. The minders took away the sum of 6s. 11d. In many places the self-

acting minders ranged from 5s. to 9s. per week, and the weavers from 2s. to 6s. per week, during the latter part of 1862.”<sup>159</sup>

Even when working short time the rent was frequently deducted from the wages of the operatives.<sup>160</sup> No wonder that in some parts of Lancashire a kind of famine fever broke out. But more characteristic than all this, was, the revolution that took place in the process of production at the expense of the workpeople. Experimenta in corpore vili, like those of anatomists on frogs, were formally made.

“Although,” says Mr. Redgrave, “I have given the actual earnings of the operatives in the several mills, it does not follow that they earn the same amount week by week. The operatives are subject to great fluctuation from the constant experimentalising of the manufacturers ... the earnings of the operatives rise and fall with the quality of the cotton mixings; sometimes they have been within 15 per cent. of former earnings, and then, in a week or two, they have fallen off from 50 to 60 per cent.”<sup>161</sup>

These experiments were not made solely at the expense of the workman’s means of subsistence. His five senses also had to pay the penalty.

“The people who are employed in making up Surat cotton complain very much. They inform me, on opening the bales of cotton there is an intolerable smell, which causes sickness.... In the mixing, scribbling and carding rooms, the dust and dirt which are disengaged, irritate the air passages, and give rise to cough and difficulty of breathing. A disease of the skin, no doubt from the irritation of the dirt contained in the Surat cotton, also prevails.... The fibre being so short, a great amount of size, both animal and vegetable, is used.... Bronchitis is more prevalent owing to the dust. Inflammatory sore throat is common, from the same cause. Sickness and dyspepsia are produced by the frequent breaking of the weft, when the weaver sucks the weft through the eye of the shuttle.” On the other hand, the substitutes for flour were a Fortunatus’ purse to the manufacturers, by increasing the weight of the yarn. They caused “15 lbs. of raw material to weigh 26 lbs. after it was woven.”<sup>162</sup>

In the Report of Inspectors of Factories for 30th April, 1864, we read as follows:

“The trade is availing itself of this resource at present to an extent which is even discreditable. I have heard on good authority of a cloth weighing 8 lbs. which was made of 5 1/4 lbs. cotton and 2 3/4 lbs. size; and of another cloth weighing 5 1/4 lbs., of which 2 lbs. was size. These were ordinary export shirtings. In cloths of other descriptions, as much as 50 per cent. size is sometimes added; so that a manufacturer may, and does truly boast, that he is getting rich by selling cloth for less money per pound than he paid for the mere yarn of which they are composed.”<sup>163</sup>

But the workpeople had to suffer, not only from the experiments of the manufacturers inside the mills, and of the municipalities outside, not only from reduced wages and absence of work, from want and from charity, and from the eulogistic speeches of lords and commons.

“Unfortunate females who, in consequence of the cotton famine, were at its commencement thrown out of employment, and have thereby become outcasts of society; and now, though trade has revived, and work is plentiful, continue members of that unfortunate class, and are likely to continue so. There are also in the borough more youthful prostitutes than I have known for the last 25 years.”<sup>164</sup>

We find then, in the first 45 years of the English cotton trade, from 1770 to 1815, only 5 years of crisis and stagnation; but this was the period of monopoly. The second period from 1815 to 1863 counts, during its 48 years, only 20 years of revival and prosperity against 28 of depression and stagnation. Between 1815 and 1830 the competition with the continent of Europe and with the United States sets in. After 1833, the extension of the Asiatic markets is enforced by “destruction of the human race” (the wholesale extinction of Indian hand-loom weavers). After the repeal of the Corn Laws, from 1846 to 1863, there are 8 years of moderate activity and prosperity against 9 years of depression and stagnation. The condition of the adult male operatives, even during the years of prosperity, may be judged from the note subjoined.<sup>165</sup>

## **Section 8: Revolution Effected in Manufacture, Handicrafts, and Domestic Industry by Modern Industry**

### **A. Overthrow of Co-operation Based on Handicraft and on the Division of Labour**

We have seen how machinery does away with co-operation based on handicrafts, and with manufacture based on the division of handicraft labour. An example of the first sort is the mowing-machine; it replaces co-operation between mowers. A striking example of the second kind, is the needle-making machine. According to Adam Smith, 10 men, in his day, made in co-operation, over 48,000 needles a-day. On the other hand, a single needle-machine makes 145,000 in a working day of 11 hours. One woman or one girl superintends four such machines, and so produces near upon 600,000 needles in a day, and upwards of 3,000,000 in a week.<sup>166</sup> A single machine, when it takes the place of co-operation or of manufacture, may itself serve as the basis of an industry of a handicraft character. Still, such a return to handicrafts is but a transition to the factory system, which, as a rule, makes its appearance so soon as the human muscles are replaced, for the purpose of driving the machines, by a mechanical motive power, such as steam or water. Here and there, but in any case only for a time, an industry may be carried on, on a small scale, by means of mechanical power. This is effected by hiring steam-power, as is done in some of the Birmingham trades, or by the use of small caloric-engines, as in some branches of weaving.<sup>167</sup> In the Coventry silk weaving industry the experiment of “cottage factories” was tried. In the centre of a square surrounded by rows of cottages, an engine-house was built and the engine connected by shafts with the looms in the cottages. In all cases the power was hired at so much per loom. The rent was payable weekly, whether the looms worked or not. Each cottage held from 2 to 6 looms; some belonged to the weaver, some were bought on credit, some were hired. The struggle between these cottage factories and the factory proper, lasted over 12 years. It ended with the complete ruin of the 300 cottage factories.<sup>168</sup> Wherever the nature of the process did not involve production on a large scale, the new industries that have sprung up in the last few decades, such as envelope making, steel-pen making, &c., have, as a general rule, first passed through the handicraft stage, and then the manufacturing stage, as short phases of transition to the factory stage. The transition is very difficult in those cases where the production of the article by manufacture consists, not of a series of graduated processes, but of a great number of disconnected ones. This circumstance formed a great hindrance to the establishment of steel-pen factories. Nevertheless, about 15 years ago, a machine was invented that automatically performed 6 separate operations at once. The first steel-pens were supplied by the handicraft system, in the year 1820, at £7 4s. the gross; in 1830 they-were supplied by manufacture at 8s., and today the factory system supplies them to the trade at from 2 to 6d. the gross.<sup>169</sup>

## B. Reaction of the Factory System on Manufacture and Domestic Industries

Along with the development of the factory system and of the revolution in agriculture that accompanies it, production in all the other branches of industry not only extends, but alters its character. The principle, carried out in the factory system, of analysing the process of production into its constituent phases, and of solving the problems thus proposed by the application of mechanics, of chemistry, and of the whole range of the natural sciences, becomes the determining principle everywhere. Hence, machinery squeezes itself into the manufacturing industries first for one detail process, then for another. Thus the solid crystal of their organisation, based on the old division of labour, becomes dissolved, and makes way for constant changes. Independently of this, a radical change takes place in the composition of the collective labourer, a change of the persons working in combination. In contrast with the manufacturing period, the division of labour is thenceforth based, wherever possible, on the employment of women, of children of all ages, and of unskilled labourers, in one word, on cheap labour, as it is characteristically called in England. This is the case not only with all production on a large scale, whether employing machinery or not, but also with the so-called domestic industry, whether carried on in the houses of the workpeople or in small workshops. This modern so-called domestic industry has nothing, except the name, in common with the old-fashioned domestic industry, the existence of which pre-supposes independent urban handicrafts, independent peasant farming, and above all, a dwelling-house for the labourer and his family. That old-fashioned industry has now been converted into an outside department of the factory, the manufactory, or the warehouse. Besides the factory operatives, the manufacturing workmen and the handicraftsman, whom it concentrates in large masses at one spot, and directly commands, capital also sets in motion, by means, of invisible threads, another army; that of the workers in the domestic industries, who dwell in the large towns and are also scattered over the face of the country. An example: The shirt factory of Messrs. Tillie at Londonderry, which employs 1,000 operatives in the factory itself, and 9,000 people spread up and down the country and working in their own houses.<sup>170</sup>

The exploitation of cheap and immature labour-power is carried out in a more shameless manner in modern Manufacture than in the factory proper. This is because the technical foundation of the factory system, namely, the substitution of machines for muscular power, and the light character of the labour, is almost entirely absent in Manufacture, and at the same time women and over-young children are subjected, in a most unconscionable way, to the influence of poisonous or injurious substances. This exploitation is more shameless in the so-called domestic industry than in manufactures, and that because the power of resistance in the labourers decreases with their dissemination; because a whole series of plundering parasites insinuate themselves between the employer and the workman; because a domestic industry has always to compete either with the factory system, or with manufacturing in the same branch of production; because poverty robs the workman of the conditions most essential to his labour, of space, light and ventilation; because employment becomes more and more irregular; and, finally, because in these the last resorts of the masses made “redundant” by modern industry and Agriculture, competition for work attains its maximum. Economy in the means of production, first systematically carried out in the factory system, and there, from the very beginning, coincident with the most reckless squandering of labour-power, and robbery of the conditions normally requisite for labour – this economy now shows its antagonistic and murderous side more and more in a given branch of industry, the less the social productive power of labour and the technical basis for a combination of processes are developed in that branch.

### C. Modern Manufacture

I now proceed, by a few examples, to illustrate the principles laid down above. As a matter of fact, the reader is already familiar with numerous instances given in the chapter on the working day. In the hardware manufactures of Birmingham and the neighbourhood, there are employed, mostly in very heavy work, 30,000 children and young persons, besides 10,000 women. There they are to be seen in the unwholesome brass-foundries, button factories, enamelling, galvanising, and lackering works.<sup>171</sup> Owing to the excessive labour of their workpeople, both adult and non-adult, certain London houses where newspapers and books are printed, have got the ill-omened name of "slaughterhouses."<sup>172</sup> Similar excesses are practised in book-binding, where the victims are chiefly women, girls, and children; young persons have to do heavy work in rope-walks and night-work in salt mines, candle manufactories, and chemical works; young people are worked to death at turning the looms in silk weaving, when it is not carried on by machinery.<sup>173</sup> One of the most shameful, the most dirty, and the worst paid kinds of labour, and one on which women and young girls are by preference employed, is the sorting of rags. It is well known that Great Britain, apart from its own immense store of rags, is the emporium for the rag trade of the whole world. They flow in from Japan, from the most remote States of South America, and from the Canary Islands. But the chief sources of their supply are Germany, France, Russia, Italy, Egypt, Turkey, Belgium, and Holland. They are used for manure, for making bedflocks, for shoddy, and they serve as the raw material of paper. The rag-sorters are the medium for the spread of small-pox and other infectious diseases, and they themselves are the first victims.<sup>174</sup> A classical example of over-work, of hard and inappropriate labour, and of its brutalising effects on the workman from his childhood upwards, is afforded not only by coal-mining and miners generally, but also by tile and brick making, in which industry the recently invented machinery is, in England, used only here and there. Between May and September the work lasts from 5 in the morning till 8 in the evening, and where the drying is done in the open air, it often lasts from 4 in the morning till 9 in the evening. Work from 5 in the morning till 7 in the evening is considered "reduced" and "moderate." Both boys and girls of 6 and even of 4 years of age are employed. They work for the same number of hours, often longer, than the adults. The work is hard and the summer heat increases the exhaustion. In a certain tile-field at Mosley, e.g., a young woman, 24 years of age, was in the habit of making 2,000 tiles a day, with the assistance of 2 little girls, who carried the clay for her, and stacked the tiles. These girls carried daily 10 tons up the slippery sides of the clay pits, from a depth of 30 feet, and then for a distance of 210 feet.

"It is impossible for a child to pass through the purgatory of a tile-field without great moral degradation... the low language, which they are accustomed to hear from their tenderest years, the filthy, indecent, and shameless habits, amidst which, unknowing, and half wild, they grow up, make them in after-life lawless, abandoned, dissolute.... A frightful source of demoralisation is the mode of living. Each moulder, who is always a skilled labourer, and the chief of a group, supplies his 7 subordinates with board and lodging in his cottage. Whether members of his family or not, the men, boys, and girls all sleep in the cottage, which contains generally two, exceptionally 3 rooms, all on the ground floor, and badly ventilated. These people are so exhausted after the day's hard work, that neither the rules of health, of cleanliness, nor of decency are in the least observed. Many of these cottages are models of untidiness, dirt, and dust.... The greatest evil of the system that employs young girls on this sort of work, consists in this, that, as a rule, it chains them fast from childhood for the whole of their after-life to the most abandoned rabble. They become rough, foul-mouthed boys, before Nature has

taught them that they are women. Clothed in a few dirty rags, the legs naked far above the knees, hair and face besmeared with dirt, they learn to treat all feelings of decency and of shame with contempt. During meal-times they lie at full length in the fields, or watch the boys bathing in a neighbouring canal. Their heavy day's work at length completed, they put on better clothes, and accompany the men to the public houses."

That excessive insobriety is prevalent from childhood upwards among the whole of this class, is only natural.

"The worst is that the brickmakers despair of themselves. You might as well, said one of the better kind to a chaplain of Southallfield, try to raise and improve the devil as a brickie, sir!"<sup>175</sup>

As to the manner, in which capital effects an economy in the requisites of labour, in modern Manufacture (in which I include all workshops of larger size, except factories proper), official and most ample material bearing on it is to be found in the Public Health Reports IV. (1863) and VI. (1864). The description of the workshops, more especially those of the London printers and tailors, surpasses the most loathsome phantasies of our romance writers. The effect on the health of the workpeople is self-evident. Dr. Simon, the chief medical officer of the Privy Council and the official editor of the "Public Health Reports," says:

"In my fourth Report (1863) I showed, how it is practically impossible for the workpeople to insist upon that which is their first sanitary right, viz., the right that, no matter what the work for which their employer brings them together, the labour, so far as it depends upon him, should be freed from all avoidably unwholesome conditions. I pointed out, that while the workpeople are practically incapable of doing themselves this sanitary justice, they are unable to obtain any effective support from the paid administrations of the sanitary police.... The life of myriads of workmen and workwomen is now uselessly tortured and shortened by the never-ending physical suffering that their mere occupation begets."<sup>176</sup>

In illustration of the way in which the workrooms influence the state of health Dr. Simon gives the following table of mortality.<sup>177</sup>

| Number of Persons of all ages in the respective industries | Industry compared as regards health | Death-rate per 100,000 men in the respective industries between the stated ages |           |           |
|--|-------------------------------------|---|-----------|-----------|
|  |                                     | Age 25-35   | Age 35-45 | Age 45-55 |
| 958,265  | Agriculture in England & Wales      | 743   | 805       | 1141      |
| 22,301 men<br>12,379 women                                 | } London tailors                    | 958   | 1,262     | 2,093     |
| 13,803   | London printers                     | 894   | 1,747     | 2,367     |

## D. Modern Domestic Industry

I now come to the so-called domestic industry. In order to get an idea of the horrors of this sphere, in which capital conducts its exploitation in the background of modern mechanical industry, one must go to the apparently quite idyllic trade of nail-making,<sup>178</sup> carried on in a few remote villages of England. In this place, however, it will be enough to give a few examples from those branches of the lace-making and straw-plaiting industries that are not yet carried on by the aid of machinery, and that as yet do not compete with branches carried on in factories or in manufactories.

Of the 150,000 persons employed in England in the production of lace, about 10,000 fall under the authority of the Factory Act, 1861. Almost the whole of the remaining 140,000 are women, young persons, and children of both sexes, the male sex, however, being weakly represented. The state of health of this cheap material for exploitation will be seen from the following table, computed by Dr. Trueman, physician to the Nottingham General Dispensary. Out of 686 female patients who were lace-makers, most of them between the ages of 17 and 24, the number of consumptive ones were:

1852. – 1 in 45. 1857. – 1 in 13.

1853. – 1 in 28. 1858. – 1 in 15.

1854. – 1 in 17. 1859. – 1 in 9.

1856. – 1 in 15. 1861. – 1 in 8.<sup>179</sup>

This progress in the rate of consumption ought to suffice for the most optimist of progressists, and for the biggest hawker of lies among the Free-trade bagmen of Germany.

The Factory Act of 1861 regulates the actual making of the lace, so far as it is done by machinery, and this is the rule in England. The branches that we are now about to examine, solely with regard to those of the workpeople who work at home, and not those who work in manufactories or warehouses, fall into two divisions, viz. (1), finishing; (2), mending. The former gives the finishing touches to the machine-made lace, and includes numerous sub-divisions.

The lace finishing is done either in what are called “mistresses’ houses,” or by women in their own houses, with or without the help of their children. The women who keep the “mistresses’ houses” are themselves poor. The workroom is in a private house. The mistresses take orders from manufacturers, or from warehousemen, and employ as many women, girls, and young children as the size of their rooms and the fluctuating demand of the business will allow. The number of the workwomen employed in these workrooms varies from 20 to 40 in some, and from 10 to 20 in others. The average age at which the children commence work is six years, but in many cases it is below five. The usual working-hours are from 8 in the morning till eight in the evening, with 1½ hours for meals, which are taken at irregular intervals, and often in the foul workrooms. When business is brisk, the labour frequently lasts from 8 or even 6 o’clock in the morning till 10, 11, or 12 o’clock at night. In English barracks the regulation space allotted to each soldier is 500-600 cubic feet, and in the military hospitals 1,200 cubic feet. But in those finishing sties there are but 67 to 100 cubic feet to each person. At the same time the oxygen of the air is consumed by gas-lights. In order to keep the lace clean, and although the floor is tiled or gaged, the children are often compelled, even in winter, to pull off their shoes.

“It is not at all uncommon in Nottingham to find 14 to 20 children huddled together in a small room, of, perhaps, not more than 12 feet square, and employed for 15 hours out of the 24, at work that of itself is exhausting, from its weariness and monotony, and is besides carried on under every possible unwholesome condition.... Even the very youngest children work with a strained attention and a

rapidity that is astonishing, hardly ever giving their fingers rest or glowering their motion. If a question be asked them, they never raise their eyes from their work from fear of losing a single moment.”

The “long stick” is used by the mistresses as a stimulant more and more as the working hours are prolonged.

“The children gradually tire and become as restless as birds towards the end of their long detention at an occupation that is monotonous, eye-straining, and exhausting from the uniformity in the posture of the body. Their work is like slavery.”<sup>180</sup>

When women and their children work at home, which now-a-days means in a hired room, often in a garret, the state of things is, if possible, still worse. This sort of work is given out within a circle of 80 miles radius from Nottingham. On leaving the warehouses at 9 or 10 o'clock at night, the children are often given a bundle of lace to take home with them and finish. The Pharisee of a capitalist represented by one of his servants, accompanies this action, of course, with the unctuous phrase: “That's for mother,” yet he knows well enough that the poor children must sit up and help.<sup>181</sup>

Pillow lace-making is chiefly carried on in England in two agricultural districts; one, the Honiton lace district, extending from 20 to 30 miles along the south coast of Devonshire, and including a few places in North Devon; the other comprising a great part of the counties of Buckingham, Bedford, and Northampton, and also the adjoining portions of Oxfordshire and Huntingdonshire. The cottages of the agricultural labourers are the places where the work is usually carried on. Many manufacturers employ upwards of 3,000 of these lace-makers, who are chiefly children and young persons of the female sex exclusively. The state of things described as incidental to lace finishing is here repeated, save that instead of the “mistresses' houses,” we find what are called “lace-schools,” kept by poor women in their cottages. From their fifth year and often earlier, until their twelfth or fifteenth year, the children work in these schools; during the first year the very young ones work from four to eight hours, and later on, from six in the morning till eight and ten o'clock at night.

“The rooms are generally the ordinary living rooms of small cottages, the chimney stopped up to keep out draughts, the inmates kept warm by their own animal heat alone, and this frequently in winter. In other cases, these so-called school-rooms are like small store-rooms without fire-places.... The over-crowding in these dens and the consequent vitiation of the air are often extreme. Added to this is the injurious effect of drains, privies, decomposing substances, and other filth usual in the purlieus of the smaller cottages.” With regard to space: “In one lace-school 18 girls and a mistress, 35 cubic feet to each person; in another, where the smell was unbearable, 18 persons and 24½ cubic feet per head. In this industry are to be found employed children of 2 and 2½ years.”<sup>182</sup>

Where lace-making ends in the counties of Buckingham and Bedford, straw-plaiting begins, and extends over a large part of Hertfordshire and the westerly and northerly parts of Essex. In 1861, there were 40,043 persons employed in straw-plaiting and straw-hat making; of these 3,815 were males of all ages, the rest females, of whom 14,913, including about 7,000 children, were under 20 years of age. In the place of the lace-schools we find here the “straw-plait schools.” The children commence their instruction in straw-plaiting generally in their 4th, often between their 3rd and 4th year. Education, of course, they get none. The children themselves call the elementary schools, “natural schools,” to distinguish them from these blood-sucking institutions, in which they are kept at work simply to get through the task, generally 30 yards daily, prescribed

by their half-starved mothers. These same mothers often make them work at home, after school is over, till 10, 11, and 12 o'clock at night. The straw cuts their mouths, with which they constantly moisten it, and their fingers. Dr. Ballard gives it as the general opinion of the whole body of medical officers in London, that 300 cubic feet is the minimum space proper for each person in a bedroom or workroom. But in the straw-plait schools space is more sparingly allotted than in the lace-schools, "12 2/3, 17, 18½ and below 22 cubic feet for each person."

"The smaller of these numbers, says one of the commissioners, Mr. White, represents less space than the half of what a child would occupy if packed in a box measuring 3 feet in each direction."

Thus do the children enjoy life till the age of 12 or 14. The wretched half-starved parents think of nothing but getting as much as possible out of their children. The latter, as soon as they are grown up, do not care a farthing, and naturally so, for their parents, and leave them.

"It is no wonder that ignorance and vice abound in a population so brought up.... Their morality is at the lowest ebb,... a great number of the women have illegitimate children, and that at such an immature age that even those most conversant with criminal statistics are astounded."<sup>183</sup>

And the native land of these model families is the pattern Christian country for Europe; so says at least Count Montalembert, certainly a competent authority on Christianity!

Wages in the above industries, miserable as they are (the maximum wages of a child in the straw-plait schools rising in rare cases to 3 shillings), are reduced far below their nominal amount by the prevalence of the truck system everywhere, but especially in the lace districts.<sup>184</sup>

### E. Passage of Modern Manufacture, and Domestic Industry into Modern Mechanical Industry. The Hastening of this Revolution by the Application of the Factory Acts to those Industries

The cheapening of labour-power, by sheer abuse of the labour of women and children, by sheer robbery of every normal condition requisite for working and living, and by the sheer brutality of overwork and night-work, meets at last with natural obstacles that cannot be overstepped. So also, when based on these methods, do the cheapening of commodities and capitalist exploitation in general. So soon as this point is at last reached – and it takes many years – the hour has struck for the introduction of machinery, and for the thenceforth rapid conversion of the scattered domestic industries and also of manufactures into factory industries.

An example, on the most colossal scale, of this movement is afforded by the production of wearing apparel. This industry, according to the classification of the Children's Employment Commission, comprises straw-hat makers, ladies'-hat makers, cap-makers, tailors, milliners and dressmakers, shirt-makers, corset-makers, glove-makers, shoemakers, besides many minor branches, such as the making of neck-ties, collars, &c. In 1861, the number of females employed in these industries, in England and Wales, amounted to 586,299, of these 115,242 at the least were under 20, and 16,650. under 15 years of age. The number of these workwomen in the United Kingdom in 1861, was 750,334. The number of males employed in England and Wales, in hat-making, shoemaking, glove-making and tailoring was 437,969; of these 14,964 under 15 years, 89,285 between 15 and 20, and 333,117 over 20 years. Many of the smaller branches are not included in these figures. But take the figures as they stand; we then have for England and Wales alone, according to the census of 1861, a total of 1,024,277 persons, about as many as are absorbed by agriculture and cattle breeding. We begin to understand what becomes of the

immense quantities of goods conjured up by the magic of machinery, and of the enormous masses of workpeople, which that machinery sets free.

The production of wearing apparel is carried on partly in manufactories in whose workrooms there is but a reproduction of that division of labour, the *membra disjecta* of which were found ready to hand; partly by small master-handicraftsmen; these, however, do not, as formerly, work for individual consumers, but for manufactories and warehouses, and to such an extent that often whole towns and stretches of country carry on certain branches, such as shoemaking, as a speciality; finally, on a very great scale by the so-called domestic workers, who form an external department of the manufactories, warehouses, and even of the workshops of the smaller masters.<sup>185</sup>

The raw material, &c., is supplied by mechanical industry, the mass of cheap human material (*taillable à merci et miséricorde*) is composed of the individuals “liberated” by mechanical industry and improved agriculture. The manufactures of this class owed their origin chiefly to the capitalist’s need of having at hand an army ready equipped to meet any increase of demand.<sup>186</sup> These manufactures, nevertheless, allowed the scattered handicrafts and domestic industries to continue to exist as a broad foundation. The great production of surplus-value in these branches of labour, and the progressive cheapening of their articles, were and are chiefly due to the minimum wages paid, no more than requisite for a miserable vegetation, and to the extension of working-time up to the maximum endurable by the human organism. It was in fact by the cheapness of the human sweat and the human blood, which were converted into commodities, that the markets were constantly being extended, and continue daily to be extended; more especially was this the case with England’s colonial markets, where, besides, English tastes and habits prevail. At last the critical point was reached. The basis of the old method, sheer brutality in the exploitation of the workpeople, accompanied more or less by a systematic division of labour, no longer sufficed for the extending markets and for the still more rapidly extending competition of the capitalists. The hour struck for the advent of machinery. The decisively revolutionary machine, the machine which attacks in an equal degree the whole of the numberless branches of this sphere of production, dressmaking, tailoring, shoemaking, sewing, hat-making, and many others, is the sewing-machine.

Its immediate effect on the workpeople is like that of all machinery, which, since the rise of modern industry, has seized upon new branches of trade. Children of too tender an age are sent adrift. The wage of the machine hands rises compared with that of the house-workers, many of whom belong to the poorest of the poor. That of the better situated handicraftsman, with whom the machine competes, sinks. The new machine hands are exclusively girls and young women. With the help of mechanical force, they destroy the monopoly that male labour had of the heavier work, and they drive off from the lighter work numbers of old women and very young children. The overpowering competition crushes the weakest of the manual labourers. The fearful increase in death from starvation during the last 10 years in London runs parallel with the extension of machine sewing.<sup>187</sup> The new workwomen turn the machines by hand and foot, or by hand alone, sometimes sitting, sometimes standing, according to the weight, size, and special make of the machine, and expend a great deal of labour-power. Their occupation is unwholesome, owing to the long hours, although in most cases they are not so long as under the old system. Wherever the sewing-machine locates itself in narrow and already over-crowded workrooms, it adds to the unwholesome influences.

“The effect,” says Mr. Lord, “on entering low-ceiled workrooms in which 30 to 40 machine hands are working is unbearable.... The heat, partly due to the gas stoves used for warming the

irons, is horrible.... Even when moderate hours of work, i.e., from 8 in the morning till 6 in the evening, prevail in such places, yet 3 or 4 persons fall into a swoon regularly every day.”<sup>188</sup>

The revolution in the industrial methods which is the necessary result of the revolution in the instruments of production, is effected by a medley of transition forms. These forms vary according to the extent to which the sewing-machine has become prevalent in one branch, of industry or the other, to the time during which it has been in operation, to the previous condition of the workpeople, to the preponderance of manufacture, of handicrafts or of domestic industry, to the rent of the workrooms,<sup>189</sup> &c. In dressmaking, for instance, where the labour for the most part was already organised, chiefly by simple co-operation, the sewing-machine at first formed merely a new factor in that manufacturing industry. In tailoring, shirtmaking, shoemaking, &c., all the forms are intermingled. Here the factory system proper. There middlemen receive the raw material from the capitalist *en chef*, and group around their sewing-machines, in “chambers” and “garrets,” from 10 to 50 or more workwomen. Finally, as is always the case with machinery when not organised into a system, and when it can also be used in dwarfish proportions, handicraftsman and domestic workers, along with their families, or with a little extra labour from without, make use of their own sewing-machines.<sup>190</sup> The system actually prevalent in England is, that the capitalist concentrates a large number of machines on his premises, and then distributes the produce of those machines for further manipulation amongst the domestic workers.<sup>191</sup> The variety of the transition forms, however, does not conceal the tendency to conversion into the factory system proper. This tendency is nurtured by the very nature of the sewing-machine, the manifold uses of which push on the concentration, under one roof, and one management, of previously separated branches of a trade. It is also favoured by the circumstance that preparatory needlework, and certain other operations, are most conveniently done on the premises where the machine is at work; as well as by the inevitable expropriation of the hand sewers, and of the domestic workers who work with their own machines. This fate has already in part overtaken them. The constantly increasing amount of capital invested in sewing-machines,<sup>192</sup> gives the spur to the production of, and gluts the markets with, machine-made articles, thereby giving the signal to the domestic workers for the sale of their machines. The overproduction of sewing-machines themselves, causes their producers, in bad want of a sale, to let them out for so much a week, thus crushing by their deadly competition the small owners of machines.<sup>193</sup> Constant changes in the construction of the machines, and their ever-increasing cheapness, depreciate day by day the older makes, and allow of their being sold in great numbers, at absurd prices, to large capitalists, who alone can thus employ them at a profit. Finally, the substitution of the steam-engine for man gives in this, as in all similar revolutions, the finishing blow. At first, the use of steam power meets with mere technical difficulties, such as unsteadiness in the machines, difficulty in controlling their speed, rapid wear and tear of the lighter machines, &c., all of which are soon overcome by experience.<sup>194</sup> If, on the one hand, the concentration of many machines in large manufactories leads to the use of steam power, on the other hand, the competition of steam with human muscles hastens on the concentration of workpeople and machines in large factories. Thus England is at present experiencing, not only in the colossal industry of making wearing apparel, but in most of the other trades mentioned above, the conversion of manufacture, of handicrafts, and of domestic work into the factory system, after each of those forms of production, totally changed and disorganised under the influence of modern industry, has long ago reproduced, and even overdone, all the horrors of the factory system, without participating in any of the elements of social progress it contains.<sup>195</sup>

This industrial revolution which takes place spontaneously, is artificially helped on by the extension of the Factory Acts to all industries in which women, young persons and children are

employed. The compulsory regulation of the working day as regards its length, pauses, beginning and end, the system of relays of children, the exclusion of all children under a certain age, &c., necessitate on the one hand more machinery<sup>196</sup> and the substitution of steam as a motive power in the place of muscles.<sup>197</sup> On the other hand, in order to make up for the loss of time, an expansion occurs of the means of production used in common, of the furnaces, buildings, &c., in one word, greater concentration of the means of production and a correspondingly greater concourse of workpeople. The chief objection, repeatedly and passionately urged on behalf of each manufacture threatened with the Factory Act, is in fact this, that in order to continue the business on the old scale a greater outlay of capital will be necessary. But as regards labour in the so-called domestic industries and the intermediate forms between them and Manufacture, so soon as limits are put to the working day and to the employment of children, those industries go to the wall. Unlimited exploitation of cheap labour-power is the sole foundation of their power to compete.

One of the essential conditions for the existence of the factory system, especially when the length of the working day is fixed, is certainty in the result, i.e., the production in a given time of a given quantity of commodities, or of a given useful effect. The statutory pauses in the working day, moreover, imply the assumption that periodical and sudden cessation of the work does no harm to the article undergoing the process of production. This certainty in the result, and this possibility of interrupting the work are, of course, easier to be attained in the purely mechanical industries than in those in which chemical and physical processes play a part; as, for instance, in the earthenware trade, in bleaching, dyeing, baking, and in most of the metal industries. Wherever there is a workingday without restriction as to length, wherever there is night-work and unrestricted waste of human life, there the slightest obstacle presented by the nature of the work to a change for the better is soon looked upon as an everlasting barrier erected by Nature. No poison kills vermin with more certainty than the Factory Act removes such everlasting barriers. No one made a greater outcry over "impossibilities" than our friends the earthenware manufacturers. In 1864, however, they were brought under the Act, and within sixteen months every "impossibility" had vanished.

"The improved method," called forth by the Act, "of making slip by pressure instead of by evaporation, the newly-constructed stoves for drying the ware in its green state, &c., are each events of great importance in the pottery art, and mark an advance which the preceding century could not rival.... It has even considerably reduced the temperature of the stoves themselves with a considerable saving of fuel, and with a readier effect on the ware."<sup>198</sup>

In spite of every prophecy, the cost-price of earthenware did not rise, but the quantity produced did, and to such an extent that the export for the twelve months, ending December, 1865, exceeded in value by £138,628 the average of the preceding three years. In the manufacture of matches it was thought to be an indispensable requirement, that boys, even while bolting their dinner, should go on dipping the matches in melted phosphorus, the poisonous vapour from which rose into their faces. The Factory Act (1864) made the saving of time a necessity, and so forced into existence a dipping machine, the vapour from which could not come in contact with the workers.<sup>199</sup> So, at the present time, in those branches of the lace manufacture not yet subject to the Factory Act, it is maintained that the meal-times cannot be regular owing to the different periods required by the various kinds of lace for drying, which periods vary from three minutes up to an hour and more. To this the Children's Employment Commissioners answer:

"The circumstances of this case are precisely analogous to that of the paper-stainers, dealt with in our first report. Some of the principal manufacturers in the trade urged that in consequence of the nature of the materials used, and their

various processes, they would be unable, without serious loss, to stop for meal-times at any given moment. But it was seen from the evidence that, by due care and previous arrangement, the apprehended difficulty would be got over; and accordingly, by clause 6 of section 6 of the Factory Acts Extension Act, passed during this Session of Parliament, an interval of eighteen months is given to them from the passing of the Act before they are required to conform to the meal hours, specified by the Factory Acts.”<sup>200</sup>

Hardly had the Act been passed when our friends the manufacturers found out:

“The inconveniences we expected to arise from the introduction of the Factory Acts into our branch of manufacture, I am happy to say, have not arisen. We do not find the production at all interfered with; in short, we produce more in the same time.”<sup>201</sup>

It is evident that the English legislature, which certainly no one will venture to reproach with being overdosed with genius, has been led by experience to the conclusion that a simple compulsory law is sufficient to enact away all the so-called impediments, opposed by the nature of the process, to the restriction and regulation of the working day. Hence, on the introduction of the Factory Act into a given industry, a period varying from six to eighteen months is fixed within which it is incumbent on the manufacturers to remove all technical impediments to the working of the Act. Mirabeau’s “Impossible! ne me dites jamais ce bête de mot!” is particularly applicable to modern technology. But though the Factory Acts thus artificially ripen the material elements necessary for the conversion of the manufacturing system into the factory system, yet at the same time, owing to the necessity they impose for greater outlay of capital, they hasten on the decline of the small masters, and the concentration of capital.<sup>202</sup>

Besides the purely technical impediments that are removable by technical means, the irregular habits of the workpeople themselves obstruct the regulation of the hours of labour. This is especially the case where piece-wage predominates, and where loss of time in one part of the day or week can be made good by subsequent over-time, or by night-work, a process which brutalises the adult workman, and ruins his wife and children.<sup>203</sup> Although this absence of regularity in the expenditure of labour-power is a natural and rude reaction against the tedium of monotonous drudgery, it originates, also, to a much greater degree from anarchy in production, anarchy that in its turn pre-supposes unbridled exploitation of labour-power by the capitalist. Besides the general periodic changes of the industrial cycle, and the special fluctuations in the markets to which each industry is subject, we may also reckon what is called “the season,” dependent either on the periodicity of favourable seasons of the year for navigation; or on fashion, and the sudden placing of large orders that have to be executed in the shortest possible time. The habit of giving such orders becomes more frequent with the extension of railways and telegraphs.

“The extension of the railway system throughout the country has tended very much to encourage giving short notice. Purchasers now come up from Glasgow, Manchester, and Edinburgh once every fortnight or so to the wholesale city warehouses which we supply, and give small orders requiring immediate execution, instead of buying from stock as they used to do. Years ago we were always able to work in the slack times, so as to meet demand of the next season, but now no one can say beforehand what will be the demand then.”<sup>204</sup>

In those factories and manufactories that are not yet subject to the Factory Acts, the most fearful over-work prevails periodically during what is called the season, in consequence of sudden

orders. In the outside department of the factory, of the manufactory, and of the warehouse, the so-called domestic workers, whose employment is at the best irregular, are entirely dependent for their raw material and their orders on the caprice of the capitalist, who, in this industry, is not hampered by any regard for depreciation of his buildings and machinery, and risks nothing by a stoppage of work, but the skin of the worker himself. Here then he sets himself systematically to work to form an industrial reserve force that shall be ready at a moment's notice; during one part of the year he decimates this force by the most inhuman toil, during the other part, he lets it starve for want of work.

“The employers avail themselves of the habitual irregularity in the homework, when any extra work is wanted at a push, so that the work goes on till 11, and 12 p.m. or 2 a.m., or as the usual phrase is, “all hours,” and that in localities where “the stench is enough to knock you down, you go to the door, perhaps, and open it, but shudder to go further.”<sup>205</sup> “They are curious men,” said one of the witnesses, a shoemaker, speaking of the masters, “they think it does a boy no harm to work too hard for half the year, if he is nearly idle for the other half.”<sup>206</sup>

In the same way as technical impediments, so, too, those “usages which have grown with the growth of trade” were and still are proclaimed by interested capitalists as obstacles due to the nature of the work. This was a favourite cry of the cotton lords at the time they were first threatened with the Factory Acts. Although their industry more than any other depends on navigation, yet experience has given them the lie. Since then, every pretended obstruction to business has been treated by the Factory inspectors as a mere sham.<sup>207</sup> The thoroughly conscientious investigations of the Children's Employment Commission prove that the effect of the regulation of the hours of work, in some industries, was to spread the mass of labour previously employed more evenly over the whole year<sup>208</sup> that this regulation was the first rational bridle on the murderous, meaningless caprices of fashion,<sup>209</sup> caprices that consort so badly with the system of modern industry; that the development of ocean navigation and of the means of communication generally, has swept away the technical basis on which season-work was really supported,<sup>210</sup> and that all other so-called unconquerable difficulties vanish before larger buildings, additional machinery, increase in the number of workpeople employed,<sup>211</sup> and the alterations caused by all these in the mode of conducting the wholesale trade.<sup>212</sup> But for all that, capital never becomes reconciled to such changes – and this is admitted over and over again by its own representatives – except “under the pressure of a General Act of Parliament”<sup>213</sup> for the compulsory regulation of the hours of labour.

## **Section 9: The Factory Acts. Sanitary and Educational Clauses of the same. Their General Extension in England**

Factory legislation, that first conscious and methodical reaction of society against the spontaneously developed form of the process of production, is, as we have seen, just as much the necessary product of modern industry as cotton yarn, self-actors, and the electric telegraph. Before passing to the consideration of the extension of that legislation in England, we shall shortly notice certain clauses contained in the Factory Acts, and not relating to the hours of work.

Apart from their wording, which makes it easy for the capitalist to evade them, the sanitary clauses are extremely meagre, and, in fact, limited to provisions for whitewashing the walls, for insuring cleanliness in some other matters, for ventilation, and for protection against dangerous machinery. In the third book we shall return again to the fanatical opposition of the masters to those clauses which imposed upon them a slight expenditure on appliances for protecting the

limbs of their workpeople, an opposition that throws a fresh and glaring light on the Free-trade dogma, according to which, in a society with conflicting interests, each individual necessarily furthers the common weal by seeking nothing but his own personal advantage! One example is enough. The reader knows that during the last 20 years, the flax industry has very much extended, and that, with that extension, the number of scutching mills in Ireland has increased. In 1864 there were in that country 1,800 of these mills. Regularly in autumn and winter women and “young persons,” the wives, sons, and daughters of the neighbouring small farmers, a class of people totally unaccustomed to machinery, are taken from field labour to feed the rollers of the scutching mills with flax. The accidents, both as regards number and kind, are wholly unexampled in the history of machinery. In one scutching mill, at Kildinan, near Cork, there occurred between 1852 and 1856, six fatal accidents and sixty mutilations; every one of which might have been prevented by the simplest appliances, at the cost of a few shillings. Dr. W. White, the certifying surgeon for factories at Downpatrick, states in his official report, dated the 15th December, 1865:

“The serious accidents at the scutching mills are of the most fearful nature. In many cases a quarter of the body is torn from the trunk, and either involves death, or a future of wretched incapacity and suffering. The increase of mills in the country will, of course, extend these dreadful results, and it will be a great boon if they are brought under the legislature. I am convinced that by proper supervision of scutching mills a vast sacrifice of life and limb would be averted.”<sup>214</sup>

What could possibly show better the character of the capitalist mode of production, than the necessity that exists for forcing upon it, by Acts of Parliament, the simplest appliances for maintaining cleanliness and health? In the potteries the Factory Act of 1864 “has whitewashed and cleansed upwards of 200 workshops, after a period of abstinence from any such cleaning, in many cases of 20 years, and in some, entirely,” (this is the “abstinence” of the capitalist!) “in which were employed 27,800 artisans, hitherto breathing through protracted days and often nights of labour, a mephitic atmosphere, and which rendered an otherwise comparatively innocuous occupation, pregnant with disease and death. The Act has improved the ventilation very much.”<sup>215</sup>

At the same time, this portion of the Act strikingly shows that the capitalist mode of production, owing to its very nature, excludes all rational improvement beyond a certain point. It has been stated over and over again that the English doctors are unanimous in declaring that where the work is continuous, 500 cubic feet is the very least space that should be allowed for each person. Now, if the Factory Acts, owing to their compulsory provisions, indirectly hasten on the conversion of small workshops into factories, thus indirectly attacking the proprietary rights of the smaller capitalists, and assuring a monopoly to the great ones, so, if it were made obligatory to provide the proper space for each workman in every workshop, thousands of small employers would, at one full sloop, be expropriated directly! The very root of the capitalist mode of production, i.e., the self-expansion of all capital, large or small, by means of the “free” purchase and consumption of labour-power, would be attacked. Factory legislation is therefore brought to a deadlock before these 500 cubic feet of breathing space. The sanitary officers, the industrial inquiry commissioners, the factory inspectors, all harp, over and over again, upon the necessity for those 500 cubic feet, and upon the impossibility of wringing them out of capital. They thus, in fact, declare that consumption and other lung diseases among the workpeople are necessary conditions to the existence of capital.<sup>216</sup>

Paltry as the education clauses of the Act appear on the whole, yet they proclaim elementary education to be an indispensable condition to the employment of children.<sup>217</sup> The success of those clauses proved for the first time the possibility of combining education and gymnastics<sup>218</sup> with

manual labour, and, consequently, of combining manual labour with education and gymnastics. The factory inspectors soon found out by questioning the schoolmasters, that the factory children, although receiving only one half the education of the regular day scholars, yet learnt quite as much and often more.

“This can be accounted for by the simple fact that, with only being at school for one half of the day, they are always fresh, and nearly always ready and willing to receive instruction. The system on which they work, half manual labour, and half school, renders each employment a rest and a relief to the other; consequently, both are far more congenial to the child, than would be the case were he kept constantly at one. It is quite clear that a boy who has been at school all the morning, cannot (in hot weather particularly) cope with one who comes fresh and bright from his work.”<sup>219</sup>

Further information on this point will be found in Senior’s speech at the Social Science Congress at Edinburgh in 1863. He there shows, amongst other things, how the monotonous and uselessly long school hours of the children of the upper and middle classes, uselessly add to the labour of the teacher, “while he not only fruitlessly but absolutely injuriously, wastes the time, health, and energy of the children.”<sup>220</sup> From the Factory system budded, as Robert Owen has shown us in detail, the germ of the education of the future, an education that will, in the case of every child over a given age, combine productive labour with instruction and gymnastics, not only as one of the methods of adding to the efficiency of production, but as the only method of producing fully developed human beings.

Modern industry, as we have seen, sweeps away by technical means the manufacturing division of labour, under which each man is bound hand and foot for life to a single detail-operation. At the same time, the capitalistic form of that industry reproduces this same division of labour in a still more monstrous shape; in the factory proper, by converting the workman into a living appendage of the machine; and everywhere outside the Factory, partly by the sporadic use of machinery and machine workers,<sup>221</sup> partly by re-establishing the division of labour on a fresh basis by the general introduction of the labour of women and children, and of cheap unskilled labour.

The antagonism between the manufacturing division of labour and the methods of modern industry makes itself forcibly felt. It manifests itself, amongst other ways, in the frightful fact that a great part of the children employed in modern factories and manufactures, are from their earliest years riveted to the most simple manipulations, and exploited for years, without being taught a single sort of work that would afterwards make them of use, even in the same manufactory or factory. In the English letter-press printing trade, for example, there existed formerly a system, corresponding to that in the old manufactures and handicrafts, of advancing the apprentices from easy to more and more difficult work. They went through a course of teaching till they were finished printers. To be able to read and write was for every one of them a requirement of their trade. All this was changed by the printing machine. It employs two sorts of labourers, one grown up, renters, the other, boys mostly from 11 to 17 years of age whose sole business is either to spread the sheets of paper under the machine, or to take from it the printed sheets. They perform this weary task, in London especially, for 14, 15, and 16 hours at a stretch, during several days in the week, and frequently for 36 hours, with only 2 hours’ rest for meals and sleep.<sup>222</sup> A great part of them cannot read, and they are, as a rule, utter savages and very extraordinary creatures.

“To qualify them for the work which they have to do, they require no intellectual training; there is little room in it for skill, and less for judgment; their wages, though rather high for boys, do not increase proportionately as they grow up, and

the majority of them cannot look for advancement to the better paid and more responsible post of machine minder, because while each machine has but one minder, it has at least two, and often four boys attached to it.”<sup>223</sup>

As soon as they get too old for such child’s work, that is about 17 at the latest, they are discharged from the printing establishments. They become recruits of crime. Several attempts to procure them employment elsewhere, were rendered of no avail by their ignorance and brutality, and by their mental and bodily degradation.

As with the division of labour in the interior of the manufacturing workshops, so it is with the division of labour in the interior of society. So long as handicraft and manufacture form the general groundwork of social production, the subjection of the producer to one branch exclusively, the breaking up of the multifariousness of his employment<sup>224</sup> is a necessary step in the development. On that groundwork each separate branch of production acquires empirically the form that is technically suited to it, slowly perfects it, and, so soon as a given degree of maturity has been reached, rapidly crystallises that form. The only thing, that here and there causes a change, besides new raw material supplied by commerce, is the gradual alteration of the instruments of labour. But their form, too, once definitely settled by experience, petrifies, as is proved by their being in many cases handed down in the same form by one generation to another during thousands of years. A characteristic feature is, that, even down into the eighteenth century, the different trades were called “mysteries” (mystères);<sup>225</sup> into their secrets none but those duly initiated could penetrate. Modern industry rent the veil that concealed from men their own social process of production, and that turned the various, spontaneously divided branches of production into so many riddles, not only to outsiders, but even to the initiated. The principle which it pursued, of resolving each process into its constituent movements, without any regard to their possible execution by the hand of man, created the new modern science of technology. The varied, apparently unconnected, and petrified forms of the industrial processes now resolved themselves into so many conscious and systematic applications of natural science to the attainment of given useful effects. Technology also discovered the few main fundamental forms of motion, which, despite the diversity of the instruments used, are necessarily taken by every productive action of the human body; just as the science of mechanics sees in the most complicated machinery nothing but the continual repetition of the simple mechanical powers.

Modern industry never looks upon and treats the existing form of a process as final. The technical basis of that industry is therefore revolutionary, while all earlier modes of production were essentially conservative.<sup>226</sup> By means of machinery, chemical processes and other methods, it is continually causing changes not only in the technical basis of production, but also in the functions of the labourer, and in the social combinations of the labour-process. At the same time, it thereby also revolutionises the division of labour within the society, and incessantly launches masses of capital and of workpeople from one branch of production to another. But if modern industry, by its very nature, therefore necessitates variation of labour, fluency of function, universal mobility of the labourer, on the other hand, in its capitalistic form, it reproduces the old division of labour with its ossified particularisations. We have seen how this absolute contradiction between the technical necessities of modern industry, and the social character inherent in its capitalistic form, dispels all fixity and security in the situation of the labourer; how it constantly threatens, by taking away the instruments of labour, to snatch from his hands his means of subsistence,<sup>227</sup> and, by suppressing his detail-function, to make him superfluous. We have seen, too, how this antagonism vents its rage in the creation of that monstrosity, an industrial reserve army, kept in misery in order to be always at the disposal of capital; in the incessant human sacrifices from among the working-class, in the most reckless squandering of labour-power and in the

devastation caused by a social anarchy which turns every economic progress into a social calamity. This is the negative side. But if, on the one hand, variation of work at present imposes itself after the manner of an overpowering natural law, and with the blindly destructive action of a natural law that meets with resistance<sup>228</sup> at all points, modern industry, on the other hand, through its catastrophes imposes the necessity of recognising, as a fundamental law of production, variation of work, consequently fitness of the labourer for varied work, consequently the greatest possible development of his varied aptitudes. It becomes a question of life and death for society to adapt the mode of production to the normal functioning of this law. Modern Industry, indeed, compels society, under penalty of death, to replace the detail-worker of to-day, grappled by life-long repetition of one and the same trivial operation, and thus reduced to the mere fragment of a man, by the fully developed individual, fit for a variety of labours, ready to face any change of production, and to whom the different social functions he performs, are but so many modes of giving free scope to his own natural and acquired powers.

One step already spontaneously taken towards effecting this revolution is the establishment of technical and agricultural schools, and of “*écoles d’enseignement professionnel*,” in which the children of the working-men receive some little instruction in technology and in the practical handling of the various implements of labour. Though the Factory Act, that first and meagre concession wrung from capital, is limited to combining elementary education with work in the factory, there can be no doubt that when the working-class comes into power, as inevitably it must, technical instruction, both theoretical and practical, will take its proper place in the working-class schools. There is also no doubt that such revolutionary ferments, the final result of which is the abolition of the old division of labour, are diametrically opposed to the capitalistic form of production, and to the economic status of the labourer corresponding to that form. But the historical development of the antagonisms, immanent in a given form of production, is the only way in which that form of production can be dissolved and a new form established. “*Ne sutor ultra crepidam*” – this *nec plus ultra* of handicraft wisdom became sheer nonsense, from the moment the watchmaker Watt invented the steam-engine, the barber Arkwright, the throstle, and the working-jeweller, Fulton, the steamship.<sup>229</sup>

So long as Factory legislation is confined to regulating the labour in factories, manufactories, &c., it is regarded as a mere interference with the exploiting rights of capital. But when it comes to regulating the so-called “home-labour,”<sup>230</sup> it is immediately viewed as a direct attack on the *patria potestas*, on parental authority. The tender-hearted English Parliament long affected to shrink from taking this step. The force of facts, however, compelled it at last to acknowledge that modern industry, in overturning the economic foundation on which was based the traditional family, and the family labour corresponding to it, had also unloosened all traditional family ties. The rights of the children had to be proclaimed. The final report of the Ch. Empl. Comm. of 1866, states:

“It is unhappily, to a painful degree, apparent throughout the whole of the evidence, that against no persons do the children of both sexes so much require protection as against their parents.” The system of unlimited exploitation of children’s labour in general and the so-called home-labour in particular is “maintained only because the parents are able, without check or control, to exercise this arbitrary and mischievous power over their young and tender offspring.... Parents must not possess the absolute power of making their children mere ‘machines to earn so much weekly wage....’ The children and young persons, therefore, in all such cases may justifiably claim from the legislature, as a natural right, that an exemption should be secured to them, from what destroys

prematurely their physical strength, and lowers them in the scale of intellectual and moral beings.”<sup>231</sup>

It was not, however, the misuse of parental authority that created the capitalistic exploitation, whether direct or indirect, of children’s labour; but, on the contrary, it was the capitalistic mode of exploitation which, by sweeping away the economic basis of parental authority, made its exercise degenerate into a mischievous misuse of power. However terrible and disgusting the dissolution, under the capitalist system, of the old family ties may appear, nevertheless, modern industry, by assigning as it does an important part in the process of production, outside the domestic sphere, to women, to young persons, and to children of both sexes, creates a new economic foundation for a higher form of the family and of the relations between the sexes. It is, of course, just as absurd to hold the Teutonic-Christian form of the family to be absolute and final as it would be to apply that character to the ancient Roman, the ancient Greek, or the Eastern forms which, moreover, taken together form a series in historical development. Moreover, it is obvious that the fact of the collective working group being composed of individuals of both sexes and all ages, must necessarily, under suitable conditions, become a source of humane development; although in its spontaneously developed, brutal, capitalistic form, where the labourer exists for the process of production, and not the process of production for the labourer, that fact is a pestiferous source of corruption and slavery.<sup>232</sup>

The necessity for a generalisation of the Factory Acts, for transforming them from an exceptional law relating to mechanical spinning and weaving – those first creations of machinery – into a law affecting social production as a whole, arose, as we have seen, from the mode in which modern industry was historically developed. In the rear of that industry, the traditional form of manufacture, of handicraft, and of domestic industry, is entirely revolutionised; manufactures are constantly passing into the factory system, and handicrafts into manufactures; and lastly, the spheres of handicraft and of the domestic industries become, in a, comparatively speaking, wonderfully short time, dens of misery in which capitalistic exploitation obtains free play for the wildest excesses. There are two circumstances that finally turn the scale: first, the constantly recurring experience that capital, so soon as it finds itself subject to legal control at one point, compensates itself all the more recklessly at other points;<sup>233</sup> secondly, the cry of the capitalists for equality in the conditions of competition, i.e., for equal restraint on all exploitation of labour.<sup>234</sup> On this point let us listen to two heart-broken cries. Messrs. Cooksley of Bristol, nail and chain, &c., manufacturers, spontaneously introduced the regulations of the Factory Act into their business.

“As the old irregular system prevails in neighbouring works, the Messrs. Cooksley are subject to the disadvantage of having their boys enticed to continue their labour elsewhere after 6 p.m. ‘This,’ they naturally say, ‘is an injustice and loss to us, as it exhausts a portion of the boy’s strength, of which we ought to have the full benefit’.”<sup>235</sup>

Mr. J. Simpson (paper box and bagmaker, London) states before the commissioners of the Ch. Empl. Comm.:

“He would sign any petition for it” (legislative interference)... “As it was, he always felt restless at night, when he had closed his place, lest others should be working later than him and getting away his orders.”<sup>236</sup>

Summarising, the Ch. Empl. Comm. says:

“It would be unjust to the larger employers that their factories should be placed under regulation, while the hours of labour in the smaller places in their own

branch of business were under no legislative restriction. And to the injustice arising from the unfair conditions of competition, in regard to hours, that would be created if the smaller places of work were exempt, would be added the disadvantage to the larger manufacturers, of finding their supply of juvenile and female labour drawn off to the places of work exempt from legislation. Further, a stimulus would be given to the multiplication of the smaller places of work, which are almost invariably the least favourable to the health, comfort, education, and general improvement of the people.”<sup>237</sup>

In its final report the Commission proposes to subject to the Factory Act more than 1,400,000 children, young persons, and women, of which number about one half are exploited in small industries and by the so-called home-work.<sup>238</sup> It says,

“But if it should seem fit to Parliament to place the whole of that large number of children, young persons and females under the protective legislation above adverted to ... it cannot be doubted that such legislation would have a most beneficent effect, not only upon the young and the feeble, who are its more immediate objects, but upon the still larger body of adult workers, who would in all these employments, both directly and indirectly, come immediately under its influence. It would enforce upon them regular and moderate hours; it would lead to their places of work being kept in a healthy and cleanly state; it would therefore husband and improve that store of physical strength on which their own well-being and that of the country so much depends; it would save the rising generation from that overexertion at an early age which undermines their constitutions and leads to premature decay; finally, it would ensure them – at least up to the age of 13 – the opportunity of receiving the elements of education, and would put an end to that utter ignorance ... so faithfully exhibited in the Reports of our Assistant Commissioners, and which cannot be regarded without the deepest pain, and a profound sense of national degradation.”<sup>239</sup>

The Tory Cabinet<sup>240</sup> announced in the Speech from the Throne, on February 5, 1867, that it had framed the proposals of the Industrial Commission of Inquiry<sup>241</sup> into Bills. To get that far, another twenty years of *experimentum in corpore vili* had been required. Already in 1840 a Parliamentary Commission of Inquiry on the labour of children had been appointed. Its Report, in 1842, unfolded, in the words of Nassau W. Senior,

“the most frightful picture of avarice, selfishness and cruelty on the part of masters and of parents, and of juvenile and infantile misery, degradation and destruction ever presented.... It may be supposed that it describes the horrors of a past age. But there is unhappily evidence that those horrors continue as intense as they were. A pamphlet published by Hardwicke about 2 years ago states that the abuses complained of in 1842, are in full bloom at the present day. It is a strange proof of the general neglect of the morals and health of the children of the working-class, that this report lay unnoticed for 20 years, during which the children, ‘bred up without the remotest sign of comprehension as to what is meant by the term morals, who had neither knowledge, nor religion, nor natural affection,’ were allowed to become the parents of the present generation.”<sup>242</sup>

The social conditions having undergone a change, Parliament could not venture to shelve the demands of the Commission of 1862, as it had done those of the Commission of 1840. Hence in 1864, when the Commission had not yet published more than a part of its reports, the earthenware industries (including the potteries), makers of paperhangings, matches, cartridges, and caps, and

fustian cutters were made subject to the Acts in force in the textile industries. In the Speech from the Throne, on 5th February, 1867, the Tory Cabinet of the day announced the introduction of Bills, founded on the final recommendations of the Commission, which had completed its labours in 1866.

On the 15th August, 1867, the Factory Acts Extension Act, and on the 21st August, the Workshops' Regulation Act received the Royal Assent; the former Act having reference to large industries, the latter to small.

The former applies to blast-furnaces, iron' and copper mills, foundries, machine shops, metal manufactories, gutta-percha works, paper mills, glass-works, tobacco manufactories, letter-press printing (including newspapers), book-binding, in short to all industrial establishments of the above kind, in which 50 individuals or more are occupied simultaneously, and for not less than 100 days during the year.

To give an idea of the extent of the sphere embraced by the Workshops' Regulation Act in its application, we cite from its interpretation clause, the following passages:

“*Handicraft* shall mean any manual labour exercised by way of trade, or for purposes of gain in, or incidental to, the making any article or part of an article, or in, or incidental to, the altering, repairing, ornamenting, finishing, or otherwise adapting for sale any article.”

“*Workshop* shall mean any room or place whatever in the open air or undercover, in which any handicraft is carried on by any child, young person, or woman, and to which and over which the person by whom such child, young person, or woman is employed, has the right of access and control.”

“*Employed* shall mean occupied in any handicraft, whether for wages or not, under a master or under a parent as herein defined.”

“*Parent* shall mean parent, guardian, or person, having the custody of, or control over, any... child or young person.”

Clause 7, which imposes a penalty for employment of children, young persons, and women, contrary to the provisions of the Act, subjects to fines, not only the occupier of the workshop, whether parent or not, but even

“the parent of, or the person deriving any direct benefit from the labour of, or having the control over, the child, young person or woman.”

The Factory Acts Extension Act, which affects the large establishments, derogates from the Factory Act by a crowd of vicious exceptions and cowardly compromises with the masters.

The Workshops' Regulation Act, wretched in all its details, remained a dead letter in the hands of the municipal and local authorities who were charged with its execution. When, in 1871, Parliament withdrew from them this power, in order to confer it on the Factory Inspectors, to whose province it thus added by a single stroke more than one hundred thousand workshops, and three hundred brickworks, care was taken at the same time not to add more than eight assistants to their already undermanned staff.<sup>243</sup>

What strikes us, then, in the English legislation of 1867, is, on the one hand, the necessity imposed on the parliament of the ruling classes, of adopting in principle measures so extraordinary, and on so great a scale, against the excesses of capitalistic exploitation; and on the other hand, the hesitation, the repugnance, and the bad faith, with which it lent itself to the task of carrying those measures into practice.

The Inquiry Commission of 1862 also proposed a new regulation of the mining industry, an industry distinguished from others by the exceptional characteristic that the interests of landlord and capitalist there join hands. The antagonism of these two interests had been favourable to Factory legislation, while on the other hand the absence of that antagonism is sufficient to explain the delays and chicanery of the legislation on mines.

The Inquiry Commission of 1840 had made revelations so terrible, so shocking, and creating such a scandal all over Europe, that to salve its conscience Parliament passed the Mining Act of 1842, in which it limited itself to forbidding the employment underground in mines of children under 10 years of age and females.

Then another Act, The Mines' Inspecting Act of 1860, provides that mines shall be inspected by public officers nominated specially for that purpose, and that boys between the ages of 10 and 12 years shall not be employed, unless they have a school certificate, or go to school for a certain number of hours. This Act was a complete dead letter owing to the ridiculously small number of inspectors, the meagreness of their powers, and other causes that will become apparent as we proceed.

One of the most recent Blue books on mines is the "Report from the Select Committee on Mines, together with &c. Evidence, 23rd July, 1866." This Report is the work of a Parliamentary Committee selected from members of the House of Commons, and authorised to summon and examine witnesses. It is a thick folio volume in which the Report itself occupies only five lines to this effect; that the committee has nothing to say, and that more witnesses must be examined!

The mode of examining the witnesses reminds one of the cross-examination of witnesses in English courts of justice, where the advocate tries, by means of impudent, unexpected, equivocal and involved questions, put without connexion, to intimidate, surprise, and confound the witness, and to give a forced meaning to the answers extorted from him. In this inquiry the members of the committee themselves are the cross-examiners, and among them are to be found both mine-owners and mine exploiters; the witnesses are mostly working coal miners. The whole farce is too characteristic of the spirit of capital, not to call for a few extracts from this Report. For the sake of conciseness I have classified them. I may also add that every question and its answer are numbered in the English Blue books.

**1. Employment in mines of boys of 10 years and upwards.** – In the mines the work, inclusive of going and returning, usually lasts 14 or 15 hours, sometimes even from 3, 4 and 5 o'clock a.m., till 5 and 6 o'clock p.m. (n. 6, 452, 83). The adults work in two shifts, of eight hours each; but there is no alternation with the boys, on account of the expense (n. 80, 203, 204). The younger boys are chiefly employed in opening and shutting the ventilating doors in the various parts of the mine; the older ones are employed on heavier work, in carrying coal, &c. (n. 122, 739, 1747). They work these long hours underground until their 18th or 22nd year, when they are put to miner's work proper (n. 161). Children and young persons are at present worse treated, and harder worked than at any previous period (n. 1663-1667). The miners demand almost unanimously an act of Parliament prohibiting the employment in mines of children under 14. And now Hussey Vivian (himself an exploiter of mines) asks:

"Would not the opinion of the workman depend upon the poverty of the workman's family?" Mr. Bruce: "Do you not think it would be a very hard case, where a parent had been injured, or where he was sickly, or where a father was dead, and there was only a mother, to prevent a child between 12 and 14 earning 1s. 7d. a day for the good of the family? ... You must lay down a general rule? ... Are you prepared to recommend legislation which would prevent the employment of children under 12 and 14, whatever the state of their parents might be?" "Yes."

(ns. 107-110). Vivian: "Supposing that an enactment were passed preventing the employment of children under the age of 14, would it not be probable that ... the parents of children would seek employment for their children in other directions, for instance, in manufacture?" "Not generally I think" (n. 174). Kinnaird: "Some of the boys are keepers of doors?" "Yes." "Is there not generally a very great draught every time you open a door or close it?" "Yes, generally there is." "It sounds a very easy thing, but it is in fact rather a painful one?" "He is imprisoned there just the same as if he was in a cell of a gaol." Bourgeois Vivian: "Whenever a boy is furnished with a lamp cannot he read?" "Yes, he can read, if he finds himself in candles.... I suppose he would be found fault with if he were discovered reading; he is there to mind his business, he has a duty to perform, and he has to attend to it in the first place, and I do not think it would be allowed down the pit." (ns. 139, 141, 143, 158, 160).

**II. Education.** – The working miners want a law for the compulsory education of their children, as in factories. They declare the clauses of the Act of 1860, which require a school certificate to be obtained before employing boys of 10 and 12 years of age, to be quite illusory. The examination of the witnesses on this subject is truly droll.

"Is it (the Act) required more against the masters or against the parents?" "It is required against both I think." "You cannot say whether it is required against one more than against the other?" "No; I can hardly answer that question." (ns. 115, 116). "Does there appear to be any desire on the part of the employers that the boys should have such hours as to enable them to go to school?" "No; the hours are never shortened for that purpose." (n. 137) Mr. Kinnaird: "Should you say that the colliers generally improve their education; have you any instances of men who have, since they began to work, greatly improved their education, or do they not rather go back, and lose any advantage that they may have gained?" "They generally become worse: they do not improve; they acquire bad habits; they get on to drinking and gambling and such like, and they go completely to wreck." (n. 211.) "Do they make any attempt of the kind (for providing instruction) by having schools at night?" "There are few collieries where night schools are held, and perhaps at those collieries a few boys do go to those schools; but they are so physically exhausted that it is to no purpose that they go there." (n. 454.) "You are then," concludes the bourgeois, "against education?" "Most certainly not; but," &c. (n. 443.) "But are they (the employers) not compelled to demand them (school certificates)?" "By law they are; but I am not aware that they are demanded by the employers." "Then it is your opinion, that this provision of the Act as to requiring certificates, is not generally carried out in the collieries?" "It is not carried out." (ns. 443, 444.) "Do the men take a great interest in this question (of education)?" "The majority of them do." (n. 717.) "Are they very anxious to see the law enforced?" "The majority are." (n. 718.) "Do you think that in this country any law that you pass ... can really be effectual unless the population themselves assist in putting it into operation?" "Many a man might wish to object to employing a boy, but he would perhaps become marked by it." (n. 720.) "Marked by whom?" "By his employers." (n. 721.) "Do you think that the employers would find any fault with a man who obeyed the law...?" "I believe they would." (n. 722.) "Have you ever heard of any workman objecting to employ a boy between 10 and 12, who could not write or read?" "It is not left to men's

option.” (n. 123.) “Would you call for the interference of Parliament?” “I think that if anything effectual is to be done in the education of the colliers’ children, it will have to be made compulsory by Act of Parliament.” (n. 1634.) “Would you lay that obligation upon the colliers only, or all the workpeople of Great Britain?” “I came to speak for the colliers.” (n. 1636.) “Why should you distinguish them (colliery boys) from other boys?” “Because I think they are an exception to the rule.” (n. 1638.) “In what respect?” “In a physical respect.” (n. 1639.) “Why should education be more valuable to them than to other classes of lads?” “I do not know that it is more valuable; but through the over-exertion in mines there is less chance for the boys that are employed there to get education, either at Sunday schools, or at day schools.” (n. 1640.) “It is impossible to look at a question of this sort absolutely by itself?” (n. 1644.) “Is there a sufficiency of schools?” – “No”... (n. 1646). “If the State were to require that every child should be sent to school, would there be schools for the children to go to?” “No; but I think if the circumstances were to spring up, the schools would be forthcoming.” (n. 1647.) “Some of them (the boys) cannot read and write at all, I suppose?” “The majority cannot... The majority of the men themselves cannot.” (ns. 705, 725.)

**III. Employment of women.** – Since 1842 women are no more employed underground, but are occupied on the surface in loading the coal, &c., in drawing the tubs to the canals and railway waggons, in sorting, &c. Their numbers have considerably increased during the last three or four years. (n. 1727.) They are mostly the wives, daughters, and widows of the working miners, and their ages range from 12 to 50 or 60 years. (ns. 645, 1779.)

“What is the feeling among the working miners as to the employment of women?” “I think they generally condemn it.” (n. 648.) “What objection do you see to it?” “I think it is degrading to the sex.” (n. 649.) “There is a peculiarity of dress?” “Yes ... it is rather a man’s dress, and I believe in some cases, it drowns all sense of decency.” “Do the women smoke?” “Some do.” “And I suppose it is very dirty work?” “Very dirty.” “They get black and grimy?” “As black as those who are down the mines ... I believe that a woman having children (and there are plenty on the banks that have) cannot do her duty to her children.” (ns. 650-654, 701.) “Do you think that those widows could get employment anywhere else, which would bring them in as much wages as that (from 8s. to 10s. a week)?” “I cannot speak to that.” (n. 709.) “You would still be prepared, would you,” (flint-hearted fellow!) “to prevent their obtaining a livelihood by these means?” “I would.” (n. 710.) “What is the general feeling in the district ... as to the employment of women?” “The feeling is that it is degrading; and we wish as miners to have more respect to the fair sex than to see them placed on the pit bank... Some part of the work is very hard; some of these girls have raised as much as 10 tons of stuff a day.” (ns. 1715, 1717.) “Do you think that the women employed about the collieries are less moral than the women employed in the factories?” “. ..the percentage of bad ones may be a little more ... than with the girls in the factories.” (n. 1237.) “But you are not quite satisfied with the state of morality in the factories?” “No.” (n. 1733.) “Would you prohibit the employment of women in factories also?” “No, I would not.” (n. 1734.) “Why not?” “I think it a more honourable occupation for them in the mills.” (n. 1735.) “Still it is injurious to their morality, you think?” “Not so much as working on the pit bank; but it is more on the social position I take it; I do not take it on its moral ground alone. The

degradation, in its social bearing on the girls, is deplorable in the extreme. When these 400 or 500 girls become colliers' wives, the men suffer greatly from this degradation, and it causes them to leave their homes and drink." (n. 1736.) "You would be obliged to stop the employment of women in the ironworks as well, would you not, if you stopped it in the collieries?" "I cannot speak for any other trade." (n. 1737.) "Can you see any difference in the circumstances of women employed in ironworks, and the circumstances of women employed above ground in collieries?" "I have not ascertained anything as to that." (n. 1740.) "Can you see anything that makes a distinction between one class and the other?" "I have not ascertained that, but I know from house to house visitation, that it is a deplorable state of things in our district..." (n. 1741.) "Would you interfere in every case with the employment of women where that employment was degrading?" "It would become injurious, I think, in this way: the best feelings of Englishmen have been gained from the instruction of a mother. ..." (n. 1750.) "That equally applies to agricultural employments, does it not?" "Yes, but that is only for two seasons, and we have work all the four seasons." (n. 1751.) "They often work day and night, wet through to the skin, their constitution undermined and their health ruined." "You have not inquired into that subject perhaps?" "I have certainly taken note of it as I have gone along, and certainly I have seen nothing parallel to the effects of the employment of women on the pit bank.... It is the work of a man... a strong man." (ns. 1753, 1793, 1794.) "Your feeling upon the whole subject is that the better class of colliers who desire to raise themselves and humanise themselves, instead of deriving help from the women, are pulled down by them?" "Yes." (n. 1808.) After some further crooked questions from these bourgeois, the secret of their "sympathy" for widows, poor families, &c., comes out at last. "The coal proprietor appoints certain gentlemen to take the oversight of the workings, and it is their policy, in order to receive approbation, to place things on the most economical basis they can, and these girls are employed at from 1s. up to 1s. 6d. a day, where a man at the rate of 2s. 6d. a day would have to be employed." (n. 1816.)

#### IV. Coroner's inquests. –

"With regard to coroner's inquests in your district, have the workmen confidence in the proceedings at those inquests when accidents occur?" "No; they have not." (n. 360.) "Why not?" "Chiefly because the men who are generally chosen, are men who know nothing about mines and such like." "Are not workmen summoned at all upon the juries?" "Never but as witnesses to my knowledge." "Who are the people who are generally summoned upon these juries?" "Generally tradesmen in the neighbourhood ... from their circumstances they are sometimes liable to be influenced by their employers ... the owners of the works. They are generally men who have no knowledge, and can scarcely understand the witnesses who are called before them, and the terms which are used and such like." "Would you have the jury composed of persons who had been employed in mining?" "Yes, partly... they (the workmen) think that the verdict is not in accordance with the evidence given generally." (ns. 361, 364, 366, 368, 371, 375.) "One great object in summoning a jury is to have an impartial one, is it not?" "Yes, I should think so." "Do you think that the juries would be impartial if they were composed to a considerable extent of workmen?" "I cannot see any motive which the

workmen would have to act partially ... they necessarily have a better knowledge of the operations in connexion with the mine." "You do not think there would be a tendency on the part of the workmen to return unfairly severe verdicts?" "No, I think not." (ns. 378, 379, 380.)

**V. False weights and measures.** – The workmen demand to be paid weekly instead of fortnightly, and by weight instead of by cubical contents of the tubs; they also demand protection against the use of false weights, &c. (n. 1071.)

"If the tubs were fraudulently increased, a man could discontinue working by giving 14 days' notice?" "But if he goes to another place, there is the same thing going on there." (n. 1071.) "But he can leave that place where the wrong has been committed?" "It is general; wherever he goes, he has to submit to it." (n. 1072.) "Could a man leave by giving 14 days' notice?" "Yes." (n. 1073.) And yet they are not satisfied!

**VI. Inspection of mines.** – Casualties from explosions are not the only things the workmen suffer from. (n. 234, sqq.)

"Our men complained very much of the bad ventilation of the collieries ... the ventilation is so bad in general that the men can scarcely breathe; they are quite unfit for employment of any kind after they have been for a length of time in connexion with their work; indeed, just at the part of the mine where I am working, men have been obliged to leave their employment and come home in consequence of that ... some of them have been out of work for weeks just in consequence of the bad state of the ventilation where there is not explosive gas ... there is plenty of air generally in the main courses, yet pains are not taken to get air into the workings where men are working." "Why do you not apply to the inspector?" "To tell the truth there are many men who are timid on that point; there have been cases of men being sacrificed and losing their employment in consequence of applying to the inspector." "Why is he a marked man for having complained?" "Yes..... And he finds it difficult to get employment in another mine?" "Yes." "Do you think the mines in your neighbourhood are sufficiently inspected to insure a compliance with the provisions of the Act?" "No; they are not inspected at all ... the inspector has been down just once in the pit, and it has been going seven years.... In the district to which I belong there are not a sufficient number of inspectors. We have one old man more than 70 years of age to inspect more than 130 collieries." "You wish to have a class of sub-inspectors?" "Yes." (ns. 234, 241, 251, 254, 274, 275, 554, 276, 293.) "But do you think it would be possible for Government to maintain such an army of inspectors as would be necessary to do all that you want them to do, without information from the men?" "No, I should think it would be next to impossible...." "It would be desirable the inspectors should come oftener?" "Yes, and without being sent for." (n. 280, 277.) "Do you not think that the effect of having these inspectors examining the collieries so frequently would be to shift the responsibility (!) of supplying proper ventilation from the owners of the collieries to the Government officials?" "No, I do not think that, I think that they should make it their business to enforce the Acts which are already in existence." (n. 285.) "When you speak of sub-inspectors, do you mean men at a less salary, and of an inferior stamp to the present inspectors?" "I would not have them inferior, if you could get them otherwise." (n. 294.) "Do you merely want more inspectors, or do you want a

lower class of men as an inspector?” “A man who would knock about, and see that things are kept right; a man who would not be afraid of himself.” (n. 295.) “If you obtained your wish in getting an inferior class of inspectors appointed, do you think that there would be no danger from want of skill, &c?” “I think not, I think that the Government would see after that, and have proper men in that position.” (n. 297.)

This kind of examination becomes at last too much even for the chairman of the committee, and he interrupts with the observation:

“You want a class of men who would look into all the details of the mine, and would go into all the holes and corners, and go into the real facts ... they would report to the chief inspector, who would then bring his scientific knowledge to bear on the facts they have stated?” (ns. 298, 299.) “Would it not entail very great expense if all these old workings were kept ventilated?” “Yes, expense might be incurred, but life would be at the same time protected.” (n. 531.)

A working miner objects to the 17th section of the Act of 1860; he says,

“At the present time, if the inspector of mines finds a part of the mine unfit to work in, he has to report it to the mine-owner and the Home Secretary. After doing that, there is given to the owner 20 days to look over the matter; at the end of 20 days he has the power to refuse making any alteration in the mine; but, when he refuses, the mine-owner writes to the Home Secretary, at the same time nominating five engineers, and from those five engineers named by the mine-owner himself, the Home Secretary appoints one, I think, as arbitrator, or appoints arbitrators from them; now we think in that case the mine-owner virtually appoints his own arbitrator.” (n. 581.)

Bourgeois examiner, himself a mine-owner:

“But ... is this a merely speculative objection?” (n. 586.) “Then you have a very poor opinion of the integrity of mining engineers?” “It is most certainly unjust and inequitable.” (n. 588.) “Do not mining engineers possess a sort of public character, and do not you think that they are above making such a partial decision as you apprehend?” “I do not wish to answer such a question as that with respect to the personal character of those men. I believe that in many cases they would act very partially indeed, and that it ought not to be in their hands to do so, where men’s lives are at stake.” (n. 589.)

This same bourgeois is not ashamed to put this question: “Do you not think that the mine-owner also suffers loss from an explosion?” Finally, “Are not you workmen in Lancashire able to take care of your own interests without calling in the Government to help you?” “No.” (n. 1042.)

In the year 1865 there were 3,217 coal mines in Great Britain, and 12 inspectors. A Yorkshire mine-owner himself calculates (*Times*, 26th January, 1867), that putting on one side their office work, which absorbs all their time, each mine can be visited but once in ten years by an inspector. No wonder that explosions have increased progressively, both in number and extent (sometimes with a loss of 200-300 men), during the last ten years. These are the beauties of “free” capitalist production! [*This sentence has been added to the English text in conformity with the 4th German edition. – Ed.*]

The very defective Act, passed in 1872, is the first that regulates the hours of labour of the children employed in mines, and makes exploiters and owners, to a certain extent, responsible for so-called accidents.

The Royal Commission appointed in 1867 to inquire into the employment in agriculture of children, young persons, and women, has published some very important reports. Several attempts to apply the principles of the Factory Acts, but in a modified form, to agriculture have been made, but have so far resulted in complete failure. All that I wish to draw attention to here is the existence of an irresistible tendency towards the general application of those principles.

If the general extension of factory legislation to all trades for the purpose of protecting the working-class both in mind and body has become inevitable, on the other hand, as we have already pointed out, that extension hastens on the general conversion of numerous isolated small industries into a few combined industries carried on upon a large scale; it therefore accelerates the concentration of capital and the exclusive predominance of the factory system. It destroys both the ancient and the transitional forms, behind which the dominion of capital is still in part concealed, and replaces them by the direct and open sway of capital; but thereby it also generalises the direct opposition to this sway. While in each individual workshop it enforces uniformity, regularity, order, and economy, it increases by the immense spur which the limitation and regulation of the working day give to technical improvement, the anarchy and the catastrophes of capitalist production as a whole, the intensity of labour, and the competition of machinery with the labourer. By the destruction of petty and domestic industries it destroys the last resort of the "redundant population," and with it the sole remaining safety-valve of the whole social mechanism. By maturing the material conditions, and the combination on a social scale of the processes of production, it matures the contradictions and antagonisms of the capitalist form of production, and thereby provides, along with the elements for the formation of a new society, the forces for exploding the old one.<sup>244</sup>

## Section 10: Modern Industry and Agriculture

The revolution called forth by modern industry in agriculture, and in the social relations of agricultural producers, will be investigated later on. In this place, we shall merely indicate a few results by way of anticipation. If the use of machinery in agriculture is for the most part free from the injurious physical effect it has on the factory operative, its action in superseding the labourers is more intense, and finds less resistance, as we shall see later in detail. In the counties of Cambridge and Suffolk, for example, the area of cultivated land has extended very much within the last 20 years (up to 1868), while in the same period the rural population has diminished, not only relatively, but absolutely. In the United States it is as yet only virtually that agricultural machines replace labourers; in other words, they allow of the cultivation by the farmer of a larger surface, but do not actually expel the labourers employed. In 1861 the number of persons occupied in England and Wales in the manufacture of agricultural machines was 1,034, whilst the number of agricultural labourers employed in the use of agricultural machines and steam-engines did not exceed 1,205.

In the sphere of agriculture, modern industry has a more revolutionary effect than elsewhere, for this reason, that it annihilates the peasant, that bulwark of the old society, and replaces him by the wage-labourer. Thus the desire for social changes, and the class antagonisms are brought to the same level in the country as in the towns. The irrational, old-fashioned methods of agriculture are replaced by scientific ones. Capitalist production completely tears asunder the old bond of union which held together agriculture and manufacture in their infancy. But at the same time it creates the material conditions for a higher synthesis in the future, viz., the union of agriculture and industry on the basis of the more perfected forms they have each acquired during their temporary separation. Capitalist production, by collecting the population in great centres, and causing an ever-increasing preponderance of town population, on the one hand concentrates the historical

motive power of society; on the other hand, it disturbs the circulation of matter between man and the soil, i.e., prevents the return to the soil of its elements consumed by man in the form of food and clothing; it therefore violates the conditions necessary to lasting fertility of the soil. By this action it destroys at the same time the health of the town labourer and the intellectual life of the rural labourer.<sup>245</sup> But while upsetting the naturally grown conditions for the maintenance of that circulation of matter, it imperiously calls for its restoration as a system, as a regulating law of social production, and under a form appropriate to the full development of the human race. In agriculture as in manufacture, the transformation of production under the sway of capital, means, at the same time, the martyrdom of the producer; the instrument of labour becomes the means of enslaving, exploiting, and impoverishing the labourer; the social combination and organisation of labour-processes is turned into an organised mode of crushing out the workman's individual vitality, freedom, and independence. The dispersion of the rural labourers over larger areas breaks their power of resistance while concentration increases that of the town operatives. In modern agriculture, as in the urban industries, the increased productiveness and quantity of the labour set in motion are bought at the cost of laying waste and consuming by disease labour-power itself. Moreover, all progress in capitalistic agriculture is a progress in the art, not only of robbing the labourer, but of robbing the soil; all progress in increasing the fertility of the soil for a given time, is a progress towards ruining the lasting sources of that fertility. The more a country starts its development on the foundation of modern industry, like the United States, for example, the more rapid is this process of destruction.<sup>246</sup> Capitalist production, therefore, develops technology, and the combining together of various processes into a social whole, only by sapping the original sources of all wealth—the soil and the labourer.

---

<sup>1</sup> Mill should have said, “of any human being not fed by other people's labour,” for, without doubt, machinery has greatly increased the number of well-to-do idlers.

<sup>2</sup> See, for instance, Hutton: “Course of Mathematics.”

<sup>3</sup> “From this point of view we may draw a sharp line of distinction between a tool and a machine: spades, hammers, chisels, &c., combinations of levers and of screws, in all of which, no matter how complicated they may be in other respects, man is the motive power, ... all this falls under the idea of a tool; but the plough, which is drawn by animal power, and wind-mills, &c., must be classed among machines.” (Wilhelm Schulz: “Die Bewegung der Produktion.” Zürich, 1843, p. 38.) In many respects a book to be recommended.

<sup>4</sup> Before his time, spinning machines, although very imperfect ones, had already been used, and Italy was probably the country of their first appearance. A critical history of technology would show how little any of the inventions of the 18th century are the work of a single individual. Hitherto there is no such book. Darwin has interested us in the history of Nature's Technology, i.e., in the formation of the organs of plants and animals, which organs serve as instruments of production for sustaining life. Does not the history of the productive organs of man, of organs that are the material basis of all social organisation, deserve equal attention? And would not such a history be easier to compile, since, as Vico says, human history differs from natural history in this, that we have made the former, but not the latter? Technology discloses man's mode of dealing with Nature, the process of production by which he sustains his life, and thereby also lays bare the mode of formation of his social relations, and of the mental conceptions that flow from them. Every history of religion, even, that fails to take account of this material basis, is uncritical. It is, in reality, much easier to discover by analysis the earthly core of the misty creations of religion, than, conversely, it is, to develop from the actual relations of life the corresponding celestialised forms of those relations. The latter method is the only materialistic, and therefore the only scientific one. The weak points in the abstract materialism of natural science, a materialism that excludes history and its process, are at once evident from the

abstract and ideological conceptions of its spokesmen, whenever they venture beyond the bounds of their own speciality.

<sup>5</sup> Especially in the original form of the power-loom, we recognise, at the first glance, the ancient loom. In its modern form, the power-loom has undergone essential alterations.

<sup>6</sup> It is only during the last 15 years (i.e., since about 1850), that a constantly increasing portion of these machine tools have been made in England by machinery, and that not by the same manufacturers who make the machines. Instances of machines for the fabrication of these mechanical tools are, the automatic bobbin-making engine, the cardsetting engine, shuttle-making machines, and machines for forging mule and throstle spindles.

<sup>7</sup> Moses says: "Thou shalt not muzzle the ox that treads the corn." The Christian philanthropists of Germany, on the contrary, fastened a wooden board round the necks of the serfs, whom they used as a motive power for grinding, in order to prevent them from putting flour into their mouths with their hands.

<sup>8</sup> It was partly the want of streams with a good fall on them, and partly their battles with superabundance of water in other respects, that compelled the Dutch to resort to wind as a motive power. The wind-mill itself they got from Germany, where its invention was the origin of a pretty squabble between the nobles, the priests, and the emperor, as to which of those three the wind "belonged." The air makes bondage, was the cry in Germany, at the same time that the wind was making Holland free. What it reduced to bondage in this case, was not the Dutchman, but the land for the Dutchman. In 1836, 12,000 windmills of 6,000 horse-power were still employed in Holland, to prevent two-thirds of the land from being reconverted into morasses.

<sup>9</sup> It was, indeed, very much improved by Watt's first so-called single acting engine; but, in this form, it continued to be a mere machine for raising water, and the liquor from salt mines.

<sup>10</sup> "The union of all these simple instruments, set in motion by a single motor, constitutes a machine." (Babbage, l.c.)

<sup>11</sup> In January, 1861, John C. Morton read before the Society of Arts a paper on "The forces employed in agriculture." He there states: "Every improvement that furthers the uniformity of the land makes the steam-engine more and more applicable to the production of pure mechanical force.... Horse-power is requisite wherever crooked fences and other obstructions prevent uniform action. These obstructions are vanishing day by day. For operations that demand more exercise of will than actual force, the only power applicable is that controlled every instant by the human mind-in other words, man-power." Mr. Morton then reduces steam-power, horse-power, and man-power, to the unit in general use for steam-engines, namely, the force required to raise 33,000 lbs. one foot in one minute, and reckons the cost of one horse-power from a steam-engine to be 3d., and from a horse to be 5½d. per hour. Further, if a horse must fully maintain its health, it can work no more than 8 hours a day. Three at the least out of every seven horses used on tillage land during the year can be dispensed with by using steam-power, at an expense not greater than that which, the horses dispensed with, would cost during the 3 or 4 months in which alone they can be used effectively. Lastly, steam-power, in those agricultural operations in which it can be employed, improves, in comparison with horse-power, the quality of the work. To do the work of a steam-engine would require 66 men, at a total cost of 15s. an hour, and to do the work of a horse, 32 men, at a total cost of 8s. an hour.

<sup>12</sup> Faulhaber, 1625; De Caus, 1688.

<sup>13</sup> The modern turbine frees the industrial exploitation of water-power from many of its former fetters.

<sup>14</sup> "In the early days of textile manufactures, the locality of the factory depended upon the existence of a stream having a sufficient fall to turn a water-wheel; and, although the establishment of the water-mills was the commencement of the breaking up of the domestic system of manufacture, yet the mills

necessarily situated upon streams, and frequently at considerable distances the one from the other, formed part of a rural, rather than an urban system; and it was not until the introduction of the steam-power as a substitute for the stream that factories were congregated in towns, and localities where the coal and water required for the production of steam were found in sufficient quantities. The steam-engine is the parent of manufacturing towns.” (A. Redgrave in “Reports of the Insp. of Fact., 30th April, 1860,” p. 36.)

<sup>15</sup> From the standpoint of division of labour in Manufacture, weaving was not simple, but, on the contrary, complicated manual labour; and consequently the power-loom is a machine that does very complicated work. It is altogether erroneous to suppose that modern machinery originally appropriated those operations alone, which division of labour had simplified. Spinning and weaving were, during the manufacturing period, split up into new species, and the implements were modified and improved; but the labour itself was in no way divided, and it retained its handicraft character. It is not the labour, but the instrument of labour, that serves as the starting-point of the machine.

<sup>16</sup> Before the epoch of Mechanical Industry, the wool manufacture was the predominating manufacture in England. Hence it was in this industry that, in the first half of the 18th century, the most experiments were made. Cotton, which required less careful preparation for its treatment by machinery, derived the benefit of the experience gained on wool, just as afterwards the manipulation of wool by machinery was developed on the lines of cotton-spinning and weaving by machinery. It was only during the 10 years immediately preceding 1866, that isolated details of the wool manufacture, such as woolcombing, were incorporated in the factory system. “The application of power to the process of combing wool ... extensively in operation since the introduction of the combing-machine, especially Lister’s ... undoubtedly had the effect of throwing a very large number of men out of work. Wool was formerly combed by hand, most frequently in the cottage of the comber. It is now very generally combed in the factory, and hand-labour is superseded, except in some particular kinds of work, in which hand-combed wool is still preferred. Many of the hand-combers found employment in the factories, but the produce of the hand-combers bears so small a proportion to that of the machine, that the employment of a very large number of combers has passed away.” (“Rep. of Insp. of Fact. for 31st Oct., 1856,” p. 16.)

<sup>17</sup> “The principle of the factory system, then, is to substitute ... the partition of a process into its essential constituents, for the division or graduation of labour among artisans.” (Andrew Ure: “The Philosophy of Manufactures,” Lond., 1835, p. 20.)

<sup>18</sup> The power-loom was at first made chiefly of wood; in its improved modern form it is made of iron. To what an extent the old forms of the instruments of production influenced their new forms at first starting, is shown by, amongst other things, the most superficial comparison of the present power-loom with the old one, of the modern blowing apparatus of a blast-furnace with the first inefficient mechanical reproduction of the ordinary bellows, and perhaps more strikingly than in any other way, by the attempts before the invention of the present locomotive, to construct a locomotive that actually had two feet, which after the fashion of a horse, it raised alternately from the ground. It is only after considerable development of the science of mechanics, and accumulated practical experience, that the form of a machine becomes settled entirely in accordance with mechanical principles, and emancipated from the traditional form of the tool that gave rise to it.

<sup>19</sup> Eli Whitney’s cotton gin had until very recent times undergone less essential changes than any other machine of the 18th century. It is only during the last decade (i.e., since 1856) that another American, Mr. Emery, of Albany, New York, has rendered Whitney’s gin antiquated by an improvement as simple as it is effective.

<sup>20</sup> “The Industry of Nations,” Lond., 1855, Part II., p. 239. This work also remarks: ‘Simple and outwardly unimportant as this appendage to lathes may appear, it is not, we believe, averring too much

to state, that its influence in improving and extending the use of machinery has been as great as that produced by Watt's improvements of the steam-engine itself. Its introduction went at once to perfect all machinery, to cheapen it, and to stimulate invention and improvement."

<sup>21</sup> One of these machines, used for forging paddle-wheel shafts in London, is called "Thor." It forges a shaft of 16½ tons with as much ease as a blacksmith forges a horseshoe.

<sup>22</sup> Wood-working machines that are also capable of being employed on a small scale are mostly American inventions.

<sup>23</sup> Science, generally speaking, costs the capitalist nothing, a fact that by no means hinders him from exploiting it. The science of others is as much annexed by capital as the labour of others. Capitalistic appropriation and personal appropriation, whether of science or of material wealth, are, however, totally different things. Dr. Ure himself deplors the gross ignorance of mechanical science existing among his dear machinery-exploiting manufacturers, and Liebig can a tale unfold about the astounding ignorance of chemistry displayed by English chemical manufacturers.

<sup>24</sup> Ricardo lays such stress on this effect of machinery (of which, in other connexions, he takes no more notice than he does of the general distinction between the labour process and the process of creating surplus-value), that he occasionally loses sight of the value given up by machines to the product, and puts machines on the same footing as natural forces. Thus "Adam Smith nowhere undervalues the services which the natural agents and machinery perform for us, but he very justly distinguishes the nature of the value which they add to commodities... as they perform their work gratuitously, the assistance which they afford us, adds nothing to value in exchange." (Ric., l.c., pp. 336, 337.) This observation of Ricardo is of course correct in so far as it is directed against J. B. Say, who imagines that machines render the "service" of creating value which forms a part of "profits."

<sup>25</sup> A horse-power is equal to a force of 33,000 foot-pounds per minute, i.e., to a force that raises 33,000 pounds one foot in a minute, or one pound 33,000 feet. This is the horse power meant in the text. In ordinary language, and also here and there in quotations in this work, a distinction is drawn between the "nominal" and the "commercial" or "indicated" horse-power of the same engine. The old or nominal horse-power is calculated exclusively from the length of piston-stroke, and the diameter of the cylinder, and leaves pressure of steam and piston speed out of consideration. It expresses practically this: This engine would be one of 50 horse-power, if it were driven with the same low pressure of steam, and the same slow piston speed, as in the days of Boulton and Watt. But the two latter factors have increased enormously since those days. In order to measure the mechanical force exerted today by an engine, an indicator has been invented which shows the pressure of the steam in the cylinder. The piston speed is easily ascertained. Thus the "indicated" or "commercial" horse-power of an engine is expressed by a mathematical formula, involving diameter of cylinder, length of stroke, piston speed, and steam pressure, simultaneously, and showing what multiple of 33,000 pounds is really raised by the engine in a minute. Hence, one "nominal" horse-power may exert three, four, or even five "indicated" or "real" horse-powers. This observation is made for the purpose of explaining various citations in the subsequent pages. — *F. E.*

<sup>26</sup> The reader who is imbued with capitalist notions will naturally miss here the "interest" that the machine, in proportion to its capital value, adds to the product. It is, however, easily seen that since a machine no more creates new value than any other part of constant capital, it cannot add any value under the name of "interest." It is also evident that here, where we are treating of the production of surplus-value, we cannot assume *a priori* the existence of any part of that value under the name of interest. The capitalist mode of calculating, which appears, *primâ facie*, absurd, and repugnant to the laws of the creation of value, will be explained in the third book of this work.

<sup>27</sup> This portion of value which is added by the machinery, decreases both absolutely and relatively, when the machinery does away with horses and other animals that are employed as mere moving

forces, and not as machines for changing the form of matter. It may here be incidentally observed, that Descartes, in defining animals as mere machines, saw with eyes of the manufacturing period, while to eyes of the middle ages, animals were assistants to man, as they were later to Von Haller in his "Restauration der Staatswissenschaften." That Descartes, like Bacon, anticipated an alteration in the form of production, and the practical subjugation of Nature by Man, as a result of the altered methods of thought, is plain from his "Discours de la Méthode." He there says: "Il est possible (by the methods he introduced in philosophy) de parvenir à des connaissances fort utiles à la vie, et qu'au lieu de cette philosophie spéculative qu'on enseigne dans les écoles, on en peut trouver une pratique, par laquelle, connaissant la force et les actions du feu, de l'eau, de l'air, des astres, et de tous les autres corps qui nous environnent, aussi distinctement que nous connaissons les divers métiers de nos artisans, nous les pourrions employer en même façon à tous les usages auxquels ils sont propres, et ainsi nous rendre comme maîtres et possesseurs de la nature" and thus "contribuer au perfectionnement de la vie humaine." [It is possible to attain knowledge very useful in life and, in place of the speculative philosophy taught in the schools, one can find a practical philosophy by which, given that we know the powers and the effectiveness of fire, water, air, the stars, and all the other bodies that surround us, as well and as accurately as we know the various trades of our craftsmen, we shall be able to employ them in the same manner as the latter to all uses to which they are adapted, and thus as it were make ourselves the masters and possessors of nature, and thus contributing to the perfection of human life.] In the preface to Sir Dudley North's "Discourses upon Trade" (1691) it is stated, that Descartes' method had begun to free Political Economy from the old fables and superstitious notions of gold, trade, &c. On the whole, however, the early English economists sided with Bacon and Hobbes as their philosophers; while, at a later period, the philosopher [...] of Political Economy in England, France, and Italy, was Locke.

<sup>28</sup> According to the annual report (1863) of the Essen chamber of commerce, there was produced in 1862, at the cast-steel works of Krupp, with its 161 furnaces, thirty-two steam-engines (in the year 1800 this was about the number of all the steam-engines working in Manchester), and fourteen steam-hammers (representing in all 1,236 horse-power) forty-nine forges, 203 tool-machines, and about 2,400 workmen - thirteen million pounds of cast steel. Here there are not two workmen to each horse-power.

<sup>29</sup> Babbage estimates that in Java the spinning labour alone adds 117% to the value of the cotton. At the same period (1832) the total value added to the cotton by machinery and labour in the fine-spinning industry, amounted to about 33% of the value of the cotton. ("On the Economy of Machinery," pp. 165, 166.)

<sup>30</sup> Machine printing also economises colour.

<sup>31</sup> See Paper read by Dr. Watson, Reporter on Products to the Government of India, before the Society of Arts, 17th April, 1860.

<sup>32</sup> "These mute agents (machines) are always the produce of much less labour than that which they displace, even when they are of the same money-value." (Ricardo, l.c., p. 40.)

<sup>33</sup> Hence in a communistic society there would be a very different scope for the employment of machinery than there can be in a bourgeois society.

<sup>34</sup> "Employers of labour would not unnecessarily retain two sets of children under thirteen.... In fact one class of manufacturers, the spinners of woollen yarn, now rarely employ children under thirteen years of age, i.e., half-timers. They have introduced improved and new machinery of various kinds, which altogether supersedes the employment of children (i.e., under 13 years); f. i., I will mention one process as an illustration of this diminution in the number of children, wherein by the addition of an apparatus, called a piecing machine, to existing machines, the work of six or four half-timers, according to the peculiarity of each machine, can be performed by one young person (over 13 years)...

the half-time system ‘stimulated’ the invention of the piecing machine.” (Reports of Insp. of Fact. for 31st Oct., 1858.)

<sup>35</sup> “Wretch” is the recognised term in English Political Economy for the agricultural labourer.

<sup>36</sup> “Machinery ... can frequently not be employed until labour (he means wages) rises.” (Ricardo, *l.c.*, p. 479.)

<sup>37</sup> See “Report of the Social Science Congress, at Edinburgh.” Oct., 1863.

<sup>38</sup> Dr. Edward Smith, during the cotton crisis caused by the American Civil War, was sent by the English Government to Lancashire, Cheshire, and other places, to report on the sanitary condition of the cotton operatives. He reported, that from a hygienic point of view, and apart from the banishment of the operatives from the factory atmosphere, the crisis had several advantages. The women now had sufficient leisure to give their infants the breast, instead of poisoning them with “Godfrey’s cordial.” They had time to learn to cook. Unfortunately the acquisition of this art occurred at a time when they had nothing to cook. But from this we see how capital, for the purposes of its self-expansion, has usurped the labour necessary in the home of the family. This crisis was also utilised to teach sewing to the daughters of the workmen in sewing schools. An American revolution and a universal crisis, in order that the working girls, who spin for the whole world, might learn to sew!

<sup>39</sup> “The numerical increase of labourers has been great, through the growing substitution of female for male, and above all, of childish for adult labour. Three girls of 13, at wages of from 6 shillings to 8 shillings a week, have replaced the one man of mature age, of wages varying from 18 shillings to 45 shillings.” (Th. de Quincey: “The Logic of Political Econ.,” London, 1844. Note to p. 147.) Since certain family functions, such as nursing and suckling children, cannot be entirely suppressed, the mothers confiscated by capital, must try substitutes of some sort. Domestic work, such as sewing and mending, must be replaced by the purchase of ready-made articles. Hence, the diminished expenditure of labour in the house is accompanied by an increased expenditure of money. The cost of keeping the family increases, and balances the greater income. In addition to this, economy and judgment in the consumption and preparation of the means of subsistence becomes impossible. Abundant material relating to these facts, which are concealed by official Political Economy, is to be found in the Reports of the Inspectors of Factories, of the Children’s Employment Commission, and more especially in the Reports on Public Health.

<sup>40</sup> In striking contrast with the great fact, that the shortening of the hours of labour of women and children in English factories was exacted from capital by the male operatives, we find in the latest reports of the Children’s Employment Commission traits of the operative parents in relation to the traffic in children, that are truly revolting and thoroughly like slave-dealing. But the Pharisee of a capitalist, as may be seen from the same reports, denounces this brutality which he himself creates, perpetuates, and exploits, and which he moreover baptises “freedom of labour.” “Infant labour has been called into aid ... even to work for their own daily bread. Without strength to endure such disproportionate toil, without instruction to guide their future life, they have been thrown into a situation physically and morally polluted. The Jewish historian has remarked upon the overthrow of Jerusalem by Titus that it was no wonder it should have been destroyed, with such a signal destruction, when an inhuman mother sacrificed her own offspring to satisfy the cravings of absolute hunger.” (“Public Economy Concentrated.” Carlisle, 1833, p. 66.)

<sup>41</sup> A. Redgrave in “Reports of Insp. of Fact. for 31st October, 1858,” pp. 40, 41.

<sup>42</sup> “Children’s Employment Commission, Fifth Report,” London, 1866, p. 81, n. 31. [*Added in the 4th German edition. — The Bethnal Green silk industry is now almost destroyed. — F. E.*]

<sup>50</sup> l.c., p. 456.

<sup>51</sup> In the agricultural as well as in the factory districts the consumption of opium among the grown-up labourers, both male and female, is extending daily. “To push the sale of opiate... is the great aim of some enterprising wholesale merchants. By druggists it is considered the leading article.” (l.c., p. 459.) Infants that take opiates “shrank up into little old men,” or “wizened like little monkeys.” (l.c., p. 460.) We here see how India and China avenged themselves on England.

<sup>57</sup> L. Horner in “Reports, &c., for 31st Oct., 1857,” pp. 17, 18.

<sup>58</sup> Sir J. Kincaid in “Reports, &c., 31st Oct., 1856,” p. 66

<sup>59</sup> A. Redgrave in “Rep. of Insp. of Fact., 31st Oct., 1857,” pp. 41-42. In those industries where the Factory Act proper (not the Print Works Act referred to in the text) has been in force for some time, the obstacles in the way of the education clauses have, in recent years, been overcome. In industries not under the Act, the views of Mr. J. Geddes, a glass manufacturer, still extensively prevail. He informed Mr. White, one of the Inquiry Commissioners: “As far as I can see, the greater amount of education which a part of the working-class has enjoyed for some years past is an evil. It is dangerous, because it makes them independent.” (“Children’s Empl. Comm., Fourth Report,” Lond., 1865, p. 253.)

<sup>60</sup> “Mr. E., a manufacturer ... informed me that he employed females exclusively at his power-looms ... gives a decided preference to married females, especially those who have families at home dependent on them for support; they are attentive, docile, more so than unmarried females, and are compelled to use their utmost exertions to procure the necessaries of life. Thus are the virtues, the peculiar virtues of the female character to be perverted to her injury – thus all that is most dutiful and tender in her nature is made a means of her bondage and suffering.” (Ten Hours’ Factory Bill. The Speech of Lord Ashley, March 15th, Lond., 1844, p. 20.)

<sup>61</sup> “Since the general introduction of machinery, human nature has been forced far beyond its average strength.” (Rob. Owen: “Observations on the Effects of the Manufacturing System,” 2nd Ed., London, 1817.)

<sup>62</sup> The English, who have a tendency to look upon the earliest form of appearance of a thing as the cause of its existence, are in the habit of attributing the long hours of work in factories to the extensive kidnapping of children, practised by capitalists in the infancy of the factory system, on workhouses and orphanages, by means of which robbery, unresisting material for exploitation was procured. Thus, for instance, Ficiden, himself a manufacturer, says: “It is evident that the long hours of work were

brought about by the circumstance of so great a number of destitute children being supplied from different parts of the country, that the masters were independent of the hands, and that having once established the custom by means of the miserable materials they had procured in this way, they could impose it on their neighbours with the greater facility.” (J. Ficiden: “The Curse of the Factory System,” Lond., 1836, p. I 1.) With reference to the labour of women, Saunders, the factory inspector, says in his report of 1844: “Amongst the female operatives there are some women who, for many weeks in succession, except for a few days, are employed from 6 a. m. till midnight, with less than 2 hours for meals, so that on 5 days of the week they have only 6 hours left out of the 24, for going to and from their homes and resting in bed.”

<sup>63</sup> “Occasion... injury to the delicate moving parts of metallic mechanism by inaction.” (Ure, l.c., p. 281.)

<sup>64</sup> The Manchester Spinner (*Times*, 26th Nov., 1862) before referred to says in relation to this subject: “It (namely, the “allowance for deterioration of machinery”) is also intended to cover the loss which is constantly arising from the superseding of machines before they are worn out, by others of a new and better construction.”

<sup>65</sup> “It has been estimated, roughly, that the first individual of a newly-invented machine will cost about five times as much as the construction of the second.” (Babbage, l.c., p. 349.)

<sup>66</sup> “The improvements which took place not long ago in frames for making patent net were so great that a machine in good repair which had cost £1,200, sold a few years after for £60 ... improvements succeeded each other so rapidly, that machines which had never been finished were abandoned in the hands of their makers, because new improvements had superseded their utility.” (Babbage, l.c., p. 233.) In these stormy, go-ahead times, therefore, the tulle manufacturers soon extended the working day, by means of double sets of hands, from the original 8 hours to 24.

<sup>67</sup> “It is self-evident, that, amid the ebbings and flowings of the markets and the alternate expansions and contractions of demand, occasions will constantly recur, in which the manufacturer may employ additional floating capital without employing additional fixed capital... if additional quantities of raw material can be worked up without incurring an additional expense for buildings and machinery.” (R. Torrens: “On Wages and Combination.” London, 1834, p. 64.)

<sup>68</sup> This circumstance is mentioned only for the sake of completeness, for I shall not consider the rate of profit, i.e., the ratio of the surplus-value to the total capital advanced, until I come to the third book.

<sup>69</sup> Senior, “Letters on the Factory Act.” London, 1837, pp. 13, 14.

<sup>70</sup> “The great proportion of fixed to circulating capital ... makes long hours of work desirable.” With the increased use of machinery, &c., “the motives to long hours of work will become greater, as the only means by which a large proportion of fixed capital can be made profitable.” (l.c., pp. 11-13.) “There are certain expenses upon a mill which go on in the same proportion whether the mill be running short or full time, as, for instance, rent rates, and taxes, insurance against fire, wages of several permanent servants, deterioration of machinery, with various other charges upon a manufacturing establishment, the proportion of which to profits increases as the production decreases.” (“Rep. of Insp. of Fact. for 31st Oct., 1862,” p. 19.)

<sup>71</sup> Why it is, that the capitalist, and also the political economists who are imbued with his views, are unconscious of this immanent contradiction, will appear from the first part of the third book.

<sup>72</sup> It is one of the greatest merits of Ricardo to have seen in machinery not only the means of producing commodities, but of creating a “redundant population.”

<sup>73</sup> F. Biese. “Die Philosophie des Aristoteles,” Vol. 2. Berlin, 1842, p. 408.

<sup>74</sup> I give below the translation of this poem by Stolberg, because it brings into relief, quite in the spirit of former quotations referring to division of labour, the antithesis between the views of the ancients

and the moderns. "Spare the hand that grinds the corn, Oh, miller girls, and softly sleep. Let Chanticleer announce the morn in vain! Deo has commanded the work of the girls to be done by the Nymphs, and now they skip lightly over the wheels, so that the shaken axles revolve with their spokes and pull round the load of the revolving stones. Let us live the life of our fathers, and let us rest from work and enjoy the gifts that the Goddess sends us."

"Schonet der mahlenden Hand, o Müllerinnen, und schlafet  
Sanft! es verkünde der Hahn euch den Morgen umsonst!  
Däo hat die Arbeit der Mädchen den Nymphen befohlen,  
Und itzt hüpfen sic leicht über die Räder dahin,  
Daß die erschütterten Achsen mit ihren Speichen sich wälzen,  
Und im Kreise die Last drehen des wälzenden Steins.  
Laßt uns leben das Leben der Väter, und laßt uns der Gaben  
Arbeitslos uns freun, welche die Göttin uns schenkt."

(Gedichte aus dem Griechischen übersetzt von Christian Graf zu Stolberg, Hamburg, 1782.)

<sup>75</sup> There are, of course, always differences, in the intensities of the labour in various industries. But these differences are, as Adam Smith has shown, compensated to a partial extent by minor circumstances, peculiar to each sort of labour. Labour-time, as a measure of value, is not, however, affected in this case, except in so far as the duration of labour, and the degree of its intensity, are two antithetical and mutually exclusive expressions for one and the same quantity of labour.

<sup>76</sup> Especially by piece-work, a form we shall investigate in Part VI. of this book.

<sup>77</sup> See "Rep. of Insp. of Fact. for 31st October, 1865."

<sup>78</sup> Rep. of Insp. of Fact. for 1844 and the quarter ending 30th April, 1845, pp. 20-21.

<sup>79</sup> I.c., p. 19. Since the wages for piece-work were unaltered, the weekly wages depended on the quantity produced.

<sup>80</sup> I.c., p. 20.

<sup>81</sup> The moral element played an important part in the above experiments. The workpeople told the factory inspector: "We work with more spirit, we have the reward ever before us of getting away sooner at night, and one active and cheerful spirit pervades the whole mill, from the youngest piecer to the oldest hand, and we can greatly help each other." (I.c., p. 21.)

<sup>82</sup> John Fielden, I.c., p. 32.

<sup>83</sup> Lord Ashley, I.c., pp. 6-9, *passim*.

<sup>84</sup> Rep. of Insp. of Fact. for Quarter ending 30th September, 1844, and from 1st October, 1844, to 30th April, 1845, p. 20.

<sup>85</sup> I.c., p. 22.

<sup>86</sup> "Rep. of Insp. of Fact. for 31st October, 1862," p. 62.

<sup>87</sup> This was altered in the "Parliamentary Return" of 1862. In it the actual horse-power of the modern steam engines and water wheels appears in place of the nominal. The doubling spindles, too, are no longer included in the spinning spindles (as was the case in the "Returns" of 1839, 1850, and 1856); further, in the case of woollen mills, the number of "gigs" is added, a distinction made between jute and hemp mills on the one hand and flax mills on the other, and finally stocking-weaving is for the first time inserted in the report.

<sup>88</sup> "Rep. of Insp. of Fact. for 31st October, 1856," pp. 13-14, 20 and 1852, p. 23.

<sup>89</sup> I.c., pp. 14-15.

<sup>90</sup> I.c., p. 20.

<sup>91</sup> “Reports, &c., for 31st October, 1858,” pp. 9-10. Compare “Reports, &c., for 30th April, 1860,” p. 30, sqq.

<sup>92</sup> “Reports of Insp. of Fact. for 31st Oct., 1862,” pp. 100 and 130.

<sup>93</sup> On 2 modern power-looms a weaver now makes in a week of 60 hours 26 pieces of certain quality, length, and breadth; while on the old power-looms he could make no more than 4 such pieces. The cost of weaving a piece of such cloth had already soon after 1850 fallen from 2s. 9d. to 5 1/8d.

“Thirty years ago (1841) one spinner with three placers was not required to attend to more than one pair of mules with 300-324 spindles. At the present time (1871) he has to mind with the help of 5 piecers 2,200 spindles, and produces not less than seven times as much yarn as in 1841.” (Alex. Redgrave, Factory Inspector – in the *Journal of Arts*, 5th January, 1872.)

<sup>94</sup> “Rep. of Insp. of Fact. for 31st Oct., 1861,” pp. 25, 26.

<sup>95</sup> The agitation for a working day of 8 hours has now (1867) begun in Lancashire among the factory operatives.

<sup>96</sup> The following few figures indicate the increase in the “factories” of the United Kingdom since 1848:

See the Blue books “Statistical Abstract of the United Kingdom,” Nos. 8 and 13. Lond., 1861 and 1866. In Lancashire the number of mills increased only 4 per cent. between 1839 and 1850; 19 per cent. between 1850 and 1856; and 33 per cent. between 1856 and 1862; while the persons employed in them during each of the above periods of 11 years increased absolutely, but diminished relatively. (See “Rep. of Insp. of Fact., for 31st Oct., 1862,” p. 63.) The cotton trade preponderates in Lancashire. We may form an idea of the stupendous nature of the cotton trade in that district when we consider that, of the gross number of textile factories in the United Kingdom, it absorbs 45.2 per cent., of the spindles 83.3 per cent., of the power-looms 81.4 per cent., of the mechanical horse-power 72.6 per cent., and of the total number of persons employed 58.2 per cent. (l.c., pp. 62-63.)

<sup>97</sup> Ure, l.c., p. 18.

<sup>98</sup> Ure, l.c., P. 3 1. See Karl Marx, l.c., pp. 140-141.

<sup>99</sup> It looks very like intentional misleading by statistics (which misleading it would be possible to prove in detail in other cases too), when the English factory legislation excludes from its operation the

class of labourers last mentioned in the text, while the parliamentary returns expressly include in the category of factory operatives, not only engineers, mechanics, &c., but also managers, salesmen, messengers, warehousemen, packers, &c., in short everybody, except the owner of the factory himself.

<sup>100</sup> Ure grants this. He says, "in case of need," the workmen can be moved at the will of the manager from one machine to another, and he triumphantly exclaims: "Such a change is in flat contradiction with the old routine, that divides the labour, and to one workman assigns the task of fashioning the head of a needle, to another the sharpening of the point." He had much better have asked himself, why this "old routine" is departed from in the automatic factory, only "in case of need."

<sup>101</sup> When distress is very great, as, for instance, during the American Civil War, the factory operative is now and then set by the Bourgeois to do the roughest of work, such as road-making, &c.. The English "ateliers nationaux" [national workshops] of 1862 and the following years, established for the benefit of the destitute cotton operatives, differ from the French of 1848 in this, that in the latter the workmen had to do unproductive work at the expense of the state, in the former they had to do productive municipal work to the advantage of the bourgeois, and that, too, cheaper than the regular workmen, with whom they were thus thrown into competition. "The physical appearance of the cotton operatives is unquestionably improved. This I attribute ... as to the men, to outdoor labour on public works." ("Rep. of Insp. of Fact., 31st Oct., 1863," p. 59.) The writer here alludes to the Preston factory operatives, who were employed on Preston Moor.

<sup>102</sup> An example: The various mechanical apparatus introduced since the Act of 1844 into woollen mills, for replacing the labour of children. So soon as it shall happen that the children of the manufacturers themselves have to go through a course of schooling as helpers in the mill, this almost unexplored territory of mechanics will soon make remarkable progress. "Of machinery, perhaps self-acting mules are as dangerous as any other kind. Most of the accidents from them happen to little children, from their creeping under the mules to sweep the floor whilst the mules are in motion. Several 'minders' have been fined for this offence, but without much general benefit. If machine makers would only invent a self-sweeper, by whose use the necessity for these little children to creep under the machinery might be prevented, it would be a happy addition to our protective measures." ("Reports of Insp. of Fact. for 31st. Oct., 1866," p. 63.)

<sup>103</sup> So much then for Proudhon's wonderful idea: he "construes" machinery not as a synthesis of instruments of labour, but as a synthesis of detail operations for the benefit of the labourer himself.

<sup>104</sup> F. Engels, l.c., p. 217. Even an ordinary and optimist Free-trader, like Mr. Molinari, goes so far as to say, "Un homme s'use plus vite en surveillant, quinze heures par jour, l'évolution uniforme d'un mécanisme, qu'en exerçant, dans le même espace de temps, sa force physique. Ce travail de surveillance qui servirait peut-être d'utile gymnastique à l'intelligence, s'il n'était pas trop prolongé, détruit à la longue, par son excès, et l'intelligence, et le corps même." [A man becomes exhausted more quickly when he watches over the uniform motion of mechanism for fifteen hours a day, than when he applies his physical strength over the same period of time. This labour of surveillance, which might perhaps serve as a useful exercise for the mind, if it did not go on too long, destroys both the mind and the body in the long run, through excessive application] (G. de Molinari: "Études Économiques." Paris, 1846.)

<sup>105</sup> F. Engels, l.c., p. 216.

<sup>106</sup> "The Master Spinners' and Manufacturers' Defence Fund. Report of the Committee." Manchester, 1854, p. 17. We shall see hereafter, that the "master" can sing quite another song, when he is threatened with the loss of his "living" automaton.

<sup>107</sup> Ure, l.c., p. 15. Whoever knows the life history of Arkwright, will never dub this barber-genius "noble." Of all the great inventors of the 18th century, he was incontestably the greatest thief of other people's inventions and the meanest fellow.

<sup>108</sup> “The slavery in which the bourgeoisie has bound the proletariat, comes nowhere more plainly into daylight than in the factory system. In it all freedom comes to an end both at law and in fact. The workman must be in the factory at half past five. If he come a few minutes late, he is punished; if he come 10 minutes late, he is not allowed to enter until after breakfast, and thus loses a quarter of a day’s wage. He must eat, drink and sleep at word of command.... The despotic bell calls him from his bed, calls him from breakfast and dinner. And how does he fare in the mill? There the master is the absolute law-giver. He makes what regulations he pleases; he alters and makes additions to his code at pleasure; and if he insert the veriest nonsense, the courts say to the workman: Since you have entered into this contract voluntarily, you must now carry it out .... These workmen are condemned to live, from their ninth year till their death, under this mental and bodily torture.” (F. Engels, *l.c.*, p. 217, sq.)

What, “the courts say,” I will illustrate by two examples. One occurs at Sheffield at the end of 1866. In that town a workman had engaged himself for 2 years in a steelworks. In consequence of a quarrel with his employer he left the works, and declared that under no circumstances would he work for that master any more. He was prosecuted for breach of contract, and condemned to two months’ imprisonment. (If the master break the contract, he can be proceeded against only in a civil action, and risks nothing but money damages.) After the workman has served his two months, the master invites him to return to the works, pursuant to the contract. Workman says: No, he has already been punished for the breach. The master prosecutes again, the court condemns again, although one of the judges, Mr. Shee, publicly denounces this as a legal monstrosity, by which a man can periodically, as long as he lives, be punished over and over again for the same offence or crime. This judgment was given not by the “Great Unpaid,” the provincial Dogberries, but by one of the highest courts of justice in London. — [Added in the 4th German edition. — This has now been done away with. With few exceptions, e.g., when public gas-works are involved, the worker in England is now put on an equal footing with the employer in case of breach of contract and can be sued only civilly. — F. E.]

The second case occurs in Wiltshire at the end of November 1863. About 30 power-loom weavers, in the employment of one Harrup, a cloth manufacturer at Leower’s Mill, Westbury Leigh, struck work because master Harrup indulged in the agreeable habit of making deductions from their wages for being late in the morning; 6d. for 2 minutes; 1s. for 3 minutes, and 1s. 6d. for ten minutes. This is at the rate of 9s. per hour, and £4 10s. 0d. per diem; while the wages of the weavers on the average of a year, never exceeded 10s. to 12s. weekly. Harrup also appointed a boy to announce the starting time by a whistle, which he often did before six o’clock in the morning; and if the hands were not all there at the moment the whistle ceased, the doors were closed, and those hands who were outside were fined: and as there was no clock on the premises, the unfortunate hands were at the mercy of the young Harrup-inspired time-keeper. The hands on strike, mothers of families as well as girls, offered to resume work if the timekeeper were replaced by a clock, and a more reasonable scale of fines were introduced. Harrup summoned 19 women and girls before the magistrates for breach of contract. To the utter indignation of all present, they were each mulcted in a fine of 6d. and 2s. 6d. for costs. Harrup was followed from the court by a crowd of people who hissed him. A favourite operation with manufacturers is to punish the workpeople by deductions made from their wages on account of faults in the material worked on. This method gave rise in 1866 to a general strike in the English pottery districts. The reports of the Ch. Empl. Com. (1863-1866), give cases where the worker not only receives no wages, but becomes, by means of his labour, and of the penal regulations, the debtor to boot, of his worthy master. The late cotton crisis also furnished edifying examples of the sagacity shown by the factory autocrats in making deductions from wages. Mr. R. Baker, the Inspector of Factories, says, “I have myself had lately to direct prosecutions against one cotton mill occupier for having in these pinching and painful times deducted 10d. a piece from some of the young workers employed by him, for the surgeon’s certificate (for which he himself had only paid 6d.), when only allowed by the law to deduct 3d., and by custom nothing at all .... And I have been informed of another, who, in order to keep without the law, but to attain the same object, charges the poor children

who work for him a shilling each, as a fee for learning them the art and mystery of cotton spinning, so soon as they are declared by the surgeon fit and proper persons for that occupation. There may therefore be undercurrent causes for such extraordinary exhibitions as strikes, not only wherever they arise, but particularly at such times as the present, which without explanation, render them inexplicable to the public understanding." He alludes here to a strike of power-loom weavers at Darwen, June, 1863. ("Reports of Insp. of Fact. for 30 April, 1863," pp. 50-51.) The reports always go beyond their official dates.

<sup>109</sup> The protection afforded by the Factory Acts against dangerous machinery has had a beneficial effect. "But ... there are other sources of accident which did not exist twenty years since; one especially, viz., the increased speed of the machinery. Wheels, rollers, spindles and shuttles are now propelled at increased and increasing rates; fingers must be quicker and defter in their movements to take up the broken thread, for, if placed with hesitation or carelessness, they are sacrificed.... A large number of accidents are caused by the eagerness of the workpeople to get through their work expeditiously. It must be remembered that it is of the highest importance to manufacturers that their machinery should be in motion, i.e., producing yarns and goods. Every minute's stoppage is not only a loss of power, but of production, and the workpeople are urged by the overlookers, who are interested in the quantity of work turned off, to keep the machinery in motion, and it is no less important to those of the operatives who are paid by the weight or piece, that the machines should be kept in motion. Consequently, although it is strictly forbidden in many, nay in most factories, that machinery should be cleaned while in motion, it is nevertheless the constant practice in most, if not in all, that the workpeople do, unreproved, pick out waste, wipe rollers and wheels, &c., while their frames are in motion. Thus from this cause only, 906 accidents have occurred during the six months.... Although a great deal of cleaning is constantly going on day by day, yet Saturday is generally the day set apart for the thorough cleaning of the machinery, and a great deal of this is done while the machinery is in motion." Since cleaning is not paid for, the workpeople seek to get done with it as speedily as possible. Hence "the number of accidents which occur on Fridays, and especially on Saturdays, is much larger than on any other day. On the former day the excess is nearly 12 per cent. over the average number of the four first days of the week, and on the latter day the excess is 25 per cent. over the average of the preceding five days; or, if the number of working-hours on Saturday being taken into account — 7½ hours on Saturday as compared with 10½ on other days — there is an excess of 65 per cent. on Saturdays over the average of the other five days." ("Rep. of Insp. of Fact., 31st Oct., 1866," pp. 9, 15, 16, 17.)

<sup>110</sup> In Part I. of Book III. I shall give an account of a recent campaign by the English manufacturers against the Clauses in the Factory Acts that protect the "hands" against dangerous machinery. For the present, let this one quotation from the official report of Leonard Horner suffice: "I have heard some mill-owners speak with inexcusable levity of some of the accidents; such, for instance, as the loss of a finger being a trifling matter. A working-man's living and prospects depend so much upon his fingers, that any loss of them is a very serious matter to him. When I have heard such inconsiderate remarks made, I have usually put this question: Suppose you were in want of an additional workman, and two were to apply, both equally well qualified in other respects, but one had lost a thumb or a forefinger, which would you engage? There never was a hesitation as to the answer...." The manufacturers have "mistaken prejudices against what they have heard represented as a pseudo-philanthropic legislation." ("Rep. of Insp. of Fact., 31st Oct., 1855.") These manufacturers are clever folk, and not without reason were they enthusiastic for the slave-holders' rebellion.

<sup>111</sup> In those factories that have been longest subject to the Factory Acts, with their compulsory limitation of the hours of labour, and other regulations, many of the older abuses have vanished. The very improvement of the machinery demands to a certain extent "improved construction of the

buildings,” and this is an advantage to the workpeople. (See “Rep. of Insp. of Fact. for 31st Oct., 1863,” p. 109.)

<sup>112</sup> See amongst others, John Houghton: “Husbandry and Trade Improved.” London, 1727. “The Advantages of the East India Trade, 1720.” John Bellers, l.c. “The masters and their workmen are, unhappily, in a perpetual war with each other. The invariable object of the former is to get their work done as cheaply as possible; and they do not fail to employ every artifice to this purpose, whilst the latter are equally attentive to every occasion of distressing their masters into a compliance with higher demands.” (“An Enquiry into the Causes of the Present High Price of Provisions,” pp. 61-62. Author, the Rev. Nathaniel Forster, quite on the side of the workmen.)

<sup>113</sup> In old-fashioned manufactures the revolts of the workpeople against machinery, even to this day, occasionally assume a savage character, as in the case of the Sheffield file cutters in 1865.

<sup>114</sup> Sir James Steuart also understands machinery quite in this sense. “Je considère donc les machines comme des moyens d’augmenter (virtuellement) le nombre des gens industriels qu’on n’est pas obligé de nourrir.... En quoi l’effet d’une machine diffère-t-il de celui de nouveaux habitants?” (French trans. t. I., l. I., ch. XIX.) More naïve is Petty, who says, it replaces “Polygamy.” The above point of view is, at the most, admissible only for some parts of the United States. On the other hand, “machinery can seldom be used with success to abridge the labour of an individual; more time would be lost in its construction than could be saved by its application. It is only really useful when it acts on great masses, when a single machine can assist the work of thousands. It is accordingly in the most populous countries, where there are most idle men, that it is most abundant.... It is not called into use by a scarcity of men, but by the facility with which they can be brought to work in masses.” (Piercy Ravenstone: “Thoughts on the Funding System and its Effects.” London, 1824, p. 45.)

<sup>115</sup> [*Note in the 4th German edition.* — This applies to Germany too. Where in our country agriculture on a large scale exists, hence particularly in the East, it has become possible only in consequence of the clearing of the estates (“Bauernlegen”), a practice which became widespread in the 16th century and was particularly so since 1648. — *F. E.*]

<sup>116</sup> “Machinery and labour are in constant competition.” Ricardo, l.c., p. 479.

<sup>117</sup> The competition between hand-weaving and power-weaving in England, before the passing of the Poor Law of 1833, was prolonged by supplementing the wages, which had fallen considerably below the minimum, with parish relief. “The Rev. Mr. Turner was, in 1827, rector of Wilmslow in Cheshire, a manufacturing district. The questions of the Committee of Emigration, and Mr. Turner’s answers, show how the competition of human labour is maintained against machinery. ‘Question: Has not the use of the power-loom superseded the use of the hand-loom? Answer: Undoubtedly; it would have superseded them much more than it has done, if the hand-loom weavers were not enabled to submit to a reduction of wages.’ ‘Question: But in submitting he has accepted wages which are insufficient to support him, and looks to parochial contribution as the remainder of his support? Answer: Yes, and in fact the competition between the hand-loom and the power-loom is maintained out of the poor-rates.’ Thus degrading pauperism or expatriation, is the benefit which the industrious receive from the introduction of machinery, to be reduced from the respectable and in some degree independent mechanic, to the cringing wretch who lives on the debasing bread of charity. This they call a temporary inconvenience.” (“A Prize Essay on the Comparative Merits of Competition and Co-operation.” Lond., 1834, p. 29.)

<sup>118</sup> “The same cause which may increase the revenue of the country” (i.e., as Ricardo explains in the same passage, the revenues of landlords and capitalists, whose wealth, from the economic point of view, forms the Wealth of the Nation), “may at the same time render the population redundant and deteriorate the condition of the labourer.” (Ricardo, l.c., p. 469.) “The constant aim and the tendency of every improvement in machinery is, in fact, to do away entirely with the labour of man, or to lessen

its price by substituting the labour of women and children for that of grown-up men, or of unskilled for that of skilled workmen.” (Ure, *l.c.*, t. I., p. 35.)

<sup>119</sup> “Rep. Insp. Fact. for 31st October, 1858,” p. 43.

<sup>120</sup> “Rep. Insp. Fact. for 31st October, 1856,” p. 15.

<sup>121</sup> Ure, *l.c.*, p. 19. “The great advantage of the machinery employed in brick-making consists in this, that the employer is made entirely independent of skilled labourers.” (“Ch. Empl. Comm. V. Report,” Lond., 1866, p. 130, n. 46.) Mr. A. Sturrock, superintendent of the machine department of the Great Northern Railway, says, with regard to the building of locomotives, &c.: “Expensive English workmen are being less used every day. The production of the workshops of England is being increased by the use of improved tools and these tools are again served by a low class of labour... Formerly their skilled labour necessarily produced all the parts of engines. Now the parts of engines are produced by labour with less skill, but with good tools. By tools, I mean engineer’s machinery, lathes, planing machines, drills, and so on.” (“Royal Com. on Railways,” Lond., 1867, Minutes of Evidence, n. 17, 862 and 17, 863.)

<sup>122</sup> Ure, *l.c.*, p. 20.

<sup>123</sup> Ure, *l.c.*, p. 321.

<sup>124</sup> Ure, *l.c.*, p. 23.

<sup>125</sup> “Rep. Insp. Fact., 31st Oct., 1863,” pp. 108,109.

<sup>126</sup> *l.c.*, p. 109. The rapid improvement of machinery, during the crisis, allowed the English manufacturers, immediately after the termination of the American Civil War, and almost in no time, to glut the markets of the world again. Cloth, during the last six months of 1866, was almost unsaleable. Thereupon began the consignment of goods to India and China, thus naturally making the glut more intense. At the beginning of 1867 the manufacturers resorted to their usual way out of the difficulty, viz., reducing wages 5 per cent. The workpeople resisted, and said that the only remedy was to work short time, 4 days a-week; and their theory was the correct one. After holding out for some time, the self-elected captains of industry had to make up their minds to short time, with reduced wages in some places, and in others without.

<sup>127</sup> “The relation of master and man in the blown-flint bottle trades amounts to a chronic strike.” Hence the impetus given to the manufacture of pressed glass, in which the chief operations are done by machinery. One firm in Newcastle, who formerly produced 350,000 lbs. of blown-flint glass, now produces in its place 3,000,500 lbs. of pressed glass. (“Ch. Empl. Comm., Fourth Rep.,” 1865, pp. 262-263.)

<sup>128</sup> Gaskell. “The Manufacturing Population of England,” London, 1833, pp. 3, 4.

<sup>129</sup> W. Fairbairn discovered several very important applications of machinery to the construction of machines, in consequence of strikes in his own workshops.

<sup>130</sup> Ure, *l.c.*, pp. 368-370

<sup>131</sup> Ure, *l.c.*, pp. 368, 7, 370, 280, 281, 321, 370, 475.

<sup>132</sup> Ricardo originally was also of this opinion, but afterwards expressly disclaimed it with the scientific impartiality and love of truth characteristic of him. See *l.c.*, ch. xxxi. “On Machinery.”

<sup>133</sup> *Nota bene.* My illustration is entirely on the lines of those given by the above named economists.

<sup>134</sup> A disciple of Ricardo, in answer to the insipidities of J. B. Say, remarks on this point: “Where division of labour is well developed, the skill of the labourer is available only in that particular branch in which it has been acquired; he himself is a sort of machine. It does not therefore help matters one jot, to repeat in parrot fashion, that things have a tendency to find their level. On looking around us we cannot but see, that they are unable to find their level for a long time; and that when they do find it,

the level is always lower than at the commencement of the process.” (“An Inquiry into those Principles Respecting the Nature of Demand,” &c., Lond. 1821, p. 72.)

<sup>135</sup> MacCulloch, amongst others, is a past master in this pretentious cretinism. “If,” he says, with the affected naïveté of a child of 8 years, “if it be advantageous, to develop the skill of the workman more and more, so that he is capable of producing, with the same or with a less quantity of labour, a constantly increasing quantity of commodities, it must also be advantageous, that he should avail himself of the help of such machinery as will assist him most effectively in the attainment of this result.” (MacCulloch: “Princ. of Pol. Econ.,” Lond. 1830, p. 166.)

<sup>136</sup> “The inventor of the spinning machine has ruined India, a fact, however, that touches us but little.” A. Thiers: *De la propriété*. — M. Thiers here confounds the spinning machine with the power-loom, “a fact, however, that touches us but little.”

<sup>137</sup> According to the census of 1861 (Vol. II., Lond., 1863), the number of people employed in coal mines in England and Wales, amounted to 246,613 of which 73,545 were under, and 173,067 were over 20 years. Of those under 20, 835 were between 5 and 10 years, 30,701 between 10 and 15 years, 42,010 between 15 and 19 years. The number employed in iron, copper, lead, tin, and other mines of every description, was 319, 222.

<sup>138</sup> In England and Wales, in 1861, there were employed in making machinery, 60,807 persons, including the masters and their clerks, &c., also all agents and business people connected with this industry, but excluding the makers of small machines, such as sewing-machines, &c., as also the makers of the operative parts of machines, such as spindles. The total number of civil engineers amounted to 3,329.

<sup>139</sup> Since iron is one of the most important raw materials; let me here state that, in 1861, there were in England and Wales 125,771 operative iron founders, of whom 123,430 were males, 2,341 females. Of the former 30,810 were under, and 92,620 over 20 years.

<sup>140</sup> “A family of four grown-up persons, with two children as winders, earned at the end of the last, and the beginning of the present century, by ten hours’ daily labour, £4 a week. If the work was very pressing, they could earn more.... Before that, they had always suffered from a deficient supply of yarn.” (Gaskell, *l.c.*, pp. 25-27.)

<sup>141</sup> F. Engels, in “Lage, &c.,” points out the miserable condition of a large number of those who work on these very articles of luxury. See also numerous instances in the “Reports of the Children’s Employment Commission.”

<sup>142</sup> In 1861, in England and Wales, there were 94,665 sailors in the merchant service.

<sup>143</sup> Of these only 177,596 are males above 13 years of age.

<sup>144</sup> Of these, 30,501 are females.

<sup>145</sup> Of these, 137,447 males. None are included in the 1,208,648 who do not serve in private houses. Between 1861 and 1870 the number of male servants nearly doubled itself. It increased to 267,671. In the year 1847 there were 2,694 gamekeepers (for the landlords’ preserves), in 1869 there were 4,921. The young servant girls in the houses of the London lower middle class are in common parlance called “slaveys.”

<sup>146</sup> Ganilh, on the contrary, considers the final result of the factory system to be an absolutely less number of operatives, at whose expense an increased number of “gens honnêtes” live and develop their well-known “perfectibilité perfectible.” Little as he understands the movement of production, at least he feels, that machinery must needs be a very fatal institution, if its introduction converts busy workmen into paupers, and its development calls more slaves of labour into existence than it has suppressed. It is not possible to bring out the cretinism of his standpoint, except by his own words: “Les classes condamnées à produire et à consommer diminuent, et les classes qui dirigent le travail,

qui soulagent, consolent, et éclairent toute la population, se multiplient ... et s'approprient tous les bienfaits qui résultent de la diminution des frais du travail, de l'abondance des productions, et du bon marché des consommations. Dans cette direction, l'espèce humaine s'élève aux plus hautes conceptions du génie, pénètre dans les profondeurs mystérieuses de la religion, établit les principes salutaires de la morale (which consists in 's'approprier tous les beinfaits,' &c.), les lois tutélaires de la liberté (liberty of 'les classes condamnées à produire?') et du pouvoir, de l'obéissance et de la justice, du devoir et de la l'humanité." [The classes condemned to produce and to consume diminish, and the classes which direct labour, which relieve, console and enlighten the whole population, multiply ... and appropriate all the benefits which result from the diminution of the costs of labour, from the abundance of products and the cheapness of consumer goods. In this way, the human species rises to the highest creations of genius, penetrates the mysterious depths of religion, and establishes the salutary principles of morality, the laws for the protection of liberty, and power, of obedience and justice, of obligation and humanity] For this twaddle, see "Des Systèmes d'Economie Politique, &c., Par M. Ch. Ganilh," 2ème ed., Paris, 1821, t. I, p. 224, and see p. 212.

<sup>147</sup> "Reports of Insp. of Fact., 31 Oct., 1865," p. 58, sq. At the same time, however, means of employment for an increased number of hands was ready in 110 new mills with 11,625 looms, 628,576 spindles and 2,695 total horse-power of steam and water (l.c.).

<sup>148</sup> "Reports, &c., for 31 Oct., 1862," p. 79. At the end of 1871, Mr. A. Redgrave, the factory inspector, in a lecture given at Bradford, in the New Mechanics' Institution, said: "What has struck me for some time past is the altered appearance of the woollen factories. Formerly they were filled with women and children, now machinery seems to do all the work. At my asking for an explanation of this from a manufacturer, he gave me the following: 'Under the old system I employed 63 persons; after the introduction of improved machinery I reduced my hands to 33, and lately, in consequence of new and extensive alterations, I have been in a position to reduce those 33 to 13'."

<sup>149</sup> See "Reports, &c., 31 Oct., 1856," p. 16.

<sup>150</sup> "The sufferings of the hand-loom weavers were the subject of an inquiry by a Royal Commission, but although their distress was acknowledged and lamented, the amelioration of their condition was left, and probably necessarily so, to the chances and changes of time, which it may now be hoped" [20 years later!] "have nearly obliterated those miseries, and not improbably by the present great extention of the power-loom." ("Rep. Insp. of Fact., 31 Oct., 1856," p. 15.)

<sup>151</sup> Other ways in which machinery affects the production of raw material will be mentioned in the third book.

<sup>155</sup> In an appeal made in July, 1866, to the Trade Societies of England, by the shoemakers of Leicester, who had been thrown on the streets by a lock-out, it is stated: "Twenty years ago the Leicester shoe trade was revolutionised by the introduction of riveting in the place of stitching. At that time good wages could be earned. Great competition was shown between the different firms as to which could turn out the neatest article. Shortly afterwards, however a worse kind of competition sprang up, namely, that of underselling one another in the market. The injurious consequences soon manifested themselves in reductions of wages, and so sweepingly quick was the fall in the price of labour, that many firms now pay only one half of the original wages. And yet, though wages sink lower and lower, profits appear, with each alteration in the scale of wages, to increase." Even bad times are utilised by the manufacturers, for making exceptional profits by excessive lowering of wages, i.e., by a direct robbery of the labourer's means of subsistence. One example (it has reference to the crisis in the Coventry silk weaving): "From information I have received from manufacturers as well as workmen, there seems to be no doubt that wages have been reduced to a greater extent than either the competition of the foreign producers, or other circumstances have rendered necessary ... the majority of weavers are working at a reduction of 30 to 40 per cent. in their wages. A piece of ribbon for making which the weaver got 6s. or 7s. five years back, now only brings them 3s. 3d. or 3s. 6d.; other work is now priced at 2s. and 2s. 3d. which was formerly priced at 4s. and 4s. 3d. The reduction in wage seems to have been carried to a greater extent than is necessary for increasing demand. Indeed, the reduction in the cost of weaving, in the case of many descriptions of ribbons, has not been accompanied by any corresponding reduction in the selling price of the manufactured article." (Mr. F. D. Longe's Report. "Ch. Emp. Com., V. Rep., 1866," p. 114, 1.)

<sup>164</sup> From a letter of Mr. Harris, Chief Constable of Bolton, in "Rep. of Insp. of Fact., 31st October, 1865," pp. 61-62.

<sup>165</sup> In an appeal, dated 1863, of the factory operatives of Lancashire, &c., for the purpose of forming a society for organised emigration, we find the following: "That a large emigration of factory workers is now absolutely essential to raise them from their present prostrate condition, few will deny; but to show that a continuous stream of emigration is at all times demanded, and, without which it is impossible for them to maintain their position in ordinary times, we beg to call attention to the subjoined facts: — In 1814 the official value of cotton goods exported was £17,665,378, whilst the real marketable value was £20,070,824. In 1858 the official value of cotton goods exported, was £182,221,681; but the real or marketable value was only £43,001,322, being a ten-fold quantity sold for little more than double the former price. To produce results so disadvantageous to the country generally, and to the factory workers in particular, several causes have co-operated, which, had circumstances permitted, we should have brought more prominently under your notice; suffice it for the present to say that the most obvious one is the constant redundancy of labour, without which a trade so ruinous in its effects never could have been carried on, and which requires a constantly extending market to save it from annihilation. Our cotton mills may be brought to a stand by the periodical stagnations of trade, which, under present arrangements, are as inevitable as death itself; but the human mind is constantly at work, and although we believe we are under the mark in stating that six millions of persons have left these shores during the last 25 years, yet, from the natural increase of population, and the displacement of labour to cheapen production, a large percentage of the male adults in the most prosperous times find it impossible to obtain work in factories on any conditions whatever." ("Reports of Insp. of Fact., 30th April 1863," pp. 51-52.) We shall, in a later chapter, see how our friends, the manufacturers, endeavoured, during the catastrophe in the cotton trade, to prevent by every means, including State interference, the emigration of the operatives.

<sup>166</sup> "Ch. Empt. Comm. III. Report, 1864," p. 108, n. 447.

<sup>167</sup> In the United States the restoration, in this way, of handicrafts based on machinery is frequent; and therefore, when the inevitable transition to the factory system shall take place, the ensuing concentration will, compared with Europe and even with England, stride on in seven-league boots.

<sup>168</sup> See "Rep. of Insp. of Fact., 31st Oct., 1865," p. 64.

<sup>169</sup> Mr. Gillott erected in Birmingham the first steel-pen factory on a large scale. It produced, so early as 1851, over 180,000,000 of pens yearly, and consumed 120 tons of steel. Birmingham has the monopoly of this industry in the United Kingdom, and at present produces thousands of millions of steel-pens. According to the Census of 1861, the number of persons employed was 1,428, of whom 1,268 females from 5 years of age upwards.

<sup>170</sup> "Ch. Empl. Comm. II. Rep. 1864," p. LXVIII., n. 415.

<sup>171</sup> And now forsooth children are employed at file-cutting in Sheffield.

<sup>172</sup> "Ch. Empl. Comm., V. Rep. 1866," p. 3, n. 24; p. 6, n. 55, 56; p. 7, n. 59, 60.

<sup>173</sup> *I.c.*, pp. 114, 115, n. 6, 7. The commissioner justly remarks that though as a rule machines take the place of men, here literally young persons replace machines.

<sup>174</sup> See the Report on the rag trade, and numerous details in "Public Health, VIII. Rep." Lond. 1866, app., pp. 196, 208.

<sup>175</sup> "Ch. Empl. Comm. V. Rep., 1866," pp. xvi-xviii, n. 86-97, and pp. 130-133, n. 39-71. See also III. Rep., 1864, pp. 48, 56.

<sup>176</sup> "Public Health. Sixth Rep.," Lond. 1864, pp. 29, 31.

<sup>177</sup> *I.c.*, p. 30. Dr. Simon remarks that the mortality among the London tailors and printers between the ages of 25 and 35 is in fact much greater, because the employers in London obtain from the country a great number of young people up to 30 years of age, as "apprentices" and "improvers," who come for the purpose of being perfected in their trade. These figure in the census as Londoners, they swell out

the number of heads on which the London death-rate is calculated, without adding proportionally to the number of deaths in that place. The greater part of them in fact return to the country, and especially in cases of severe illness. (l.c.)

<sup>178</sup> I allude here to hammered nails, as distinguished from nails cut out and made by machinery. See “Child. Empl. Comm., Third Rep.,” pp. xi., xix., n. 125-130, p. 52, n. 11, p. 114, n. 487, p. 137, n. 674.

<sup>179</sup> “Ch. Empl. Comm., II. Rep.,” p. xxii, n. 166.

<sup>180</sup> “Ch. Empl. Comm., II. Rep., 1864,” pp. xix., xx., xxi.

<sup>181</sup> l.c., pp. xxi., xxii.

<sup>182</sup> l.c., pp. xxix., xxx.

<sup>183</sup> l.c., pp. xi., xii.

<sup>184</sup> “Child. Empl. Comm., I. Rep. 1863,” p. 185.

<sup>185</sup> In England millinery and dressmaking are for the most part carried on, on the premises of the employer, partly by workwomen who live there, partly by women who live off the premises.

<sup>186</sup> Mr. White, a commissioner, visited a military clothing manufactory that employed 1,000 to 1,200 persons, almost all females, and a shoe manufactory with 1,300 persons; of these nearly one half were children and young persons.

<sup>187</sup> An instance. The weekly report of deaths by the Registrar-General dated 26th Feb., 1864, contains 5 cases of death from starvation. On the same day *The Times* reports another case. Six victims of starvation in one week!

<sup>188</sup> “Child. Empl. Comm., Second Rep., 1864,” p. lxxvii., n. 406-9, p. 84, n. 124, p. lxxiii, n. 441, p. 68, n. 6, p. 84, n. 126, p. 78, n. 85, p. 76, n. 69, p. lxxii, n. 483.

<sup>189</sup> “The rental of premises required for workrooms seems the element which ultimately determines the point; and consequently it is in the metropolis, that the old system of giving work out to small employers and families has been longest retained, and earliest returned to.” (l.c., p. 83, n. 123.) The concluding statement in this quotation refers exclusively to shoemaking.

<sup>190</sup> In glove-making and other industries where the condition of the work-people is hardly distinguishable from that of paupers, this does not occur.

<sup>191</sup> l.c., p. 83, n. 122.

<sup>192</sup> In the wholesale boot and shoe trade of Leicester alone, there were in 1864, 800 sewing-machines already in use.

<sup>193</sup> l.c., p. 84, n. 124.

<sup>194</sup> Instances: The Army Clothing Depot at Pimlico, London, the Shirt factory of Tillie and Henderson at Londonderry, and the clothes factory of Messrs. Tait at Limerick which employs about 1,200 hands.

<sup>195</sup> “Tendency to Factory System” (l.c., p. lxxvii). “The whole employment is at this time in a state of transition, and is undergoing the same Change as that effected in the lace trade, weaving, &c.” (l.c., n. 405.) “A complete revolution” (l.c., p. xlvi., n. 318). At the date of the Child. Empl. Comm. of 1840 stocking making was still done by manual labour. Since 1846 various sorts of machines have been introduced, which are now driven by steam. The total number of persons of both sexes and of all ages from 3 years upwards, employed in stocking making in England, was in 1862 about 129,000. Of these only 4,063 were, according to the Parliamentary Return of the 11th February, 1862, working under the Factory Acts.

<sup>196</sup> Thus, e.g., in the earthenware trade, Messrs. Cochrane, of the Britain Pottery, Glasgow, report: “To keep up our quantity we have gone extensively into machines wrought by unskilled labour, and every

day convinces us that we can produce a greater quantity than by the old method.” (“Rep. of Insp. of Fact., 31st Oct., 1865,” p. 13.) “The effect of the Fact. Acts is to force on the further introduction of machinery” (l.c., pp. 13-14).

<sup>197</sup> Thus, after the extension of the Factory Act to the potteries, great increase of powerjiggers in place of hand-moved jiggers.

<sup>198</sup> “Report of Insp. of Fact., 31st Oct., 1865,” pp. 96 and 127.

<sup>199</sup> The introduction of this and other machinery into match-making caused in one department alone 230 young persons to be replaced by 32 boys and girls of 14 to 17 years of age. This saving in labour was carried still further in 1865, by the employment of steam power.

<sup>200</sup> “Ch. Empl. Comm., 11. Rep., 1864,” p. ix., n. 50.

<sup>201</sup> “Rep. of Insp. of Fact., 31st Oct., 1865,” p. 22.

<sup>202</sup> “But it must be borne in mind that those improvements, though carried out fully in some establishments, are by no means general, and are not capable of being brought into use in many of the old manufactories without an expenditure of capital beyond the means of many of the present occupiers.” “I cannot but rejoice,” writes Sub-Insp. May, “that notwithstanding the temporary disorganisation which inevitably follows the introduction of such a measure (as the Factory Act Extension Act), and is, indeed, directly indicative of the evils which it was intended to remedy, &c.” (Rep. of Insp. of Fact., 31st Oct., 1865.)

<sup>203</sup> With blast furnaces, for instance, “work towards the end of the week being generally much increased in duration in consequence of the habit of the men of idling on Monday and occasionally during a part or the whole of Tuesday also.” (“Child. Empl. Comm., III. Rep.,” p. vi.) “The little masters generally have very irregular hours. They lose two or three days, and then work all night to make it up.... They always employ their own children, if they have any.” (l.c., p. vii.) “The want of regularity in coming to work, encouraged by the possibility and practice of making up for this by working longer hours.” (l.c., p. xviii.) “In Birmingham ... an enormous amount of time is lost ... idling part of the time, slaving the rest.” (l.c., p. xi.)

<sup>204</sup> “Child. Empl. Comm., IV., Rep.,” p. xxxii., “The extension of the railway system is said to have contributed greatly to this custom of giving sudden orders, and the consequent hurry, neglect of meal-times, and late hours of the workpeople.” (l.c., p. xxxi.)

<sup>205</sup> “Ch. Empl. Comm. IV. Rep.,” pp. xxxv., n. 235, 237.

<sup>206</sup> “Ch. Empl. Comm. IV. Rep.,” p. 127, n. 56.

<sup>207</sup> “With respect to the loss of trade by non-completion of shipping orders in time, I remember that this was the pet argument of the factory masters in 1832 and 1833. Nothing that can be advanced now on this subject, could have the force that it had then, before steam had halved all distances and established new regulations for transit. It quite failed at that time of proof when put to the test, and again it will certainly fail should it have to be tried.” (“Reports of Insp. of Fact., 31 Oct., 1862,” pp. 54, 55.)

<sup>208</sup> “Ch. Empl. Comm. IV. Rep.,” p. xviii, n. 118.

<sup>209</sup> John Bellers remarked as far back as 1699: “The uncertainty of fashions does increase necessitous poor. It has two great mischiefs in it. 1st, The journeymen are miserable in winter for want of work, the mercers and master-weavers not daring to lay out their stocks to keep the journeymen employed before the spring comes, and they know what the fashion will then be; 2ndly, In the spring the journeymen are not sufficient, but the master-weavers must draw in many prentices, that they may supply the trade of the kingdom in a quarter or half a year, which robs the plough of hands, drains the

country of labourers, and in a great part stocks the city with beggars, and starves some in winter that are ashamed to beg.” (“Essays about the Poor, Manufactures, &c.,” p. 9.)

<sup>210</sup> “Ch. Empl. Comm. V. Rep.,” p. 171, n. 34.

<sup>211</sup> The evidence of some Bradford export-houses is as follows: “Under these circumstances, it seems clear that no boys need be worked longer than from 8 a.m. to 7 or 7.30 p.m., in making up. It is merely a question of extra hands and extra outlay. If some masters were not so greedy, the boys would not work late; an extra machine costs only £16 or £18; much of such over-time as does occur is to be referred to an insufficiency of appliances, and a want of space.” “Ch. Empl. Comm. V. Rep.,” p. 171, n. 35, 36, 38.

<sup>212</sup> I.c. A London manufacturer, who in other respects looks upon the compulsory regulation of the hours of labour as a protection for the workpeople against the manufacturers, and for the manufacturers themselves against the wholesale trade, states: “The pressure in our business is caused by the shippers, who want, e.g., to send the goods by sailing vessel so as to reach their destination at a given season, and at the same time want to pocket the difference in freight between a sailing vessel and a steamship, or who select the earlier of two steamships in order to be in the foreign market before their competitors.”

<sup>213</sup> “This could be obviated,” says a manufacturer, “at the expense of an enlargement of the works under the pressure of a General Act of Parliament.” I.c., p. x., n. 38.

<sup>214</sup> I.c., p. xv., n. 72. sqq.

<sup>215</sup> “Rep. Insp. Fact., 31st October, 1865,” p. 127.

<sup>216</sup> It has been found out by experiment, that with each respiration of average intensity made by a healthy average individual, about 25 cubic inches of air are consumed, and that about 20 respirations are made in each minute. Hence the air inhaled in 24 hours by each individual is about 720,000 cubic inches, or 416 cubic feet. It is clear, however, that air which has been once breathed, can no longer serve for the same process until it has been purified in the great workshop of Nature. According to the experiments of Valentin and Brunner, it appears that a healthy man gives off about 1,300 cubic inches of carbonic acid per hour; this would give about 8 ounces of solid carbon thrown off from the lungs in 24 hours. “Every man should have at least 800 cubic feet.” (Huxley.)

<sup>217</sup> According to the English Factory Act, parents cannot send their children under 14 years of age into Factories under the control of the Act, unless at the same time they allow them to receive elementary education. The manufacturer is responsible for compliance with the Act. “Factory education is compulsory, and it is a condition of labour.” (“Rep. Insp. Fact., 31st Oct., 1865,” p. 111.)

<sup>218</sup> On the very advantageous results of combining gymnastics (and drilling in the case of boys) with compulsory education for factory children and pauper scholars, see the speech of N. W. Senior at the seventh annual congress of “The National Association for the Promotion of Social Science,” in “Report of Proceedings, &c.,” Lond. 1863, pp. 63, 64, also the “Rep. Insp. Fact., 31st Oct., 1865,” pp. 118, 119, 120, 126, sqq.

<sup>219</sup> “Rep. Insp. Fact., 31st Oct., 1865,” p. 118. A silk manufacturer naively states to the Children’s Employment Commissioners: “I am quite sure that the true secret of producing efficient workpeople is to be found in uniting education and labour from a period of childhood. Of course the occupation must not be too severe, nor irksome, or unhealthy. But of the advantage of the union I have no doubt. I wish my own children could have some work as well as play to give variety to their schooling.” (“Ch. Empl. Comm. V. Rep.,” p. 82, n. 36.)

<sup>220</sup> Senior, I.c., p. 66. How modern industry, when it has attained to a certain pitch, is capable, by the revolution it effects in the mode of production and in the social conditions of production, of also revolutionising people’s minds, is strikingly shown by a comparison of Senior’s speech in 1863, with

his philippic against the Factory Act of 1833; or by a comparison, of the views of the congress above referred to, with the fact that in certain country districts of England poor parents are forbidden, on pain of death by starvation, to educate their children. Thus, e.g., Mr. Snell reports it to be a common occurrence in Somersetshire that, when a poor person claims parish relief, he is compelled to take his children from school. Mr. Wollarton, the clergyman at Feltham, also tells of cases where all relief was denied to certain families “because they were sending their children to school!”

<sup>221</sup> Wherever handicraft-machines, driven by men, compete directly or indirectly with more developed machines driven by mechanical power, a great change takes place with regard to the labourer who drives the machine. At first the steam-engine replaces this labourer, afterwards he must replace the steam-engine. Consequently the tension and the amount of tambour-power expended become monstrous, and especially so in the case of the children who are condemned to this torture. Thus Mr. Longe; one of the commissioners, found in Coventry and the neighbourhood boys of from 10 to 15 years employed in driving the ribbon-looms, not to mention younger children who had to drive smaller machines. “It is extraordinarily fatiguing work. The boy is a mere substitute for steam power.” (“Ch. Empl. Comm. V, Rep. 1866;” p. 114, n. 6.) As to the fatal consequences of “this system of slavery,” as the official report styles it, see *l.c.*, p. 114 sqq.

<sup>222</sup> *l.c.*, p. 3, n. 24.

<sup>223</sup> *l.c.*, P. 7, n. 60.

<sup>224</sup> “In some parts of the Highlands of Scotland, not many years ago, every peasant, according to the Statistical Account, made his own shoes of leather tanned by himself. Many a shepherd and cottar too, with his wife and children, appeared at Church in clothes which had been touched by no hands but their own, since they were shorn from the sheep and sown in the flaxfield. In the preparation of these. it is added, scarcely a single article had been purchased, except the awl, needle, thimble, and a very few parts of the iron-work employed in the weaving. The dyes, *toci*, were chiefly extracted by the women from trees, shrubs and herbs.” (Dugald Stewart’s “Works,” Hamilton’s Ed., Vol. viii., pp. 327-328.)

<sup>225</sup> In the celebrated “*Livre des métiers*” of Etienne Boileau, we find it prescribed that a journeyman on being admitted among the masters had to swear “to love his brethren with brotherly love, to support them in their respective trades, not wilfully to betray the secrets of the trade, and besides, in the interests of all, not to recommend his own wares by calling the attention of the buyer to defects in the articles made by others.”

<sup>226</sup> “The bourgeoisie cannot exist without continually revolutionising the instruments of production, and thereby the relations of production and all the social relations. Conservation, in an unaltered form, of the old modes of production was on the contrary the first condition of existence for all earlier industrial classes. Constant revolution in production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation, distinguish the bourgeois epoch from all earlier ones. All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses his real conditions of life, and his relations with his kind.” (F. Engels und Karl Marx: “*Manifest der Kommunistischen Partei.*” Lond. 1848, p. 5.)

<sup>227</sup> “You take my life

When you do take the means whereby I live.”

Shakespeare.

<sup>228</sup> A French workman, on his return from San-Francisco, writes as follows: “I never could have believed, that I was capable of working at the various occupations I was employed on in California. I was firmly convinced that I was fit for nothing but letter-press printing.... Once in the midst of this

world of adventurers, who change their occupation as often as they do their shirt, egad, I did as the others. As mining did not turn out remunerative enough, I left it for the town, where in succession I became typographer, slater, plumber, &c. In consequence of thus finding out that I am fit to any sort of work, I feel less of a mollusk and more of a man.” (A. Corbon, “De l’enseignement professionnel,” 2ème ed., p. 50.)

<sup>229</sup> John Bellers, a very phenomenon in the history of Political Economy, saw most clearly at the end of the 17th century, the necessity for abolishing the present system of education and division of labour, which beget hypertrophy and atrophy at the two opposite extremities of society. Amongst other things he says this: “An idle learning being little better than the learning of idleness.... Bodily labour, it’s a primitive institution of God.... Labour being as proper for the bodies’ health as eating is for its living; for what pains a man saves by ease, he will find in disease.... Labour adds oil to the lamp of life, when thinking inflames it.... A childish silly employ” (a warning this, by presentiment, against the Basedows and their modern imitators) “leaves the children’s minds silly,” (“Proposals for Raising a Colledge of Industry of all Useful Trades and Husbandry.” Lond., 1696, pp. 12, 14, 18.)

<sup>230</sup> This sort of labour goes on mostly in small workshops, as we have seen in the lacemaking and straw-plaiting trades, and as could be shown more in detail from the metal trades of Sheffield, Birmingham, &c.

<sup>231</sup> “Ch. Empl. Comm., V. Rep.,” p. xxv., n. 162, and II. Rep., p. xxxviii., n. 285, 289, p. xxv., xxvi., n. 191.

<sup>232</sup> “Factory labour may be as pure and as excellent as domestic labour, and perhaps more so.” (“Rep. Insp. of Fact., 31st October, 1865,” p. 129.)

<sup>233</sup> “Rep. Insp. of Fact., 31st October, 1865,” pp. 27-32.

<sup>234</sup> Numerous instances will be found in “Rep. of Insp. of Fact.”

<sup>235</sup> “Ch. Empl. Comm., V. Rep.,” p. x., n. 35.

<sup>236</sup> “Ch. Empl. Comm., V. Rep.,” p. ix., n. 28.

<sup>237</sup> I.c., p. xxv., n. 165-167. As to the advantages of large scale, compared with small scale, industries, see “Ch. Empl. Comm., III. Rep.,” p. 13, n. 144, p. 25, n. 121, p. 26, n. 125, p. 27, n. 140, &c.

<sup>238</sup> The trades proposed to be brought under the Act were the following: Lace-making, stocking-weaving, straw-plaiting, the manufacture of wearing apparel with its numerous sub-divisions, artificial flower-making, shoemaking, hat-making, glove-making, tailoring, all metal works, from blast furnaces down to needleworks, &c., paper-mills, glassworks, tobacco factories, India-rubber works, braid-making (for weaving), hand-carpetmaking, umbrella and parasol making, the manufacture of spindles and spools, letterpress printing, book-binding, manufacture of stationery (including paper bags, cards, coloured paper, &c.), rope-making, manufacture of jet ornaments, brick-making, silk manufacture by hand, Coventry weaving, salt works, tallow chandlers, cement works, sugar refineries, biscuit-making, various industries connected with timber, and other mixed trades.

<sup>239</sup> I.c., p. xxv., n. 169.

<sup>240</sup> Here (from “The Tory Cabinet..... to “Nassau W. Senior”) the English text has been altered in conformity with the 4th German edition. — Ed.

<sup>241</sup> The Factory Acts Extension Act was passed on August 12, 1867. It regulates all foundries, smithies, and metal manufactories, including machine shops; furthermore glass-works, paper mills, gutta-percha and India-rubber works, tobacco manufactories, letter-press printing and book-binding works, and, lastly, all workshops in which more than 50 persons are employed. The Hours of Labour Regulation Act, passed on August 17, 1867, regulates the smaller workshops and the so-called domestic industries. I shall revert to these Acts and to the new Mining Act of 1872 in Volume II.

<sup>242</sup> Senior, "Social Science Congress," pp. 55-58.

<sup>243</sup> The "personnel" of this staff consisted of 2 inspectors, 2 assistant inspectors and 41 sub-inspectors. Eight additional sub-inspectors were appointed in 1871. The total cost of administering the Acts in England, Scotland, and Ireland amounted for the year 1871-72 to no more than £25,347, inclusive of the law expenses incurred by prosecutions of offending masters.

<sup>244</sup> Robert Owen, the father of Co-operative Factories and Stores, but who, as before remarked, in no way shared the illusions of his followers with regard to the bearing of these isolated elements of transformation, not only practically made the factory system the sole foundation of his experiments, but also declared that system to be theoretically the starting-point of the social revolution. Herr Vissering, Professor of Political Economy in the University of Leyden, appears to have a suspicion of this when, in his "Handboek van Practische Staatshuishoudkunde, 1860-62," which reproduces all the platitudes of vulgar economy, he strongly supports handicrafts against the factory system.

[*Added in the 4th German edition* — The "hopelessly bewildering tangle of contradictory enactments" (S. 314) (present volume, p. 284) which English legislation called into life by means of the mutually conflicting Factory Acts, the Factory Acts Extension Act and the Workshops' Act, finally became intolerable, and thus all legislative enactments on this subject were codified in the Factory and Workshop Act of 1878. Of course no detailed critique of this English industrial code now in effect can be presented here. The following remarks will have to suffice. The Act comprises:

1) **Textile Mills.** Here everything remains about as it was: children more than 10 years of age may work 5½ hours a day; or 6 hours and Saturday off; young persons and women, 10 hours on 5 days, and at most 6½ on Saturday.

2) **Non-Textile Factories.** Here the regulations are brought closer than before to those of No. 1, but there are still several exceptions which favour the capitalists and which in certain cases may be expanded by special permission of the Home Secretary.

3) **Workshops,** defined approximately as in the former Act; as for the children, young workers and women employed there, the workshops are about on a par with the non-textile factories, but again conditions are easier in details.

4) **Workshops** in which no children or young workers are employed, but only persons of both sexes above the age of 18; this category enjoy still easier conditions.

5) **Domestic Workshops,** where only members of the family are employed, in the family dwelling: still more elastic regulations and simultaneously the restriction that the inspector may, without special permission of the ministry or a court, enter only rooms not used also for dwelling purposes; and lastly unrestricted freedom for straw-plaiting and lace and glove-making by members of the family. With all its defects this Act, together with the Swiss Federal Factory Law of March 23, 1877, is still by far the best piece of legislation in this field. A comparison of it with the said Swiss federal law is of particular interest because it clearly demonstrates the merits and demerits of the two legislative methods — the English, "historical" method, which intervenes when occasion requires, and the continental method, which is built up on the traditions of the French Revolution and generalises more. Unfortunately, due to insufficient inspection personnel, the English code is still largely a dead letter with regard to its application to workshops. — *F. E.*]

<sup>245</sup> "You divide the people into two hostile camps of clownish boors and emasculated dwarfs. Good heavens! a nation divided into agricultural and commercial interests, calling itself sane; nay, styling itself enlightened and civilised, not only in spite of, but in consequence of this monstrous and unnatural division." (David Urquhart, *l.c.*, p. 119.) This passage shows, at one and the same time, the strength and the weakness of that kind of criticism which knows how to judge and condemn the present, but not how to comprehend it.

---

<sup>246</sup> See Liebig: “Die Chemie in ihrer Anwendung auf Agricultur und Physiologie,” 7. Auflage, 1862, and especially the “Einleitung in die Naturgesetze des Feldbaus,” in the 1st Volume. To have developed from the point of view of natural science, the negative, i.e., destructive side of modern agriculture, is one of Liebig’s immortal merits. His summary, too, of the history of agriculture, although not free from gross errors, contains flashes of light. It is, however, to be regretted that he ventures on such haphazard assertions as the following: “By greater pulverising and more frequent ploughing, the circulation of air in the interior of porous soil is aided, and the surface exposed to the action of the atmosphere is increased and renewed; but it is easily seen that the increased yield of the land cannot be proportional to the labour spent on that land, but increases in a much smaller proportion. This law,” adds Liebig, “was first enunciated by John Stuart Mill in his ‘Principles of Pol. Econ.,’ Vol. 1, p. 17, as follows: ‘That the produce of land increases, *caeteris paribus*, in a diminishing ratio to the increase of the labourers employed’ (Mill here introduces in an erroneous form the law enunciated by Ricardo’s school, for since the ‘decrease of the labourers employed,’ kept even pace in England with the advance of agriculture, the law discovered in, and applied to, England, could have no application to that country, at all events), ‘is the universal law of agricultural industry.’ This is very remarkable, since Mill was ignorant of the reason for this law.” (Liebig, l.c., Bd. I., p. 143 and Note.) Apart from Liebig’s wrong interpretation of the word “labour,” by which word he understands something quite different from what Political Economy does, it is, in any case, “very remarkable” that he should make Mr. John Stuart Mill the first propounder of a theory which was first published by James Anderson in A. Smith’s days, and was repeated in various works down to the beginning of the 19th century; a theory which Malthus, that master in plagiarism (the whole of his population theory is a shameless plagiarism), appropriated to himself in 1815; which West developed at the same time as, and independently of, Anderson; which in the year 1817 was connected by Ricardo with the general theory of value, then made the round of the world as Ricardo’s theory, and in 1820 was vulgarised by James Mill, the father of John Stuart Mill; and which, finally, was reproduced by John Stuart Mill and others, as a dogma already quite commonplace, and known to every schoolboy. It cannot be denied that John Stuart Mill owes his, at all events, “remarkable” authority almost entirely to such *quid-pro-quos*.

## **Part 5: Production of Absolute and Relative Surplus-Value**

## Chapter 16: Absolute and Relative Surplus-Value

In considering the labour-process, we began (see Chapter VII.) by treating it in the abstract, apart from its historical forms, as a process between man and Nature. We there stated, "If we examine the whole labour-process, from the point of view of its result, it is plain that both the instruments and the subject of labour are means of production, and that the labour itself is productive labour." And in Note 2, same page, we further added: "This method of determining, from the standpoint of the labour-process alone, what is productive labour, is by no means directly applicable to the case of the capitalist process of production." We now proceed to the further development of this subject.

So far as the labour-process is purely individual, one and the same labourer unites in himself all the functions, that later on become separated. When an individual appropriates natural objects for his livelihood, no one controls him but himself. Afterwards he is controlled by others. A single man cannot operate upon Nature without calling his own muscles into play under the control of his own brain. As in the natural body head and hand wait upon each other, so the labour-process unites the labour of the hand with that of the head. Later on they part company and even become deadly foes. The product ceases to be the direct product of the individual, and becomes a social product, produced in common by a collective labourer, *i.e.*, by a combination of workmen, each of whom takes only a part, greater or less, in the manipulation of the subject of their labour. As the co-operative character of the labour-process becomes more and more marked, so, as a necessary consequence, does our notion of productive labour, and of its agent the productive labourer, become extended. In order to labour productively, it is no longer necessary for you to do manual work yourself; enough, if you are an organ of the collective labourer, and perform one of its subordinate functions. The first definition given above of productive labour, a definition deduced from the very nature of the production of material objects, still remains correct for the collective labourer, considered as a whole. But it no longer holds good for each member taken individually.

On the other hand, however, our notion of productive labour becomes narrowed. Capitalist production is not merely the production of commodities, it is essentially the production of surplus-value. The labourer produces, not for himself, but for capital. It no longer suffices, therefore, that he should simply produce. He must produce surplus-value. That labourer alone is productive, who produces surplus-value for the capitalist, and thus works for the self-expansion of capital. If we may take an example from outside the sphere of production of material objects, a schoolmaster is a productive labourer when, in addition to belabouring the heads of his scholars, he works like a horse to enrich the school proprietor. That the latter has laid out his capital in a teaching factory, instead of in a sausage factory, does not alter the relation. Hence the notion of a productive labourer implies not merely a relation between work and useful effect, between labourer and product of labour, but also a specific, social relation of production, a relation that has sprung up historically and stamps the labourer as the direct means of creating surplus-value. To be a productive labourer is, therefore, not a piece of luck, but a misfortune. In Book IV. which treats of the history of the theory, it will be more clearly seen, that the production of surplus-value has at all times been made, by classical political economists, the distinguishing characteristic of the productive labourer. Hence their definition of a productive labourer changes with their comprehension of the nature of surplus-value. Thus the Physiocrats insist that only agricultural

labour is productive, since that alone, they say, yields a surplus-value. And they say so because, with them, surplus-value has no existence except in the form of rent.

The prolongation of the working day beyond the point at which the labourer would have produced just an equivalent for the value of his labour-power, and the appropriation of that surplus labour by capital, this is production of absolute surplus-value. It forms the general groundwork of the capitalist system, and the starting-point for the production of relative surplus-value. The latter pre-supposes that the working day is already divided into two parts, necessary labour, and surplus labour. In order to prolong the surplus labour, the necessary labour is shortened by methods whereby the equivalent for the wages is produced in less time. The production of absolute surplus-value turns exclusively upon the length of the working day; the production of relative surplus-value, revolutionises out and out the technical processes of labour, and the composition of society. It therefore pre-supposes a specific mode, the capitalist mode of production, a mode which, along with its methods, means, and conditions, arises and develops itself spontaneously on the foundation afforded by the formal subjection of labour to capital. In the course of this development, the formal subjection is replaced by the real subjection of labour to capital.

It will suffice merely to refer to certain intermediate forms, in which surplus labour is not extorted by direct compulsion from the producer, nor the producer himself yet formally subjected to capital. In such forms capital has not yet acquired the direct control of the labour-process. By the side of independent producers who carry on their handicrafts and agriculture in the traditional old-fashioned way, there stands the usurer or the merchant, with his usurer's capital or merchant's capital, feeding on them like a parasite. The predominance, in a society, of this form of exploitation excludes the capitalist mode of production; to which mode, however, this form may serve as a transition, as it did towards the close of the Middle Ages. Finally, as is shown by modern "domestic industry," some intermediate forms are here and there reproduced in the background of Modern Industry, though their physiognomy is totally changed.

If, on the one hand, the mere formal subjection of labour to capital suffices for the production of absolute surplus-value, if, *e.g.*, it is sufficient that handicraftsmen who previously worked on their own account, or as apprentices of a master, should become wage labourers under the direct control of a capitalist; so, on the other hand, we have seen, how the methods of producing relative surplus-value, are, at the same time, methods of producing absolute surplus-value. Nay, more, the excessive prolongation of the working day turned out to be the peculiar product of Modern Industry. Generally speaking, the specifically capitalist mode of production ceases to be a mere means of producing relative surplus-value, so soon as that mode has conquered an entire branch of production; and still more so, so soon as it has conquered all the important branches. It then becomes the general, socially predominant form of production. As a special method of producing relative surplus-value, it remains effective only, first, in so far as it seizes upon industries that previously were only formally subject to capital, that is, so far as it is propagandist; secondly, in so far as the industries that have been taken over by it, continue to be revolutionised by changes in the methods of production.

From one standpoint, any distinction between absolute and relative surplus-value appears illusory. Relative surplus-value is absolute, since it compels the absolute prolongation of the working day beyond the labour-time necessary to the existence of the labourer himself. Absolute surplus-value is relative, since it makes necessary such a development of the productiveness of labour, as will allow of the necessary labour-time being confined to a portion of the working day. But if we keep in mind the behaviour of surplus-value, this appearance of identity vanishes. Once the capitalist mode of production is established and become general, the difference between

absolute and relative surplus-value makes itself felt, whenever there is a question of raising the rate of surplus-value. Assuming that labour-power is paid for at its value, we are confronted by this alternative: given the productiveness of labour and its normal intensity, the rate of surplus-value can be raised only by the actual prolongation of the working day; on the other hand, given the length of the working day, that rise can be effected only by a change in the relative magnitudes of the components of the working day, viz., necessary labour and surplus labour; a change which, if the wages are not to fall below the value of labour-power, presupposes a change either in the productiveness or in the intensity of the labour.

If the labourer wants all his time to produce the necessary means of subsistence for himself and his race, he has no time left in which to work gratis for others. Without a certain degree of productiveness in his labour, he has no such superfluous time at his disposal; without such superfluous time, no surplus labour, and therefore no capitalists, no slave-owners, no feudal lords, in one word, no class of large proprietors.<sup>1</sup>

Thus we may say that surplus-value rests on a natural basis; but this is permissible only in the very general sense, that there is no natural obstacle absolutely preventing one man from disburdening himself of the labour requisite for his own existence, and burdening another with it, any more, for instance, than unconquerable natural obstacle prevent one man from eating the flesh of another.<sup>2</sup> No mystical ideas must in any way be connected, as sometimes happens, with this historically developed productiveness of labour. It is only after men have raised themselves above the rank of animals, when therefore their labour has been to some extent socialised, that a state of things arises in which the surplus labour of the one becomes a condition of existence for the other. At the dawn of civilisation the productiveness acquired by labour is small, but so too are the wants which develop with and by the means of satisfying them. Further, at that early period, the portion of society that lives on the labour of others is infinitely small compared with the mass of direct producers. Along with the progress in the productiveness of labour, that small portion of society increases both absolutely and relatively.<sup>3</sup> Besides, capital with its accompanying relations springs up from an economic soil that is the product of a long process of development. The productiveness of labour that serves as its foundation and starting-point, is a gift, not of nature, but of a history embracing thousands of centuries.

Apart from the degree of development, greater or less, in the form of social production, the productiveness of labour is fettered by physical conditions. These are all referable to the constitution of man himself (race, &c.), and to surrounding nature. The external physical conditions fall into two great economic classes, (1) Natural wealth in means of subsistence, *i.e.*, a fruitful soil, waters teeming with fish, &c., and (2), natural wealth in the instruments of labour, such as waterfalls, navigable rivers, wood, metal, coal, &c. At the dawn of civilisation, it is the first class that turns the scale; at a higher stage of development, it is the second. Compare, for example, England with India, or in ancient times, Athens and Corinth with the shores of the Black Sea.

The fewer the number of natural wants imperatively calling for satisfaction, and the greater the natural fertility of the soil and the favourableness of the climate, so much less is the labour-time necessary for the maintenance and reproduction of the producer. So much greater therefore can be the excess of his labours for others over his labour for himself. Diodorus long ago remarked this in relation to the ancient Egyptians.

“It is altogether incredible how little trouble and expense the bringing up of their children causes them. They cook for them the first simple food at hand; they also give them the lower part of the papyrus stem to eat, so far as it can be roasted in the fire, and the roots and stalks of marsh plants, some raw, some boiled and

roasted. Most of the children go without shoes and unclothed, for the air is so mild. Hence a child, until he is grown up, costs his parents not more, on the whole, than twenty drachmas. It is this, chiefly, which explains why the population of Egypt is so numerous, and, therefore, why so many great works can be undertaken.”<sup>4</sup>

Nevertheless the grand structures of ancient Egypt are less due to the extent of its population than to the large proportion of it that was freely disposable. Just as the individual labourer can do more surplus labour in proportion as his necessary labour-time is less, so with regard to the working population. The smaller the part of it which is required for the production of the necessary means of subsistence, so much the greater is the part that can be set to do other work.

Capitalist production once assumed, then, all other circumstances remaining the same, and given the length of the working day, the quantity of surplus labour will vary with the physical conditions of labour, especially with the fertility of the soil. But it by no means follows from this that the most fruitful soil is the most fitted for the growth of the capitalist mode of production. This mode is based on the dominion of man over nature. Where nature is too lavish, she “keeps him in hand, like a child in leading-strings.” She does not impose upon him any necessity to develop himself.<sup>5</sup> It is not the tropics with their luxuriant vegetation, but the temperate zone, that is the mother-country of capital. It is not the mere fertility of the soil, but the differentiation of the soil, the variety of its natural products, the changes of the seasons, which form the physical basis for the social division of labour, and which, by changes in the natural surroundings, spur man on to the multiplication of his wants, his capabilities, his means and modes of labour. It is the necessity of bringing a natural force under the control of society, of economising, of appropriating or subduing it on a large scale by the work of man’s hand, that first plays the decisive part in the history of industry. Examples are, the irrigation works in Egypt,<sup>6</sup> Lombardy, Holland, or in India and Persia where irrigation by means of artificial canals, not only supplies the soil with the water indispensable to it, but also carries down to it, in the shape of sediment from the hills, mineral fertilisers. The secret of the flourishing state of industry in Spain and Sicily under the dominion of the Arabs lay in their irrigation works.<sup>7</sup>

Favourable natural conditions alone, give us only the possibility, never the reality, of surplus labour, nor, consequently, of surplus-value and a surplus-product. The result of difference in the natural conditions of labour is this, that the same quantity of labour satisfies, in different countries, a different mass of requirements,<sup>8</sup> consequently, that under circumstances in other respects analogous, the necessary labour-time is different. These conditions affect surplus labour only as natural limits, *i.e.*, by fixing the points at which labour for others can begin. In proportion as industry advances, these natural limits recede. In the midst of our West European society, where the labourer purchases the right to work for his own livelihood only by paying for it in surplus labour, the idea easily takes root that it is an inherent quality of human labour to furnish a surplus-product.<sup>9</sup> But consider, for example, an inhabitant of the eastern islands of the Asiatic Archipelago, where sago grows wild in the forests.

“When the inhabitants have convinced themselves, by boring a hole in the tree, that the pith is ripe, the trunk is cut down and divided into several pieces, the pith is extracted, mixed with water and filtered: it is then quite fit for use as sago. One tree commonly yields 300 lbs., and occasionally 500 to 600 lbs. There, then, people go into the forests, and cut bread for themselves, just as with us they cut fire-wood.”<sup>10</sup>

Suppose now such an eastern bread-cutter requires 12 working hours a week for the satisfaction of all his wants. Nature’s direct gift to him is plenty of leisure time. Before he can apply this

leisure time productively for himself, a whole series of historical events is required; before he spends it in surplus labour for strangers, compulsion is necessary. If capitalist production were introduced, the honest fellow would perhaps have to work six days a week, in order to appropriate to himself the product of one working day. The bounty of Nature does not explain why he would then have to work 6 days a week, or why he must furnish 5 days of surplus labour. It explains only why his necessary labour-time would be limited to one day a week. But in no case would his surplus-product arise from some occult quality inherent in human labour.

Thus, not only does the historically developed social productiveness of labour, but also its natural productiveness, appear to be productiveness of the capital with which that labour is incorporated.

Ricardo never concerns himself about the origin of surplus-value. He treats it as a thing inherent in the capitalist mode of production, which mode, in his eyes, is the natural form of social production. Whenever he discusses the productiveness of labour, he seeks in it, not the cause of surplus-value, but the cause that determines the magnitude of that value. On the other hand, his school has openly proclaimed the productiveness of labour to be the originating cause of profit (read: Surplus-value). This at all events is a progress as against the mercantilists who, on their side, derived the excess of the price over the cost of production of the product, from the act of exchange, from the product being sold above its value. Nevertheless, Ricardo's school simply shirked the problem, they did not solve it. In fact these bourgeois economists instinctively saw, and rightly so, that it is very dangerous to stir too deeply the burning question of the origin of surplus-value. But what are we to think of John Stuart Mill, who, half a century after Ricardo, solemnly claims superiority over the mercantilists, by clumsily repeating the wretched evasions of Ricardo's earliest vulgarisers?

Mill says:

“The cause of profit is that labour produces more than is required for its support.”

So far, nothing but the old story; but Mill wishing to add something of his own, proceeds:

“To vary the form of the theorem; the reason why capital yields a profit, is because food, clothing, materials and tools, last longer than the time which was required to produce them.”

He here confounds the duration of labour-time with the duration of its products. According to this view, a baker whose product lasts only a day, could never extract from his workpeople the same profit, as a machine maker whose products endure for 20 years and more. Of course it is very true, that if a bird's nest did not last longer than the time it takes in building, birds would have to do without nests.

This fundamental truth once established, Mill establishes his own superiority over the mercantilists.

“We thus see,” he proceeds, “that profit arises, not from the incident of exchange, but from the productive power of labour; and the general profit of the country is always what the productive power of labour makes it, whether any exchange takes place or not. If there were no division of employments, there would be no buying or selling, but there would still be profit.”

For Mill then, exchange, buying and selling, those general conditions of capitalist production, are but an incident, and there would always be profits even without the purchase and sale of labour-power!

“If,” he continues, “the labourers of the country collectively produce twenty per cent more than their wages, profits will be twenty per cent, whatever prices may or may not be.” This is, on the

one hand, a rare bit of tautology; for if labourers produce a surplus-value of 20% for the capitalist, his profit will be to the total wages of the labourers as 20:100. On the other hand, it is absolutely false to say that “profits will be 20%.” They will always be less, because they are calculated upon the *sum total* of the capital advanced. If, for example, the capitalist have advanced £500, of which £400 is laid out in means of production and £100 in wages, and if the rate of surplus-value be 20%, the rate of profit will be 20:500, *i.e.*, 4% and not 20%.

Then follows a splendid example of Mill’s method of handling the different historical forms of social production.

“I assume, throughout, the state of things which, where the labourers and capitalists are separate classes, prevails, with few exceptions, universally; namely, that the capitalist advances the whole expenses, including the entire remuneration of the labourer.”

Strange optical illusion to see everywhere a state of things which as yet exists only exceptionally on our earth.<sup>11</sup> But let us finish – Mill is willing to concede,

“that he should do so is not a matter of inherent necessity.” On the contrary: “the labourer might wait, until the production is complete, for all that part of his wages which exceeds mere necessities: and even for the whole, if he has funds in hand sufficient for his temporary support. But in the latter case, the labourer is to that extent really a capitalist in the concern, by supplying a portion of the funds necessary for carrying it on.”

Mill might have gone further and have added, that the labourer who advances to himself not only the necessities of life but also the means of production, is in reality nothing but his own wage-labourer. He might also have said that the American peasant proprietor is but a serf who does enforced labour for himself instead of for his lord.

After thus proving clearly, that even if capitalist production had no existence, still it would always exist, Mill is consistent enough to show, on the contrary, that it has no existence, even when it does exist.

“And even in the former case” (when the workman is a wage labourer to whom the capitalist advances all the necessities of life, he the labourer), “may be looked upon in the same light,” (*i.e.*, as a capitalist), “since, contributing his labour at less than the market-price, (!) he may be regarded as lending the difference (?) to his employer and receiving it back with interest, &c.”<sup>12</sup>

In reality, the labourer advances his labour gratuitously to the capitalist during, say one week, in order to receive the market price at the end of the week, &c., and it is this which, according to Mill, transforms him into a capitalist. On the level plain, simple mounds look like hills; and the imbecile flatness of the present bourgeoisie is to be measured by the altitude of its great intellects.

<sup>1</sup> “The very existence of the master-capitalists, as a distinct class, is dependent on the productiveness of industry.” (Ramsay, *l.c.*, p. 206.) “If each man’s labour were but enough to produce his own food, there could be no property.” (Ravenstone, *l.c.* p. 14, 15.)

<sup>2</sup> According to a recent calculation, there are yet at least 4,000,000 cannibals in those parts of the earth which have already been explored.

<sup>3</sup> “Among the wild Indians in America, almost everything is the labourer’s, 99 parts of a hundred are to be put upon the account of labour. In England, perhaps, the labourer has not 2/3.” (The Advantages of the East India Trade, &c., p. 73.)

<sup>4</sup> Diodorus, l.c., l. I., c. 80.

<sup>5</sup> “The first (natural wealth) as it is most noble and advantageous, so doth it make the people careless, proud, and given to all excesses; whereas the second enforceth vigilancy, literature, arts and policy.” (England’s Treasure by Foreign Trade. Or the Balance of our Foreign Trade is the Rule of our Treasure. Written by Thomas Mun of London, merchant, and now published for the common good by his son John Mun. London, 1669, p. 181, 182.) “Nor can I conceive a greater curse upon a body of people, than to be thrown upon a spot of land, where the productions for subsistence and food were, in great measure, spontaneous, and the climate required or admitted little care for raiment and covering... there may be an extreme on the other side. A soil incapable of produce by labour is quite as bad as a soil that produces plentifully without any labour.” (An Inquiry into the Present High Price of Provisions. Lond. 1767, p. 10.)

<sup>6</sup> The necessity for predicting the rise and fall of the Nile created Egyptian astronomy, and with it the dominion of the priests, as directors of agriculture. “Le solstice est le moment de l’année ou commence la crue du Nil, et celui que les Egyptiens ont du observer avec le plus d’attention.... C’était cette année tropique qu’il leur importait de marquer pour se diriger dans leurs opérations agricoles. Ils durent donc chercher dans le ciel un signe apparent de son retour.” [The solstice is the moment of the year when the Nile begins to rise, and it is the moment the Egyptians have had to watch for with the greatest attention ... It was the evolution of the tropical year which they had to establish firmly so as to conduct their agricultural operations in accordance with it. They therefore had to search the heavens for a visible sign of the solstice’s return.] (Cuvier: Discours sur les révolutions du globe, ed. Hoefer, Paris, 1863, p. 141.)

<sup>7</sup> One of the material bases of the power of the state over the small disconnected producing organisms in India, was the regulation of the water supply. The Mahometan rulers of India understood this better than their English successors. It is enough to recall to mind the famine of 1866, which cost the lives of more than a million Hindus in the district of Orissa, in the Bengal presidency.

<sup>8</sup> “There are no two countries which furnish an equal number of the necessaries of life in equal plenty, and with the same quantity of labour. Men’s wants increase or diminish with the severity or temperateness of the climate they live in; consequently, the proportion of trade which the inhabitants of different countries are obliged to carry on through necessity cannot be the same, nor is it practicable to ascertain the degree of variation farther than by the degrees of Heat and Cold; from whence one may make this general conclusion, that the quantity of labour required for a certain number of people is greatest in cold climates, and least in hot ones; for in the former men not only want more clothes, but the earth more cultivating than in the latter.” (An Essay on the Governing Causes of the Natural Rate of Interest. Lond. 1750. p. 60.) The author of this epoch-making anonymous work is J. Massy. Hume took his theory of interest from it.

<sup>9</sup> “Chaque travail doit (this appears also to be part of the *droits et devoirs du citoyen* [rights and duties of the citizen]) laisser un excédent.” [All labour must leave a surplus] Proudhon.

<sup>10</sup> F. Schouw: “Die Erde, die Pflanze und der Mensch,” 2. Ed. Leipz. 1854, p. 148.

<sup>11</sup> In earlier editions of *Capital* the quotation from John Stuart Mill, “I assume throughout...of the labourer,” had been given incorrectly, the words “where the labourers and capitalists are separate classes” having been left out. Marx, in a letter dated November 28, 1878, pointed this out to Danielson, the Russian translator of *Capital*, adding:

“The next two sentences, viz. ‘Strange optical illusion to see everywhere a state of things which as yet exists only exceptionally on our earth. But let us finish’ - should be deleted and the following sentence substituted:

---

“Mr. Mill is good enough to believe that this state of things is not an absolute necessity, even in that economic system in which ‘labourers and capitalists are separate classes.’”

The substance of this note has been taken from the *Volksausgabe*. The quotation from Mill is from his *Principles of Political Economy*, Book II, Chap XV, 5.

## Chapter 17: Changes of Magnitude in the Price of Labour-Power and in Surplus-Value

The value of labour-power is determined by the value of the necessaries of life habitually required by the average labourer. The quantity of these necessaries is known at any given epoch of a given society, and can therefore be treated as a constant magnitude. What changes, is the value of this quantity. There are, besides, two other factors that enter into the determination of the value of labour-power. One, the expenses of developing that power, which expenses vary with the mode of production; the other, its natural diversity, the difference between the labour-power of men and women, of children and adults. The employment of these different sorts of labour-power, an employment which is, in its turn, made necessary by the mode of production, makes a great difference in the cost of maintaining the family of the labourer, and in the value of the labour-power of the adult male. Both these factors, however, are excluded in the following investigation.<sup>1</sup>

I assume (1) that commodities are sold at their value; (2) that the price of labour-power rises occasionally above its value, but never sinks below it.

On this assumption we have seen that the relative magnitudes of surplus-value and of price of labour-power are determined by three circumstances; (1) the length of the working day, or the extensive magnitude of labour; (2) the normal intensity of labour, its intensive magnitude, whereby a given quantity of labour is expended in a given time; (3) the productiveness of labour, whereby the same quantum of labour yields, in a given time, a greater or less quantum of product, dependent on the degree of development in the conditions of production. Very different combinations are clearly possible, according as one of the three factors is constant and two variable, or two constant and one variable, or lastly, all three simultaneously variable. And the number of these combinations is augmented by the fact that, when these factors simultaneously vary, the amount and direction of their respective variations may differ. In what follows the chief combinations alone are considered.

### Section 1: Length of the Working day and Intensity of Labour Constant. Productiveness of Labour Variable

On these assumptions the value of labour-power, and the magnitude of surplus-value, are determined by three laws.

(1.) A working day of given length always creates the same amount of value, no matter how the productiveness of labour, and, with it, the mass of the product, and the price of each single commodity produced, may vary.

If the value created by a working day of 12 hours be, say, six shillings, then, although the mass of the articles produced varies with the productiveness of labour, the only result is that the value represented by six shillings is spread over a greater or less number of articles.

(2.) Surplus-value and the value of labour-power vary in opposite directions. A variation in the productiveness of labour, its increase or diminution, causes a variation in the opposite direction in the value of labour-power, and in the same direction in surplus-value.

The value created by a working day of 12 hours is a constant quantity, say, six shillings. This constant quantity is the sum of the surplus-value plus the value of the labour-power, which latter

value the labourer replaces by an equivalent. It is self-evident, that if a constant quantity consists of two parts, neither of them can increase without the other diminishing. Let the two parts at starting be equal; 3 shillings value of labour-power, 3 shillings surplus-value. Then the value of the labour-power cannot rise from three shillings to four, without the surplus-value falling from three shillings to two; and the surplus-value cannot rise from three shillings to four, without the value of labour-power falling from three shillings to two. Under these circumstances, therefore, no change can take place in the absolute magnitude, either of the surplus-value, or of the value of labour-power, without a simultaneous change in their relative magnitudes, *i.e.*, relatively to each other. It is impossible for them to rise or fall simultaneously.

Further, the value of labour-power cannot fall, and consequently surplus-value cannot rise, without a rise in the productiveness of labour. For instance, in the above case, the value of the labour-power cannot sink from three shillings to two, unless an increase in the productiveness of labour makes it possible to produce in 4 hours the same quantity of necessaries as previously required 6 hours to produce. On the other hand, the value of the labour-power cannot rise from three shillings to four, without a decrease in the productiveness of labour, whereby eight hours become requisite to produce the same quantity of necessaries, for the production of which six hours previously sufficed. It follows from this, that an increase in the productiveness of labour causes a fall in the value of labour-power and a consequent rise in surplus-value, while, on the other hand, a decrease in such productiveness causes a rise in the value of labour-power, and a fall in surplus-value.

In formulating this law, Ricardo overlooked one circumstance; although a change in the magnitude of the surplus-value or surplus labour causes a change in the opposite direction in the magnitude of the value of labour-power, or in the quantity of necessary labour, it by no means follows that they vary in the same proportion. They do increase or diminish by the same quantity. But their proportional increase or diminution depends on their original magnitudes before the change in the productiveness of labour took place. If the value of the labour-power be 4 shillings, or the necessary labour time 8 hours, and the surplus-value be 2 shillings, or the surplus labour 4 hours, and if, in consequence of an increase in the productiveness of labour, the value of the labour-power fall to 3 shillings, or the necessary labour to 6 hours, the surplus-value will rise to 3 shillings, or the surplus labour to 6 hours. The same quantity, 1 shilling or 2 hours, is added in one case and subtracted in the other. But the proportional change of magnitude is different in each case. While the value of the labour-power falls from 4 shillings to 3, *i.e.*, by 1/4 or 25%, the surplus-value rises from 2 shillings to 3, *i.e.*, by 1/2 or 50%. It therefore follows that the proportional increase or diminution in surplus-value, consequent on a given change in the productiveness of labour, depends on the original magnitude of that portion of the working day which embodies itself in surplus-value; the smaller that portion, the greater is the proportional change; the greater that portion, the less is the proportional change.

(3.) Increase or diminution in surplus-value is always consequent on, and never the cause of, the corresponding diminution or increase in the value of labour-power.<sup>2</sup>

Since the working day is constant in magnitude, and is represented by a value of constant magnitude, since, to every variation in the magnitude of surplus-value, there corresponds an inverse variation in the value of labour-power, and since the value of labour-power cannot change, except in consequence of a change in the productiveness of labour, it clearly follows, under these conditions, that every change of magnitude in surplus-value arises from an inverse change of magnitude in the value of labour-power. If, then, as we have already seen, there can be no change of absolute magnitude in the value of labour-power, and in surplus-value, unaccompanied by a change in their relative magnitudes, so now it follows that no change in their

relative magnitudes is possible, without a previous change in the absolute magnitude of the value of labour-power.

According to the third law, a change in the magnitude of surplus-value, presupposes a movement in the value of labour-power, which movement is brought about by a variation in the productiveness of labour. The limit of this change is given by the altered value of labour-power. Nevertheless, even when circumstances allow the law to operate, subsidiary movements may occur. For example: if in consequence of the increased productiveness of labour, the value of labour-power falls from 4 shillings to 3, or the necessary labour time from 8 hours to 6, the price of labour-power may possibly not fall below 3s. 8d., 3s. 6d., or 3s. 2d., and the surplus-value consequently not rise above 3s. 4d., 3s. 6d., or 3s. 10d. The amount of this fall, the lowest limit of which is 3 shillings (the new value of labour-power), depends on the relative weight, which the pressure of capital on the one side, and the resistance of the labourer on the other, throws into the scale.

The value of labour-power is determined by the value of a given quantity of necessaries. It is the value and not the mass of these necessaries that varies with the productiveness of labour. It is, however, possible that, owing to an increase of productiveness, both the labourer and the capitalist may simultaneously be able to appropriate a greater quantity of these necessaries, without any change in the price of labour-power or in surplus-value. If the value of labour-power be 3 shillings, and the necessary labour time amount to 6 hours, if the surplus-value likewise be 3 shillings, and the surplus labour 6 hours, then if the productiveness of labour were doubled without altering the ratio of necessary labour to surplus labour, there would be no change of magnitude in surplus-value and price of labour-power. The only result would be that each of them would represent twice as many use-values as before; these use-values being twice as cheap as before. Although labour-power would be unchanged in price, it would be above its value. If, however, the price of labour-power had fallen, not to 1s. 6d., the lowest possible point consistent with its new value, but to 2s. 10d. or 2s. 6d., still this lower price would represent an increased mass of necessaries. In this way it is possible with an increasing productiveness of labour, for the price of labour-power to keep on falling, and yet this fall to be accompanied by a constant growth in the mass of the labourer's means of subsistence. But even in such case, the fall in the value of labour-power would cause a corresponding rise of surplus-value, and thus the abyss between the labourer's position and that of the capitalist would keep widening.<sup>3</sup>

Ricardo was the first who accurately formulated the three laws we have above stated. But he falls into the following errors: (1) he looks upon the special conditions under which these laws hold good as the general and sole conditions of capitalist production. He knows no change, either in the length of the working day, or in the intensity of labour; consequently with him there can be only one variable factor, viz., the productiveness of labour; (2), and this error vitiates his analysis much more than (1), he has not, any more than have the other economists, investigated surplus-value as such, *i.e.*, independently of its particular forms, such as profit, rent, &c. He therefore confounds together the laws of the rate of surplus-value and the laws of the rate of profit. The rate of profit is, as we have already said, the ratio of the surplus-value to the total capital advanced; the rate of surplus-value is the ratio of the surplus-value to the variable part of that capital. Assume that a capital C of £500 is made up of raw material, instruments of labour, &c. (c) to the amount of £400; and of wages (v) to the amount of £100; and further, that the surplus-value (s) = £100. Then we have rate of surplus-value  $s/v = £100/£100 = 100\%$ . But the rate of profit  $s/c = £100/£500 = 20\%$ . It is, besides, obvious that the rate of profit may depend on circumstances that in no way affect the rate of surplus-value. I shall show in Book III. that, with a given rate of

surplus-value, we may have any number of rates of profit, and that various rates of surplus-value may, under given conditions, express themselves in a single rate of profit.

## **Section 2: Working day Constant. Productiveness of Labour Constant. Intensity of Labour Variable**

Increased intensity of labour means increased expenditure of labour in a given time. Hence a working day of more intense labour is embodied in more products than is one of less intense labour, the length of each day being the same. Increased productiveness of labour also, it is true, will supply more products in a given working day. But in this latter case, the value of each single product falls, for it costs less labour than before; in the former case, that value remains unchanged, for each article costs the same labour as before. Here we have an increase in the number of products, unaccompanied by a fall in their individual prices: as their number increases, so does the sum of their prices. But in the case of increased productiveness, a given value is spread over a greater mass of products. Hence the length of the working day being constant, a day's labour of increased intensity will be incorporated in an increased value, and, the value of money remaining unchanged, in more money. The value created varies with the extent to which the intensity of labour deviates from its normal intensity in the society. A given working day, therefore, no longer creates a constant, but a variable value; in a day of 12 hours of ordinary intensity, the value created is, say 6 shillings, but with increased intensity, the value created may be 7, 8, or more shillings. It is clear that, if the value created by a day's labour increases from, say, 6 to 8 shillings then the two parts into which this value is divided, viz., price of labour-power and surplus-value, may both of them increase simultaneously, and either equally or unequally. They may both simultaneously increase from 3 shillings to 4. Here, the rise in the price of labour-power does not necessarily imply that the price has risen above the value of labour-power. On the contrary, the rise in price may be accompanied by a fall in value. This occurs whenever the rise in the price of labour-power does not compensate for its increased wear and tear.

We know that, with transitory exceptions, a change in the productiveness of labour does not cause any change in the value of labour-power, nor consequently in the magnitude of surplus-value, unless the products of the industries affected are articles habitually consumed by the labourers. In the present case this condition no longer applies. For when the variation is either in the duration or in the intensity of labour, there is always a corresponding change in the magnitude of the value created, independently of the nature of the article in which that value is embodied.

If the intensity of labour were to increase simultaneously and equally in every branch of industry, then the new and higher degree of intensity would become the normal degree for the society, and would therefore cease to be taken account of. But still, even then, the intensity of labour would be different in different countries, and would modify the international application of the law of value. The more intense working day of one nation would be represented by a greater sum of money than would the less intense day of another nation.<sup>4</sup>

## **Section 3: Productiveness and Intensity of Labour Constant. Length of the Working day Variable**

The working day may vary in two ways. It may be made either longer or shorter. From our present data, and within the limits of the assumptions made above we obtain the following laws:

(1.) The working day creates a greater or less amount of value in proportion to its length – thus, a variable and not a constant quantity of value.

(2.) Every change in the relation between the magnitudes of surplus-value and of the value of labour-power arises from a change in the absolute magnitude of the surplus labour, and consequently of the surplus-value.

(3.) The absolute value of labour-power can change only in consequence of the reaction exercised by the prolongation of surplus labour upon the wear and tear of labour-power. Every change in this absolute value is therefore the effect, but never the cause, of a change in the magnitude of surplus-value.

We begin with the case in which the working day is shortened.

(1.) A shortening of the working day under the conditions given above, leaves the value of labour-power, and with it, the necessary labour time, unaltered. It reduces the surplus labour and surplus-value. Along with the absolute magnitude of the latter, its relative magnitude also falls, *i.e.*, its magnitude relatively to the value of labour-power whose magnitude remains unaltered. Only by lowering the price of labour-power below its value could the capitalist save himself harmless.

All the usual arguments against the shortening of the working day, assume that it takes place under the conditions we have here supposed to exist; but in reality the very contrary is the case: a change in the productiveness and intensity of labour either precedes, or immediately follows, a shortening of the working day.<sup>5</sup>

(2.) Lengthening of the working day. Let the necessary labour time be 6 hours, or the value of labour-power 3 shillings; also let the surplus labour be 6 hours or the surplus-value 3 shillings. The whole working day then amounts to 12 hours and is embodied in a value of 6 shillings. If, now, the working day be lengthened by 2 hours and the price of labour-power remain unaltered, the surplus-value increases both absolutely and relatively. Although there is no absolute change in the value of labour-power, it suffers a relative fall. Under the conditions assumed in 1. there could not be a change of relative magnitude in the value of labour-power without a change in its absolute magnitude. Here, on the contrary, the change of relative magnitude in the value of labour-power is the result of the change of absolute magnitude in surplus-value.

Since the value in which a day's labour is embodied, increases with the length of that day, it is evident that the surplus-value and the price of labour-power may simultaneously increase, either by equal or unequal quantities. This simultaneous increase is therefore possible in two cases, one, the actual lengthening of the working day, the other, an increase in the intensity of labour unaccompanied by such lengthening.

When the working day is prolonged, the price of labour-power may fall below its value, although that price be nominally unchanged or even rise. The value of a day's labour-power is, as will be remembered, estimated from its normal average duration, or from the normal duration of life among the labourers, and from corresponding normal transformations of organised bodily matter into motion,<sup>6</sup> in conformity with the nature of man. Up to a certain point, the increased wear and tear of labour-power, inseparable from a lengthened working day, may be compensated by higher wages. But beyond this point the wear and tear increases in geometrical progression, and every condition suitable for the normal reproduction and functioning of labour-power is suppressed. The price of labour-power and the degree of its exploitation cease to be commensurable quantities.

## Section 4: Simultaneous Variations in the Duration, Productiveness, and Intensity of Labour

It is obvious that a large number of combinations are here possible. Any two of the factors may vary and the third remain constant, or all three may vary at once. They may vary either in the same or in different degrees, in the same or in opposite directions, with the result that the variations counteract one another, either wholly or in part. Nevertheless the analysis of every possible case is easy in view of the results given in I., II., and III. The effect of every possible combination may be found by treating each factor in turn as variable, and the other two constant for the time being. We shall, therefore, notice, and that briefly, but two important cases.

### A. Diminishing Productiveness of Labour with a Simultaneous Lengthening of the Working day

In speaking of diminishing productiveness of labour, we here refer to diminution in those industries whose products determine the value of labour-power; such a diminution, for example, as results from decreasing fertility of the soil, and from the corresponding dearness of its products. Take the working day at 12 hours and the value created by it at 6 shillings, of which one half replaces the value of the labour-power, the other forms the surplus-value. Suppose, in consequence of the increased dearness of the products of the soil, that the value of labour-power rises from 3 shillings to 4, and therefore the necessary labour time from 6 hours to 8. If there be no change in the length of the working day, the surplus labour would fall from 6 hours to 4, the surplus-value from 3 shillings to 2. If the day be lengthened by 2 hours, *i.e.*, from 12 hours to 14, the surplus labour remains at 6 hours, the surplus-value at 3 shillings\*, but the surplus-value decreases compared with the value of labour-power, as measured by the necessary labour time. If the day be lengthened by 4 hours, *viz.*, from 12 hours to 16, the proportional magnitudes of surplus-value and value of labour-power, of surplus labour and necessary labour, continue unchanged, but the absolute magnitude of surplus-value rises from 3 shillings to 4, that of the surplus labour from 6 hours to 8, an increment of 33 1/3%. Therefore, with diminishing productiveness of labour and a simultaneous lengthening of the working day, the absolute magnitude of surplus-value may continue unaltered, at the same time that its relative magnitude diminishes; its relative magnitude may continue unchanged, at the same time that its absolute magnitude increases; and, provided the lengthening of the day be sufficient, both may increase.

In the period between 1799 and 1815 the increasing price of provisions led in England to a nominal rise in wages, although the real wages, expressed in the necessaries of life, fell. From this fact West and Ricardo drew the conclusion, that the diminution in the productiveness of agricultural labour had brought about a fall in the rate of surplus-value, and they made this assumption of a fact that existed only in their imaginations, the starting-point of important investigations into the relative magnitudes of wages, profits, and rent. But, as a matter of fact, surplus-value had at that time, thanks to the increased intensity of labour, and to the prolongation of the working day, increased both in absolute and relative magnitude. This was the period in which the right to prolong the hours of labour to an outrageous extent was established;<sup>7</sup> the period that was especially characterised by an accelerated accumulation of capital here, by pauperism there.<sup>8</sup>

---

\* Earlier English translations have "6 sh." instead of 3 shillings. This error was pointed out to us by a reader, we have investigated and checked with the 1872 German Edition and duly corrected an obvious error.

## B. Increasing Intensity and Productiveness of Labour with Simultaneous Shortening of the Working day

Increased productiveness and greater intensity of labour, both have a like effect. They both augment the mass of articles produced in a given time. Both, therefore, shorten that portion of the working day which the labourer needs to produce his means of subsistence or their equivalent. The minimum length of the working day is fixed by this necessary but contractile portion of it. If the whole working day were to shrink to the length of this portion, surplus labour would vanish, a consummation utterly impossible under the régime of capital. Only by suppressing the capitalist form of production could the length of the working day be reduced to the necessary labour time. But, even in that case, the latter would extend its limits. On the one hand, because the notion of “means of subsistence” would considerably expand, and the labourer would lay claim to an altogether different standard of life. On the other hand, because a part of what is now surplus labour, would then count as necessary labour; I mean the labour of forming a fund for reserve and accumulation.

The more the productiveness of labour increases, the more can the working day be shortened; and the more the working day is shortened, the more can the intensity of labour increase. From a social point of view, the productiveness increases in the same ratio as the economy of labour, which, in its turn, includes not only economy of the means of production, but also the avoidance of all useless labour. The capitalist mode of production, while on the one hand, enforcing economy in each individual business, on the other hand, begets, by its anarchical system of competition, the most outrageous squandering of labour-power and of the social means of production, not to mention the creation of a vast number of employments, at present indispensable, but in themselves superfluous.

The intensity and productiveness of labour being given, the time which society is bound to devote to material production is shorter, and as a consequence, the time at its disposal for the free development, intellectual and social, of the individual is greater, in proportion as the work is more and more evenly divided among all the able-bodied members of society, and as a particular class is more and more deprived of the power to shift the natural burden of labour from its own shoulders to those of another layer of society. In this direction, the shortening of the working day finds at last a limit in the generalisation of labour. In capitalist society spare time is acquired for one class by converting the whole life-time of the masses into labour time.

---

<sup>1</sup> *Note in the 3rd German edition.* — The case considered at pages 321-324 is here of course omitted. — *F. E.*

<sup>2</sup> To this third law MacCulloch has made, amongst others, this absurd addition, that a rise in surplus-value, unaccompanied by a fall in the value of labour-power, can occur through the abolition of taxes payable by the capitalist. The abolition of such taxes makes no change whatever in the quantity of surplus-value that the capitalist extorts at first-hand from the labourer. It alters only the proportion in which that surplus-value is divided between himself and third persons. It consequently makes no alteration whatever in the relation between surplus-value and value of labour-power. MacCulloch's exception therefore proves only his misapprehension of the rule, a misfortune that as often happens to him in the vulgarisation of Ricardo, as it does to J. B. Say in the vulgarisation of Adam Smith.

<sup>3</sup> “When an alteration takes place in the productiveness of industry, and that either more or less is produced by a given quantity of labour and capital, the proportion of wages may obviously vary, whilst the quantity, which that proportion represents, remains the same, or the quantity may vary, whilst the proportion remains the same.” (“*Outlines of Political Economy, &c.*,” p. 67.)

<sup>4</sup> “All things being equal, the English manufacturer can turn out a considerably larger amount of work in a given time than a foreign manufacturer, so much as to counterbalance the difference of the working days, between 60 hours a week here, and 72 or 80 elsewhere.” (Rep. of Insp. of Fact. for 31st Oct., 1855, p. 65.) The most infallible means for reducing this qualitative difference between the English and Continental working hour would be a law shortening quantitatively the length of the working day in Continental factories.

<sup>5</sup> “There are compensating circumstances ... which the working of the Ten Hours' Act has brought to light.” (“Rep. of Insp. of Fact. for 31st Oct. 1848,” p. 7.)

<sup>6</sup> “The amount of labour which a man had undergone in the course of 24 hours might be approximately arrived at by an examination of the chemical changes which had taken place in his body, changed forms in matter indicating the anterior exercise of dynamic force.” (Grove: “On the Correlation of Physical Forces.”)

<sup>7</sup> “Corn and labour rarely march quite abreast; but there is an obvious limit, beyond which they cannot be separated. With regard to the unusual exertions made by the labouring classes in periods of dearth, which produce the fall of wages noticed in the evidence” (namely, before the Parliamentary Committee of Inquiry, 1814-15), “they are most meritorious in the individuals, and certainly favour the growth of capital. But no man of humanity could wish to see them constant and unremitted. They are most admirable as a temporary relief; but if they were constantly in action, effects of a similar kind would result from them, as from the population of a country being pushed to the very extreme limits of its food.” (Malthus: “Inquiry into the Nature and Progress of Rent,” Lond., 1815, p. 48, note.) All honour to Malthus that he lays stress on the lengthening of the hours of labour, a fact to which he elsewhere in his pamphlet draws attention, while Ricardo and others, in face of the most notorious facts, make invariability in the length of the working day the groundwork of all their investigations. But the conservative interests, which Malthus served, prevented him from seeing that an unlimited prolongation of the working day, combined with an extraordinary development of machinery, and the exploitation of women and children, must inevitably have made a great portion of the working-class “supernumerary,” particularly whenever the war should have ceased, and the monopoly of England in the markets of the world should have come to an end. It was, of course, far more convenient, and much more in conformity with the interests of the ruling classes, whom Malthus adored like a true priest, to explain this “over-population” by the eternal laws of Nature, rather than by the historical laws of capitalist production.

<sup>8</sup> “A principal cause of the increase of capital, during the war, proceeded from the greater exertions, and perhaps the greater privations of the labouring classes, the most numerous in every society. More women and children were compelled by necessitous circumstances, to enter upon laborious occupations, and former workmen were, from the same cause, obliged to devote a greater portion of their time to increase production.” (Essays on Pol. Econ., in which are illustrated the principal causes of the present national distress. Lond., 1830, p. 248.)

## Chapter 18: Various Formula for the rate of Surplus-Value

We have seen that the rate of surplus-value is represented by the following formulae:

$$\text{I. } \frac{\text{Surplus-value}}{\text{Variable Capital}} \left( \frac{s}{v} \right) = \frac{\text{Surplus-value}}{\text{Value of labour-power}} = \frac{\text{Surplus-labour}}{\text{Necessary labour}}$$

The two first of these formulae represent, as a ratio of values, that which, in the third, is represented as a ratio of the times during which those values are produced. These formulae, supplementary the one to the other, are rigorously definite and correct. We therefore find them substantially, but not consciously, worked out in classical Political Economy. There we meet with the following derivative formulae.

$$\text{II. } \frac{\text{Surplus-labour}}{\text{Working day}} = \frac{\text{Surplus-value}}{\text{Value of the Product}} = \frac{\text{Surplus-product}}{\text{Total Product}}$$

One and the same ratio is here expressed as a ratio of labour-times, of the values in which those labour-times are embodied, and of the products in which those values exist. It is of course understood that, by "Value of the Product," is meant only the value newly created in a working day, the constant part of the value of the product being excluded.

In all of these formulae (II.), the actual degree of exploitation of labour, or the rate of surplus-value, is falsely expressed. Let the working day be 12 hours. Then, making the same assumptions as in former instances, the real degree of exploitation of labour will be represented in the following proportions.

$$\frac{6 \text{ hours surplus-labour}}{6 \text{ hours necessary labour}} = \frac{\text{Surplus-value of 3 sh.}}{\text{Variable Capital of 3 sh.}} = 100\%$$

From formulae II. we get very differently,

$$\frac{6 \text{ hours surplus-labour}}{\text{Working day of 12 hours}} = \frac{\text{Surplus-value of 3 sh.}}{\text{Value created of 6 sh.}} = 50\%$$

These derivative formulae express, in reality, only the proportion in which the working day, or the value produced by it, is divided between capitalist and labourer. If they are to be treated as direct expressions of the degree of self-expansion of capital, the following erroneous law would hold good: Surplus-labour or surplus-value can never reach 100%.<sup>1</sup> Since the surplus-labour is only an aliquot part of the working day, or since surplus-value is only an aliquot part of the value created, the surplus-labour must necessarily be always less than the working day, or the surplus-value always less than the total value created. In order, however, to attain the ratio of 100:100 they must be equal. In order that the surplus-labour may absorb the whole day (i.e., an average day of any week or year), the necessary labour must sink to zero. But if the necessary labour vanish, so too does the surplus-labour, since it is only a function of the former. The ratio

$$\frac{\text{Surplus-labour or Surplus-value}}{\text{Working day Value created}}$$

can therefore never reach the limit 100/100, still less rise to 100 + x/100. But not so the rate of surplus-value, the real degree of exploitation of labour. Take, e.g., the estimate of L. de Lavergne, according to which the English agricultural labourer gets only 1/4, the capitalist (farmer) on the other hand 3/4 of the product<sup>2</sup> or its value, apart from the question of how the booty is

subsequently divided between the capitalist, the landlord, and others. According to this, this surplus-labour of the English agricultural labourer is to his necessary labour as 3:1, which gives a rate of exploitation of 300%.

The favorite method of treating the working day as constant in magnitude became, through the use of formulae II., a fixed usage, because in them surplus-labour is always compared with a working day of given length. The same holds good when the repartition of the value produced is exclusively kept in sight. The working day that has already been realized in given value, must necessarily be a day of given length.

The habit of representing surplus-value and value of labour-power as fractions of the value created – a habit that originates in the capitalist mode of production itself, and whose import will hereafter be disclosed – conceals the very transaction that characterizes capital, namely the exchange of variable capital for living labour-power, and the consequent exclusion of the labourer from the product. Instead of the real fact, we have false semblance of an association, in which labourer and capitalist divide the product in proportion to the different elements which they respectively contribute towards its formation.<sup>3</sup>

Moreover, the formulae II. can at any time be reconverted into formulae I. If, for instance, we have

$$\frac{\text{Surplus-labour of 6 hours}}{\text{Working day of 12 hours}}$$

then the necessary labour-time being 12 hours less the surplus-labour of 6 hours, we get the following result,

$$\frac{\text{Surplus-labour of 6 hours}}{\text{Necessary labour of 6 hours}} = \frac{100}{100}$$

There is a third formula which I have occasionally already anticipated; it is

$$\text{III.} \quad \frac{\text{Surplus-value}}{\text{Value of labour-power}} = \frac{\text{Surplus-labour}}{\text{Necessary labour}} = \frac{\text{Unpaid labour}}{\text{Paid labour}}$$

After the investigations we have given above, it is no longer possible to be misled, by the formula

$$\frac{\text{Unpaid labour,}}{\text{Paid labour}}$$

into concluding, that the capitalist pays for labour and not for labour-power. This formula is only a popular expression for

$$\frac{\text{Surplus-labour,}}{\text{Necessary labour}}$$

The capitalist pays the value, so far as price coincides with value, of the labour-power, and receives in exchange the disposal of the living labour-power itself. His usufruct is spread over two periods. During one the labourer produces a value that is only equal to the value of his labour-power; he produces its equivalent. This the capitalist receives in return for his advance of the price of the labour-power, a product ready made in the market. During the other period, the period of surplus-labour, the usufruct of the labour-power creates a value for the capitalist, that costs him no equivalent.<sup>4</sup> This expenditure of labour-power comes to him gratis. In this sense it is that surplus-labour can be called unpaid labour.

Capital, therefore, it not only, as Adam Smith says, the command over labour. It is essentially the command over unpaid labour. All surplus-value, whatever particular form (profit, interest, or

rent), it may subsequently crystallize into, is in substance the materialisation of unpaid labour. The secret of the self-expansion of capital resolves itself into having the disposal of a definite quantity of other people's unpaid labour.

---

<sup>1</sup> Thus, e.g., in "Dritter Brief an v. Kirchmann von Rodbertus. Widerlegung der Ricardo'schen Lehre von der Grundrente und Begründung einer neuen Rententheorie." Berlin, 1851. I shall return to this letter later on; in spite of its erroneous theory of rent, it sees through the nature of capitalist production.

NOTE ADDED IN THE 3RD GERMAN EDITION: It may be seen from this how favorably Marx judged his predecessors, whenever he found in them real progress, or new and sound ideas. The subsequent publications of Robertus' letters to Rud. Meyer has shown that the above acknowledgement by Marx wants restricting to some extent. In those letters this passage occurs:

"Capital must be rescued not only from labor, but from itself, and that will be best effected, by treating the acts of the industrial capitalist as economic and political functions, that have been delegated to him with his capital, and by treating his profit as a form of salary, because we still know no other social organisation. But salaries may be regulated, and may also be reduced if they take too much from wages. The irruption of Marx into Society, as I may call his book, must be warded off.... Altogether, Marx's book is not so much an investigation into capital, as a polemic against the present form of capital, a form which he confounds with the concept itself of capital." ("Briefe, &c., von Dr. Robertus-Jagetzow, herausgg. von Dr. Rud. Meyer," Berlin, 1881, I, Bd. P.111, 46. Brief von Rodbertus.) To such ideological commonplaces did the bold attack by Robertus in his "social letters" finally dwindle down. — *F. E.*

<sup>2</sup> That part of the product which merely replaces the constant capital advanced is of course left out in this calculation. Mr. L. de Lavergne, a blind admirer of England, is inclined to estimate the share of the capitalist too low, rather than too high.

<sup>3</sup> All well-developed forms of capitalist production being forms of co-operation, nothing is, of course, easier, than to make abstraction from their antagonistic character, and to transform them by a word into some form of free association, as is done by A. de Laborde in "De l'Esprit d'Association dans tous les intérêts de la communauté". Paris 1818. H. Carey, the Yankee, occasionally performs this conjuring trick with like success, even with the relations resulting from slavery.

<sup>4</sup> Although the Physiocrats could not penetrate the mystery of surplus-value, yet this much was clear to them, viz., that it is "une richesse indépendante et disponible qu'il (the possessor) n'a point achetée et qu'il vend." [a wealth which is independent and disposable, which he ... has not bought and which he sells] (Turgot: "Réflexions sur la Formation et la Distribution des Richesses," p.11.)

## **Part 6: Wages**

## Chapter 19: The Transformation of the Value (and Respective Price) of Labour-Power into Wages

On the surface of bourgeois society the wage of the labourer appears as the price of labour, a certain quantity of money that is paid for a certain quantity of labour. Thus people speak of the value of labour and call its expression in money its necessary or natural price. On the other hand they speak of the market-prices of labour, i.e., prices oscillating above or below its natural price.

But what is the value of a commodity? The objective form of the social labour expended in its production. And how do we measure the quantity of this value? By the quantity of the labour contained in it. How then is the value, e.g., of a 12 hour working-day to be determined? By the 12 working-hours contained in a working day of 12 hours, which is an absurd tautology.<sup>1</sup>

In order to be sold as a commodity in the market, labour must at all events exist before it is sold. But, could the labourer give it an independent objective existence, he would sell a commodity and not labour.<sup>2</sup>

Apart from these contradictions, a direct exchange of money, i.e., of realized labour, with living labour would either do away with the law of value which only begins to develop itself freely on the basis of capitalist production, or do away with capitalist production itself, which rests directly on wage-labour. The working day of 12 hours embodies itself, e.g., in a money-value of 6s. Either equivalents are exchanged, and then the labourer receives 6s, for 12 hours' labour; the price of his labour would be equal to the price of his product. In this case he produces no surplus-value for the buyer of his labour, the 6s. are not transformed into capital, the basis of capitalist production vanishes. But it is on this very basis that he sells his labour and that his labour is wage-labour. Or else he receives for 12 hours' labour less than 6s., i.e., less than 12 hours' labour. Twelve hours' labour are exchanged against 10, 6, &c., hours' labour. This equalisation of unequal quantities not merely does away with the determination of value. Such a self-destructive contradiction cannot be in any way even enunciated or formulated as a law.<sup>3</sup>

It is of no avail to deduce the exchange of more labour against less, from their difference of form, the one being realized, the other living.<sup>4</sup> This is the more absurd as the value of a commodity is determined not by the quantity of labour actually realized in it, but by the quantity of living labour necessary for its production. A commodity represents, say, 6 working-hours. If an invention is made by which it can be produced in 3 hours, the value, even of the commodity already produced, falls by half. It represents now 3 hours of social labour instead of the 6 formerly necessary. It is the quantity of labour required for its production, not the realized form of that labour, by which the amount of the value of a commodity is determined.

That which comes directly face to face with the possessor of money on the market, is in fact not labour, but the labourer. What the latter sells is his labour-power. As soon as his labour actually begins, it has already ceased to belong to him; it can therefore no longer be sold by him. Labour is the substance, and the immanent measure of value, but has itself no value.<sup>5</sup>

In the expression "value of labour," the idea of value is not only completely obliterated, but actually reversed. It is an expression as imaginary as the value of the earth. These imaginary expressions, arise, however, from the relations of production themselves. They are categories for the phenomenal forms of essential relations. That in their appearance things often represent themselves in inverted form is pretty well known in every science except Political Economy.<sup>6</sup>

Classical Political Economy borrowed from every-day life the category “price of labour” without further criticism, and then simply asked the question, how is this price determined? It soon recognized that the change in the relations of demand and supply explained in regard to the price of labour, as of all other commodities, nothing except its changes i.e., the oscillations of the market-price above or below a certain mean. If demand and supply balance, the oscillation of prices ceases, all other conditions remaining the same. But then demand and supply also cease to explain anything. The price of labour, at the moment when demand and supply are in equilibrium, is its natural price, determined independently of the relation of demand and supply. And how this price is determined is just the question. Or a larger period of oscillations in the market-price is taken, e.g., a year, and they are found to cancel one the other, leaving a mean average quantity, a relatively constant magnitude. This had naturally to be determined otherwise than by its own compensating variations. This price which always finally predominates over the accidental market-prices of labour and regulates them, this “necessary price” (Physiocrats) or “natural price” of labour (Adam Smith) can, as with all other commodities, be nothing else than its value expressed in money. In this way Political Economy expected to penetrate athwart the accidental prices of labour, to the value of labour. As with other commodities, this value was determined by the cost of production. But what is the cost of production - of the labourer, i.e., the cost of producing or reproducing the labourer himself? This question unconsciously substituted itself in Political Economy for the original one; for the search after the cost of production of labour as such turned in a circle and never left the spot. What economists therefore call value of labour, is in fact the value of labour-power, as it exists in the personality of the labourer, which is as different from its function, labour, as a machine is from the work it performs. Occupied with the difference between the market-price of labour and its so-called value, with the relation of this value to the rate of profit, and to the values of the commodities produced by means of labour, &c., they never discovered that the course of the analysis had led not only from the market-prices of labour to its presumed value, but had led to the resolution of this value of labour itself into the value of labour-power. Classical economy never arrived at a consciousness of the results of its own analysis; it accepted uncritically the categories “value of labour,” “natural price of labour,” &c., as final and as adequate expressions for the value-relation under consideration, and was thus led, as will be seen later, into inextricable confusion and contradiction, while it offered to the vulgar economists a secure basis of operations for their shallowness, which on principle worships appearances only.

Let us next see how value (and price) of labour-power, present themselves in this transformed condition as wages.

We know that the daily value of labour-power is calculated upon a certain length of the labourer’s life, to which, again, corresponds a certain length of working day. Assume the habitual working day as 12 hours, the daily value of labour-power as 3s., the expression in money of a value that embodies 6 hours of labour. If the labourer receives 3s., then he receives the value of his labour-power functioning through 12 hours. If, now, this value of a day’s labour-power is expressed as the value of a day’s labour itself, we have the formula: Twelve hours’ labour has a value of 3s. The value of labour-power thus determines the value of labour, or, expressed in money, its necessary price. If, on the other hand, the price of labour-power differs from its value, in like manner the price of labour differs from its so-called value.

As the value of labour is only an irrational expression for the value of labour-power, it follows, of course, that the value of labour must always be less than the value it produces, for the capitalist always makes labour-power work longer than is necessary for the reproduction of its own value. In the above example, the value of the labour-power that functions through 12 hours is 3s., a

value for the reproduction of which 6 hours are required. The value which the labour-power produces is, on the other hand, 6s., because it, in fact, functions during 12 hours, and the value it produces depends, not on its own value, but on the length of time it is in action. Thus, we have a result absurd at first sight that labour which creates a value of 6s. possesses a value of 3s.<sup>7</sup>

We see, further: The value of 3s. by which a part only of the working day – i.e., 6 hours' labour-is paid for, appears as the value or price of the whole working day of 12 hours, which thus includes 6 hours unpaid for. The wage form thus extinguishes every trace of the division of the working day into necessary labour and surplus labour, into paid and unpaid labour. All labour appears as paid labour. In the *corvée*, the labour of the worker for himself, and his compulsory labour for his lord, differ in space and time in the clearest possible way. In slave labour, even that part of the working day in which the slave is only replacing the value of his own means of existence, in which, therefore, in fact, he works for himself alone, appears as labour for his master. All the slave's labour appears as unpaid labour.<sup>8</sup> In wage labour, on the contrary, even surplus labour, or unpaid labour, appears as paid. There the property-relation conceals the labour of the slave for himself; here the money-relation conceals the unrequited labour of the wage labourer.

Hence, we may understand the decisive importance of the transformation of value and price of labour-power into the form of wages, or into the value and price of labour itself. This phenomenal form, which makes the actual relation invisible, and, indeed, shows the direct opposite of that relation, forms the basis of all the juridical notions of both labourer and capitalist, of all the mystifications of the capitalistic mode of production, of all its illusions as to liberty, of all the apologetic shifts of the vulgar economists.

If history took a long time to get at the bottom of the mystery of wages, nothing, on the other hand, is more easy to understand than the necessity, the *raison d'être*, of this phenomenon.

The exchange between capital and labour at first presents itself to the mind in the same guise as the buying and selling of all other commodities. The buyer gives a certain sum of money, the seller an article of a nature different from money. The jurist's consciousness recognizes in this, at most, a material difference, expressed in the juridically equivalent formula: "Do ut des, do ut facias, facio ut des, facio ut facias."<sup>9</sup>

Furthermore, exchange-value and use-value, being intrinsically incommensurable magnitudes, the expressions "value of labour," "price of labour," do not seem more irrational than the expressions "value of cotton," "price of cotton." Moreover, the labourer is paid after he has given his labour. In its function of means of payment, money realizes subsequently the value or price of the article supplied – i.e., in this particular case, the value or price of the labour supplied. Finally, the use-value supplied by the labourer to the capitalist is not, in fact, his labour-power, but its function, some definite useful labour, the work of tailoring, shoemaking, spinning, &c. That this same labour is, on the other hand, the universal value-creating element, and thus possesses a property by which it differs from all other commodities, is beyond the cognizance of the ordinary mind.

Let us put ourselves in the place of the labourer who receives for 12 hours' labour, say the value produced by 6 hours' labour, say 3s. For him, in fact, his 12 hours' labour is the means of buying the 3s. The value of his labour-power may vary, with the value of his usual means of subsistence, from 3 to 4 shillings, or from 3 to 2 shillings; or, if the value of his labour-power remains constant, its price may, in consequence of changing relations of demand and supply, rise to 4s. or fall to 2s. He always gives 12 hours of labour. Every change in the amount of the equivalent that he receives appears to him, therefore, necessarily as a change in the value or price of his 12 hours' work. This circumstance misled Adam Smith, who treated the working day as a constant quantity,<sup>10</sup> to the assertion that the value of labour is constant, although the value of the means of

subsistence may vary, and the same working day, therefore, may represent itself in more or less money for the labourer.

Let us consider, on the other hand, the capitalist. He wishes to receive as much labour as possible for as little money as possible. Practically, therefore, the only thing that interests him is the difference between the price of labour-power and the value which its function creates. But, then, he tries to buy all commodities as cheaply as possible, and always accounts for his profit by simple cheating, by buying under, and selling over the value. Hence, he never comes to see that, if such a thing as the value of labour really existed, and he really paid this value, no capital would exist, his money would not be turned into capital.

Moreover, the actual movement of wages presents phenomena which seem to prove that not the value of labour-power is paid, but the value of its function, of labour itself. We may reduce these phenomena to two great classes: 1.) Change of wages with the changing length of the working day. One might as well conclude that not the value of a machine is paid, but that of its working, because it costs more to hire a machine for a week than for a day. 2.) The individual difference in the wages of different labourers who do the same kind of work. We find this individual difference, but are not deceived by it, in the system of slavery, where, frankly and openly, without any circumlocution, labour-power itself is sold. Only, in the slave system, the advantage of a labour-power above the average, and the disadvantage of a labour-power below the average, affects the slave-owner; in the wage-labour system, it affects the labourer himself, because his labour-power is, in the one case, sold by himself, in the other, by a third person.

For the rest, in respect to the phenomenal form, “value and price of labour,” or “wages,” as contrasted with the essential relation manifested therein, viz., the value and price of labour-power, the same difference holds that holds in respect to all phenomena and their hidden substratum. The former appear directly and spontaneously as current modes of thought; the latter must first be discovered by science. Classical Political Economy nearly touches the true relation of things, without, however, consciously formulating it. This it cannot, so long as it sticks in its bourgeois skin.

---

<sup>1</sup> “Mr. Ricardo ingeniously enough avoids a difficulty which, on a first view, threatens to encumber his doctrine — that value depends on the quantity of labour employed in production. If this principle is rigidly adhered to, it follows that the value of labour depends on the quantity of labour employed in producing it — which is evidently absurd. By a dexterous turn, therefore, Mr. Ricardo makes the value of labour depend on the quantity of labour required to produce wages; or, to give him the benefit of his own language, he maintains, that the value of labour is to be estimated by the quantity of labour required to produce wages; by which he means the quantity of labour required to produce the money or commodities given to the labourer. This is similar to saying, that the value of cloth is estimated, not by the quantity of labour bestowed on its production, but by the quantity of labour bestowed on the production of the silver, for which the cloth is exchanged.” — “A Critical Dissertation on the Nature, &c., of Value,” pp. 50, 51.

<sup>2</sup> “If you call labour a commodity, it is not like a commodity which is first produced in order to exchange, and then brought to market where it must exchange with other commodities according to the respective quantities of each which there may be in the market at the time; labour is created the moment it is brought to market; nay, it is brought to market before it is created.” — “Observations on Certain Verbal Disputes,” &c., pp. 75, 76.

<sup>3</sup> “Treating labour as a commodity, and capital, the produce of labour, as another, then, if the values of these two commodities were regulated by equal quantities of labour, a given amount of labour would ... exchange for that quantity of capital which had been produced by the same amount of labour;

antecedent labour would ... exchange for the same amount as present labour. But the value of labour in relation to other commodities ... is determined not by equal quantities of labour.” — E. G. Wakefield in his edition of Adam Smith’s “Wealth of Nations,” Vol. I., London, 1836, p. 231, note.

<sup>4</sup> “There has to be a new agreement” (a new edition of the social contract!) “that whenever there is an exchange of work done for work to be done, the latter” (the capitalist) “is to receive a higher value than the former” (the worker). — Simonde (de Sismondi), “De la Richesse Commerciale,” Geneva, 1803, Vol I, p. 37.

<sup>5</sup> “Labour the exclusive standard of value ... the creator of all wealth, no commodity.” Thomas Hodgskin, “Popul. Polit. Econ.,” p. 186.

<sup>6</sup> On the other hand, the attempt to explain such expressions as merely poetic license only shows the impotence of the analysis. Hence, in answer to Proudhon’s phrase; “Labour is called value, not as being a commodity itself, but in view of the values supposed to be potentially embodied in it. The value of labour is a figurative expression,” &c. I have remarked: “In labour, commodity, which is a frightful reality, he (Proudhon) sees nothing but a grammatical ellipsis. The whole of existing society, then, based upon labour commodity, is henceforth based upon a poetic license, on a figurative expression. Does society desire to eliminate all the inconveniences which trouble it, it has only to eliminate all the ill-sounding terms. Let it change the language, and for that it has only to address itself to the Academy and ask it for a new edition of its dictionary.” (Karl Marx, “Misère de la Philosophie,” pp. 34, 35.) It is naturally still more convenient to understand by value nothing at all. Then one can without difficulty subsume everything under this category. Thus, e.g., J. B. Say: “What is value?” Answer: “That which a thing is worth”; and what is “price”? Answer: “The value of a thing expressed in money.” And why has agriculture a value? Answer: “Because one sets a price on it.” Therefore value is what a thing is worth, and the land has its “value,” because its value is “expressed in money.” This is, anyhow, a very simple way of explaining the why and the wherefore of things.

<sup>7</sup> Cf. “Zur Kritik &c.,” p. 40, where I state that, in the portion of that work that deals with Capital, this problem will be solved: “How does production, on the basis of exchange-value determined simply by labour-time, lead to the result that the exchange-value of labour is less than the exchange-value of its product?”

<sup>8</sup> The “Morning Star,” a London Free-trade organ, naif to silliness, protested again and again during the American Civil War, with all the moral indignation of which man is capable, that the Negro in the “Confederate States” worked absolutely for nothing. It should have compared the daily cost of such a Negro with that of the free workman in the East-end of London.

<sup>9</sup> I give in order that you may give; I give in order that you may produce; I produce so that you may give; I produce so that you may produce.

<sup>10</sup> Adam Smith only accidentally alludes to the variation of the working day when he is referring to piece-wages.

## Chapter 20: Time-Wages

Wages themselves again take many forms, a fact not recognizable in the ordinary economic treatises which, exclusively interested in the material side of the question, neglect every difference of form. An exposition of all these forms however, belongs to the special study of wage labour, not therefore to this work. Still the two fundamental forms must be briefly worked out here.

The sale of labour-power, as will be remembered, takes place for a definite period of time. The converted form under which the daily, weekly, &c., value of labour-power presents itself, is hence that of time wages, therefore day-wages, &c.

Next it is to be noted that the laws set forth, in the 17th chapter, on the changes in the relative magnitudes of price of labour-power and surplus-value, pass by a simple transformation of form, into laws of wages. Similarly the distinction between the exchange-value of labour power, and the sum of the necessaries of life into which this value is converted, now reappears as the distinction between nominal and real wages. It would be useless to repeat here, with regard to the phenomenal form, what has been already worked out in the substantial form. We limit ourselves therefore to a few points characteristic of time-wages.

The sum of money<sup>1</sup> which the labourer receives for his daily or weekly labour, forms the amount of his nominal wages, or of his wages estimated in value. But it is clear that according to the length of the working day, that is, according to the amount of actual labour daily supplied, the same daily or weekly wage may represent very different prices of labour, i.e., very different sums of money for the same quantity of labour.<sup>2</sup> We must, therefore, in considering time-wages, again distinguish between the sum-total of the daily or weekly wages, &c., and the price of labour. How then, to find this price, i.e., the money-value of a given quantity of labour? The average price of labour is found, when the average daily value of the labour-power is divided by the average number of hours in the working day. If, e.g., the daily value of labour-power is 3 shillings, the value of the product of 6 working-hours, and if the working day is 12 hours, the price of 1 working hour is  $3/12$  shillings = 3d. The price of the working-hour thus found serves as the unit measure for the price of labour.

It follows therefore that the daily and weekly wages, &c., may remain the same, although the price of labour falls constantly. If, e.g., the habitual working day is 10 hours and the daily value of the labour-power 3s., the price of the working-hour is  $3 \frac{3}{5}$ d. It falls to 3s. as soon as the working day rises to 12 hours, to  $2 \frac{2}{5}$ d as soon as it rises to 15 hours. Daily or weekly wages remain, despite all this, unchanged. On the contrary, the daily or weekly wages may rise, although the price of labour remains constant or even falls. If, e.g., the working day is 10 hours, and the daily value of labour-power 3 shillings, the price of one working-hour is  $3 \frac{3}{5}$ d. If the labourer, in consequence of increase of trade, works 12 hours, the price of labour remaining the same, his daily wage now rises to 3 shillings  $7 \frac{1}{5}$  d. without any variation in the price of labour. The same result might follow if, instead of the extensive amount of labour, its intensive amount increased.

<sup>3</sup>The rise of the nominal daily or weekly wages may therefore be accompanied by a price of labour that remains stationary or falls. The same holds as to the income of the labourer's family, as soon as the quantity of labour expended by the head of the family is increased by the labour of the members of his family. There are, therefore, methods of lowering the price of labour independent of the reduction of the nominal daily or weekly wages.<sup>4</sup>

As a general law it follows that, given the amount of daily or weekly labour, &c., the daily or weekly wages depend on the price of labour which itself varies either with the value of labour-power, or with the difference between its price and its value. Given, on the other hand, the price of labour, the daily or weekly wages depend on the quantity of the daily or weekly labour.

The unit-measure for time-wages, the price of the working-hour, is the quotient of the value of a day's labour-power, divided by the number of hours of the average working day. Let the latter be 12 hours, and the daily value of labour-power 3 shillings, the value of the product of 6 hours of labour. Under these circumstances the price of a working hour is 3d.; the value produced in it is 6d. If the labourer is now employed less than 12 hours (or less than 6 days in the week), e.g., only 6 or 8 hours, he receives, with this price of labour, only 2s. or 1s. 6d. a day.<sup>5</sup> As on our hypothesis he must work on the average 6 hours daily, in order to produce a day's wage corresponding merely to the value of his labour power, as according to the same hypothesis he works only half of every hour for himself, and half for the capitalist, it is clear that he cannot obtain for himself the value of the product of 6 hours if he is employed less than 12 hours. In previous chapters we saw the destructive consequences of over-work; here we find the sources of the sufferings that result to the labourer from his insufficient employment.

If the hour's wage is fixed so that the capitalist does not bind himself to pay a day's or a week's wage, but only to pay wages for the hours during which he chooses to employ the labourer, he can employ him for a shorter time than that which is originally the basis of the calculation of the hour-wage, or the unit-measure of the price of labour. Since this unit is determined by the ratio

$$\frac{\text{daily value of labour-power}}{\text{working day of a given number of hours}}$$

it, of course, loses all meaning as soon as the working day ceases to contain a definite number of hours. The connection between the paid and the unpaid labour is destroyed. The capitalist can now wring from the labour a certain quantity of surplus labour without allowing him the labour-time necessary for his own subsistence. He can annihilate all regularity of employment, and according to his own convenience, caprice, and the interest of the moment, make the most enormous overwork alternate with relative or absolute cessation of work. He can, under the pretense of paying "the normal price of labour," abnormally lengthen the working day without any corresponding compensation to the labourer. Hence the perfectly rational revolt in 1860 of the London labourers, employed in the building trades, against the attempt of the capitalists to impose on them this sort of wage by the hour. The legal limitation of the working day puts an end to such mischief, although not, of course, to the diminution of employment caused by the competition of machinery, by changes in the quality of the labourers employed, and by crises partial or general.

With an increasing daily or weekly wage the price of labour may remain nominally constant, and yet may fall below its normal level. This occurs every time that, the price of labour (reckoned per working-hour) remaining constant, the working day is prolonged beyond its customary length. If in the fraction:

$$\frac{\text{daily value of labour power}}{\text{working day}}$$

the denominator increases, the numerator increases yet more rapidly. The value of labour-power, as dependent on its wear and tear, increases with the duration of its functioning, and in more rapid proportion than the increase of that duration. In many branches of industry where time-wage is the general rule without legal limits to the working-time, the habit has, therefore, spontaneously grown up of regarding the working day as normal only up to a certain point, e.g., up to the

expiration of the tenth hour (“normal working day,” “the day’s work,” “the regular hours of work”). Beyond this limit the working-time is over-time, and is, taking the hour as unit-measure, paid better (“extra pay”), although often in a proportion ridiculously small.<sup>6</sup> The normal working day exists here as a fraction of the actual working day, and the latter, often during the whole year, lasts longer than the former.<sup>7</sup> The increase in the price of labour with the extension of the working day beyond a certain normal limit, takes such a shape in various British industries that the low price of labour during the so-called normal time compels the labourer to work during the better paid over-time, if he wishes to obtain a sufficient wage at all.<sup>8</sup> Legal limitation of the working day puts an end to these amenities.<sup>9</sup>

It is a fact generally known that, the longer the working days, in any branch of industry, the lower are the wages.<sup>10</sup> A. Redgrave, factory inspector, illustrates this by a comparative review of the 20 years from 1839-1859, according to which wages rose in the factories under the 10 Hours Law, whilst they fell in the factories in which the work lasted 14 to 15 hours daily.<sup>11</sup>

From the law, “the price of labour being given, the daily or weekly wage depends on the quantity of labour expended,” it follows, first of all, that the lower the price of labour, the greater must be the quantity of labour, or the longer must be the working day for the labourer to secure even a miserable average wage. The lowness of the price of labour acts here as a stimulus to the extension of the labour-time.<sup>12</sup>

On the other hand, the extension of the working-time produces, in its turn, a fall in the price of labour, and with this a fall in the day’s or week’s wages.

The determination of the price of labour by:

daily value of labour power

working day of a given number of hours

shows that a mere prolongation of the working day lowers the price of labour, if no compensation steps in. But the same circumstances which allow the capitalist in the long run to prolong the working day, also allow him first, and compel him finally, to nominally lower the price of labour until the total price of the increased number of hours is lowered, and, therefore, the daily or weekly wage. Reference to two circumstances is sufficient here. If one man does the work of 1½ or 2 men, the supply of labour increases, although the supply of labour-power on the market remains constant. The competition thus created between the labourers allows the capitalist to beat down the price of labour, whilst the falling price of labour allows him, on the other hand, to screw up still further the working-time.<sup>13</sup> Soon, however, this command over abnormal quantities of unpaid labour, i.e., quantities in excess of the average social amount, becomes a source of competition amongst the capitalists themselves. A part of the price of the commodity consists of the price of labour. The unpaid part of the labour-price need not be reckoned in the price of the commodity. It may be presented to the buyer. This is the first step to which competition leads. The second step to which it drives is to exclude also from the selling price of the commodity at least a part of the abnormal surplus-value created by the extension of the working day. In this way, an abnormally low selling price of the commodity arises, at first sporadically, and becomes fixed by degrees; a lower selling price which henceforward becomes the constant basis of a miserable wage for an excessive working-time, as originally it was the product of these very circumstances. This movement is simply indicated here, as the analysis of competition does not belong to this part of our subject. Nevertheless, the capitalist may, for a moment, speak for himself. “In Birmingham there is so much competition of masters one against another that many are obliged to do things as employers that they would otherwise be ashamed of; and yet no more money is made, but only the public gets the benefit.”<sup>14</sup> The reader will remember the two sorts of

London bakers, of whom one sold the bread at its full price (the “full-priced” bakers), the other below its normal price (“the under-priced,” “the undersellers”). The “full-priced” denounced their rivals before the Parliamentary Committee of Inquiry: “They only exist now by first defrauding the public, and next getting 18 hours’ work out of their men for 12 hours’ wages.... The unpaid labour of the men was made ... the source whereby the competition was carried on, and continues so to this day.... The competition among the master bakers is the cause of the difficulty in getting rid of night-work. An underseller, who sells his bread below the cost-price according to the price of flour, must make it up by getting more out of the labour of the men.... If I got only 12 hours’ work out of my men, and my neighbor got 18 or 20, he must beat me in the selling price. If the men could insist on payment for over-work, this would be set right.... A large number of those employed by the undersellers are foreigners and youths, who are obliged to accept almost any wages they can obtain.”<sup>15</sup>

This jeremiad is also interesting because it shows how the appearance only of the relations of production mirrors itself in the brain of the capitalist. The capitalist does not know that the normal price of labour also includes a definite quantity of unpaid labour, and that this very unpaid labour is the normal source of his gain. The category of surplus labour-time does not exist at all for him, since it is included in the normal working day, which he thinks he has paid for in the day’s wages. But over-time does exist for him, the prolongation of the working day beyond the limits corresponding with the usual price of labour. Face to face with his underselling competitor, he even insists upon extra pay for this over-time. He again does not know that this extra pay includes unpaid labour, just as well as does the price of the customary hour of labour. For example, the price of one hour of the 12 hours’ working day is 3d., say the value-product of half a working-hour, whilst the price of the over-time working-hour is 4d., or the value-product of 2/3 of a working hour. In the first case the capitalist appropriates to himself one-half, in the second, one-third of the working-hour without paying for it.

---

<sup>1</sup> The value of money itself is here always supposed constant.

<sup>2</sup> “The price of labour is the sum paid for a given quantity of labour.” (Sir Edward West, “Price of Corn and Wages of Labour,” London, 1836, p. 67.) West is the author of the anonymous “Essay on the Application of Capital to Land.” by a Fellow of the University College of Oxford, London, 1815. An epoch-making work in the history of Political Economy.

<sup>3</sup> “The wages of labour depend upon the price of labour and the quantity of labour performed.... An increase in the wages of labour does not necessarily imply an enhancement of the price of labour. From fuller employment, and greater exertions, the wages of labour may be considerably increased, while the price of labour may continue the same.” (West, *op. cit.*, pp. 67, 68, 112.) The main question: “How is the price of labour determined?” West, however, dismisses with mere banalities.

<sup>4</sup> This is perceived by the fanatical representative of the industrial bourgeoisie of the 18th century, the author of the “Essay on Trade and Commerce” often quoted by us, although he puts the matter in a confused way: “It is the quantity of labour and not the price of it” (he means by this the nominal daily or weekly wages) “that is determined by the price of provisions and other necessaries: reduce the price of necessaries very low, and of course you reduce the quantity of labour in proportion. Master manufacturers know that there are various ways of raising and felling the price of labour, besides that of altering its nominal amount.” (*op. cit.*, pp. 48, 61.) In his “Three Lectures on the Rate of Wages,” London, 1830, in which N. W. Senior uses West’s work without mentioning it, he says: “The labourer is principally interested in the amount of wages” (p. 14), that is to say, the labourer is principally interested in what he receives, the nominal sum of his wages, not in that which he gives, the amount of labour!

<sup>5</sup> The effect of such an abnormal lessening of employment is quite different from that of a general reduction of the working day, enforced by law. The former has nothing to do with the absolute length of the working day, and may occur just as well in a working day of 15, as of 6 hours. The normal price of labour is in the first case calculated on the labourer working 15 hours, in the second case on his working 6 hours a day on the average. The result is therefore the same, if he in the one case is employed only for 7½, in the other only for 3 hours.

<sup>6</sup> “The rate of payment for overtime (in lace-making) is so small, from ½ d. and ¾ d. to 2d. per hour, that it stands in painful contrast to the amount of injury produced to the health and stamina of the workpeople.... The small amount thus earned is also often obliged to be spent in extra nourishment.” (“Child.Empl.Com., II. Rep.,” p. xvi., n. 117.)

<sup>7</sup> E.g., in paper-staining before the recent introduction into this trade of the Factory Act. “We work on with no stoppage for meals, so that the day’s work of 10½ hours is finished by 4:30 p.m., and all after that is over-time, and we seldom leave off working before 6 p.m., so that we are really working over-time the whole year round.” (Mr. Smith’s “Evidence in Child. Empl. Com., 1. Rep.,” p. 125.)

<sup>8</sup> E.g., in the Scotch bleaching-works. “In some parts of Scotland this trade” (before the introduction of the Factory Act in 1862) “was carried on by a system of over-time, i.e., ten hours a day were the regular hours of work, for which a nominal wage of 1s. 2d. per day was paid to a man, there being every day over-time for three or four hours, paid at the rate of 3d. per hour. The effect of this system ... a man could not earn more than 8s. per week when working the ordinary hours ... without over-time they could not earn a fair day’s wages.” (“Rept. of Insp. of Factories,” April 30th, 1863, p. 10.) “The higher wages, for getting adult males to work longer hours, are a temptation too strong to be resisted.” (“Rept. of Insp. of Fact.,” April 30th, 1848, p. 5.) The book-binding trade in the city of London employs very many young girls from 14 to 15 years old, and that under indentures which prescribe certain definite hours of labour. Nevertheless, they work in the last week of each month until 10, 11, 12, or 1 o’clock at night, along with the older labourers, in a very mixed company. “The masters tempt them by extra pay and supper,” which they eat in neighboring public houses. The great debauchery thus produced among these “young immortals” (“Children’s Employment Comm., V. Rept.,” p. 44, n. 191) is compensated by the fact that among the rest many Bibles and religious books are bound by them.

<sup>9</sup> See “Reports of Insp. of Fact.,” 30th April, 1863, p. 10. With very accurate appreciation of the state of things, the London labourers employed in the building trades declared, during the great strike and lock-out of 1860, that they would only accept wages by the hour under two conditions: (1), that, with the price of the working-hour, a normal working day of 9 and 10 hours respectively should be fixed, and that the price of the hour for the 10 hours’ working day should be higher than that for the hour of the 9 hours working day; (2), that every hour beyond the normal working day should be reckoned as over-time and proportionally more highly paid.

<sup>10</sup> “It is a very notable thing, too, that where long hours are the rule, small wages are also so.” (“Report of Insp. of Fact.,” 31st. Oct., 1863, p. 9.) “The work which obtains the scanty pittance of food, is, for the most part, excessively prolonged.” (“Public Health, Sixth Report,” 1864, p. 15.)

<sup>11</sup> “Report of Inspectors of Fact.,” 30th April, 1860, pp. 31, 32.

<sup>12</sup> The hand nail-makers in England, e.g., have, on account of the low price of labour, to work 15 hours a day in order to hammer out their miserable weekly wage. “It’s a great many hours in a day (6 a.m. to 8 p.m.), and he has to work hard all the time to get 11 d. or 1s., and there is the wear of the tools, the cost of firing, and something for waste iron to go out of this, which takes off altogether 2½d. or 3d.” (“Children’s Employment Com., III. Report,” p. 136, n. 671.) The women earn by the same working-time a week’s wage of only 5 shillings. (l.c., p. 137, n. 674.)

---

<sup>13</sup> If a factory-hand, e.g., refused to work the customary long hours, “he would very shortly be replaced by somebody who would work any length of time, and thus be thrown out of employment.” (“Reports of Inspectors of Factories,” 30th April, 1848. Evidence, p. 39, n. 58.) “If one man performs the work of two... the rate of profits will generally be raised ... in consequence of the additional supply of labour having diminished its price.” (Senior, l.c., p. 15.)

<sup>14</sup> “Children’s Employment Com., III Rep.,” Evidence, p. 66, n. 22.

<sup>15</sup> “Report, &c., Relative to the Grievances Complained of by the Journeymen Bakers.” London, 1862, p. 411, and ib. Evidence, notes 479, 359, 27. Anyhow the full-priced bakers, as was mentioned above, and as their spokesman, Bennett, himself admits, make their men “generally begin work at 11 p.m. ... up to 8 o’clock the next morning.... They are then engaged all day long ... as late as 7 o’clock in the evening.” (l.c., p. 22.)

## Chapter 21: Piece Wages

Wages by the piece are nothing else than a converted form of wages by time, just as wages by time are a converted form of the value or price of labour-power.

In piece wages it seems at first sight as if the use-value bought from the labourer was, not the function of his labour-power, living labour, but labour already realized in the product, and as if the price of this labour was determined, not as with time-wages, by the fraction

daily value of labour-power

the working day of a given number of hours

but by the capacity for work of the producer.<sup>1</sup>

The confidence that trusts in this appearance ought to receive a first severe shock from the fact that both forms of wages exist side by side, simultaneously, in the same branches of industry; e.g.,

“the compositors of London, as a general rule, work by the piece, time-work being the exception, while those in the country work by the day, the exception being work by the piece. The shipwrights of the port of London work by the job or piece, while those of all other parts work by the day.”<sup>2</sup>

In the same saddlery shops of London, often for the same work, piece wages are paid to the French, time-wages to the English. In the regular factories in which throughout piece wages predominate, particular kinds of work are unsuitable to this form of wage, and are therefore paid by time.<sup>3</sup> But it is, moreover, self-evident that the difference of form in the payment of wages alters in no way their essential nature, although the one form may be more favorable to the development of capitalist production than the other.

Let the ordinary working day contain 12 hours of which 6 are paid, 6 unpaid. Let its value-product be 6 shillings, that of one hour's labour therefore 6d. Let us suppose that, as the result of experience, a labourer who works with the average amount of intensity and skill, who, therefore, gives in fact only the time socially necessary to the production of an article, supplies in 12 hours 24 pieces, either distinct products or measurable parts of a continuous whole. Then the value of these 24 pieces, after subtraction of the portion of constant capital contained in them, is 6 shillings, and the value of a single piece 3d. The labourer receives 1 ½d. per piece, and thus earns in 12 hours 3 shillings. Just as, with time-wages, it does not matter whether we assume that the labourer works 6 hours for himself and 6 hours for the capitalist, or half of every hour for himself, and the other half for the capitalist, so here it does not matter whether we say that each individual piece is half paid, and half unpaid for, or that the price of 12 pieces is the equivalent only of the value of the labour-power, whilst in the other 12 pieces surplus-value is incorporated.

The form of piece wages is just as irrational as that of time-wages. Whilst in our example two pieces of a commodity, after subtraction of the value of the means of production consumed in them, are worth 6d. as being the product of one hour, the labourer receives for them a price of 3d. Piece wages do not, in fact, distinctly express any relation of value. It is not, therefore, a question of measuring the value of the piece by the working-time incorporated in it, but on the contrary, of measuring the working-time the labourer has expended by the number of pieces he has produced. In time-wages, the labour is measured by its immediate duration; in piece wages, by the quantity of products in which the labour has embodied itself during a given time.<sup>4</sup> The price of labour time

itself is finally determined by the equation: value of a day's labour = daily value of labour-power. Piece-wage is, therefore, only a modified form of time-wage.

Let us now consider a little more closely the characteristic peculiarities of piece wages.

The quality of the labour is here controlled by the work itself, which must be of average perfection if the piece-price is to be paid in full. piece wages become, from this point of view, the most fruitful source of reductions of wages and capitalistic cheating.

They furnish to the capitalist an exact measure for the intensity of labour. Only the working-time which is embodied in a quantum of commodities determined beforehand, and experimentally fixed, counts as socially necessary working-time, and is paid as such. In the larger workshops of the London tailors, therefore, a certain piece of work, a waistcoat, e.g., is called an hour, or half an hour, the hour at 6d. By practice it is known how much is the average product of one hour. With new fashions, repairs, &c., a contest arises between master and labourer as to whether a particular piece of work is one hour, and so on, until here also experience decides. Similarly in the London furniture workshops, &c. If the labourer does not possess the average capacity, if he cannot in consequence supply a certain minimum of work per day, he is dismissed.<sup>5</sup>

Since the quality and intensity of the work are here controlled by the form of wage itself, superintendence of labour becomes in great part superfluous. Piece wages therefore lay the foundation of the modern "domestic labour," described above, as well as of a hierarchically organized system of exploitation and oppression. The latter has two fundamental forms. On the one hand, piece wages facilitate the interposition of parasites between the capitalist and the wage-labourer, the "sub-letting of labour." The gain of these middlemen comes entirely from the difference between the labour-price which the capitalist pays, and the part of that price which they actually allow to reach the labourer.<sup>6</sup> In England this system is characteristically called the "sweating system." On the other hand, piece-wage allows the capitalist to make a contract for so much per piece with the head labourer – in manufactures with the chief of some group, in mines with the extractor of the coal, in the factory with the actual machine-worker – at a price for which the head labourer himself undertakes the enlisting and payment of his assistant work people. The exploitation of the labourer by capital is here effected through the exploitation of the labourer by the labourer.<sup>7</sup>

Given piece-wage, it is naturally the personal interest of the labourer to strain his labour-power as intensely as possible; this enables the capitalist to raise more easily the normal degree of intensity of labour.<sup>8</sup> It is moreover now the personal interest of the labourer to lengthen the working day, since with it his daily or weekly wages rise.<sup>9</sup> This gradually brings on a reaction like that already described in time-wages, without reckoning that the prolongation of the working day, even if the piece wage remains constant, includes of necessity a fall in the price of the labour.

In time-wages, with few exceptions, the same wage holds for the same kind of work, whilst in piece wages, though the price of the working time is measured by a certain quantity of product, the day's or week's wage will vary with the individual differences of the labourers, of whom one supplies in a given time the minimum of product only, another the average, a third more than the average. With regard to actual receipts there is, therefore, great variety according to the different skill, strength, energy, staying-power, &c., of the individual labourers.<sup>10</sup> Of course this does not alter the general relations between capital and wage-labour. First, the individual differences balance one another in the workshop as a whole, which thus supplies in a given working-time the average product, and the total wages paid will be the average wages of that particular branch of industry. Second, the proportion between wages and surplus-value remains unaltered, since the mass of surplus labour supplied by each particular labourer corresponds with the wage received by him. But the wider scope that piece-wage gives to individuality tends to develop on the one

hand that individuality, and with it the sense of liberty, independence, and self-control of the labourers, and on the other, their competition one with another. Piece-work has, therefore, a tendency, while raising individual wages above the average, to lower this average itself. But where a particular rate of piece-wage has for a long time been fixed by tradition, and its lowering, therefore, presented especial difficulties, the masters, in such exceptional cases, sometimes had recourse to its compulsory transformation into time-wages. Hence, e.g., in 1860 a great strike among the ribbon-weavers of Coventry.<sup>11</sup> Piece-wage is finally one of the chief supports of the hour-system described in the preceding chapter.<sup>12</sup>

From what has been shown so far, it follows that piece-wage is the form of wages most in harmony with the capitalist mode of production. Although by no means new – it figures side by side with time-wages officially in the French and English labour statutes of the 14th century – it only conquers a larger field for action during the period of manufacture, properly so-called. In the stormy youth of modern industry, especially from 1797 to 1815, it served as a lever for the lengthening of the working day, and the lowering of wages. Very important materials for the fluctuation of wages during that period are to be found in the Blue books: “Report and Evidence from the Select Committee on Petitions respecting the Corn Laws” (Parliamentary Session of 1813-14), and “Report from the Lords’ Committee, on the State of the Growth, Commerce, and Consumption of Grain, and all Laws relating thereto” (Session of 1814-15). Here we find documentary evidence of the constant lowering of the price of labour from the beginning of the anti-Jacobin War. In the weaving industry, e.g., piece wages had fallen so low that, in spite of the very great lengthening of the working day, the daily wages were then lower than before.

“The real earnings of the cotton weaver are now far less than they were; his superiority over the common labourer, which at first was very great, has now almost entirely ceased. Indeed... the difference in the wages of skillful and common labour is far less now than at any former period.”<sup>13</sup>

How little the increased intensity and extension of labour through piece wages benefited the agricultural proletariat, the following passage borrowed from a work on the side of the landlords and farmers shows:

“By far the greater part of agricultural operations is done by people who are hired for the day or on piece-work. Their weekly wages are about 12s., and although it may be assumed that a man earns on piece-work under the greater stimulus to labour, 1s. or perhaps 2s. more than on weekly wages, yet it is found, on calculating his total income, that his loss of employment, during the year, outweighs this gain...Further, it will generally be found that the wages of these men bear a certain proportion to the price of the necessary means of subsistence, so that a man with two children is able to bring up his family without recourse to parish relief.”<sup>14</sup>

Malthus at that time remarked with reference to the facts published by Parliament:

“I confess that I see, with misgiving, the great extension of the practice of piece-wage. Really hard work during 12 or 14 hours of the day, or for any longer time, is too much for any human being.”<sup>15</sup>

In the workshops under the Factory Acts, piece wages become the general rule, because capital can there only increase the efficacy of the working day by intensifying labour.<sup>16</sup>

With the changing productiveness of labour the same quantum of product represents a varying working-time. Therefore, piece-wage also varies, for it is the money expression of a determined working-time. In our example above, 24 pieces were produced in 12 hours, whilst the value of the

product of the 12 hours was 6s., the daily value of the labour-power 3s., the price of the labour-hour 3d., and the wage for one piece ½d. In one piece half-an-hour's labour was absorbed. If the same working day now supplies, in consequence of the doubled productiveness of labour, 48 pieces instead of 24, and all other circumstances remain unchanged, then the piece-wage falls from 1 ½d. to 3/4d., as every piece now only represents 1/4, instead of ½ of a working-hour. 24 by 1 ½d. = 3s., and in like manner 48 by 3/4d. = 3s. In other words, piece-wage is lowered in the same proportion as the number of the pieces produced in the same time rises,<sup>17</sup> and, therefore, as the working time spent on the same piece falls. This change in piece-wage, so far purely nominal, leads to constant battles between capitalist and labour. Either because the capitalist uses it as a pretext for actually lowering the price of labour, or because increased productive power of labour is accompanied by an increased intensity of the same. Or because the labourer takes seriously the appearance of piece wages (viz., that his product is paid for, and not his labour-power) and therefore revolts against a lowering of wages, unaccompanied by a lowering in the selling price of the commodity.

“The operatives...carefully watch the price of the raw material and the price of manufactured goods, and are thus enabled to form an accurate estimate of their master's profits.”<sup>18</sup>

The capitalist rightly knocks on the head such pretensions as gross errors as to the nature of wage-labour.<sup>19</sup> He cries out against this usurping attempt to lay taxes on the advance of industry, and declares roundly that the productiveness of labour does not concern the labourer at all.<sup>20</sup>

---

<sup>1</sup> “The system of piece-work illustrates an epoch in the history of the working-man; it is halfway between the position of the mere day-labourer depending upon the will of the capitalist and the co-operative artisan, who in the not distant future promises to combine the artisan and the capitalist in his own person. Piece-workers are in fact their own masters, even whilst working upon the capital of the employer.” (John Watts: “Trade Societies and Strikes, Machinery and Co-operative Societies.” Manchester, 1865, pp. 52, 53.) I quote this little work because it is a very sink of all long-ago-rotten, apologetic commonplaces. This same Mr. Watts earlier traded in Owenism and published in 1842 another pamphlet: “Facts and Fictions of Political Economists,” in which among other things he declares that “property is robbery.” That was long ago.

<sup>2</sup> T. J. Dunning: “Trades' Unions and Strikes,” Lond., 1860, p. 22.

<sup>3</sup> How the existence, side by side and simultaneously, of these two forms of wage favors the masters' cheating: “A factory employs 400 people, the half of which work by the piece, and have a direct interest in working longer hours. The other 200 are paid by the day, work equally long with the others, and get no more money for their over-time.... The work of these 200 people for half an hour a day is equal to one person's work for 50 hours, or 5/6's of one person's labour in a week, and is a positive gain to the employer.” (“Reports of Insp. of Fact., 31st Oct., 1860,” p. 9.) “Over-working to a very considerable extent still prevails; and, in most instances, with that security against detection and punishment which the law itself affords. I have in many former reports shown ... the injury to workpeople who are not employed on piece-work, but receive weekly wages.” (Leonard Horner in “Reports of Insp. of Fact.,” 30th April, 1859, pp. 8, 9.)

<sup>4</sup> “Wages can be measured in two ways: either by the duration of the labour, or by its product.” (“Abrégé élémentaire des principes de l'économie politique.” Paris, 1796, p. 32.) The author of this anonymous work: G. Garnier.

<sup>5</sup> “So much weight of cotton is delivered to him” (the spinner), “and he has to return by a certain time, in lieu of it, a given weight of twist or yarn, of a certain degree of fineness, and he is paid so much per pound for all that he so returns. If his work is defective in quality, the penalty falls on him, if less in

quantity than the minimum fixed for a given time, he is dismissed and an abler operative procured.” (Ure, *l.c.*, p. 317.)

<sup>6</sup> “It is when work passes through several hands, each of which is to take its share of profits, while only the last does the work, that the pay which reaches the workwoman is miserably disproportioned.” (“Child. Emp. Comm. II Report,” p. 1xx., n. 424.)

<sup>7</sup> Even Watts, the apologetic, remarks: “It would be a great improvement to the system of piece-work, if all the men employed on a job were partners in the contract, each according to his abilities, instead of one man being interested in over-working his fellows for his own benefit.” (*l.c.*, p. 53.) On the vileness of this system, cf. “Child. Emp. Comm., Rep. III.,” p. 66, n. 22, p. 11, n. 124, p. xi, n. 13, 53, 59, &c.

<sup>8</sup> This spontaneous result is often artificially helped along, e.g., in the Engineering Trade of London, a customary trick is “the selecting of a man who possesses superior physical strength and quickness, as the principal of several workmen, and paying him an additional rate, by the quarter or otherwise, with the understanding that he is to exert himself to the utmost to induce the others, who are only paid the ordinary wages, to keep up to him ... without any comment this will go far to explain many of the complaints of stinting the action, superior skill, and working-power, made by the employers against the men” (in *Trades-Unions. Dunning, l.c.*, pp. 22, 23). As the author is himself a labourer and secretary of a Trades’ Union, this might be taken for exaggeration. But the reader may compare the “highly respectable” “Cyclopedia of Agriculture” of J. C. Morton, Art., the article “Labourer,” where this method is recommended to the farmers as an approved one.

<sup>9</sup> “All those who are paid by piece-work ... profit by the transgression of the legal limits of work. This observation as to the willingness to work over-time is especially applicable to the women employed as weavers and reelers.” (“Rept. of Insp. of Fact., 30th April, 1858,” p. 9.) “This system” (piece-work), “so advantageous to the employer ... tends directly to encourage the young potter greatly to over-work himself during the four or five years during which he is employed in the piece-work system, but at low wages.... This is ... another great cause to which the bad constitutions of the potters are to be attributed.” (“Child. Empl. Comm. 1. Rept.,” p. xiii.)

<sup>10</sup> “Where the work in any trade is paid for by the piece at so much per job ... wages may very materially differ in amount.... But in work by the day there is generally an uniform rate ... recognized by both employer and employed as the standard of wages for the general run of workmen in the trade.” (*Dunning, l.c.*, p. 17.)

<sup>11</sup> “The work of the journeyman-artisans will be ruled by the day or by the piece. These master-artisans know about how much work a journeyman-artisan can do per day in each craft, and often pay them in proportion to the work which they do; the journey men, therefore, work as much as they can, in their own interest, without any further inspection.” (Cantillon, “*Essai sur la Nature du Commerce en général*,” Amst. Ed., 1756, pp. 185 and 202. The first edition appeared in 1755.) Cantillon, from whom Quesnay, Sir James Steuart & A. Smith have largely drawn, already here represents piece-wage as simply a modified form of time-wage. The French edition of Cantillon professes in its title to be a translation from the English, but the English edition: “*The Analysis of Trade, Commerce, &c.*,” by Philip Cantillon, late of the city of London, Merchant, is not only of later date (1759), but proves by its contents that it is a later and revised edition: e.g., in the French edition, Hume is not yet mentioned, whilst in the English, on the other hand, Petty hardly figures any longer. The English edition is theoretically less important, but it contains numerous details referring specifically to English commerce, bullion trade, &c., that are wanting in the French text. The words on the title-page of the English edition, according to which the work is “taken chiefly from the manuscript of a very ingenious gentleman, deceased, and adapted, &c.,” seem, therefore, a pure fiction, very customary at that time.

<sup>12</sup> “How often have we seen, in some workshops, many more workers recruited than the work actually called for? On many occasions, workers are recruited in anticipation of future work, which may never materialize. Because they are paid by piece wages, it is said that no risk is incurred, since any loss of time will be charged against the unemployed.” (H. Gregoir: “Les Typographes devant le Tribunal correctionnel de Bruxelles,” Bruxelles, 1865, p. 9.)

<sup>13</sup> “Remarks on the Commercial Policy of Great Britain,” London, 1815.

<sup>14</sup> “A Defense of the Landowners and Farmers of Great Britain,” 1814, pp. 4, 5

<sup>15</sup> Malthus, “Inquiry into the Nature and Progress of Rent,” Lond., 1815.

<sup>16</sup> “Those who are paid by piece-work ... constitute probably four-fifths of the workers in the factories.” “Report of Insp. of Fact.,” 30th April, 1858.

<sup>17</sup> “The productive power of his spinning-machine is accurately measured, and the rate of pay for work done with it decreases with, though not as, the increase of its productive power.” (Ure, l.c., p. 317.) This last apologetic phrase Ure himself again cancels. The lengthening of the mule causes some increase of labour, he admits. The labour does therefore not diminish in the same ratio as its productivity increases. Further: “By this increase the productive power of the machine will be augmented one-fifth. When this event happens the spinner will not be paid at the same rate for work done as he was before, but as that rate will not be diminished in the ratio of one-fifth, the improvement will augment his money earnings for any given number of hours’ work,” but “the foregoing statement requires a certain modification.... The spinner has to pay something additional for juvenile aid out of his additional sixpence, accompanied by displacing a portion of adults” (l.c., p. 321), which has in no way a tendency to raise wages.

<sup>18</sup> H. Fawcett: “The Economic Position of the British labourer.” Cambridge and London, 1865, p. 178.

<sup>19</sup> In the “London Standard” of October 26, 1861, there is a report of proceedings of the firm of John Bright & Co., before the Rochdale magistrates “to prosecute for intimidation the agents of the Carpet Weavers Trades’ Union. Bright’s partners had introduced new machinery which would turn out 240 yards of carpet in the time and with the labour (!) previously required to produce 160 yards. The workmen had no claim whatever to share in the profits made by the investment of their employer’s capital in mechanical improvements. Accordingly, Messrs. Bright proposed to lower the rate of pay from 1½d. per yard to 1d., leaving the earnings of the men exactly the same as before for the same labour. But there was a nominal reduction, of which the operatives, it is asserted, had not fair warning beforehand.”

<sup>20</sup> “Trades’ Unions, in their desire to maintain wages, endeavor to share in the benefits of improved machinery.” (Quelle horreur!) “... the demanding higher wages, because labour is abbreviated, is in other words the endeavor to establish a duty on mechanical improvements.” (“On Combination of Trades,” new ed., London, 1834, p. 42.)

## Chapter 22: National Differences of Wages

In the 17th chapter we were occupied with the manifold combinations which may bring about a change in magnitude of the value of labour-power – this magnitude being considered either absolutely or relatively, i.e., as compared with surplus-value; whilst on the other hand, the quantum of the means of subsistence in which the price of labour is realized might again undergo fluctuations independent of, or different from, the changes of this price.<sup>1</sup> As has been already said, the simple translation of the value, or respectively of the price, of labour-power into the exoteric form of wages transforms all these laws into laws of the fluctuations of wages. That which appears in these fluctuations of wages within a single country as a series of varying combinations, may appear in different countries as contemporaneous difference of national wages. In the comparison of the wages in different nations, we must therefore take into account all the factors that determine changes in the amount of the value of labour-power; the price and the extent of the prime necessities of life as naturally and historically developed, the cost of training the labourers, the part played by the labour of women and children, the productiveness of labour, its extensive and intensive magnitude. Even the most superficial comparison requires the reduction first of the average day-wage for the same trades, in different countries, to a uniform working day. After this reduction to the same terms of the day-wages, time-wage must again be translated into piece-wage, as the latter only can be a measure both of the productivity and the intensity of labour.

In every country there is a certain average intensity of labour below which the labour for the production of a commodity requires more than the socially necessary time, and therefore does not reckon as labour of normal quality. Only a degree of intensity above the national average affects, in a given country, the measure of value by the mere duration of the working-time. This is not the case on the universal market, whose integral parts are the individual countries. The average intensity of labour changes from country to country; here it is greater, there less. These national averages form a scale, whose unit of measure is the average unit of universal labour. The more intense national labour, therefore, as compared with the less intense, produces in the same time more value, which expresses itself in more money.

But the law of value in its international application is yet more modified by the fact that on the world-market the more productive national labour reckons also as the more intense, so long as the more productive nation is not compelled by competition to lower the selling price of its commodities to the level of their value.

In proportion as capitalist production is developed in a country, in the same proportion do the national intensity and productivity of labour there rise above the international level.<sup>2</sup> The different quantities of commodities of the same kind, produced in different countries in the same working-time, have, therefore, unequal international values, which are expressed in different prices, i.e., in sums of money varying according to international values. The relative value of money will, therefore, be less in the nation with more developed capitalist mode of production than in the nation with less developed. It follows, then, that the nominal wages, the equivalent of labour-power expressed in money, will also be higher in the first nation than in the second; which does not at all prove that this holds also for the real wages, i.e., for the means of subsistence placed at the disposal of the labourer.

But even apart from these relative differences of the value of money in different countries, it will be found, frequently, that the daily or weekly, &c., wage in the first nation is higher than in the

second, whilst the relative price of labour, i.e., the price of labour as compared both with surplus-value and with the value of the product, stands higher in the second than in the first.<sup>3</sup>

J. W. Cowell, member of the Factory Commission of 1833, after careful investigation of the spinning trade, came to the conclusion that

“in England wages are virtually lower to the capitalist, though higher to the operative than on the Continent of Europe.”<sup>4</sup>

The English Factory Inspector, Alexander Redgrave, in his report of Oct. 31st, 1866, proves by comparative statistics with continental states, that in spite of lower wages and much longer working-time, continental labour is, in proportion to the product, dearer than English. An English manager of a cotton factory in Oldenburg declares that the working time there lasted from 5:30 a.m. to 8 p.m., Saturdays included, and that the workpeople there, when under English overlookers, did not supply during this time quite so much product as the English in 10 hours, but under German overlookers much less. Wages are much lower than in England, in many cases 50%, but the number of hands in proportion to the machinery was much greater, in certain departments in the proportion of 5:3.
