Such was animal magnetism under the auspices of the Marquis de Puysegur. While he was exhibiting these phenomena around his elm-tree, a magnetiser of another class appeared in Lyons, in the person of the Chevalier de Barbarin. This gentleman thought the effort of the will, without any of the paraphernalia of wands or *baquets*, was sufficient to throw patients into the magnetic sleep. He tried it and succeeded. By sitting at the bedside of his patients, and praying that they might be magnetised, they went off into a state very similar to that of the persons who fell under the notice of M. de Puysegur. In the course of time a very considerable number of magnetisers, acknowledging Barbarin for their model, and called after him Barbarinists, appeared in different parts, and were believed to have effected some remarkable cures. In Sweden and Germany this sect of fanatics increased rapidly, and were called *spiritualists*, to distinguish them from the followers of M. de Puysegur, who were called *experimentalists*. They maintained that all the effects of animal magnetism, which Mesmer believed to be producible by a magnetic fluid dispersed through nature, were produced by the mere effort of one human soul acting upon another; that when a connexion had once been

established between a magnetiser and his patient, the former could communicate his influence to the latter from any distance, even hundreds of miles, by the will. One of them thus described the blessed state of a magnetic patient: “In such a man animal instinct ascends to the highest degree admissible in this world. The *clairvoyant* is then a pure animal, without any admixture of matter. His observations are those of a spirit. He is similar to God: his eye penetrates all the secrets of nature. When his attention is fixed on any of the objects of this world—on his disease, his death, his well-beloved, his friends, his relations, his enemies—in spirit he sees them acting; he penetrates into the causes and the consequences of their actions; he becomes a physician, a prophet, a divine!”⁷⁴

Let us now see what progress these mysteries made in England. In the year 1788 Dr. Mainauduc, who had been a pupil, first of Mesmer, and afterwards of D’Eslon, arrived in Bristol, and gave public lectures upon magnetism. His success was quite extraordinary. People of rank and fortune hastened from London to Bristol to be magnetised, or to place themselves under his tuition. Dr. George Winter, in his *History of Animal Magnetism*, gives the following list of them: “They amounted to one hundred and twenty-seven, among whom there were one duke, one duchess, one marchioness, two countesses, one earl, one baron, three baronesses, one bishop, five right honourable gentlemen and ladies, two baronets, seven members of parliament, one clergyman, two physicians, seven surgeons, besides ninety-two gentlemen and ladies of respectability.” He afterwards established himself in London, where he performed with equal success.

He began by publishing proposals to the ladies for the formation of a Hygeian Society. In this paper he vaunted highly the curative effects of animal magnetism, and took great credit to himself for being the first person to introduce it into England, and thus concluded: “As this method of cure is not confined to sex or college education, and the fair sex being in general the most sympathising part of the creation, and most immediately

concerned in the health and care of its offspring, I think myself bound in gratitude to you, ladies, for the partiality you have shewn me in midwifery, to contribute, as far as lies in my power, to render you additionally useful and valuable to the community. With this view I propose forming my Hygeian Society, to be incorporated with that of Paris. As soon as twenty ladies have given in their names, the day shall be appointed for the first meeting at my house, when they are to pay fifteen guineas, which will include the whole expense.”

Hannah More, in a letter addressed to Horace Walpole in September 1788, speaks of the “demoniacal mummeries” of Dr. Mainauduc, and says he was in a fair way of gaining a hundred thousand pounds by them, as Mesmer had done by his exhibitions in Paris.

So much curiosity was excited by the subject, that, about the same time, a man named Holloway gave a course of lectures on animal magnetism in London, at the rate of five guineas for each pupil, and realised a considerable fortune. Louthembourg the painter and his wife followed the same profitable trade; and such was the infatuation of the people to be witnesses of their strange manipulations, that at times upwards of three thousand persons crowded around their house at Hammersmith, unable to gain admission. The tickets sold at prices varying from one to three guineas. Louthembourg performed his cures by the touch, after the manner of Valentine Greatraks, and finally pretended to a divine mission. An account of his miracles, as they were called, was published in 1789, entitled *A List of New Cures performed by Mr. and Mrs. de Louthembourg, of Hammersmith Terrace, without Medicine; by a Lover of the Lamb of God. Dedicated to his Grace the Archbishop of Canterbury.*

This “Lover of the Lamb of God” was a half-crazy old woman, named Mary Pratt, who conceived for Mr. and Mrs. de Louthembourg a veneration which almost prompted her to worship them. She chose for the motto of her pamphlet a verse in the thirteenth chapter of the Acts of the Apostles: “Behold, ye despisers, and wonder and perish! for I will work a work in

your days which ye shall not believe, though a man declare it unto you.” Attempting to give a religious character to the cures of the painter, she thought a *woman* was the proper person to make them known, since the apostle had declared that a *man* should not be able to conquer the incredulity of the people. She stated, that from Christmas 1788 to July 1789, De Louthembourg and his wife had cured two thousand people, “having been made *proper recipients to receive divine manuductions*; which heavenly and divine influx, coming from the radix *God*, his Divine Majesty had most graciously bestowed upon them to diffuse healing to all, be they deaf, dumb, blind, lame, or halt.”

In her dedication to the Archbishop of Canterbury she implored him to compose a new form of prayer, to be used in all churches and chapels, that nothing might impede this inestimable gift from having its due course. She further entreated all the magistrates and men of authority in the land to wait on Mr. and Mrs. de Louthembourg, to consult with them on the immediate erection of a large hospital, with a pool of Bethesda attached to it. All the magnetisers were scandalised at the preposterous jabber of this old woman, and De Louthembourg appears to have left London to avoid her, —continuing, however, in conjunction with his wife, the fantastic tricks which had turned the brain of this poor fanatic, and deluded many others who pretended to more sense than she had.

From this period until 1798 magnetism excited little or no attention in England. An attempt to revive the belief in it was made in that year, but it was in the shape of mineral rather than of animal magnetism. One Benjamin Douglas Perkins, an American, practising as a surgeon in Leicester Square, invented and took out a patent for the celebrated “Metallic Tractors.” He pretended that these tractors, which were two small pieces of metal strongly magnetised, something resembling the steel plates which were first brought into notice by Father Hell, would cure gout, rheumatism, palsy, and, in fact, almost every disease the human frame was subject to, if applied externally to the afflicted part, and moved about

gently, touching the surface only. The most wonderful stories soon obtained general circulation, and the press groaned with pamphlets, all vaunting the curative effects of the tractors, which were sold at five guineas the pair. Perkins gained money rapidly. Gouty subjects forgot their pains in the presence of this new remedy; the rheumatism fled at its approach; and toothache, which is often cured by the mere sight of a dentist, vanished before Perkins and his marvellous steel-plates. The benevolent Society of Friends, of whose body he was a member, warmly patronised the invention. Desirous that the poor, who could not afford to pay Mr. Perkins five guineas, or even five shillings for his tractors, should also share in the benefits of that sublime discovery, they subscribed a large sum, and built an hospital, called the "Perkinean Institution," in which all comers might be magnetised free of cost. In the course of a few months they were in very general use, and their lucky inventor in possession of five thousand pounds.

Dr. Haygarth, an eminent physician at Bath, recollecting the influence of imagination in the cure of disease, hit upon an expedient to try the real value of the tractors. Perkins's cures were too well established to be doubted; and Dr. Haygarth, without gain-saying them, quietly, but in the face of numerous witnesses, exposed the delusion under which people laboured with respect to the curative medium. He suggested to Dr. Falconer that they should make wooden tractors, paint them to resemble the steel ones, and see if the very same effects would not be produced. Five patients were chosen from the hospital in Bath, upon whom to operate. Four of them suffered severely from chronic rheumatism in the ankle, knee, wrist, and hip; and the fifth had been afflicted for several months with the gout. On the day appointed for the experiments Dr. Haygarth and his friends assembled at the hospital, and with much solemnity brought forth the fictitious tractors. Four out of the five patients said their pains were immediately relieved; and three of them said they were not only relieved but very much benefited. One felt his knee warmer, and said he

could walk across the room. He tried and succeeded, although on the previous day he had not been able to stir. The gouty man felt his pains diminish rapidly, and was quite easy for nine hours, until he went to bed, when the twitching began again. On the following day the real tractors were applied to all the patients, when they described their symptoms in nearly the same terms.

To make still more sure, the experiment was tried in the Bristol infirmary, a few weeks afterwards, on a man who had a rheumatic affection in the shoulder, so severe as to incapacitate him from lifting his hand from his knee. The fictitious tractors were brought and applied to the afflicted part, one of the physicians, to add solemnity to the scene, drawing a stopwatch from his pocket to calculate the time exactly, while another, with a pen in his hand, sat down to write the change of symptoms from minute to minute as they occurred. In less than four minutes the man felt so much relieved, that he lifted his hand several inches without any pain in the shoulder!

An account of these matters was published by Dr. Haygarth, in a small volume entitled, *Of the Imagination, as a Cause and Cure of Disorders, exemplified by fictitious Tractors*. The exposure was a *coup de grace* to the system of Mr. Perkins. His friends and patrons, still unwilling to confess that they had been deceived, tried the tractors upon sheep, cows, and horses, alleging that the animals received benefit from the metallic plates, but none at all from the wooden ones. But they found nobody to believe them; the Perkinian institution fell into neglect; and Perkins made his exit from England, carrying with him about ten thousand pounds, to soothe his declining years in the good city of Pennsylvania.

Thus was magnetism laughed out of England for a time. In France the revolution left men no leisure for studying it. The *Sociétés de l'Harmonie* of Strasbourg, and other great towns lingered for a while, till sterner matters occupying men's attention, they were one after the other abandoned, both by pupils and professors. The system, thus driven from the first two

nations of Europe, took refuge among the dreamy philosophers of Germany. There the wonders of the magnetic sleep grew more and more wonderful every day; the patients acquired the gift of prophecy; their vision extended over all the surface of the globe; they could hear and see with their toes and fingers, and read unknown languages, and understand them too, by merely having the book placed on their stomachs. Ignorant peasants, when once entranced by the grand mesmeric fluid, could spout philosophy diviner than Plato ever wrote, descant upon the mysteries of the mind with more eloquence and truth than the profoundest metaphysicians the world ever saw, and solve knotty points of divinity with as much ease as waking men could undo their shoe-buckles!

During the first twelve years of the present century little was heard of animal magnetism in any country of Europe. Even the Germans forgot their airy fancies, recalled to the knowledge of this every-day world by the roar of Napoleon's cannon and the fall or the establishment of kingdoms. During this period a cloud of obscurity hung over the science, which was not dispersed until M. Deleuze published, in 1813, his *Histoire Critique du Magnétisme Animal*. This work gave a new impulse to the half-forgotten fancy. Newspapers, pamphlets, and books again waged war upon each other on the question of its truth or falsehood; and many eminent men in the profession of medicine recommenced inquiry with an earnest design to discover the truth.

The assertions made in the celebrated treatise of Deleuze are thus summed up:⁷⁵ "There is a fluid continually escaping from the human body," and "forming an atmosphere around us," which, as "it has no determined current," produces no sensible effects on surrounding individuals. It is, however, "capable of being directed by the will;" and, when so directed, "is sent forth in currents," with a force corresponding to the energy we possess. Its motion is "similar to that of the rays from burning bodies;" "it possesses different qualities in different individuals." It is capable of a high degree of concentration, "and exists also in trees." The

will of the magnetiser, “guided by a motion of the hand, several times repeated in the same direction,” can fill a tree with this fluid. Most persons, when this fluid is poured into them from the body and by the will of the magnetiser, “feel a sensation of heat or cold” when he passes his hand before them, without even touching them. Some persons, when sufficiently charged with this fluid, fall into a state of somnambulism, or magnetic ecstasy; and when in this state, “they see the fluid encircling the magnetiser like a halo of light, and issuing in luminous streams from his mouth and nostrils, his head and hands, possessing a very agreeable smell, and communicating a particular taste to food and water.”

One would think that these “notions” were quite enough to be insisted upon by any physician who wished to be considered sane; but they form only a small portion of the wondrous things related by M. Deleuze. He further said, “When magnetism produces somnambulism, the person who is in this state acquires a prodigious extension of all his faculties. Several of his external organs, especially those of sight and hearing, become inactive; but the sensations which depend upon them take place internally. Seeing and hearing are carried on by the magnetic fluid, which transmits the impressions immediately, and without the intervention of any nerves or organs directly to the brain. Thus the somnambulist, though his eyes and ears are closed, not only sees and hears, but sees and hears much better than he does when awake. In all things he feels the will of the magnetiser, although that will be not expressed. He sees into the interior of his own body, and the most secret organisation of the bodies of all those who may be put *en rapport*, or in magnetic connexion, with him. Most commonly, he only sees those parts which are diseased and disordered, and intuitively prescribes a remedy for them. He has prophetic visions and sensations, which are generally true, but sometimes erroneous. He expresses himself with astonishing eloquence and facility. He is not free from vanity. He becomes a more perfect being of his own accord for a certain time, if guided wisely by the magnetiser, but wanders if he is ill-directed.”

According to M. Deleuze, any person could become a magnetiser and produce these effects, by conforming to the following conditions, and acting upon the following rules:

“Forget for a while all your knowledge of physics and metaphysics.

“Remove from your mind all objections that may occur.

“Imagine that it is in your power to take the malady in hand, and throw it on one side.

“Never reason for six weeks after you have commenced the study.

“Have an active desire to do good; a firm belief in the power of magnetism, and an entire confidence in employing it. In short, repel all doubts; desire success, and act with simplicity and attention.”

That is to say, “be very credulous; be very persevering; reject all past experience, and do not listen to reason,” and you are a magnetiser after M. Deleuze’s own heart.

Having brought yourself into this edifying state, “remove from the patient all persons who might be troublesome to you; keep with you only the necessary witnesses—a single person if need be; desire them not to occupy themselves in any way with the processes you employ and the effects which result from them, but to join with you in the desire of doing good to your patient. Arrange yourself so as neither to be too hot nor too cold, and in such a manner that nothing may obstruct the freedom of your motions; and take precautions to prevent interruption during the sitting. Make your patient then sit as commodiously as possible, and place yourself opposite to him, on a seat a little more elevated, in such a manner that his knees may be betwixt yours, and your feet at the side of his. First, request him to resign himself; to think of nothing; not to perplex himself by examining the effects which may be produced; to banish all fear; to surrender himself to hope, and not to be disturbed or discouraged if the action of magnetism should cause in him momentary pains. After having

collected yourself, take his thumbs between your fingers in such a way that the internal part of your thumbs may be in contact with the internal part of his, *and then fix your eyes upon him!* You must remain from two to five minutes in this situation, or until you feel an equal heat between your thumbs and his. This done, you will withdraw your hands, removing them to the right and left; and at the same time turning them till their internal surface be outwards, and you will raise them to the height of the head. You will now place them upon the two shoulders, and let them remain there about a minute; afterwards drawing them gently along the arms to the extremities of the fingers, touching very slightly as you go. You will renew this pass five or six times, always turning your hands, and removing them a little from the body before you lift them. You will then place them above the head; and after holding them there for an instant, lower them, passing them before the face, at the distance of one or two inches, down to the pit of the stomach. There you will stop them two minutes also, putting your thumbs upon the pit of the stomach and the rest of your fingers below the ribs. You will then descend slowly along the body to the knees, or rather, if you can do so without deranging yourself, to the extremity of the feet. You will repeat the same processes several times during the remainder of the sitting. You will also occasionally approach your patient, so as to place your hands behind his shoulders, in order to descend slowly along the spine of the back and the thighs, down to the knees or the feet. After the first passes, you may dispense with putting your hands upon the head, and may make the subsequent passes upon the arms, beginning at the shoulders, and upon the body, beginning at the stomach.”

Such was the process of magnetising recommended by Deleuze. That delicate, fanciful, and nervous women, when subjected to it, should have worked themselves into convulsions will be readily believed by the sturdiest opponent of animal magnetism. To sit in a constrained posture—be stared out of countenance by a fellow who enclosed her knees between his, while he made *passes* upon different parts of her body, was quite

enough to throw any weak woman into a fit, especially if she were predisposed to hysteria, and believed in the efficacy of the treatment. It is just as evident that those of stronger minds and healthier bodies should be sent to sleep by the process. That these effects have been produced by these means, there are thousands of instances to shew. But are they testimony in favour of animal magnetism?—do they prove the existence of the magnetic fluid? It needs neither magnetism, nor ghost from the grave, to tell us that silence, monotony, and long recumbency in one position, must produce sleep; or that excitement, imitation, and a strong imagination acting upon a weak body, will bring on convulsions.

M. Deleuze's book produced quite a sensation in France; the study was resumed with redoubled vigour. In the following year, a journal was established devoted exclusively to the science, under the title of *Annales du Magnétisme Animal*; and shortly afterwards appeared the *Bibliothèque du Magnétisme Animal*, and many others. About the same time, the Abbé Faria, "the man of wonders," began to magnetise; and the belief being that he had more of the mesmeric fluid about him, and a stronger will, than most men, he was very successful in his treatment. His experiments afford a convincing proof that imagination can operate all, and the supposed fluid none, of the results so confidently claimed as evidence of the new science. He placed his patients in an arm-chair; told them to shut their eyes; and then, in a loud commanding voice, pronounced the single word, "Sleep!" He used no manipulations whatever—had no *baquet*, or conductor of the fluid; but he nevertheless succeeded in causing sleep in hundreds of patients. He boasted of having in his time produced five thousand somnambulists by this method. It was often necessary to repeat the command three or four times; and if the patient still remained awake, the abbé got out of the difficulty by dismissing him from the chair, and declaring that he was incapable of being acted on. And it should be especially remarked that the magnetisers do not lay claim to universal efficacy for their fluid; the strong and the healthy cannot be magnetised;

the incredulous cannot be magnetised; those who reason upon it cannot be magnetised; those who firmly believe in it can be magnetised; the weak in body can be magnetised, and the weak in mind can be magnetised. And lest, from some cause or other, individuals of the latter classes should resist the magnetic charm, the apostles of the science declare that there are times when even *they* cannot be acted upon; the presence of one scorner or unbeliever may weaken the potency of the fluid and destroy its efficacy. In M. Deleuze's instructions to a magnetiser, he expressly says, "Never magnetise before inquisitive persons!"⁷⁶

Here we conclude the subject, as it would serve no good purpose to extend to greater length the history of Animal Magnetism; especially at a time when many phenomena, the reality of which it is impossible to dispute, are daily occurring to startle and perplex the most learned, impartial, and truth-loving of mankind. Enough, however, has been stated to shew, that if there be some truth in magnetism, there has been much error, misconception, and exaggeration. Taking its history from the commencement, it can hardly be said to have been without its uses. To quote the words of Bailly, in 1784, "Magnetism has not been altogether unavailing to the philosophy which condemns it: it is an additional fact to record among the errors of the human mind, and a great experiment on the strength of the imagination." Over that vast inquiry of the influence of mind over matter,—an inquiry which the embodied intellect of mankind will never be able to fathom completely,—it will at least have thrown a feeble and imperfect light. It will have afforded an additional proof of the strength of the unconquerable will, and the weakness of matter as compared with it; another illustration of the words of the inspired Psalmist, that "we are fearfully and wonderfully made."

INFLUENCE OF POLITICS AND RELIGION ON THE HAIR AND BEARD.

Speak with respect and honour
Both of the beard and the beard's owner.

Hudibras.

THE famous declaration of St. Paul, "that long hair was a shame unto a man," has been made the pretext for many singular enactments, both of civil and ecclesiastical governments. The fashion of the hair and the cut of the beard were state questions in France and England, from the establishment of Christianity until the fifteenth century.

We find, too, that in much earlier times, men were not permitted to do as they liked with their own hair. Alexander the Great thought that the beards of the soldiery afforded convenient handles for the enemy to lay hold of, preparatory to cutting off their heads; and, with a view of depriving them of this advantage, he ordered the whole of his army to be closely shaven. His notions of courtesy towards an enemy were quite different from those entertained by the North American Indians, and amongst whom it is held a point of honour to allow one "chivalrous lock" to grow, that the foe, in taking the scalp, may have something to catch hold of.

At one time, long hair was the symbol of sovereignty in Europe. We learn from Gregory of Tours, that, among the successors of Clovis, it was the exclusive privilege of the royal family to have their hair long and curled. The nobles, equal to kings in power, would not shew any inferiority in this respect, and wore not only their hair, but their beards of an enormous

length. This fashion lasted, with but slight changes, till the time of Louis the Debonnaire; but his successors, up to Hugh Capet, wore their hair short, by way of distinction. Even the serfs had set all regulation at defiance, and allowed their locks and beards to grow.

At the time of the invasion of England by William the Conqueror, the Normans wore their hair very short. Harold, in his progress towards Hastings, sent forward spies to view the strength and number of the enemy. They reported, amongst other things, on their return, that “the host did almost seem to be priests, because they had all their face and both their lips shaven.” The fashion among the English at the time was to wear the hair long upon the head and the upper lip, but to shave the chin. When the haughty victors had divided the broad lands of the Saxon thanes and franklins among them, when tyranny of every kind was employed to make the English feel that they were indeed a subdued and broken nation, the latter encouraged the growth of their hair, that they might resemble as little as possible their cropped and shaven masters.

This fashion was exceedingly displeasing to the clergy, and prevailed to a considerable extent in France and Germany. Towards the end of the eleventh century, it was decreed by the pope, and zealously supported by the ecclesiastical authorities all over Europe, that such persons as wore long hair should be excommunicated while living, and not be prayed for when dead. William of Malmesbury relates, that the famous St. Wulstan, Bishop of Worcester, was peculiarly indignant whenever he saw a man with long hair. He declaimed against the practice as one highly immoral, criminal, and beastly. He continually carried a small knife in his pocket, and whenever any body offending in this respect knelt before him to receive his blessing, he would whip it out slyly, and cut off a handful, and then, throwing it in his face, tell him to cut off all the rest, or he would go to hell.

But fashion, which at times it is possible to move with a wisp, stands firm against a lever; and men preferred to run the risk of damnation to parting

with the superfluity of their hair. In the time of Henry I., Anselm, Archbishop of Canterbury, found it necessary to republish the famous decree of excommunication and outlawry against the offenders; but, as the court itself had begun to patronise curls, the fulminations of the Church were unavailing. Henry I. and his nobles wore their hair in long ringlets down their backs and shoulders, and became a *scandalum magnatum* in the eyes of the godly. One Serlo, the king's chaplain, was so grieved in spirit at the impiety of his master, that he preached a sermon from the well-known text of St. Paul before the assembled court, in which he drew so dreadful a picture of the torments that awaited them in the other world, that several of them burst into tears, and wrung their hair, as if they would have pulled it out by the roots. Henry himself was observed to weep. The priest, seeing the impression he had made, determined to strike while the iron was hot, and pulling a pair of scissors from his pocket, cut the king's hair in presence of them all. Several of the principal courtiers consented to do the like, and for a short time long hair appeared to be going out of fashion. But the courtiers thought, after the first glow of their penitence had been cooled by reflection, that the clerical Delilah had shorn them of their strength, and in less than six months they were as great sinners as ever.

Anselm, the Archbishop of Canterbury, who had been a monk of Bec, in Normandy, and who had signalled himself at Rouen by his fierce opposition to long hair, was still anxious to work a reformation in this matter. But his pertinacity was far from pleasing to the king, who had finally made up his mind to wear ringlets. There were other disputes, of a more serious nature, between them; so that when the archbishop died, the king was so glad to be rid of him, that he allowed the see to remain vacant for five years. Still the cause had other advocates, and every pulpit in the land resounded with anathemas against that disobedient and long-haired generation. But all was of no avail. Stowe, in writing of this period, asserts, on the authority of some more ancient chronicler, "that men, forgetting

their birth, transformed themselves, by the length of their haire, into the semblance of woman kind;” and that when their hair decayed from age, or other causes, “they knit about their heads certain rolls and braidings of false hair.” At last accident turned the tide of fashion. A knight of the court, who was exceedingly proud of his beauteous locks, dreamed one night that, as he lay in bed, the devil sprang upon him, and endeavoured to choke him with his own hair. He started in affright, and actually found that he had a great quantity of hair in his mouth. Sorely stricken in conscience, and looking upon the dream as a warning from heaven, he set about the work of reformation, and cut off his luxuriant tresses the same night. The story was soon bruited abroad; of course it was made the most of by the clergy, and the knight, being a man of influence and consideration, and the acknowledged leader of the fashion, his example, aided by priestly exhortations, was very generally imitated. Men appeared almost as decent as St. Wulstan himself could have wished, the dream of a dandy having proved more efficacious than the entreaties of a saint. But, as Stowe informs us, “scarcely was one year past, when all that thought themselves courtiers fell into the former vice, and contended with women in their long haire.” Henry, the king, appears to have been quite uninfluenced by the dreams of others, for even his own would not induce him a second time to undergo a cropping from priestly shears. It is said, that he was much troubled at this time by disagreeable visions. Having offended the Church in this and other respects, he could get no sound, refreshing sleep, and used to imagine that he saw all the bishops, abbots, and monks of every degree, standing around his bed-side, and threatening to belabour him with their pastoral staves; which sight, we are told, so frightened him, that he often started naked out of his bed, and attacked the phantoms sword in hand. Grimbalde, his physician, who, like most of his fraternity at that day, was an ecclesiastic, never hinted that his dreams were the result of a bad digestion, but told him to shave his head, be reconciled to the Church, and reform himself with alms and prayer. But he would not take this good

advice, and it was not until he had been nearly drowned a year afterwards, in a violent storm at sea, that he repented of his evil ways, cut his hair short, and paid proper deference to the wishes of the clergy.

In France, the thunders of the Vatican with regard to long curly hair were hardly more respected than in England. Louis VII., however, was more obedient than his brother-king, and cropped himself as closely as a monk, to the great sorrow of all the gallants of his court. His queen, the gay, haughty, and pleasure-seeking Eleanor of Guienne, never admired him in this trim, and continually reproached him with imitating, not only the head-dress, but the asceticism of the monks. From this cause a coldness arose between them. The lady proving at last unfaithful to her shaven and indifferent lord, they were divorced, and the kings of France lost the rich provinces of Guienne and Poitou, which were her dowry. She soon after bestowed her hand and her possessions upon Henry Duke of Normandy, afterwards Henry II. of England, and thus gave the English sovereigns that strong footing in France which was for so many centuries the cause of such long and bloody wars between the nations. When the Crusades had drawn all the smart young fellows into Palestine, the clergy did not find it so difficult to convince the staid burghers who remained in Europe, of the enormity of long hair. During the absence of Richard Cœur de Lion, his English subjects not only cut their hair close, but shaved their faces. William Fitz-osbert, or Long-beard, the great demagogue of that day, reintroduced among the people who claimed to be of Saxon origin the fashion of long hair. He did this with the view of making them as unlike as possible to the citizens and the Normans. He wore his own beard hanging down to his waist, from whence the name by which he is best known to posterity.

The Church never shewed itself so great an enemy to the beard as to long hair on the head. It generally allowed fashion to take its own course, both with regard to the chin and the upper lip. This fashion varied continually; for we find that, in little more than a century after the time of Richard I.,

when beards were short, that they had again become so long as to be mentioned in the famous epigram made by the Scots who visited London in 1327, when David, son of Robert Bruce, was married to Joan, the sister of King Edward. This epigram, which was stuck on the church-door of St. Peter Stangate, ran as follows:

“Long beards heartlesse,
Painted hoods witlesse,
Gray coats gracelesse,
Make England thriftlesse.”

When the Emperor Charles V. ascended the throne of Spain he had no beard. It was not to be expected that the obsequious parasites who always surround a monarch, could presume to look more virile than their master. Immediately all the courtiers appeared beardless, with the exception of such few grave old men as had outgrown the influence of fashion, and who had determined to die bearded as they had lived. Sober people in general saw this revolution with sorrow and alarm, and thought that every manly virtue would be banished with the beard. It became at the time a common saying,—

“Desde que no hay barba, no hay mas alma.”

We have no longer souls since we have lost our beards.

In France also the beard fell into disrepute after the death of Henry IV., from the mere reason that his successor was too young to have one. Some of the more immediate friends of the great Béarnais, and his minister Sully among the rest, refused to part with their beards, notwithstanding the jeers of the new generation.

Who does not remember the division of England into the two great parties of Roundheads and Cavaliers? In those days every species of vice

and iniquity was thought by the Puritans to lurk in the long curly tresses of the monarchists, while the latter imagined that their opponents were as destitute of wit, of wisdom, and of virtue, as they were of hair. A man's locks were the symbol of his creed, both in politics and religion. The more abundant the hair, the more scant the faith; and the balder the head, the more sincere the piety.

PETER THE GREAT.

But among all the instances of the interference of governments with men's hair, the most extraordinary, not only for its daring, but for its success, is that of Peter the Great, in 1705. By this time fashion had condemned the beard in every other country in Europe, and with a voice more potent than popes or emperors, had banished it from civilised society. But this only made the Russians cling more fondly to their ancient ornament, as a mark to distinguish them from foreigners, whom they hated. Peter, however, resolved that they should be shaven. If he had been a man deeply read in history, he might have hesitated before he attempted so despotic an attack upon the time-hallowed customs and prejudices of his countrymen; but he was not. He did not know or consider the danger of the innovation; he only listened to the promptings of his own indomitable will, and his fiat went forth, that not only the army, but all ranks of citizens, from the nobles to the serfs, should shave their beards. A certain time was given, that people might get over the first throes of their repugnance, after which every man who chose to retain his beard was to pay a tax of one hundred roubles. The priests and the serfs were put on a lower footing, and

allowed to retain theirs upon payment of a copeck every time they passed the gate of a city. Great discontent existed in consequence, but the dreadful fate of the Strelitzes was too recent to be forgotten, and thousands who had the will had not the courage to revolt. As is well remarked by a writer in the *Encyclopædia Britannica*, they thought it wiser to cut off their beards than to run the risk of incensing a man who would make no scruple in cutting off their heads. Wiser, too, than the popes and bishops of a former age, he did not threaten them with eternal damnation, but made them pay in hard cash the penalty of their disobedience. For many years, a very considerable revenue was collected from this source. The collectors gave in receipt for its payment a small copper coin, struck expressly for the purpose, and called the "*borodováia*," or "the bearded." On one side it bore the figure of a nose, mouth, and moustaches, with a long bushy beard, surmounted by the words, "*Deuyee Vyeatee*," "money received;" the whole encircled by a wreath, and stamped with the black eagle of Russia. On the reverse, it bore the date of the year. Every man who chose to wear a beard was obliged to produce this receipt on his entry into a town. Those who were refractory, and refused to pay the tax, were thrown into prison.

Since that day, the rulers of modern Europe have endeavoured to persuade, rather than to force, in all matters pertaining to fashion. The Vatican troubles itself no more about beards or ringlets, and men may become hairy as bears, if such is their fancy, without fear of excommunication or deprivation of their political rights. Folly has taken a new start, and cultivates the moustache.

Even upon this point governments will not let men alone. Religion as yet has not meddled with it; but perhaps it will; and politics already influence it considerably. Before the revolution of 1830, neither the French nor Belgian citizens were remarkable for their moustaches; but, after that event, there was hardly a shopkeeper either in Paris or Brussels whose upper lip did not suddenly become hairy with real or mock moustaches. During a temporary triumph gained by the Dutch soldiers over the citizens

of Louvain, in October 1830, it became a standing joke against the patriots, that they shaved their faces clean immediately; and the wits of the Dutch army asserted that they had gathered moustaches enough from the denuded lips of the Belgians to stuff mattresses for all the sick and wounded in their hospital.

The last folly of this kind is still more recent. In the German newspapers, of August 1838, appeared an ordonnance, signed by the king of Bavaria, forbidding civilians, on any pretence whatever, to wear moustaches, and commanding the police and other authorities to arrest, and cause to be shaved, the offending parties. "Strange to say," adds *Le Droit*, the journal from which this account is taken, "moustaches disappeared immediately, like leaves from the trees in autumn; every body made haste to obey the royal order, and not one person was arrested."

The king of Bavaria, a rhymester of some celebrity, has taken a good many poetical licences in his time. His licence in this matter appears neither poetical nor reasonable. It is to be hoped that he will not take it into his royal head to make his subjects shave theirs; nothing but that is wanting to complete their degradation.

BAYEUX TAPESTRY.⁷⁷

Footnotes

1. Miss Elizabeth Villiers, afterwards Countess of Orkney.
[Return](#)
2. The wits of the day called it a *sand-bank*, which would wreck the vessel of the state.
[Return](#)
3. This anecdote, which is related in the correspondence of Madame de Bavière, Duchess of Orleans and mother of the Regent, is discredited by Lord John Russell in his *History of the principal States of Europe from the Peace of Utrecht*; for what reason he does not inform us. There is no doubt that Law proposed his scheme to Desmarets, and that Louis refused to hear of it. The reason given for the refusal is quite consistent with the character of that bigoted and tyrannical monarch.
[Return](#)
4. From *maltôte*, an oppressive tax.
[Return](#)
5. This anecdote is related by M. de la Hode, in his *Life of Philippe of Orleans*. It would have looked more authentic if he had given the names of the dishonest contractor and the still more dishonest minister. But M. de la Hode's book is liable to the same objection as most of the French memoirs of that and of subsequent periods. It is sufficient with most of them that an anecdote be *ben trovato*; the *vero* is but matter of secondary consideration.
[Return](#)

6. The French pronounced his name in this manner to avoid the ungallic sound, *aw*. After the failure of his scheme, the wags said the nation was *lasse de lui*, and proposed that he should in future be known by the name of Monsieur Helas!

[Return](#)

7. The curious reader may find an anecdote of the eagerness of the French ladies to retain Law in their company, which will make him blush or smile according as he happens to be very modest or the reverse. It is related in the *Letters of Madame Charlotte Elizabeth de Bavière, Duchess of Orleans*, vol. ii. p. 274.

[Return](#)

8. The following squib was circulated on the occasion:

“Foin de ton zèle séraphique,
Malheureux Abbé de Tencin,
Depuis que Law est Catholique,
Tout le royaume est Capucin!”

Thus somewhat weakly and paraphrastically rendered by Justandson, in his translation of the *Memoirs of Louis XV.*:

“Tencin, a curse on thy seraphic zeal,
Which by persuasion hath contrived the means
To make the Scotchman at our altars kneel,
Since which we all are poor as Capucines!”

19. Tree, surrounded by water; people climbing up the tree. One of a series of bubble cards, copied from the *Bubblers' Medley*, published by Carrington Bowles.

[Return](#)

20. Gay (the poet), in that disastrous year, had a present from young Craggs of some South-Sea stock, and once supposed himself to be master of twenty thousand pounds. His friends persuaded him to sell his share, but he dreamed of dignity and splendour, and could not hear to obstruct his own fortune. He was then importuned to sell as much as would purchase a hundred a year for life, "which," says Fenton, "will make you sure of a clean shirt and a shoulder of mutton every day." This counsel was rejected; the profit and principal were lost, and Gay sunk under the calamity so low that his life became in danger.—*Johnson's Lives of the Poets*

24. "God cannot love,' says Blunt, with tearless eyes,
'The wretch he starves, and piously denies.' ...
Much-injur'd Blunt! why bears he Britain's hate?
A wizard told him in these words our fate:
'At length corruption, like a gen'ral flood,
So long by watchful ministers withstood,
Shall deluge all; and av'rice, creeping on,
Spread like a low-born mist, and blot the sun;
Statesman and patriot ply alike the stocks,
Peeress and butler share alike the box,

And judges job, and bishops bite the Town,
And mighty dukes pack cards for half-a-crown:
See Britain sunk in Lucre's forbid charms,
And France reveng'd of Ann's and Edward's arms!
'Twas no court-badge, great Scriv'ner! fir'd thy brain,
Nor lordly luxury, nor city gain:
No, 'twas thy righteous end, asham'd to see
Senates degen'rate, patriots disagree,
And nobly wishing party-rage to cease,
To buy both sides, and give thy country peace."

Pope's Epistle to Allen Lord Bathurst.

[Return](#)

41. The “crystal” alluded to appears to have been a black stone, or piece of polished coal. The following account of it is given, in the supplement to Granger’s *Biographical History*. “The black stone into which Dee used to call his spirits was in the collection of the Earls of Peterborough, from whence it came to Lady Elizabeth Germaine. It was next the property of the late Duke of Argyle, and is now Mr. Walpole’s. It appears upon examination to be nothing more than a polished piece of cannel coal; but this is what Butler means when he says,

‘Kelly did all his feats upon
The devil’s looking-glass—a stone.’”

[Return](#)

42. Lilly the astrologer, in his *Life*, written by himself, frequently tells of prophecies delivered by the angels in a manner similar to the angels of Dr. Dee. He says, “The prophecies were not given vocally by the angels, but by inspection of the crystal in types and figures, or by apparition the circular way; where, at some distance, the angels appear, representing by forms, shapes, and creatures, what is demanded. It is very rare, yea even in our days,” quoth that wiseacre, “for any operator or master to hear the angels speak articulately: when they do speak, *it is like, the Irish, much in the throat!*”

43. Albert Laski, son of Jaroslav, was Palatine of Siradz, and afterwards of Sendomir, and chiefly contributed to the election of Henry of Valois, the Third of France, to the throne of Poland, and was one of the delegates who went to France in order to announce to the new monarch his elevation to the sovereignty of Poland. After the deposition of Henry, Albert Laski voted for Maximilian of Austria. In 1583 he visited England, when Queen Elizabeth received him with great distinction. The honours which were shewn him during his visit to Oxford, by the especial command of the Queen, were equal to those rendered to sovereign princes. His extraordinary prodigality rendered his enormous wealth insufficient to defray his expenses, and he therefore became a zealous

adept in alchemy, and took from England to Poland with him two known alchemists.—Count Valerian Krasinski's *Historical Sketch of the Reformation in Poland*.

[Return](#)

44. The following legend of the tomb of Rosencreutz, written by Eustace Budgell, appears in No. 379 of the *Spectator*:—"A certain person, having occasion to dig somewhat deep in the ground where this philosopher lay interred, met with a small door, having a wall on each side of it. His curiosity, and the hope of finding some hidden treasure, soon prompted him to force open the door. He was immediately surprised by a sudden blaze of light, and discovered a very fair vault. At the upper end of it was a statue of a man in armour, sitting by a table, and leaning on his left arm. He held a truncheon in his right hand, and had a lamp burning before him. The man had no sooner set one foot within the vault, than the statue, erecting itself from its leaning posture, stood bolt upright; and, upon the fellow's advancing another step, lifted up the truncheon in his right hand. The man still ventured a third step; when the statue, with a furious blow, broke the lamp into a thousand pieces, and left his guest in sudden darkness. Upon the report of this adventure, the country people came with lights to the sepulchre, and discovered that the statue, which was made of brass, was nothing more than a piece of clock-work; that the floor of the vault was all loose, and underlaid with several springs, which, upon any man's entering, naturally produced that which had happened.

"Rosicreucius, say his disciples, made use of this method to shew the world that he had re-invented the ever-burning lamps of the ancients, though he was resolved no one should reap any advantage from the discovery."

53. This prophecy seems to have been that set forth at length in the popular *Life of Mother Shipton*:

“When fate to England shall restore
A king to reign as heretofore,
Great death in London shall be though,
And many houses be laid low.”

[Return](#)

54. The *London Saturday Journal* of March 12th, 1842, contains the following:—“An absurd report is gaining ground among the weak-minded, that London will be destroyed by an earthquake on the 17th of March, or St. Patrick’s day. This rumour is founded on the following ancient prophecies: one professing to be pronounced in the year 1203; the other, by Dr. Dee the astrologer, in 1598:

“In eighteen hundred and forty-two
Four things the sun shall view;
London’s rich and famous town

Hungry earth shall swallow down.
Storm and rain in France shall be,
Till every river runs a sea.
Spain shall be rent in twain,
And famine waste the land again.
So say I, the Monk of Dree,
In the twelve hundredth year and three.”

Harleian Collection (British Museum), 800 b, fol. 319.

“The Lord have mercy on you all—
Prepare yourselves for dreadful fall
Of house and land and human soul—
The measure of your sins is full.
In the year one, eight, and forty-two,
Of the year that is so new;
In the third month of that sixteen,
It may be a day or two between—
Perhaps you’ll soon be stiff and cold.
Dear Christian, be not stout and bold—
The mighty, kingly-proud will see
This comes to pass as my name’s Dee.”

1598. *Ms.*, in the British Museum.

The alarm of the population of London did not on this occasion extend beyond the wide circle of the uneducated classes, but among them it equalled that recorded in the text. It was soon afterwards stated that no such prophecy is to be found in the Harleian *Ms.*

57. Although other places claim the honour(!) of Mother Shipton’s birth, her residence is asserted, by oral tradition, to have been for many years a cottage at Winslow-cum-Shipton, in Buckinghamshire, of which the above is a representation. We give the contents of one of the popular books containing her prophecies:

The Strange and Wonderful History and Prophecies of Mother Shipton, plainly setting forth her Birth, Life, Death, and Burial. 12mo, Newcastle. Chap. 1.—Of her birth and parentage. 2. How Mother Shipton’s mother proved with child; how she fitted the justice, and what happened at her delivery. 3. By what name Mother Shipton was christened, and how her mother went into a monastery. 4. Several other pranks play’d by Mother Shipton in revenge of such as abused her. 5. How Ursula married a young man named Tobias Shipton, and how strangely she discovered a thief. 6. Her prophecy against Cardinal Wolsey. 7. Some other prophecies of Mother Shipton relating to those times. 8. Her prophecies in verse to the Abbot of Beverly. 9. Mother Shipton’s life, death, and burial.

[Return](#)

58. Let us try. In his second century, prediction 66, he says:

“From great dangers the captive is escaped.
A little time, great fortune changed.
In the palace the people are caught.
By good augury the city is besieged.”

“What is this,” a believer might exclaim, “but the escape of Napoleon from Elba—his changed fortune, and the occupation of Paris by the allied armies?”

Let us try again. In his third century, prediction 98, he says:

“Two royal brothers will make fierce war on each other;
So mortal shall be the strife between them,
That each one shall occupy a fort against the other;
For their reign and life shall be the quarrel.”

Some Lillius Redivivus would find no difficulty in this prediction. To use a vulgar phrase, it is as clear as a pikestaff. Had not the astrologer in view Don Miguel and Don Pedro when he penned this stanza, so much less obscure and oracular than the rest?

62. It is quite astonishing to see the great demand there is, both in England and France, for dream-books, and other trash of the same kind. Two books in England enjoy an extraordinary popularity, and have run through upwards of fifty editions in as many years in London alone, besides being reprinted in Manchester, Edinburgh, Glasgow, and Dublin. One is *Mother Bridget's Dream-book and Oracle of Fate*; the other is the *Norwood Gipsy*. It is stated, on the authority of one who is curious in these matters, that there is a demand for these works, which are sold at sums varying from a penny to sixpence, chiefly to servant-girls and imperfectly-educated people, all over the country, of upwards of eleven thousand annually; and that at no period during the last thirty years has the average number sold been less than this. The total number during this period would thus amount to 330,000.

64. See Van der Mye's account of the siege of Breda. The garrison, being afflicted with scurvy, the Prince of Orange sent the physicians two or three small phials, containing a decoction of camomile, wormwood, and camphor, telling them to pretend that it was a medicine of the greatest value and extremest rarity, which had been procured with very much danger and difficulty from the East; and so strong, that two or three drops would impart a healing virtue to a gallon of water. The soldiers had faith in their commander; they took the medicine with cheerful faces, and grew well rapidly. They afterwards thronged about the prince in groups of twenty and thirty at a time, praising his skill, and loading him with protestations of gratitude.

[Return](#)

65. Mummies were of several kinds, and were all of great use in magnetic medicines. Paracelsus enumerates six kinds of mummies; the first four only differing in the composition used by different people for preserving

their dead, are the Egyptian, Arabian, Pisasphaltos, and Libyan. The fifth mummy of peculiar power was made from criminals that had been hanged; “for from such there is a gentle siccation, that expungeth the watery humour, without destroying the oil and spirituall, which is cherished by the heavenly luminaries, and strengthened continually by the affluence and impulses of the celestial spirits; whence it may be properly called by the name of constellated or celestial mummie.” The sixth kind of mummy was made of corpuscles, or spiritual effluences, radiated from the living body; though we cannot get very clear ideas on this head, or respecting the manner in which they were caught.—*Medicina Diastastica; or, Sympathetical Mummie, abstracted from the Works of Paracelsus, and translated out of the Latin*, by Fernando Parkhurst, Gent. London, 1653, pp. 2, 7. Quoted by the *Foreign Quarterly Review*, vol. xii, p. 415.

LIST OF ENGRAVINGS IN VOL. II.

- Pope Urban preaching the first Crusade.—Frontispiece.
- View in the Harz Mountains. (Capt. Batty's *Hanoverian and Saxon Scenery*.)—Title-page.
- Initial—Crusaders' Weapons of the eleventh century
- Peter the Hermit preaching
- Cathedral at Clermont. (Sommerard's *Album*)
- Nicée, Asia Minor. (Leon de Laborde's *Voyage en Orient*)
- Godfrey of Bouillon. (From the Statue by Simonis, Brussels)
- Siege of Antioch
- The Holy Lance. (Copied, in Hone's *Everyday Book*, from a very rare print published by the Ecclesiastics of Nuremberg)
- Shrine of the Nativity, Bethlehem. (Laborde's *Voyage en Orient*)
- Pilgrims' first sight of Jerusalem. (Print by Plüddemann)
- Siege of Jerusalem
- Jerusalem. (Gerhardt von Breydenbach's *Grand Voyage de Jherusalem*, 1517)
- Bible of Baldwin's Queen. (Original in the British Museum)

Cathedral of Vezelai. (Sommerard's *Album*)
Pilgrim's Staff. (The *Archæologia*)
Damascus. (Laborde's *Voyage en Orient*)
Seal of Frederick Barbarossa. (Venetian History)
Henry II. (Stothard's *Monumental Effigies*)
Château of Gisors, Normandy. (*L'Univers Pittoresque*)
Philip Augustus. (Willemin's *Monumens Français inédits*)
The Island of Rhodes. (Royal Library, British Museum; print "in
Venetia, 1570")
Richard I. and Berengaria. (Stothard's *Monumental Effigies*)
Bethlehem. (Laborde's *Voyage en Orient*)
Constantinople. (Print, Johann Baptist Hooman, Royal Library,
British Museum)
Templar and Hospitaller. (Fairholt's *Book of Costumes*)
Jaffa. (Laborde's *Voyage en Orient*)
Longespee or Longsword, Earl of Salisbury. (Effigy in Salisbury
Cathedral)
Seal of Edward I. (From Great Seal)
Tomb of Queen Eleanor, Westminster Abbey. (Original sketch)
Arras. (Coney's *Cathedrals and Hotels de Ville*)
Philip IV. of France
Joan of Arc
Gate of Constance. (Print, from drawing by Major Cockburn)
Charles IX. of France. (French print by Adolph Brune)

MEMOIRS
OF
EXTRAORDINARY POPULAR DELUSIONS.

THE CRUSADES.

They heard, and up they sprang upon the wing
Innumerable. As when the potent rod
Of Amram's son, in Egypt's evil day,
Waved round the coast, up call'd a pitchy cloud
Of locusts, warping on the eastern wind
That o'er the realm of impious Pharaoh hung
Like night, and darken'd all the realm of Nile,
So numberless were they. * * * *
All in a moment through the gloom were seen
Ten thousand banners rise into the air,
With orient colours waving. With them rose
A forest huge of spears; and thronging helms
Appear'd, and serried shields, in thick array,
Of depth immeasurable.

Paradise Lost.

EVERY age has its peculiar folly; some scheme, project, or phantasy into which it plunges, spurred on either by the love of gain, the necessity of excitement, or the mere force of imitation. Failing in these, it has some madness, to which it is goaded by political or religious causes, or both combined. Every one of these causes influenced the Crusades, and conspired to render them the most extraordinary instance upon record of the extent to which popular enthusiasm can be carried. History in her solemn page informs us, that the Crusaders were but ignorant and savage

men, that their motives were those of bigotry unmitigated, and that their pathway was one of blood and tears. Romance, on the other hand, dilates upon their piety and heroism, and portrays, in her most glowing and impassioned hues, their virtue and magnanimity, the imperishable honour they acquired for themselves, and the great services they rendered to Christianity. In the following pages we shall ransack the stores of both, to discover the true spirit that animated the motley multitude who took up arms in the service of the cross, leaving history to vouch for facts, but not disdaining the aid of contemporary poetry and romance, to throw light upon feelings, motives, and opinions.

In order to understand thoroughly the state of public feeling in Europe at the time when Peter the Hermit preached the holy war, it will be necessary to go back for many years anterior to that event. We must make acquaintance with the pilgrims of the eighth, ninth, and tenth centuries, and learn the tales they told of the dangers they had passed and the wonders they had seen. Pilgrimages to the Holy Land seem at first to have been undertaken by converted Jews, and by Christian devotees of lively imagination, pining with a natural curiosity to visit the scenes which of all others were most interesting in their eyes. The pious and the impious alike flocked to Jerusalem,—the one class to feast their sight on the scenes hallowed by the life and sufferings of their Lord, and the other, because it soon became a generally received opinion, that such a pilgrimage was sufficient to rub off the long score of sins, however atrocious. Another and very numerous class of pilgrims were the idle and roving, who visited Palestine then as the moderns visit Italy or Switzerland now, because it was the fashion, and because they might please their vanity by retailing, on their return, the adventures they had met with. But the really pious formed the great majority. Every year their numbers increased, until at last they became so numerous as to be called the “armies of the Lord.” Full of enthusiasm, they set the dangers and difficulties of the way at defiance, and lingered with holy rapture on every scene described by the Evangelists. To

them it was bliss indeed to drink the clear waters of the Jordan, or be baptised in the same stream where John had baptised the Saviour. They wandered with awe and pleasure in the purlieu of the Temple, on the solemn Mount of Olives, or the awful Calvary, where a God had bled for sinful men. To these pilgrims every object was precious. Relics were eagerly sought after; flagons of water from Jordan, or panniers of mould from the hill of the Crucifixion, were brought home, and sold at extravagant prices to churches and monasteries. More apocryphal relics, such as the wood of the true cross, the tears of the Virgin Mary, the hems of her garments, the toe-nails and hair of the Apostles—even the tents that Paul had helped to manufacture—were exhibited for sale by the knavish in Palestine, and brought back to Europe “with wondrous cost and care.” A grove of a hundred oaks would not have furnished all the wood sold in little morsels as remnants of the true cross; and the tears of Mary, if collected together, would have filled a cistern.

For upwards of two hundred years the pilgrims met with no impediment in Palestine. The enlightened Haroun Al Reschid, and his more immediate successors, encouraged the stream which brought so much wealth into Syria, and treated the wayfarers with the utmost courtesy. The race of Fatemite caliphs,—who, although in other respects as tolerant, were more distressed for money, or more unscrupulous in obtaining it, than their predecessors of the house of Abbas,—imposed a tax of a bezant for each pilgrim that entered Jerusalem. This was a serious hardship upon the poorer sort, who had begged their weary way across Europe, and arrived at the bourne of all their hopes without a coin. A great outcry was immediately raised, but still the tax was rigorously levied. The pilgrims unable to pay were compelled to remain at the gate of the holy city until some rich devotee arriving with his train, paid the tax and let them in. Robert of Normandy, father of William the Conqueror, who, in common with many other nobles of the highest rank, undertook the pilgrimage,

found on his arrival scores of pilgrims at the gate, anxiously expecting his coming to pay the tax for them. Upon no occasion was such a boon refused.

The sums drawn from this source were a mine of wealth to the Moslem governors of Palestine, imposed as the tax had been at a time when pilgrimages had become more numerous than ever. A strange idea had taken possession of the popular mind at the close of the tenth and commencement of the eleventh century. It was universally believed that the end of the world was at hand; that the thousand years of the Apocalypse were near completion, and that Jesus Christ would descend upon Jerusalem to judge mankind. All Christendom was in commotion. A panic terror seized upon the weak, the credulous, and the guilty, who in those days formed more than nineteen-twentieths of the population. Forsaking their homes, kindred, and occupation, they crowded to Jerusalem to await the coming of the Lord, lightened, as they imagined, of a load of sin by their weary pilgrimage. To increase the panic, the stars were observed to fall from heaven, earthquakes to shake the land, and violent hurricanes to blow down the forests. All these, and more especially the meteoric phenomena, were looked upon as the forerunners of the approaching judgments. Not a meteor shot athwart the horizon that did not fill a district with alarm, and send away to Jerusalem a score of pilgrims, with staff in hand and wallet on their back, praying as they went for the remission of their sins. Men, women, and even children, trudged in droves to the holy city, in expectation of the day when the heavens would open, and the Son of God descend in his glory. This extraordinary delusion, while it augmented the numbers, increased also the hardships of the pilgrims. Beggars became so numerous on all the highways between the west of Europe and Constantinople, that the monks, the great almsgivers upon these occasions, would have brought starvation within sight of their own doors, if they had not economised their resources, and left the devotees to shift for themselves as they could. Hundreds of them were glad to subsist

upon the berries that ripened by the road, who, before this great flux, might have shared the bread and flesh of the monasteries.

But this was not the greatest of their difficulties. On their arrival in Jerusalem they found that a sterner race had obtained possession of the Holy Land. The caliphs of Bagdad had been succeeded by the harsh Turks of the race of Seljook, who looked upon the pilgrims with contempt and aversion. The Turks of the eleventh century were more ferocious and less scrupulous than the Saracens of the tenth. They were annoyed at the immense number of pilgrims who overran the country, and still more so because they shewed no intention of quitting it. The hourly expectation of the last judgment kept them waiting; and the Turks, apprehensive of being at last driven from the soil by the swarms that were still arriving, heaped up difficulties in their way. Persecution of every kind awaited them. They were plundered, and beaten with stripes, and kept in suspense for months at the gates of Jerusalem, unable to pay the golden bezant that was to procure them admission.

When the first epidemic terror of the day of judgment began to subside, a few pilgrims ventured to return to Europe, their hearts big with indignation at the insults they had suffered. Every where as they passed they related to a sympathising auditory the wrongs of Christendom. Strange to say, even these recitals increased the mania for pilgrimage. The greater the dangers of the way, the fairer chance that sins of deep dye would be atoned for. Difficulty and suffering only heightened the merit, and fresh hordes issued from every town and village, to win favour in the sight of heaven by a visit to the holy sepulchre. Thus did things continue during the whole of the eleventh century.

The train that was to explode so fearfully was now laid, and there wanted but the hand to apply the torch. At last the man appeared upon the scene. Like all who have ever achieved so great an end, Peter the Hermit was exactly suited to the age; neither behind it nor in advance of it; but acute enough to penetrate its mystery ere it was discovered by any other.

Enthusiastic, chivalrous, bigoted, and, if not insane, not far removed from insanity, he was the very prototype of the time. True enthusiasm is always persevering and always eloquent, and these two qualities were united in no common degree in the person of this extraordinary preacher. He was a monk of Amiens, and ere he assumed the hood had served as a soldier. He is represented as having been ill favoured and low in stature, but with an eye of surpassing brightness and intelligence. Having been seized with the mania of the age, he visited Jerusalem, and remained there till his blood boiled to see the cruel persecution heaped upon the devotees. On his return home he shook the world by the eloquent story of their wrongs.

Before entering into any further details of the marvellous results of his preaching, it will be advisable to cast a glance at the state of the mind of Europe, that we may understand all the better the causes of his success. First of all, there was the priesthood, which, exercising as it did the most conspicuous influence upon the fortunes of society, claims the largest share of attention. Religion was the ruling idea of that day, and the only civiliser capable of taming such wolves as then constituted the flock of the faithful. The clergy were all in all; and though they kept the popular mind in the most slavish subjection with regard to religious matters, they furnished it with the means of defence against all other oppression except their own. In the ecclesiastical ranks were concentrated all the true piety, all the learning, all the wisdom of the time; and, as a natural consequence, a great portion of power, which their very wisdom perpetually incited them to extend. The people knew nothing of kings and nobles, except in the way of injuries inflicted. The first ruled for, or more properly speaking against, the barons, and the barons only existed to brave the power of the kings, or to trample with their iron heels upon the neck of prostrate democracy. The latter had no friend but the clergy, and these, though they necessarily instilled the superstition from which they themselves were not exempt, yet taught the cheering doctrine that all men were equal in the sight of heaven. Thus, while Feudalism told them they had no rights in this world, Religion

told them they had every right in the next. With this consolation they were for the time content, for political ideas had as yet taken no root. When the clergy, for other reasons, recommended the Crusade, the people joined in it with enthusiasm. The subject of Palestine filled all minds; the pilgrims' tales of two centuries warmed every imagination; and when their friends, their guides, and their instructors preached a war so much in accordance with their own prejudices and modes of thinking, the enthusiasm rose into a frenzy.

But while religion inspired the masses, another agent was at work upon the nobility. These were fierce and lawless; tainted with every vice, endowed with no virtue, and redeemed by one good quality alone, that of courage. The only religion they felt was the religion of fear. That and their overboiling turbulence alike combined to guide them to the Holy Land. Most of them had sins enough to answer for. They lived with their hand against every man, and with no law but their own passions. They set at defiance the secular power of the clergy; but their hearts quailed at the awful denunciations of the pulpit with regard to the life to come. War was the business and the delight of their existence; and when they were promised remission of all their sins upon the easy condition of following their favourite bent, it is not to be wondered at that they rushed with enthusiasm to the onslaught, and became as zealous in the service of the cross as the great majority of the people, who were swayed by more purely religious motives. Fanaticism and the love of battle alike impelled them to the war, while the kings and princes of Europe had still another motive for encouraging their zeal. Policy opened their eyes to the great advantages which would accrue to themselves by the absence of so many restless, intriguing, and bloodthirsty men, whose insolence it required more than the small power of royalty to restrain within due bounds. Thus every motive was favourable to the Crusades. Every class of society was alike incited to join or encourage the war: kings and the clergy by policy, the nobles by turbulence and the love of dominion, and the people by religious

zeal and the concentrated enthusiasm of two centuries, skilfully directed by their only instructors.

It was in Palestine itself that Peter the Hermit first conceived the grand idea of rousing the powers of Christendom to rescue the Christians of the East from the thralldom of the Mussulmans, and the sepulchre of Jesus from the rude hands of the infidel. The subject engrossed his whole mind. Even in the visions of the night he was full of it. One dream made such an impression upon him, that he devoutly believed the Saviour of the world himself appeared before him, and promised him aid and protection in his holy undertaking. If his zeal had ever wavered before, this was sufficient to fix it for ever.

Peter, after he had performed all the penances and duties of his pilgrimage, demanded an interview with Simeon, the Patriarch of the Greek Church at Jerusalem. Though the latter was a heretic in Peter's eyes, yet he was still a Christian, and felt as acutely as himself for the persecutions heaped by the Turks upon the followers of Jesus. The good prelate entered fully into his views, and, at his suggestion, wrote letters to the Pope, and to the most influential monarchs of Christendom, detailing the sorrows of the faithful, and urging them to take up arms in their defence. Peter was not a laggard in the work. Taking an affectionate farewell of the Patriarch, he returned in all haste to Italy. Pope Urban II. occupied the apostolic chair. It was at that time far from being an easy seat. His predecessor Gregory had bequeathed him a host of disputes with the Emperor Henry IV. of Germany, and he had converted Philip I. of France into an enemy by his strenuous opposition to an adulterous connexion formed by that monarch. So many dangers encompassed him, that the Vatican was no secure abode, and he had taken refuge in Apulia, under the protection of the renowned Robert Guiscard. Thither Peter appears to have followed him, though in what spot their meeting took place is not stated with any precision by ancient chroniclers or modern historians. Urban received him most kindly; read, with tears in his eyes, the epistle from the

Patriarch Simeon, and listened to the eloquent story of the Hermit with an attention which shewed how deeply he sympathised with the woes of the Christian Church. Enthusiasm is contagious; and the Pope appears to have caught it instantly from one whose zeal was so unbounded. Giving the Hermit full powers, he sent him abroad to preach the holy war to all the nations and potentates of Christendom. The Hermit preached, and countless thousands answered to his call. France, Germany, and Italy started at his voice, and prepared for the deliverance of Zion. One of the early historians of the Crusade, who was himself an eye-witness of the rapture of Europe,¹ describes the personal appearance of the Hermit at this time. He says, that there appeared to be something of divine in every thing which he said or did. The people so highly revered him, that they plucked hairs from the mane of his mule that they might keep them as relics. While preaching, he wore in general a woollen tunic, with a dark-coloured mantle, which fell down to his heels. His arms and feet were bare; and he ate neither flesh nor bread, supporting himself chiefly upon fish and wine. "He set out," says the chronicler, "from whence I know not; but we saw him passing through the towns and villages, preaching every where, and the people surrounding him in crowds, loading him with offerings, and celebrating his sanctity with such great praises, that I never remember to have seen such honours bestowed upon any one." Thus he went on, untired, inflexible, and full of devotion, communicating his own madness to his hearers, until Europe was stirred from its very depths.

While the Hermit was appealing with such signal success to the people, the Pope appealed with as much success to those who were to become the chiefs and leaders of the expedition. His first step was to call a council at Placentia, in the autumn of the year 1095. Here, in the assembly of the clergy, the Pope debated the grand scheme, and gave audience to emissaries who had been sent from Constantinople by the Emperor of the East, to detail the progress made by the Turks in their design of establishing themselves in Europe. The clergy were of course unanimous in

support of the Crusade; and the council separated, each individual member of it being empowered to preach it to his people.

But Italy could not be expected to furnish all the aid required; and the Pope crossed the Alps to inspire the fierce and powerful nobility and chivalrous population of Gaul. His boldness in entering the territory, and placing himself in the power of his foe, King Philip of France, is not the least surprising feature of his mission. Some have imagined that cool policy alone actuated him; while others assert that it was mere zeal, as warm and as blind as that of Peter the Hermit. The latter opinion seems to be the true one. Society did not calculate the consequences of what it was doing. Every man seemed to act from impulse only; and the Pope, in throwing himself into the heart of France, acted as much from impulse as the thousands who responded to his call. A council was eventually summoned to meet him at Clermont, in Auvergne, to consider the state of the Church, reform abuses, and, above all, make preparations for the war. It was in the midst of an extremely cold winter, and the ground was covered with snow. During seven days the council sat with closed doors, while immense crowds from all parts of France flocked into the town, in expectation that the Pope himself would address the people. All the towns and villages for miles around were filled with the multitude; even the fields were encumbered with people, who, unable to procure lodging, pitched their tents under the trees and by the way-side. All the neighbourhood presented the appearance of a vast camp.

THE CATHEDRAL OF CLERMONT.

During the seven days' deliberation, a sentence of excommunication was passed upon King Philip for adultery with Bertrade de Montfort, Countess of Anjou, and for disobedience to the supreme authority of the apostolic see. This bold step impressed the people with reverence for so stern a Church, which in the discharge of its duty shewed itself no respecter of persons. Their love and their fear were alike increased, and they were prepared to listen with more intense devotion to the preaching of so righteous and inflexible a pastor. The great square before the cathedral church of Clermont became every instant more densely crowded as the hour drew nigh when the Pope was to address the populace. Issuing from the church in his full canonicals, surrounded by his cardinals and bishops in all the splendour of Romish ecclesiastical costume, the Pope stood before the populace on a high scaffolding erected for the occasion, and covered with scarlet cloth. A brilliant array of bishops and cardinals surrounded him; and among them, humbler in rank, but more important in the world's eye, the Hermit Peter, dressed in his simple and austere habiliments. Historians differ as to whether or not Peter addressed the crowd, but as all agree that he was present, it seems reasonable to suppose

that he spoke. But it was the oration of the Pope that was most important. As he lifted up his hands to ensure attention, every voice immediately became still. He began by detailing the miseries endured by their brethren in the Holy Land; how the plains of Palestine were desolated by the outrageous heathen, who with the sword and the firebrand carried wailing into the dwellings and flames into the possessions of the faithful; how Christian wives and daughters were defiled by pagan lust; how the altars of the true God were desecrated, and the relics of the saints trodden under foot. "You," continued the eloquent pontiff (and Urban II. was one of the most eloquent men of the day), "you, who hear me, and who have received the true faith, and been endowed by God with power, and strength, and greatness of soul,—whose ancestors have been the prop of Christendom, and whose kings have put a barrier against the progress of the infidel,—I call upon you to wipe off these impurities from the face of the earth, and lift your oppressed fellow-Christians from the depths into which they have been trampled. The sepulchre of Christ is possessed by the heathen, the sacred places dishonoured by their vileness. Oh, brave knights and faithful people! offspring of invincible fathers! ye will not degenerate from your ancient renown. Ye will not be restrained from embarking in this great cause by the tender ties of wife or little ones, but will remember the words of the Saviour of the world himself, 'Whosoever loves father and mother more than me is not worthy of me. Whosoever shall abandon for my name's sake his house, or his brethren, or his sisters, or his father, or his mother, or his wife, or his children, or his lands, shall receive a hundredfold, and shall inherit eternal life.'"

The warmth of the Pontiff communicated itself to the crowd, and the enthusiasm of the people broke out several times ere he concluded his address. He went on to portray, not only the spiritual but the temporal advantages that would accrue to those who took up arms in the service of the cross. Palestine was, he said, a land flowing with milk and honey, and precious in the sight of God, as the scene of the grand events which had

saved mankind. That land, he promised, should be divided among them. Moreover, they should have full pardon for all their offences, either against God or man. "Go, then," he added, "in expiation of your sins; and go assured, that after this world shall have passed away, imperishable glory shall be yours in the world which is to come." The enthusiasm was no longer to be restrained, and loud shouts interrupted the speaker; the people exclaiming as if with one voice, "*Dieu le veult! Dieu le veult!*" With great presence of mind Urban took advantage of the outburst, and as soon as silence was obtained, continued: "Dear brethren, to-day is shewn forth in you that which the Lord has said by his Evangelist, 'When two or three are gathered together in my name, there will I be in the midst of them to bless them.' If the Lord God had not been in your souls, you would not all have pronounced the same words; or rather God himself pronounced them by your lips, for it was he that put them in your hearts. Be they, then, your war-cry in the combat, for those words came forth from God. Let the army of the Lord, when it rushes upon his enemies, shout but that one cry, '*Dieu le veult! Dieu le veult!*' Let whoever is inclined to devote himself to this holy cause make it a solemn engagement, and bear the cross of the Lord either on his breast or his brow till he set out; and let him who is ready to begin his march place the holy emblem on his shoulders, in memory of that precept of our Saviour, 'He who does not take up his cross and follow me is not worthy of me.'"

The news of this council spread to the remotest parts of Europe in an incredibly short space of time. Long before the fleetest horseman could have brought the intelligence, it was known by the people in distant provinces; a fact which was considered as nothing less than supernatural. But the subject was in every body's mouth, and the minds of men were prepared for the result. The enthusiastic merely asserted what they wished, and the event tallied with their prediction. This was, however, quite enough in those days for a miracle, and as a miracle every one regarded it.

For several months after the Council of Clermont, France and Germany presented a singular spectacle. The pious, the fanatic, the needy, the dissolute, the young and the old, even women and children, and the halt and lame, enrolled themselves by hundreds. In every village the clergy were busied in keeping up the excitement, promising eternal rewards to those who assumed the red cross, and fulminating the most awful denunciations against all the worldly-minded who refused or even hesitated. Every debtor who joined the Crusade was freed by the papal edict from the claims of his creditors; outlaws of every grade were made equal with the honest upon the same conditions. The property of those who went was placed under the protection of the Church, and St. Paul and St. Peter themselves were believed to descend from their high abode, to watch over the chattels of the absent pilgrims. Signs and portents were seen in the air, to increase the fervour of the multitude. An aurora-borealis of unusual brilliancy appeared, and thousands of the Crusaders came out to gaze upon it, prostrating themselves upon the earth in adoration. It was thought to be a sure prognostic of the interposition of the Most High; and a representation of his armies fighting with and overthrowing the infidels. Reports of wonders were every where rife. A monk had seen two gigantic warriors on horseback, the one representing a Christian and the other a Turk, fighting in the sky with flaming swords, the Christian of course overcoming the Paynim. Myriads of stars were said to have fallen from heaven, each representing the fall of a Pagan foe. It was believed at the same time that the Emperor Charlemagne would rise from the grave, and lead on to victory the embattled armies of the Lord. A singular feature of the popular madness was the enthusiasm of the women. Every where they encouraged their lovers and husbands to forsake all things for the holy war. Many of them burned the sign of the cross upon their breasts and arms, and coloured the wound with a red dye, as a lasting memorial of their zeal. Others, still more zealous, impressed the mark by the same means upon the tender limbs of young children and infants at the breast.

Guibert de Nogent tells of a monk who made a large incision upon his forehead in the form of a cross, which he coloured with some powerful ingredient, telling the people that an angel had done it when he was asleep. This monk appears to have been more of a rogue than a fool, for he contrived to fare more sumptuously than any of his brother pilgrims, upon the strength of his sanctity. The Crusaders every where gave him presents of food and money, and he became quite fat ere he arrived at Jerusalem, notwithstanding the fatigues of the way. If he had acknowledged in the first place that he had made the wound himself, he would not have been thought more holy than his fellows; but the story of the angel was a clincher.

All those who had property of any description rushed to the mart to change it into hard cash. Lands and houses could be had for a quarter of their value, while arms and accoutrements of war rose in the same proportion. Corn, which had been excessively dear in anticipation of a year of scarcity, suddenly became plentiful; and such was the diminution in the value of provisions, that seven sheep were sold for five *deniers*.² The nobles mortgaged their estates for mere trifles to Jews and unbelievers, or conferred charters of immunity upon the towns and communes within their fiefs, for sums which, a few years previously, they would have rejected with disdain. The farmer endeavoured to sell his plough, and the artisan his tools, to purchase a sword for the deliverance of Jerusalem. Women disposed of their trinkets for the same purpose. During the spring and summer of this year (1096) the roads teemed with crusaders, all hastening to the towns and villages appointed as the rendezvous of the district. Some were on horseback, some in carts, and some came down the rivers in boats and rafts, bringing their wives and children, all eager to go to Jerusalem. Very few knew where Jerusalem was. Some thought it fifty thousand miles away, and others imagined that it was but a month's journey; while at sight of every town or castle the children exclaimed, "Is that Jerusalem? Is that the city?"³ Parties of knights and nobles might be seen travelling eastward,

and amusing themselves as they went with the knightly diversion of hawking, to lighten the fatigues of the way.

Guibert de Nogent, who did not write from hearsay, but from actual observation, says the enthusiasm was so contagious, that when any one heard the orders of the Pontiff, he went instantly to solicit his neighbours and friends to join with him in “the way of God,” for so they called the proposed expedition. The Counts Palatine were full of the desire to undertake the journey, and all the inferior knights were animated with the same zeal. Even the poor caught the flame so ardently, that no one paused to think of the inadequacy of his means, or to consider whether he ought to yield up his farm, his vineyard, or his fields. Each one set about selling his property at as low a price as if he had been held in some horrible captivity, and sought to pay his ransom without loss of time. Those who had not determined upon the journey joked and laughed at those who were thus disposing of their goods at such ruinous prices, prophesying that the expedition would be miserable and their return worse. But they held this language only for a day; the next they were suddenly seized with the same frenzy as the rest. Those who had been loudest in their jeers gave up all their property for a few crowns, and set out with those they had so laughed at a few hours before. In most cases the laugh was turned against them; for when it became known that a man was hesitating, his more zealous neighbours sent him a present of a knitting-needle or a distaff, to shew their contempt of him. There was no resisting this; so that the fear of ridicule contributed its fair contingent to the armies of the Lord.

Another effect of the Crusade was, the religious obedience with which it inspired the people and the nobility for that singular institution “The Truce of God.” At the commencement of the eleventh century, the clergy of France, sympathising for the woes of the people, but unable to diminish them, by repressing the rapacity and insolence of the feudal chiefs, endeavoured to promote universal good-will by the promulgation of the famous “Peace of God.” All who conformed to it bound themselves by oath

not to take revenge for any injury, not to enjoy the fruits of property usurped from others, nor to use deadly weapons; in reward of which they would receive remission of all their sins. However benevolent the intention of this "Peace," it led to nothing but perjury, and violence reigned as uncontrolled as before. In the year 1041, another attempt was made to soften the angry passions of the semi-barbarous chiefs, and the "Truce of God" was solemnly proclaimed. The *truce* lasted from the Wednesday evening to the Monday morning of every week, in which interval it was strictly forbidden to recur to violence on any pretext, or to seek revenge for any injury. It was impossible to civilise men by these means. Few even promised to become peaceable for so unconscionable a period as five days a-week; or if they did, they made ample amends on the two days left open to them. The truce was afterwards shortened from the Saturday evening to the Monday morning; but little or no diminution of violence and bloodshed was the consequence. At the Council of Clermont, Urban II. again solemnly proclaimed the truce. So strong was the religious feeling, that every one hastened to obey. All minor passions disappeared before the grand passion of crusading. The feudal chief ceased to oppress, the robber to plunder, the people to complain; but one idea was in all hearts, and there seemed to be no room for any other.

The encampments of these heterogeneous multitudes offered a singular aspect. Those vassals who ranged themselves under the banners of their lord erected tents around his castle; while those who undertook the war on their own account constructed booths and huts in the neighbourhood of the towns or villages, preparatory to their joining some popular leader of the expedition. The meadows of France were covered with tents. As the belligerents were to have remission of all their sins on their arrival in Palestine, hundreds of them gave themselves up to the most unbounded licentiousness. The courtesan, with the red cross upon her shoulders, plied her shameless trade with sensual pilgrims without scruple on either side; the lover of good cheer gave loose rein to his appetite, and drunkenness

and debauchery flourished. Their zeal in the service of the Lord was to wipe out all faults and follies, and they had the same surety of salvation as the rigid anchorite. This reasoning had charms for the ignorant, and the sounds of lewd revelry and the voice of prayer rose at the same instant from the camp.

It is now time to speak of the leaders of the expedition. Great multitudes ranged themselves under the command of Peter the Hermit, whom, as the originator, they considered the most appropriate leader of the war. Others joined the banner of a bold adventurer, whom history has dignified with no other name than that of Gautier sans Avoir, or Walter the Pennyless, but who is represented as having been of noble family, and well skilled in the art of war. A third multitude from Germany flocked around the standard of a monk named Gottschalk, of whom nothing is known except that he was a fanatic of the deepest dye. All these bands, which together are said to have amounted to three hundred thousand men, women, and children, were composed of the vilest rascality of Europe. Without discipline, principle, or true courage, they rushed through the nations like a pestilence, spreading terror and death wherever they went. The first multitude that set forth was led by Walter the Pennyless early in the spring of 1096, within a very few months after the Council of Clermont. Each man of that irregular host aspired to be his own master. Like their nominal leader, each was poor to penury, and trusted for subsistence on his journey to the chances of the road. Rolling through Germany like a tide, they entered Hungary, where, at first, they were received with some degree of kindness by the people. The latter had not yet caught sufficient of the fire of enthusiasm to join the Crusade themselves, but were willing enough to forward the cause by aiding those embarked in it. Unfortunately this good understanding did not last long. The swarm were not contented with food for their necessities, but craved for luxuries also. They attacked and plundered the dwellings of the country people, and thought nothing of murder where resistance was offered. On their arrival before Semlin, the outraged Hungarians collected

in large numbers, and, attacking the rear of the crusading host, slew a great many of the stragglers, and, taking away their arms and crosses, affixed them as trophies to the walls of the city. Walter appears to have been in no mood or condition to make reprisals; for his army, destructive as a plague of locusts when plunder urged them on, were useless against any regular attack from a determined enemy. Their rear continued to be thus harassed by the wrathful Hungarians until they were fairly out of their territory. On his entrance into Bulgaria, Walter met with no better fate. The cities and towns refused to let him pass; the villages denied him provisions; and the citizens and country people uniting, slaughtered his followers by hundreds. The progress of the army was more like a retreat than an advance; but as it was impossible to stand still, Walter continued his course till he arrived at Constantinople with a force which famine and the sword had diminished to one-third of its original number.

The greater multitude, led by the enthusiastic Hermit, followed close upon his heels, with a bulky train of baggage, and women and children sufficient to form a host of themselves. If it were possible to find a rabble more vile than the army of Walter the Pennyless, it was that led by Peter the Hermit. Being better provided with means, they were not reduced to the necessity of pillage in their progress through Hungary; and had they taken any other route than that which led through Semlin, might perhaps have traversed the country without molestation. On their arrival before that city, their fury was raised at seeing the arms and red crosses of their predecessors hanging as trophies over the gates. Their pent-up ferocity exploded at the sight. The city was tumultuously attacked, and the besiegers entering, not by dint of bravery, but of superior numbers, it was given up to all the horrors which follow when victory, brutality, and licentiousness are linked together. Every evil passion was allowed to revel with impunity, and revenge, lust, and avarice,—each had its hundreds of victims in unhappy Semlin. Any maniac can kindle a conflagration, but it may require many wise men to put it out. Peter the Hermit had blown the

popular fury into a flame, but to cool it again was beyond his power. His followers rioted unrestrained, until the fear of retaliation warned them to desist. When the king of Hungary was informed of the disasters of Semlin, he marched with a sufficient force to chastise the Hermit, who, at the news, broke up his camp and retreated towards the Morava, a broad and rapid stream that joins the Danube a few miles to the eastward of Belgrade. Here a party of indignant Bulgarians awaited him, and so harassed him, as to make the passage of the river a task both of difficulty and danger. Great numbers of his infatuated followers perished in the waters, and many fell under the swords of the Bulgarians. The ancient chronicles do not mention the amount of the Hermit's loss at this passage, but represent it in general terms as very great.

At Nissa, the Duke of Bulgaria fortified himself, in fear of an assault; but Peter, having learned a little wisdom from experience, thought it best to avoid hostilities. He passed three nights in quietness under the walls, and the duke, not wishing to exasperate unnecessarily so fierce and rapacious a host, allowed the townspeople to supply them with provisions. Peter took his departure peaceably on the following morning; but some German vagabonds, falling behind the main body of the army, set fire to the mills and house of a Bulgarian, with whom, it appears, they had had some dispute on the previous evening. The citizens of Nissa, who had throughout mistrusted the Crusaders, and were prepared for the worst, sallied out immediately, and took signal vengeance. The spoilers were cut to pieces, and the townspeople pursuing the Hermit, captured all the women and children who had lagged in the rear, and a great quantity of baggage. Peter hereupon turned round and marched back to Nissa, to demand explanation of the Duke of Bulgaria. The latter fairly stated the provocation given, and the Hermit could urge nothing in palliation of so gross an outrage. A negotiation was entered into, which promised to be successful, and the Bulgarians were about to deliver up the women and children, when a party of undisciplined Crusaders, acting solely upon their own suggestion,

endeavoured to scale the walls and seize upon the town. Peter in vain exerted his authority; the confusion became general, and after a short but desperate battle, the Crusaders threw down their arms, and fled in all directions. Their vast host was completely routed, the slaughter being so great among them, as to be counted, not by hundreds, but by thousands.

It is said that the Hermit fled from this fatal field to a forest a few miles from Nissa, abandoned by every human creature. It would be curious to know whether, after so dire a reverse,

“His enpierced breast
Sharp sorrow did in thousand pieces rive,”

or whether his fiery zeal still rose superior to calamity, and pictured the eventual triumph of his cause. He, so lately the leader of a hundred thousand men, was now a solitary skulker in the forests, liable at every instant to be discovered by some pursuing Bulgarian, and cut off in mid career. Chance at last brought him within sight of an eminence, where two or three of his bravest knights had collected five hundred of the stragglers. These gladly received the Hermit, and a consultation having taken place, it was resolved to gather together the scattered remnants of the army. Fires were lighted on the hill, and scouts sent out in all directions for the fugitives. Horns were sounded at intervals, to make known that friends were near, and before nightfall the Hermit saw himself at the head of seven thousand men. During the succeeding day, he was joined by twenty thousand more, and with this miserable remnant of his force, he pursued his route towards Constantinople. The bones of the rest mouldered in the forests of Bulgaria.

On his arrival at Constantinople, where he found Walter the Pennyless awaiting him, he was hospitably received by the Emperor Alexius. It might have been expected that the sad reverses they had undergone would have

taught his followers common prudence; but, unhappily for them, their turbulence and love of plunder was not to be restrained. Although they were surrounded by friends, by whom all their wants were liberally supplied, they could not refrain from rapine. In vain the Hermit exhorted them to tranquillity; he possessed no more power over them, in subduing their passions, than the obscurest soldier of the host. They set fire to several public buildings in Constantinople out of pure mischief, and stripped the lead from the roofs of the churches, which they afterwards sold for old metal in the purlieu of the city. From this time may be dated the aversion which the Emperor Alexius entertained for the Crusaders, and which was afterwards manifested in all his actions, even when he had to deal with the chivalrous and more honourable armies which arrived after the Hermit. He seems to have imagined that the Turks themselves were enemies less formidable to his power than these outpourings of the refuse of Europe: he soon found a pretext to hurry them into Asia Minor. Peter crossed the Bosphorus with Walter, but the excesses of his followers were such, that, despairing of accomplishing any good end by remaining at their head, he left them to themselves, and returned to Constantinople, on the pretext of making arrangements with the government of Alexius for a proper supply of provisions. The Crusaders, forgetting that they were in the enemy's country, and that union, above all things, was desirable, gave themselves up to dissensions. Violent disputes arose between the Lombards and Normans commanded by Walter the Pennyless, and the Franks and Germans led out by Peter. The latter separated themselves from the former, and, choosing for their leader one Reinaldo, or Reinhold, marched forward, and took possession of the fortress of Exorogorgon. The Sultan Solimaun was on the alert, with a superior force. A party of Crusaders, which had been detached from the fort, and stationed at a little distance as an ambuscade, were surprised and cut to pieces, and Exorogorgon invested on all sides. The siege was protracted for eight days, during which the Christians suffered the most acute agony from the want

of water. It is hard to say how long the hope of succour or the energy of despair would have enabled them to hold out: their treacherous leader cut the matter short by renouncing the Christian faith, and delivering up the fort into the hands of the sultan. He was followed by two or three of his officers; all the rest, refusing to become Mahometans, were ruthlessly put to the sword. Thus perished the last wretched remnant of the vast multitude which had traversed Europe with Peter the Hermit.

Walter the Pennyless and his multitude met as miserable a fate. On the news of the disasters of Exorogorgon, they demanded to be led instantly against the Turks. Walter, who only wanted good soldiers to have made a good general, was cooler of head, and saw all the dangers of such a step. His force was wholly insufficient to make any decisive movement in a country where the enemy was so much superior, and where, in case of defeat, he had no secure position to fall back upon; and he therefore expressed his opinion against advancing until the arrival of reinforcements. This prudent counsel found no favour: the army loudly expressed their dissatisfaction at their chief, and prepared to march forward without him. Upon this, the brave Walter put himself at their head, and rushed to destruction. Proceeding towards Nice, the modern Isnik, he was intercepted by the army of the sultan: a fierce battle ensued, in which the Turks made fearful havoc; out of twenty-five thousand Christians, twenty-two thousand were slain, and among them Gautier himself, who fell pierced by seven mortal wounds. The remaining three thousand retreated upon Civitot, where they entrenched themselves.

ISNIK.

Disgusted as was Peter the Hermit at the excesses of the multitude, who, at his call, had forsaken Europe, his heart was moved with grief and pity at their misfortunes. All his former zeal revived: casting himself at the feet of the Emperor Alexius, he implored him, with tears in his eyes, to send relief to the few survivors at Civitot. The emperor consented, and a force was sent, which arrived just in time to save them from destruction. The Turks had beleaguered the place, and the Crusaders were reduced to the last extremity. Negotiations were entered into, and the last three thousand were conducted in safety to Constantinople. Alexius had suffered too much by their former excesses to be very desirous of retaining them in his capital:

he therefore caused them all to be disarmed, and, furnishing each with a sum of money, he sent them back to their own country.

While these events were taking place, fresh hordes were issuing from the woods and wilds of Germany, all bent for the Holy Land. They were commanded by a fanatical priest, named Gottschalk, who, like Gautier and Peter the Hermit, took his way through Hungary. History is extremely meagre in her details of the conduct and fate of this host, which amounted to at least one hundred thousand men. Robbery and murder seem to have journeyed with them, and the poor Hungarians were rendered almost desperate by their numbers and rapacity. Karloman, the king of the country, made a bold effort to get rid of them; for the resentment of his people had arrived at such a height, that nothing short of the total extermination of the Crusaders would satisfy them. Gottschalk had to pay the penalty, not only for the ravages of his own bands, but for those of the swarms that had come before him. He and his army were induced, by some means or other, to lay down their arms: the savage Hungarians, seeing them thus defenceless, set upon them, and slaughtered them in great numbers. How many escaped their arrows we are not informed; but not one of them reached Palestine.

Other swarms, under nameless leaders, issued from Germany and France, more brutal and more frantic than any that had preceded them. Their fanaticism surpassed by far the wildest freaks of the followers of the Hermit. In bands, varying in numbers from one to five thousand, they traversed the country in all directions, bent upon plunder and massacre. They wore the symbol of the Crusade upon their shoulders, but inveighed against the folly of proceeding to the Holy Land to destroy the Turks, while they left behind them so many

Jews, the still more inveterate enemies of Christ. They swore fierce vengeance against this unhappy race, and murdered all the Hebrews they could lay their hands on, first subjecting them to the most horrible mutilation. According to the testimony of Albert Aquensis, they lived among each other in the most shameless profligacy, and their vice was only exceeded by their superstition. Whenever they were in search of Jews, they were preceded by a goose and goat, which they believed to be holy, and animated with divine power to discover the retreats of the unbelievers. In Germany alone they slaughtered more than a thousand Jews, notwithstanding all the efforts of the clergy to save them. So dreadful was the cruelty of their tormentors, that great numbers of Jews committed self-destruction to avoid falling into their hands.

Again it fell to the lot of the Hungarians to deliver Europe from these pests. When there were no more Jews to murder, the bands collected in one body, and took the old route to the Holy Land, a route stained with the blood of three hundred thousand who had gone before, and destined also to receive theirs. The number of these swarms has never been stated; but so many of them perished in Hungary, that contemporary writers, despairing of giving any adequate idea of their multitudes, state that the fields were actually heaped with their corpses, and that for miles in its course the waters of the Danube were dyed with their blood. It was at Mersburg, on the Danube, that the greatest slaughter took place,—a slaughter so great as to amount almost to extermination. The Hungarians for a while disputed the passage of the river, but the Crusaders forced their way across, and attacking the city with the blind courage of madness, succeeded in making a breach in the walls. At this moment of victory

an unaccountable fear came over them. Throwing down their arms, they fled panic-stricken, no one knew why, and no one knew whither. The Hungarians followed, sword in hand, and cut them down without remorse, and in such numbers, that the stream of the Danube is said to have been choked up by their unburied bodies.

This was the worst paroxysm of the madness of Europe; and this passed, her chivalry stepped upon the scene. Men of cool heads, mature plans, and invincible courage stood forward to lead and direct the grand movement of Europe upon Asia. It is upon these men that romance has lavished her most admiring epithets, leaving to the condemnation of history the vileness and brutality of those who went before. Of these leaders the most distinguished were Godfrey of Bouillon duke of Lorraine, and Raymond count of Toulouse. Four other chiefs of the royal blood of Europe also assumed the cross, and led each his army to the Holy Land; Hugh count of Vermandois, brother of the king of France; Robert duke of Normandy, the elder brother of William Rufus; Robert count of Flanders, and Bohemund prince of Tarentum, eldest son of the celebrated Robert Guiscard. These men were all tinged with the fanaticism of the age, but none of them acted entirely from religious motives. They were neither utterly reckless like Gautier sans Avoir, crazy like Peter the Hermit, nor brutal like Gottschalk the Monk, but possessed each of these qualities in a milder form; their valour being tempered by caution, their religious zeal by worldly views, and their ferocity by the spirit of chivalry. They saw whither led the torrent of the public will; and it being neither their wish nor their interest to stem it, they allowed themselves to be carried with it, in the hope that it would lead them at last to a haven of aggrandisement. Around

them congregated many minor chiefs, the flower of the nobility of France and Italy, with some few from Germany, England, and Spain. It was wisely conjectured that armies so numerous would find a difficulty in procuring provisions if they all journeyed by the same road. They therefore resolved to separate; Godfrey de Bouillon proceeding through Hungary and Bulgaria, the Count of Toulouse through Lombardy and Dalmatia, and the other leaders through Apulia to Constantinople, where the several divisions were to reunite. The forces under these leaders have been variously estimated. The Princess Anna Comnena talks of them as having been as numerous as the sands on the sea-shore, or the stars in the firmament. Fulcher of Chartres is more satisfactory, and exaggerates less magnificently, when he states, that all the divisions, when they had sat down before Nice in Bithynia, amounted to one hundred thousand horsemen, and six hundred thousand men on foot, exclusive of the priests, women, and children. Gibbon is of opinion that this amount is exaggerated; but thinks the actual numbers did not fall very far short of the calculation. The Princess Anna afterwards gives the number of those under Godfrey of Bouillon as eighty thousand foot and horse; and supposing that each of the other chiefs led an army as numerous, the total would be near half a million. This must be over rather than under the mark, as the army of Godfrey of Bouillon was confessedly the largest when it set out, and suffered less by the way than any other.

GODFREY DE BOUILLON.

The Count of Vermandois was the first who set foot on the Grecian territory. On his arrival at Durazzo he was received with every mark of respect and courtesy by the agents of the emperor, and his followers were abundantly supplied with provisions. Suddenly, however, and without cause assigned, the count was arrested by order of the Emperor Alexius, and conveyed a close prisoner to Constantinople. Various motives have been assigned by different authors as having induced the emperor to this treacherous and imprudent proceeding. By every writer he has been condemned for so flagrant a breach of hospitality and justice. The most probable reason for his conduct appears to be that suggested by Guibert of Nogent, who states that Alexius, fearful of the designs of the Crusaders upon his throne, resorted to this extremity in order afterwards to force the count to take the oath of allegiance to him, as the price of his liberation. The example of a prince so eminent as the brother of the king of France, would, he thought, be readily followed by the other chiefs of the Crusade. In the result he was wofully

disappointed, as every man deserves to be who commits positive evil that doubtful good may ensue. But this line of policy accorded well enough with the narrowmindedness of the emperor, who, in the enervating atmosphere of his highly civilised and luxurious court, dreaded the influx of the hardy and ambitious warriors of the West, and strove to nibble away by unworthy means the power which he had not energy enough to confront. If danger to himself had existed from the residence of the chiefs in his dominions, he might easily have averted it, by the simple means of placing himself at the head of the European movement, and directing its energies to their avowed object, the conquest of the Holy Land. But the emperor, instead of being, as he might have been, the lord and leader of the Crusades, which he had himself aided in no inconsiderable degree to suscite by his embassies to the Pope, became the slave of men who hated and despised him. No doubt the barbarous excesses of the followers of Gautier and Peter the Hermit made him look upon the whole body of them with disgust, but it was the disgust of a little mind, which is glad of any excuse to palliate or justify its own irresolution and love of ease.

Godfrey of Bouillon traversed Hungary in the most quiet and orderly manner. On his arrival at Mersburg he found the country strewn with the mangled corpses of the Jew-killers, and demanded of the king of Hungary for what reason his people had set upon them. The latter detailed the atrocities they had committed, and made it so evident to Godfrey that the Hungarians had only acted in self-defence, that the high-minded leader declared himself satisfied, and passed on without giving or receiving molestation. On his arrival at Philippopoli he was informed for the first time of the imprisonment

of the count of Vermandois. He immediately sent messengers to the emperor, demanding the count's release, and threatening, in case of refusal, to lay waste the country with fire and sword. After waiting a day at Philippopoli, he marched on to Adrianople, where he was met by his messengers returning with the emperor's refusal. Godfrey, the bravest and most determined of the leaders of the Crusade, was not a man to swerve from his word, and the country was given up to pillage. Alexius here committed another blunder. No sooner did he learn from dire experience that the Crusader was not an utterer of idle threats, than he consented to the release of the prisoner. As he had been unjust in the first instance, he became cowardly in the second, and taught his enemies (for so the Crusaders were forced to consider themselves) a lesson which they took care to remember to his cost, that they could hope nothing from his sense of justice, but every thing from his fears. Godfrey remained encamped for several weeks in the neighbourhood of Constantinople, to the great annoyance of Alexius, who sought by every means to extort from him the homage he had extorted from Vermandois. Sometimes he acted as if at open and declared war with the Crusaders, and sent his troops against them. Sometimes he refused to supply them with food, and ordered the markets to be shut against them, while at other times he was all for peace and good-will, and sent costly presents to Godfrey. The honest, straightforward Crusader was at last so wearied by his false kindness, and so pestered by his attacks, that, allowing his indignation to get the better of his judgment, he gave up the country around Constantinople to be plundered by his soldiers. For six days the flames of the farm-houses around struck terror into the heart of Alexius; but, as Godfrey anticipated, they convinced him of

his error. Fearing that Constantinople itself would be the next object of attack, he sent messengers to demand an interview with Godfrey, offering at the same time to leave his son as a hostage for his good faith. Godfrey agreed to meet him; and, whether to put an end to these useless dissensions, or for some other unexplained reason, he rendered homage to Alexius as his liege lord. He was thereupon loaded with honours, and, according to a singular custom of that age, underwent the ceremony of the “adoption of honour” as son to the emperor. Godfrey and his brother Baudouin de Bouillon conducted themselves with proper courtesy on this occasion, but were not able to restrain the insolence of their followers, who did not conceive themselves bound to keep any terms with a man so insincere as he had shewn himself. One barbarous chieftain, Count Robert of Paris, carried his insolence so far as to seat himself upon the throne; an insult which Alexius merely resented with a sneer, but which did not induce him to look with less mistrust upon the hordes that were still advancing.

It is impossible, notwithstanding his treachery, to avoid feeling some compassion for the emperor, whose life at this time was rendered one long scene of misery by the presumption of the Crusaders, and his not altogether groundless fears of the evil they might inflict upon him, should any untoward circumstance force the current of their ambition to the conquest of his empire. His daughter Anna Comnena feelingly deplores his state of life at this time, and a learned German⁴, in a recent work, describes it, on the authority of the princess, in the following manner:

“To avoid all occasion of offence to the Crusaders, Alexius complied with all their whims and their (on many occasions)

unreasonable demands, even at the expense of great bodily exertion, at a time when he was suffering severely under the gout, which eventually brought him to his grave. No Crusader who desired an interview with him was refused access; he listened with the utmost patience to the long-winded harangues which their loquacity or zeal continually wearied him with; he endured, without expressing any impatience, the unbecoming and haughty language which they permitted themselves to employ towards him, and severely reprimanded his officers when they undertook to defend the dignity of the imperial station from these rude assaults, for he trembled with apprehension at the slightest disputes, lest they might become the occasion of greater evil. Though the counts often appeared before him with trains altogether unsuitable to their dignity and to his—sometimes with an entire troop, which completely filled the royal apartment—the emperor held his peace. He listened to them at all hours; he often seated himself on his throne at day-break to attend to their wishes and requests, and the evening twilight saw him still in the same place. Very frequently he could not snatch time to refresh himself with meat and drink. During many nights he could not obtain any repose, and was obliged to indulge in an unrefreshing sleep upon his throne, with his head resting on his hands. Even this slumber was continually disturbed by the appearance and harangues of some newly-arrived rude knights. When all the courtiers, wearied out by the efforts of the day and by night-watching, could no longer keep themselves on their feet, and sank down exhausted—some upon benches and others on the floor—Alexius still rallied his strength

to listen with seeming attention to the wearisome chatter of the Latins, that they might have no occasion or pretext for discontent. In such a state of fear and anxiety, how could Alexius comport himself with dignity and like an emperor?”

Alexius, however, had himself to blame, in a great measure, for the indignities he suffered: owing to his insincerity, the Crusaders mistrusted him so much, that it became at last a common saying, that the Turks and Saracens were not such inveterate foes to the Western or Latin Christians as the Emperor Alexius and the Greeks⁵. It would be needless in this sketch, which does not profess to be so much a history of the Crusades, as of the madness of Europe, from which they sprang, to detail the various acts of bribery and intimidation, cajolery and hostility, by which Alexius contrived to make each of the leaders in succession, as they arrived, take the oath of allegiance to him as their suzerain. One way or another he exacted from each the barren homage on which he had set his heart, and they were then allowed to proceed into Asia Minor. One only, Raymond de St. Gilles count of Toulouse, obstinately refused the homage.

Their residence in Constantinople was productive of no good to the armies of the cross. Bickerings and contentions on the one hand, and the influence of a depraved and luxurious court on the other, destroyed the elasticity of their spirits, and cooled the first ardour of their enthusiasm. At one time the army of the Count of Toulouse was on the point of disbanding itself; and, had not their leader energetically removed them across the Bosphorus, this would have been the result. Once in Asia, their spirits in some degree revived, and the presence of danger and difficulty nerved them to the work

they had undertaken. The first operation of the war was the siege of Nice, to gain possession of which all their efforts were directed.

Godfrey of Bouillon and the Count of Vermandois were joined under its walls by each host in succession as it left Constantinople. Among the celebrated Crusaders who fought at this siege we find, besides the leaders already mentioned, the brave and generous Tancred, whose name and fame have been immortalised in the *Gerusalemme Liberata*, the valorous Bishop of Puy, Baldwin, afterwards king of Jerusalem, and Peter the Hermit, now an almost solitary soldier, shorn of all the power and influence he had formerly possessed. Kilij Aslaun the sultan of Roum and chief of the Seljukian Turks, whose deeds, surrounded by the false halo of romance, are familiar to the readers of Tasso, under the name of Soliman, marched to defend this city, but was defeated after several obstinate engagements, in which the Christians shewed a degree of heroism that quite astonished him. The Turkish chief had expected to find a wild undisciplined multitude, like that under Peter the Hermit, without leaders capable of enforcing obedience; instead of which, he found the most experienced leaders of the age at the head of armies that had just fanaticism enough to be ferocious, but not enough to render them ungovernable. In these engagements, many hundreds fell on both sides; and on both sides the most revolting barbarity was practised: the Crusaders cut off the heads of the fallen Mussulmans, and sent them in panniers to Constantinople, as trophies of their victory. After the temporary defeat of Kilij Aslaun, the siege of Nice was carried on with redoubled vigour. The Turks defended themselves with the greatest obstinacy, and discharged showers of poisoned arrows upon the Crusaders. When any unfortunate wretch

was killed under the walls, they let down iron hooks from above, and drew the body up, which, after stripping and mutilating, they threw back again at the besiegers. The latter were well supplied with provisions, and for six-and-thirty days the siege continued without any relaxation of the efforts on either side. Many tales are told of the almost superhuman heroism of the Christian leaders—how one man put a thousand to flight; and how the arrows of the faithful never missed their mark. One anecdote of Godfrey of Bouillon, related by Albert of Aix, is worth recording, not only as shewing the high opinion entertained of his valour, but as shewing the contagious credulity of the armies—a credulity which as often led them to the very verge of defeat, as it incited them to victory. One Turk, of gigantic stature, took his station day by day on the battlements of Nice, and, bearing an enormous bow, committed great havoc among the Christian host. Not a shaft he sped but bore death upon its point; and although the Crusaders aimed repeatedly at his breast, and he stood in the most exposed position, their arrows fell harmless at his feet. He seemed to be invulnerable to attack; and a report was soon spread abroad, that he was no other than the Arch Fiend himself, and that mortal hand could not prevail against him. Godfrey of Bouillon, who had no faith in the supernatural character of the Mussulman, determined, if possible, to put an end to the dismay which was rapidly paralysing the exertions of his best soldiers. Taking a huge cross-bow, he stood forward in front of the army, to try the steadiness of his hand against the much-dreaded archer: the shaft was aimed directly at his heart, and took fatal effect. The Moslem fell amid the groans of the besieged, and the shouts of *Deus adjuva! Deus adjuva!* the war-cry of the besiegers.

At last the Crusaders imagined that they had overcome all obstacles, and were preparing to take possession of the city, when, to their great astonishment, they saw the flag of the Emperor Alexius flying from the battlements. An emissary of the emperor, named Faticius or Tatin, had contrived to gain admission, with a body of Greek troops, at a point which the Crusaders had left unprotected, and had persuaded the Turks to surrender to him rather than to the crusading forces. The greatest indignation prevailed in the army when this stratagem was discovered, and the soldiers were, with the utmost difficulty, prevented from renewing the attack and besieging the Greek emissary.

The army, however, continued its march, and, by some means or other, was broken into two divisions; some historians say accidentally,⁶ while others affirm by mutual consent, and for the convenience of obtaining provisions on the way.⁷ The one division was composed of the forces under Bohemund, Tancred, and the Duke of Normandy; while the other, which took a route at some distance on the right, was commanded by Godfrey of Bouillon and the other chiefs. The Sultan of Roum, who, after his losses at Nice, had been silently making great efforts to crush the Crusaders at one blow, collected in a very short time all the multitudinous tribes that owed him allegiance, and with an army which, according to a moderate calculation, amounted to two hundred thousand men, chiefly cavalry, he fell upon the first division of the Christian host in the valley of Dorylæum. It was early in the morning of the 1st of July 1097, when the Crusaders saw the first companies of the Turkish horsemen pouring down upon them from the hills. Bohemund had hardly time to set himself in order, and transport his sick and

helpless to the rear, when the overwhelming force of the Orientals was upon him. The Christian army, composed principally of men on foot, gave way on all sides, and the hoofs of the Turkish steeds, and the poisoned arrows of their bowmen, mowed them down by hundreds. After having lost the flower of their chivalry, the Christians retreated upon their baggage, when a dreadful slaughter took place. Neither women nor children, nor the sick, were spared. Just as they were reduced to the last extremity, Godfrey of Bouillon and the Count of Toulouse made their appearance on the field, and turned the tide of battle. After an obstinate engagement the Turks fled, and their rich camp fell into the hands of the enemy. The loss of the Crusaders amounted to about four thousand men, with several chiefs of renown, among whom were Count Robert of Paris and William the brother of Tancred. The loss of the Turks, which did not exceed this number, taught them to pursue a different mode of warfare. The sultan was far from being defeated. With his still gigantic army, he laid waste all the country on either side of the Crusaders. The latter, who were unaware of the tactics of the enemy, found plenty of provisions in the Turkish camp; but so far from economising these resources, they gave themselves up for several days to the most unbounded extravagance. They soon paid dearly for their heedlessness. In the ravaged country of Phrygia, through which they advanced towards Antiochetta, they suffered dreadfully for want of food for themselves and pasture for their cattle. Above them was a scorching sun, almost sufficient of itself to dry up the freshness of the land, a task which the firebrands of the sultan had but too surely effected, and water was not to be had after the first day of their march. The pilgrims died at the rate of five hundred a day. The

horses of the knights perished on the road, and the baggage which they had aided to transport was either placed upon dogs, sheep, and swine, or abandoned altogether. In some of the calamities that afterwards befell them, the Christians gave themselves up to the most reckless profligacy; but upon this occasion, the dissensions which prosperity had engendered were all forgotten. Religion, often disregarded, arose in the stern presence of misfortune, and cheered them as they died by the promises of eternal felicity.

At length they reached Antiochetta, where they found water in abundance, and pastures for their expiring cattle. Plenty once more surrounded them, and here they pitched their tents. Untaught by the bitter experience of famine, they again gave themselves up to luxury and waste.

On the 18th of October they sat down before the strong city of Antioch, the siege of which, and the events to which it gave rise, are among the most extraordinary incidents of the Crusade. The city, which is situated on an eminence, and washed by the river Orontes, is naturally a very strong position, and the Turkish garrison were well supplied with provisions to endure a long siege. In this respect the Christians were also fortunate, but unluckily for themselves, unwise. Their force amounted to three hundred thousand fighting men; and we are informed by Raymond d'Argilles, that they had so much provision, that they threw away the greater part of every animal they killed, being so dainty, that they would only eat particular parts of the beast. So insane was their extravagance, that in less than ten days famine began to stare them in the face. After making a fruitless attempt to gain possession of the city by a *coup de main*, they, starving themselves, sat down to starve out the enemy.

But with want came a cooling of enthusiasm. The chiefs began to grow weary of the expedition. Baldwin had previously detached himself from the main body of the army, and, proceeding to Edessa, had intrigued himself into the supreme power in that little principality. The other leaders were animated with less zeal than heretofore. Stephen of Chartres and Hugh of Vermandois began to waver, unable to endure the privations which their own folly and profusion had brought upon them. Even Peter the Hermit became sick at heart ere all was over. When the famine had become so urgent that they were reduced to eat human flesh in the extremity of their hunger, Bohemund and Robert of Flanders set forth on an expedition to procure a supply. They were in a slight degree successful; but the relief they brought was not economised, and in two days they were as destitute as before. Faticius, the Greek commander and representative of Alexius, deserted with his division under pretence of seeking for food, and his example was followed by various bodies of Crusaders.

Misery was rife among those who remained, and they strove to alleviate it by a diligent attention to signs and omens. These, with extraordinary visions seen by the enthusiastic, alternately cheered and depressed them according as they foretold the triumph or pictured the reverses of the cross. At one time a violent hurricane arose, levelling great trees with the ground, and blowing down the tents of the Christian leaders. At another time an earthquake shook the camp, and was thought to prognosticate some great impending evil to the cause of Christendom. But a comet which appeared shortly afterwards raised them from the despondency into which they had fallen; their lively imaginations making it assume the form of a

flaming cross leading them on to victory. Famine was not the least of the evils they endured. Unwholesome food, and the impure air from the neighbouring marshes, engendered pestilential diseases, which carried them off more rapidly than the arrows of the enemy. A thousand of them died in a day, and it became at last a matter of extreme difficulty to afford them burial. To add to their misery, each man grew suspicious of his neighbour; for the camp was infested by Turkish spies, who conveyed daily to the besieged intelligence of the movements and distresses of the enemy. With a ferocity, engendered by despair, Bohemund caused two spies, whom he had detected, to be roasted alive in presence of the army, and within sight of the battlements of Antioch. But even this example failed to reduce their numbers, and the Turks continued to be as well informed as the Christians themselves of all that was passing in the camp.

The news of the arrival of a reinforcement of soldiers from Europe, with an abundant stock of provisions, came to cheer them when reduced to the last extremity. The welcome succour landed at St. Simeon, the port of Antioch, and about six miles from that city. Thitherwards the famishing Crusaders proceeded in tumultuous bands, followed by Bohemund and the Count of Toulouse, with strong detachments of their retainers and vassals, to escort the supplies in safety to the camp. The garrison of Antioch, forewarned of this arrival, was on the alert, and a corps of Turkish archers was despatched to lie in ambush among the mountains and intercept their return. Bohemund, laden with provisions, was encountered in the rocky passes by the Turkish host. Great numbers of his followers were slain, and he himself had just time to escape to the camp with the news of his defeat. Godfrey of Bouillon, the Duke of Normandy,

and the other leaders had heard the rumour of this battle, and were at that instant preparing for the rescue. The army was immediately in motion, animated both by zeal and by hunger, and marched so rapidly as to intercept the victorious Turks before they had time to reach Antioch with their spoil. A fierce battle ensued, which lasted from noon till the going down of the sun. The Christians gained and maintained the advantage, each man fighting as if upon himself alone had depended the fortune of the day. Hundreds of Turks perished in the Orontes, and more than two thousand were left dead upon the field of battle. All the provision was recaptured and brought in safety to the camp, whither the Crusaders returned singing *Alleluia!* or shouting *Deus adjuva! Deus adjuva!*

This relief lasted for some days, and, had it been duly economised, would have lasted much longer; but the chiefs had no authority, and were unable to exercise any control over its distribution. Famine again approached with rapid strides, and Stephen count of Blois, not liking the prospect, withdrew from the camp with four thousand of his retainers, and established himself at Alexandretta. The moral influence of this desertion was highly prejudicial upon those who remained; and Bohemund, the most impatient and ambitious of the chiefs, foresaw that, unless speedily checked, it would lead to the utter failure of the expedition. It was necessary to act decisively; the army murmured at the length of the siege, and the sultan was collecting his forces to crush them. Against the efforts of the Crusaders Antioch might have held out for months; but treason within effected that which courage without might have striven for in vain.

Baghasihan, the Turkish prince or emir of Antioch, had under his command an Armenian of the name of Phirouz, whom he had entrusted with the defence of a tower on that part of the city wall which overlooked the passes of the mountains. Bohemund, by means of a spy who had embraced the Christian religion, and to whom he had given his own name at baptism, kept up a daily communication with this captain, and made him the most magnificent promises of reward, if he would deliver up his post to the Crusaders. Whether the proposal was first made by Bohemund or by the Armenian is uncertain, but that a good understanding soon existed between them is undoubted; and a night was fixed for the execution of the project. Bohemund communicated the scheme to Godfrey and the Count of Toulouse, with the stipulation that, if the city were won, he, as the soul of the enterprise, should enjoy the dignity of Prince of Antioch. The other leaders hesitated: ambition and jealousy prompted them to refuse their aid in furthering the views of the intriguer. More mature consideration decided them to acquiesce, and seven hundred of the bravest knights were chosen for the expedition, the real object of which, for fear of spies, was kept a profound secret from the rest of the army. When all was ready, a report was promulgated that the seven hundred were intended to form an ambuscade for a division of the sultan's army, which was stated to be approaching.

Every thing favoured the treacherous project of the Armenian captain, who, on his solitary watch-tower, received due intimation of the approach of the Crusaders. The night was dark and stormy; not a star was visible above, and the wind howled so furiously as to overpower all other sounds: the rain fell in torrents, and the watchers on the towers adjoining to that of Phirouz could not hear

the tramp of the armed knights for the wind, nor see them for the obscurity of the night and the dismalness of the weather. When within shot of the walls, Bohemund sent forward an interpreter to confer with the Armenian. The latter urged them to make haste, and seize the favourable interval, as armed men, with lighted torches, patrolled the battlements every half hour, and at that instant they had just passed. The chiefs were instantly at the foot of the wall: Phirouz let down a rope; Bohemund attached it to the end of a ladder of hides, which was then raised by the Armenian, and held while the knights mounted. A momentary fear came over the spirits of the adventurers, and every one hesitated. At last Bohemund,⁸ encouraged by Phirouz from above, ascended a few steps on the ladder, and was followed by Godfrey, Count Robert of Flanders, and a number of other knights. As they advanced, others pressed forward, until their weight became too great for the ladder, which, breaking, precipitated about a dozen of them to the ground, where they fell one upon the other, making a great clatter with their heavy coats of mail. For a moment they thought that all was lost; but the wind made so loud a howling as it swept in fierce gusts through the mountain gorges—and the Orontes, swollen by the rain, rushed so noisily along—that the guards heard nothing. The ladder was easily repaired, and the knights ascended two at a time, and reached the platform in safety. When sixty of them had thus ascended, the torch of the coming patrol was seen to gleam at the angle of the wall. Hiding themselves behind a buttress, they awaited his coming in breathless silence. As soon as he arrived at arm's length, he was suddenly seized, and, before he could open his lips to raise an alarm, the silence of death closed them up for ever. They next descended

rapidly the spiral staircase of the tower, and opening the portal, admitted the whole of their companions. Raymond of Toulouse, who, cognisant of the whole plan, had been left behind with the main body of the army, heard at this instant the signal horn, which announced that an entry had been effected, and, leading on his legions, the town was attacked from within and without.

Imagination cannot conceive a scene more dreadful than that presented by the devoted city of Antioch on that night of horror. The Crusaders fought with a blind fury, which fanaticism and suffering alike incited. Men, women, and children were indiscriminately slaughtered, till the streets ran with blood. Darkness increased the destruction, for when morning dawned the Crusaders found themselves with their swords at the breasts of their fellow-soldiers, whom they had mistaken for foes. The Turkish commander fled, first to the citadel, and that becoming insecure, to the mountains, whither he was pursued and slain, and his grey head brought back to Antioch as a trophy. At daylight the massacre ceased, and the Crusaders gave themselves up to plunder. They found gold, and jewels, and silks, and velvets in abundance, but of provisions, which were of more importance to them, they found but little of any kind. Corn was excessively scarce, and they discovered to their sorrow that in this respect the besieged had been but little better off than the besiegers.

SIEGE OF ANTIOCH.

Before they had time to instal themselves in their new position, and take the necessary measures for procuring a supply, the city was invested by the Turks. The sultan of Persia had raised an immense army, which he entrusted to the command of Kerbogha, the emir of Mosul, with instructions to sweep the Christian locusts from the face of the land. The emir effected a junction with Kilij Aslaun, and the two armies surrounded the city. Discouragement took complete possession of the Christian host, and numbers of them contrived to elude the vigilance of the besiegers, and escape to Count Stephen of Blois at Alexandretta, to whom they related the most exaggerated tales of the misery they had endured, and the utter hopelessness of continuing the war. Stephen forthwith broke up his camp and retreated towards Constantinople. On his way he was met by the Emperor Alexius, at the head of a considerable force, hastening to take possession of the conquests made by the Christians in Asia. As

soon as he heard of their woful plight, he turned back, and proceeded with the Count of Blois to Constantinople, leaving the remnant of the Crusaders to shift for themselves.

The news of this defection increased the discouragement at Antioch. All the useless horses of the army had been slain and eaten, and dogs, cats, and rats were sold at enormous prices. Even vermin were becoming scarce. With increasing famine came a pestilence, so that in a short time but sixty thousand remained of the three hundred thousand that had originally invested Antioch. But this bitter extremity, while it annihilated the energy of the host, only served to knit the leaders more firmly together; and Bohemund, Godfrey, and Tancred swore never to desert the cause as long as life lasted. The former strove in vain to reanimate the courage of his followers. They were weary and sick at heart, and his menaces and promises were alike thrown away. Some of them had shut themselves up in the houses, and refused to come forth. Bohemund, to drive them to their duty, set fire to the whole quarter, and many of them perished in the flames, while the rest of the army looked on with the utmost indifference. Bohemund, animated himself by a worldly spirit, did not know the true character of the Crusaders, nor understand the religious madness which had brought them in such shoals from Europe. A priest, more clear-sighted, devised a scheme which restored all their confidence, and inspired them with a courage so wonderful as to make the poor sixty thousand emaciated, sick, and starving zealots put to flight the well-fed and six times as numerous legions of the Sultan of Persia.

This priest, a native of Provence, was named Peter Barthelemy, and whether he were a knave or an enthusiast, or both; a principal,

or a tool in the hands of others, will ever remain a matter of doubt. Certain it is, however, that he was the means of raising the siege of Antioch, and causing the eventual triumph of the armies of the cross. When the strength of the Crusaders was completely broken by their sufferings, and hope had fled from every bosom, Peter came to Count Raymond of Toulouse, and demanded an interview on matters of serious moment. He was immediately admitted. He said that, some weeks previously, at the time the Christians were besieging Antioch, he was reposing alone in his tent, when he was startled by the shock of the earthquake, which had so alarmed the whole host. Through violent terror of the shock he could only ejaculate, God help me! when turning round he saw two men standing before him, whom he at once recognised by the halo of glory around them as beings of another world. One of them appeared to be an aged man, with reddish hair sprinkled with grey, black eyes, and a long flowing grey beard. The other was younger, larger, and handsomer, and had something more divine in his aspect. The elderly man alone spoke, and informed him that he was the holy apostle St. Andrew, and desired him to seek out the Count Raymond, the Bishop of Puy, and Raymond of Altopulto, and ask them why the bishop did not exhort the people, and sign them with the cross which he bore. The apostle then took him, naked in his shirt as he was, and transported him through the air into the heart of the city of Antioch, where he led him into the church of St. Peter, at that time a Saracen mosque. The apostle made him stop by the pillar close to the steps by which they ascend on the south side to the altar, where hung two lamps, which gave out a light brighter than that of the noonday sun; the younger man, whom he did not at that time know, standing afar off, near the

steps of the altar. The apostle then descended into the ground and brought up a lance, which he gave into his hand, telling him that it was the very lance that had opened the side whence had flowed the salvation of the world. With tears of joy he held the holy lance, and implored the apostle to allow him to take it away and deliver it into the hands of Count Raymond. The apostle refused, and buried the lance again in the ground, commanding him, when the city was won from the infidels, to go with twelve chosen men, and dig it up again in the same place. The apostle then transported him back to his tent, and the two vanished from his sight. He had neglected, he said, to deliver this message, afraid that his wonderful tale would not obtain credence from men of such high rank. After some days he again saw the holy vision, as he was gone out of the camp to look for food. This time the divine eyes of the younger looked reproachfully upon him. He implored the apostle to choose some one else more fitted for the mission, but the apostle refused, and smote him with a disorder of the eyes, as a punishment for his disobedience. With an obstinacy unaccountable even to himself, he had still delayed. A third time the apostle and his companion had appeared to him, as he was in a tent with his master William at St. Simeon. On that occasion St. Andrew told him to bear his command to the Count of Toulouse not to bathe in the waters of the Jordan when he came to it, but to cross over in a boat, clad in a shirt and breeches of linen, which he should sprinkle with the sacred waters of the river. These clothes he was afterwards to preserve along with the holy lance. His master William, although he could not see the saint, distinctly heard the voice giving orders to that effect. Again he neglected to execute the commission, and again the saints appeared to him, when he was at the port of Mamistra,

about to sail for Cyprus, and St. Andrew threatened him with eternal perdition if he refused longer. Upon this he made up his mind to divulge all that had been revealed to him.

The Count of Toulouse, who, in all probability, concocted this tale with the priest, appeared struck with the recital, and sent immediately for the Bishop of Puy and Raymond of Altapulto. The bishop at once expressed his disbelief of the whole story, and refused to have any thing to do in the matter. The Count of Toulouse, on the contrary, saw abundant motives, if not for believing, for pretending to believe; and, in the end, he so impressed upon the mind of the bishop the advantage that might be derived from it, in working up the popular mind to its former excitement, that the latter reluctantly agreed to make search in due form for the holy weapon. The day after the morrow was fixed upon for the ceremony; and, in the mean time, Peter was consigned to the care of Raymond, the count's chaplain, in order that no profane curiosity might have an opportunity of cross-examining him, and putting him to a nonplus.

Twelve devout men were forthwith chosen for the undertaking, among whom were the Count of Toulouse and his chaplain. They began digging at sunrise, and continued unwearied till near sunset, without finding the lance; they might have dug till this day with no better success, had not Peter himself sprung into the pit, praying to God to bring the lance to light, for the strengthening and victory of his people. Those who hide know where to find; and so it was with Peter, for both he and the lance found their way into the hole at the same time. On a sudden, he and Raymond the chaplain beheld its point in the earth, and Raymond, drawing it forth, kissed it with tears of joy, in sight of the multitude which had assembled in the

church. It was immediately enveloped in a rich purple cloth, already prepared to receive it, and exhibited in this state to the faithful, who made the building resound with their shouts of gladness.

THE HOLY LANCE.

Peter had another vision the same night, and became from that day forth “dreamer of dreams” in general to the army. He stated on the following day, that the Apostle Andrew and “the youth with the divine aspect” appeared to him again, and directed that the Count of Toulouse, as a reward for his persevering piety, should carry the Holy Lance at the head of the army, and that the day on which it was found should be observed as a solemn festival throughout Christendom. St. Andrew shewed him at the same time the holes in the feet and hands of his benign companion; and he became convinced that he stood in the awful presence of THE REDEEMER.

Peter gained so much credit by his visions that dreaming became contagious. Other monks beside himself were visited by the saints, who promised victory to the host if it would valiantly hold out to the last, and crowns of eternal glory to those who fell in the fight. Two deserters, wearied of the fatigues and privations of the war, who had

stealthily left the camp, suddenly returned, and seeking Bohemund, told him that they had been met by two apparitions, who, with great anger, had commanded them to return. The one of them said, that he recognised his brother, who had been killed in battle some months before, and that he had a halo of glory around his head. The other, still more hardy, asserted that the apparition which had spoken to him was the Saviour himself, who had promised eternal happiness as his reward if he returned to his duty, but the pains of eternal fire if he rejected the cross. No one thought of disbelieving these men. The courage of the army immediately revived; despondency gave way to hope; every arm grew strong again, and the pangs of hunger were for a time disregarded. The enthusiasm which had led them from Europe, burned forth once more as brightly as ever, and they demanded, with loud cries, to be led against the enemy. The leaders were not unwilling. In a battle lay their only chance of salvation; and although Godfrey, Bohemund, and Tancred received the story of the lance with much suspicion, they were too wise to throw discredit upon an imposture which bade fair to open the gates of victory.

Peter the Hermit was previously sent to the camp of Kerbogha to propose that the quarrel between the two religions should be decided by a chosen number of the bravest soldiers of each army. Kerbogha turned from him with a look of contempt, and said he could agree to no proposals from a set of such miserable beggars and robbers. With this uncourteous answer Peter returned to Antioch. Preparations were immediately commenced for an attack upon the enemy: the latter continued to be perfectly well informed of all the proceedings of the Christian camp. The citadel of Antioch, which remained in their possession, overlooked the town, and the commander of the

fortress could distinctly see all that was passing within. On the morning of the 28th of June, 1098, a black flag, hoisted from its highest tower, announced to the besieging army that the Christians were about to sally forth.

The Moslem leaders knew the sad inroads that famine and disease had made upon the numbers of the foe; they knew that not above two hundred of the knights had horses to ride upon, and that the foot soldiers were sick and emaciated; but they did not know the almost incredible valour which superstition had infused into their hearts. The story of the lance they treated with the most supreme contempt, and, secure of an easy victory, they gave themselves no trouble in preparing for the onslaught. It is related that Kerbogha was playing a game at chess, when the black flag on the citadel gave warning of the enemy's approach, and that, with true oriental coolness, he insisted upon finishing the game ere he bestowed any of his attention upon a foe so unworthy. The defeat of his advanced post of two thousand men aroused him from his apathy.

The Crusaders, after this first victory, advanced joyfully towards the mountains, hoping to draw the Turks to a place where their cavalry would be unable to manoeuvre. Their spirits were light and their courage high, as, led on by the Duke of Normandy, Count Robert of Flanders, and Hugh of Vermandois, they came within sight of the splendid camp of the enemy. Godfrey of Bouillon and Adhemar Bishop of Puy, followed immediately after these leaders, the latter clad in complete armour, and bearing the Holy Lance within sight of the whole army: Bohemund and Tancred brought up the rear.

Kerbogha, aware at last that his enemy was not so despicable, took vigorous measures to remedy his mistake, and, preparing himself to meet the Christians in front, he despatched the Sultan Soliman of Roum to attack them in the rear. To conceal this movement, he set fire to the dried weeds and grass with which the ground was covered, and Soliman, taking a wide circuit with his cavalry, succeeded, under cover of the smoke, in making good his position in the rear. The battle raged furiously in front; the arrows of the Turks fell thick as hail, and their well-trained squadrons trod the Crusaders under their hoofs like stubble. Still the affray was doubtful; for the Christians had the advantage of the ground, and were rapidly gaining upon the enemy, when the overwhelming forces of Soliman arrived in the rear. Godfrey and Tancred flew to the rescue of Bohemund, spreading dismay in the Turkish ranks by their fierce impetuosity. The Bishop of Puy was left almost alone with the Provençals to oppose the legions commanded by Kerbogha in person; but the presence of the Holy Lance made a hero of the meanest soldier in his train. Still, however, the numbers of the enemy seemed interminable. The Christians, attacked on every side, began at last to give way, and the Turks made sure of victory.

At this moment a cry was raised in the Christian host that the saints were fighting on their side. The battle-field was clear of the smoke from the burning weeds, which had curled away, and hung in white clouds of fantastic shape on the brow of the distant mountains. Some imaginative zealot, seeing this dimly through the dust of the battle, called out to his fellows, to look at the army of saints, clothed in white, and riding upon white horses, that were pouring over the hills to the rescue. All eyes were immediately turned to the distant

smoke; faith was in every heart; and the old battle-cry, *God wills it!* *God wills it!* resounded through the field, as every soldier, believing that God was visibly sending his armies to his aid, fought with an energy unfelt before. A panic seized the Persian and Turkish hosts, and they gave way in all directions. In vain Kerbogha tried to rally them. Fear is more contagious than enthusiasm, and they fled over the mountains like deer pursued by the hounds. The two leaders, seeing the uselessness of further efforts, fled with the rest; and that immense army was scattered over Palestine, leaving nearly seventy thousand of its dead upon the field of battle.

Their magnificent camp fell into the hands of the enemy, with its rich stores of corn, and its droves of sheep and oxen. Jewels, gold, and rich velvets in abundance were distributed among the army. Tancred followed the fugitives over the hills, and reaped as much plunder as those who had remained in the camp. The way, as they fled, was covered with valuables, and horses of the finest breed of Arabia became so plentiful that every knight of the Christians was provided with a steed. The Crusaders, in this battle, acknowledge to have lost nearly ten thousand men.

Their return to Antioch was one of joy indeed: the citadel was surrendered at once, and many of the Turkish garrison embraced the Christian faith, and the rest were suffered to depart. A solemn thanksgiving was offered up by the Bishop of Puy, in which the whole army joined, and the Holy Lance was visited by every soldier.

The enthusiasm lasted for some days, and the army loudly demanded to be led forward to Jerusalem, the grand goal of all their wishes: but none of their leaders was anxious to move;—the more prudent among them, such as Godfrey and Tancred, for reasons of

expediency; and the more ambitious, such as the Count of Toulouse and Bohemund, for reasons of self-interest. Violent dissensions sprang up again between all the chiefs. Raymond of Toulouse, who was left at Antioch to guard the town, had summoned the citadel to surrender, as soon as he saw that there was no fear of any attack upon the part of the Persians; and the other chiefs found, upon their return, his banner waving on its walls. This had given great offence to Bohemund, who had stipulated the principality of Antioch as his reward for winning the town in the first instance. Godfrey and Tancred supported his claim, and, after a great deal of bickering, the flag of Raymond was lowered from the tower, and that of Bohemund hoisted in its stead, who assumed from that time the title of Prince of Antioch. Raymond, however, persisted in retaining possession of one of the city gates and its adjacent towers, which he held for several months, to the great annoyance of Bohemund and the scandal of the army. The count became in consequence extremely unpopular, although his ambition was not a whit more unreasonable than that of Bohemund himself, nor of Baldwin, who had taken up his quarters at Edessa, where he exercised the functions of a petty sovereign.

The fate of Peter Barthelemy deserves to be recorded. Honours and consideration had come thick upon him after the affair of the lance, and he consequently felt bound in conscience to continue the dreams which had made him a personage of so much importance. The mischief of it was, that, like many other liars, he had a very bad memory, and he contrived to make his dreams contradict each other in the most palpable manner. St. John one night appeared to him, and told one tale; while, a week after, St. Paul told a totally different story, and held out hopes quite incompatible with those of his

apostolic brother. The credulity of that age had a wide maw, and Peter's visions must have been absurd and outrageous indeed, when the very men who had believed in the lance refused to swallow any more of his wonders. Bohemund at last, for the purpose of annoying the Count of Toulouse, challenged poor Peter to prove the truth of his story of the lance by the fiery ordeal. Peter could not refuse a trial so common in that age, and being besides encouraged by the count and his chaplain Raymond, an early day was appointed for the ceremony. The previous night was spent in prayer and fasting, according to custom, and Peter came forth in the morning bearing the lance in his hand, and walked boldly up to the fire. The whole army gathered round, impatient for the result, many thousands still believing that the lance was genuine, and Peter a holy man. Prayers having been said by Raymond d'Agilles, Peter walked into the flames, and had got nearly through, when pain caused him to lose his presence of mind: the heat too affected his eyes, and, in his anguish, he turned round unwittingly, and passed through the fire again, instead of stepping out of it, as he should have done. The result was, that he was burned so severely that he never recovered, and, after lingering for some days, he expired in great agony.

Most of the soldiers were suffering either from wounds, disease, or weariness; and it was resolved by Godfrey,—the tacitly acknowledged chief of the enterprise,—that the army should have time to refresh itself ere they advanced upon Jerusalem. It was now July, and he proposed that they should pass the hot months of August and September within the walls of Antioch, and march forward in October with renewed vigour, and numbers increased by fresh arrivals from Europe. This advice was finally adopted, although the

enthusiasts of the army continued to murmur at the delay. In the mean time the Count of Vermandois was sent upon an embassy to the Emperor Alexius at Constantinople, to reproach him for his base desertion of the cause, and urge him to send the reinforcements he had promised. The count faithfully executed his mission (of which, by the way, Alexius took no notice whatever), and remained for some time at Constantinople, till his zeal, never very violent, totally evaporated. He then returned to France, sick of the Crusade, and determined to intermeddle with it no more.

The chiefs, though they had determined to stay at Antioch for two months, could not remain quiet for so long a time. They would, in all probability, have fallen upon each other, had there been no Turks in Palestine upon whom they might vent their impetuosity. Godfrey proceeded to Edessa, to aid his brother Baldwin in expelling the Saracens from his principality, and the other leaders carried on separate hostilities against them as caprice or ambition dictated. At length the impatience of the army to be led against Jerusalem became so great that the chiefs could no longer delay, and Raymond, Tancred, and Robert of Normandy marched forward with their divisions, and laid siege to the small but strong town of Marah. With their usual improvidence, they had not food enough to last a beleaguering army for a week. They suffered great privations in consequence, till Bohemund came to their aid and took the town by storm. In connexion with this siege, the chronicler, Raymond d'Agilles (the same Raymond the chaplain who figured in the affair of the Holy Lance), relates a legend, in the truth of which he devoutly believed, and upon which Tasso has founded one of the most beautiful passages of his poem. It is worth preserving, as shewing the

spirit of the age and the source of the extraordinary courage manifested by the Crusaders on occasions of extreme difficulty. "One day," says Raymond, "Anselme de Ribeaumont beheld young Engelram, the son of the Count de St. Paul, who had been killed at Marah, enter his tent. 'How is it,' said Anselme to him, 'that you, whom I saw lying dead on the field of battle, are full of life?'—'You must know,' replied Engelram, 'that those who fight for Jesus Christ never die.' 'But whence,' resumed Anselme, 'comes that strange brightness that surrounds you?' Upon this Engelram pointed to the sky, where Anselme saw a palace of diamond and crystal. 'It is thence,' said he, 'that I derive the beauty which surprises you. My dwelling is there; a still finer one is prepared for you, and you shall soon come to inhabit it. Farewell! we shall meet again to-morrow.' With these words Engelram returned to heaven. Anselme, struck by the vision, sent the next morning for the priests, received the sacrament, and although full of health, took a last farewell of all his friends, telling them that he was about to leave this world. A few hours afterwards, the enemy having made a sortie, Anselme went out against them sword in hand, and was struck on the forehead by a stone from a Turkish sling, which sent him to heaven, to the beautiful palace that was prepared for him."

SHRINE OF THE NATIVITY.

New disputes arose between the Prince of Antioch and the Count of Toulouse with regard to the capture of this town, which were with the utmost difficulty appeased by the other chiefs. Delays also took place in the progress of the army, especially before Archas, and the soldiery were so exasperated that they were on the point of choosing new leaders to conduct them to Jerusalem. Godfrey, upon this, set fire to his camp at Archas, and marched forward. He was immediately joined by hundreds of the Provençals of the Count of Toulouse. The latter, seeing the turn affairs were taking, hastened after them, and the whole host proceeded towards the holy city, so long desired amid sorrow, and suffering, and danger. At Emmaus they were met by a deputation from the Christians of Bethlehem,

praying for immediate aid against the oppression of the infidels. The very name of Bethlehem, the birthplace of the Saviour, was music to their ears, and many of them wept with joy to think they were approaching a spot so hallowed. Albert of Aix informs us that their hearts were so touched that sleep was banished from the camp, and that, instead of waiting till the morning's dawn to recommence their march, they set out shortly after midnight, full of hope and enthusiasm. For upwards of four hours the mail-clad legions tramped stedfastly forward in the dark, and when the sun arose in unclouded splendour, the towers and pinnacles of Jerusalem gleamed upon their sight. All the tender feelings of their nature were touched; no longer brutal fanatics, but meek and humble pilgrims, they knelt down upon the sod, and with tears in their eyes, exclaimed to one another "*Jerusalem! Jerusalem!*" Some of them kissed the holy ground, others stretched themselves at full length upon it, in order that their bodies might come in contact with the greatest possible extent of it, and others prayed aloud. The women and children who had followed the camp from Europe, and shared in all its dangers, fatigues, and privations, were more boisterous in their joy; the former from long-nourished enthusiasm, and the latter from mere imitation,⁹ and prayed, and wept, and laughed till they almost put the more sober to the blush.

THE PILGRIMS AT THE FIRST SIGHT OF JERUSALEM.

The first ebullition of their gladness having subsided, the army marched forward, and invested the city on all sides. The assault was almost immediately begun; but after the Christians had lost some of their bravest knights, that mode of attack was abandoned, and the army commenced its preparations for a regular siege. Mangonels, moveable towers, and battering-rams, together with a machine called a sow, made of wood, and covered with raw hides, inside of which miners worked to undermine the walls, were forthwith constructed; and to restore the courage and discipline of the army, which had suffered from the unworthy dissensions of the chiefs, the latter held out the hand of friendship to each other, and Tancred and the Count of Toulouse embraced in sight of the whole camp. The clergy aided the cause with their powerful voice, and preached union and goodwill to the highest and the lowest. A solemn procession was also ordered round the city, in which the entire army joined, prayers being offered up at every spot which gospel records had taught them to consider as peculiarly sacred.

The Saracens upon the ramparts beheld all these manifestations without alarm. To incense the Christians, whom they despised, they constructed rude crosses, and fixed them upon the walls, and spat

upon and pelted them with dirt and stones. This insult to the symbol of their faith raised the wrath of the Crusaders to that height that bravery became ferocity, and enthusiasm madness. When all the engines of war were completed, the attack was recommenced, and every soldier of the Christian army fought with a vigour which the sense of private wrong invariably inspires. Every man had been personally outraged, and the knights worked at the battering-rams with as much readiness as the meanest soldiers. The Saracen arrows and balls of fire fell thick and fast among them, but the tremendous rams still heaved against the walls, while the best marksmen of the host were busily employed in the several floors of the moveable towers in dealing death among the Turks upon the battlements. Godfrey, Raymond, Tancred, and Robert of Normandy, each upon his tower, fought for hours with unwearied energy, often repulsed, but ever ready to renew the struggle. The Turks, no longer despising the enemy, defended themselves with the utmost skill and bravery till darkness brought a cessation of hostilities. Short was the sleep that night in the Christian camp. The priests offered up solemn prayers in the midst of the attentive soldiery for the triumph of the cross in this last great struggle; and as soon as morning dawned, every one was in readiness for the affray. The women and children lent their aid, the latter running unconcerned to and fro while the arrows fell fast around them, bearing water to the thirsty combatants. The saints were believed to be aiding their efforts, and the army, impressed with this idea, surmounted difficulties under which a force thrice as numerous, but without their faith, would have quailed and been defeated. Raymond of Toulouse at last forced his way into the city by escalade, while at the very same moment

Tancred and Robert of Normandy succeeded in bursting open one of the gates. The Turks flew to repair the mischief, and Godfrey of Bouillon, seeing the battlements comparatively deserted, let down the drawbridge of his moveable tower, and sprang forward, followed by all the knights of his train. In an instant after, the banner of the cross floated upon the walls of Jerusalem. The Crusaders, raising once more their redoubtable war-cry, rushed on from every side, and the city was taken. The battle raged in the streets for several hours, and the Christians, remembering their insulted faith, gave no quarter to young or old, male or female, sick or strong. Not one of the leaders thought himself at liberty to issue orders for staying the carnage, and if he had, he would not have been obeyed. The Saracens fled in great numbers to the mosque of Soliman, but they had not time to fortify themselves within it ere the Christians were upon them. Ten thousand persons are said to have perished in that building alone.

Peter the Hermit, who had remained so long under the veil of neglect, was repaid that day for all his zeal and all his sufferings. As soon as the battle was over, the Christians of Jerusalem issued forth from their hiding-places to welcome their deliverers. They instantly recognised the Hermit as the pilgrim who, years before, had spoken to them so eloquently of the wrongs and insults they had endured, and promised to stir up the princes and people of Europe in their behalf. They clung to the skirts of his garments in the fervour of their gratitude, and vowed to remember him for ever in their prayers. Many of them shed tears about his neck, and attributed the deliverance of Jerusalem solely to his courage and perseverance. Peter afterwards held some ecclesiastical office in the holy city, but what it was, or what was his ultimate fate, history has forgotten to

inform us. Some say that he returned to France and founded a monastery, but the story does not rest upon sufficient authority.

SIEGE OF JERUSALEM.

The grand object for which the popular swarms of Europe had forsaken their homes was now accomplished. The Moslem mosques of Jerusalem were converted into churches for a purer faith, and the mount of Calvary and the sepulchre of Christ were profaned no longer by the presence or the power of the infidel. Popular frenzy had fulfilled its mission, and, as a natural consequence, it began to subside from that time forth. The news of the capture of Jerusalem brought numbers of pilgrims from Europe, and, among others, Stephen count of Chartres and Hugh of Vermandois, to atone for their desertion; but nothing like the former enthusiasm existed among the nations.

Thus then ends the history of the first Crusade. For the better understanding of the second, it will be necessary to describe the interval between them, and to enter into a slight sketch of the history of Jerusalem under its Latin kings, the long and fruitless wars they continued to wage with the unvanquished Saracens, and the poor and miserable results which sprang from so vast an expenditure of zeal, and so deplorable a waste of human life.

JERUSALEM.

The necessity of having some recognised chief was soon felt by the Crusaders, and Godfrey de Bouillon, less ambitious than Bohemund or Raymond of Toulouse, gave his cold consent to wield a sceptre which the latter chiefs would have clutched with eagerness. He was hardly invested with the royal mantle before the Saracens menaced his capital. With much vigour and judgment he exerted himself to follow up the advantages he had gained, and marching out to meet the enemy before they had time to besiege him in Jerusalem, he gave them battle at Ascalon, and defeated them with great loss. He did not, however, live long to enjoy his new dignity, being seized with a

fatal illness when he had only reigned nine months. To him succeeded his brother, Baldwin of Edessa. The latter monarch did much to improve the condition of Jerusalem and to extend its territory, but was not able to make a firm footing for his successors. For fifty years, in which the history of Jerusalem is full of interest to the historical student, the Crusaders were exposed to fierce and constant hostilities, often gaining battles and territory, and as often losing them, but becoming every day weaker and more divided, while the Saracens became stronger and more united to harass and root them out. The battles of this period were of the most chivalrous character, and deeds of heroism were done by the handful of brave knights that remained in Syria, which have hardly their parallel in the annals of war. In the course of time, however, the Christians could not avoid feeling some respect for the courage, and admiration for the polished manners and advanced civilisation of the Saracens, so much superior to the rudeness and semi-barbarism of Europe at that day. Difference of faith did not prevent them from forming alliances with the dark-eyed maidens of the East. One of the first to set the example of taking a Paynim spouse was King Baldwin himself, and these connexions in time became not only frequent, but almost universal, among such of the knights as had resolved to spend their lives in Palestine. These Eastern ladies were obliged, however, to submit to the ceremony of baptism before they could be received to the arms of a Christian lord. These, and their offspring, naturally looked upon the Saracens with less hatred than did the zealots who conquered Jerusalem, and who thought it a sin deserving the wrath of God to spare an unbeliever. We find, in consequence, that the most obstinate battles waged during the reigns of the later kings of

Jerusalem were fought by the new and raw levies who from time to time arrived from Europe, lured by the hope of glory or spurred by fanaticism. The latter broke without scruple the truces established between the original settlers and the Saracens, and drew down severe retaliation upon many thousands of their brethren in the faith, whose prudence was stronger than their zeal, and whose chief desire was to live in peace.

BIBLE OF BALDWIN'S QUEEN.

Things remained in this unsatisfactory state till the close of the year 1145, when Edessa, the strong frontier town of the Christian kingdom, fell into the hands of the Saracens. The latter were commanded by Zenghi, a powerful and enterprising monarch, and, after his death, by his son Nourheddin, as powerful and enterprising as his father. An unsuccessful attempt was made by the Count of Edessa to regain the fortress, but Nourheddin with a large army came to the rescue, and after defeating the count with great slaughter, marched into Edessa and caused its fortifications to be razed to the ground, that the town might never more be a bulwark of defence for the kingdom of Jerusalem. The road to the capital was now open, and consternation seized the hearts of the Christians.

Nourheddin, it was known, was only waiting for a favourable opportunity to advance upon Jerusalem, and the armies of the cross, weakened and divided, were not in a condition to make any available resistance. The clergy were filled with grief and alarm, and wrote repeated letters to the Pope and the sovereigns of Europe, urging the expediency of a new Crusade for the relief of Jerusalem. By far the greater number of the priests of Palestine were natives of France, and these naturally looked first to their own country. The solicitations they sent to Louis VII. were urgent and oft repeated, and the chivalry of France began to talk once more of arming in defence of the birthplace of Jesus. The kings of Europe, whose interest it had not been to take any part in the first Crusade, began to bestir themselves in this; and a man appeared, eloquent as Peter the Hermit, to arouse the people as that preacher had done.

We find, however, that the enthusiasm of the second did not equal that of the first Crusade; in fact, the mania had reached its climax in the time of Peter the Hermit, and decreased regularly from that period. The third Crusade was less general than the second, and the fourth than the third, and so on, until the public enthusiasm was quite extinct, and Jerusalem returned at last to the dominion of its old masters without a convulsion in Christendom. Various reasons have been assigned for this; and one very generally put forward is, that Europe was wearied with continued struggles, and had become sick of "precipitating itself upon Asia." M. Guizot, in his admirable lectures upon European civilisation, successfully combats this opinion, and offers one of his own, which is far more satisfactory. He says, in his eighth lecture, "It has been often repeated that Europe was tired of continually invading Asia. This expression appears to me

exceedingly incorrect. It is not possible that human beings can be wearied with what they have not done—that the labours of their forefathers can fatigue them. Weariness is a personal, not an inherited feeling. The men of the thirteenth century were not fatigued by the Crusades of the twelfth. They were influenced by another cause. A great change had taken place in ideas, sentiments, and social conditions. The same desires and the same wants were no longer felt. The same things were no longer believed. The people refused to believe what their ancestors were persuaded of.”

This is, in fact, the secret of the change; and its truth becomes more apparent as we advance in the history of the Crusades, and compare the state of the public mind at the different periods when Godfrey of Bouillon, Louis VII., and Richard I., were chiefs and leaders of the movement. The Crusades themselves were the means of operating a great change in national ideas, and advancing the civilisation of Europe. In the time of Godfrey, the nobles were all-powerful and all-oppressive, and equally obnoxious to kings and people. During their absence along with that portion of the community the deepest sunk in ignorance and superstition, both kings and people fortified themselves against the renewal of aristocratic tyranny, and in proportion as they became free became civilised. It was during this period that in France, the grand centre of the crusading madness, the *communes* began to acquire strength, and the monarch to possess a practical and not a merely theoretic authority. Order and comfort began to take root, and, when the second Crusade was preached, men were in consequence much less willing to abandon their homes than they had been during the first. Such pilgrims as had returned from the Holy Land came back with

minds more liberal and expanded than when they set out. They had come in contact with a people more civilised than themselves; they had seen something more of the world, and had lost some portion, however small, of the prejudice and bigotry of ignorance. The institution of chivalry had also exercised its humanising influence, and coming bright and fresh through the ordeal of the Crusades, had softened the character and improved the hearts of the aristocratic order. The *Trouvères* and *Troubadours*, singing of love and war in strains pleasing to every class of society, helped to root out the gloomy superstitions which, at the first Crusade, filled the minds of all those who were able to think. Men became in consequence less exclusively under the mental thralldom of the priesthood, and lost much of the credulity which formerly distinguished them.

The Crusades appear never to have excited so much attention in England as on the continent of Europe; not because the people were less fanatical than their neighbours, but because they were occupied in matters of graver interest. The English were suffering too severely from the recent successful invasion of their soil, to have much sympathy to bestow upon the distresses of people so far away as the Christians of Palestine; and we find that they took no part in the first Crusade, and very little in the second. Even then those who engaged in it were chiefly Norman knights and their vassals, and not the Saxon franklins and population, who no doubt thought, in their sorrow, as many wise men have thought since, that charity should begin at home.

Germany was productive of more zeal in the cause, and her raw uncivilised hordes continued to issue forth under the banners of the cross in numbers apparently undiminished, when the enthusiasm

had long been on the wane in other countries. They were sunk at that time in a deeper slough of barbarism than the livelier nations around them, and took, in consequence, a longer period to free themselves from their prejudices. In fact the second Crusade drew its chief supplies of men from that quarter, where alone the expedition can be said to have retained any portion of popularity.

Such was the state of mind of Europe when Pope Eugenius, moved by the reiterated entreaties of the Christians of Syria, commissioned St. Bernard to preach a new Crusade. St. Bernard was a man eminently qualified for the mission. He was endowed with an eloquence of the highest order, could move an auditory to tears, or laughter, or fury, as it pleased him, and had led a life of such rigid and self-denying virtue, that not even calumny could lift her finger and point it at him. He had renounced high prospects in the Church, and contented himself with the simple abbacy of Clairvaux, in order that he might have the leisure he desired, to raise his powerful voice against abuses wherever he found them. Vice met in him an austere and uncompromising reprover; no man was too high for his reproach, and none too low for his sympathy. He was just as well suited for his age as Peter the Hermit had been for the age preceding. He appealed more to the reason, his predecessor to the passions; Peter the Hermit collected a mob, while St. Bernard collected an army. Both were endowed with equal zeal and perseverance, springing in the one from impulse, and in the other from conviction, and a desire to increase the influence of the Church, that great body of which he was a pillar and an ornament.

CATHEDRAL OF VEZELAI.

One of the first converts he made was in himself a host. Louis VII. was both superstitious and tyrannical, and, in a fit of remorse for the infamous slaughter he had authorised at the sacking of Vitry, he made a vow to undertake the journey to the Holy Land.¹⁰ He was in this disposition when St. Bernard began to preach, and wanted but little persuasion to embark in the cause. His example had great influence upon the nobility, who, impoverished as many of them were by the sacrifices made by their fathers in the holy wars, were anxious to repair their ruined fortunes by conquests on a foreign shore. These took the field with such vassals as they could command, and in a very short time an army was raised amounting to two hundred thousand men. At Vezelai the monarch received the cross from the hands of St. Bernard, on a platform elevated in sight of all the people. Several nobles, three bishops, and his queen, Eleanor of Aquitaine, were present at this ceremony, and enrolled themselves

under the banner of the cross, St. Bernard cutting up his red sacerdotal vestments, and making crosses of them, to be sewn on the shoulders of the people. An exhortation from the Pope was read to the multitude, granting remission of their sins to all who should join the Crusade, and directing that no man on that holy pilgrimage should encumber himself with heavy baggage and vain superfluities, and that the nobles should not travel with dogs or falcons, to lead them from the direct road, as had happened to so many during the first Crusade.

The command of the army was offered to St. Bernard; but he wisely refused to accept a station for which his habits had unqualified him. After consecrating Louis with great solemnity, at St. Denis, as chief of the expedition, he continued his course through the country, stirring up the people wherever he went. So high an opinion was entertained of his sanctity, that he was thought to be animated by the spirit of prophecy, and to be gifted with the power of working miracles. Many women, excited by his eloquence, and encouraged by his predictions, forsook their husbands and children, and, clothing themselves in male attire, hastened to the war. St. Bernard himself wrote a letter to the Pope detailing his success, and stating, that in several towns there did not remain a single male inhabitant capable of bearing arms, and that every where castles and towns were to be seen filled with women weeping for their absent husbands. But in spite of this apparent enthusiasm, the numbers who really took up arms were inconsiderable, and not to be compared to the swarms of the first Crusade. A levy of no more than two hundred thousand men, which was the utmost the number amounted to, could hardly have depopulated a country like France, to the extent mentioned by

St. Bernard. His description of the state of the country appears, therefore, to have been much more poetical than true.

Suger, the able minister of Louis, endeavoured to dissuade him from undertaking so long a journey at a time when his own dominions so much needed his presence. But the king was pricked in his conscience by the cruelties of Vitry, and was anxious to make the only reparation which the religion of that day considered sufficient. He was desirous, moreover, of testifying to the world, that though he could brave the temporal power of the Church when it encroached upon his prerogatives, he could render all due obedience to its spiritual decrees whenever it suited his interest or tallied with his prejudices to do so. Suger, therefore, implored in vain, and Louis received the pilgrim's staff at St. Denis, and made all preparations for his pilgrimage.

In the mean time St. Bernard passed into Germany, where similar success attended his preaching. The renown of his sanctity had gone before him, and he found every where an admiring audience. Thousands of people, who could not understand a word he said, flocked around him to catch a glimpse of so holy a man; and the knights enrolled themselves in great numbers in the service of the cross, each receiving from his hands the symbol of the cause. But the people were not led away as in the days of Gottschalk. We do not find that they rose in such tremendous masses of two and three hundred thousand men, swarming over the country like a plague of locusts. Still the enthusiasm was very great. The extraordinary tales that were told and believed of the miracles worked by the preacher brought the country people from far and near. Devils were said to vanish at his sight, and diseases of the most malignant nature to be cured by his

touch.¹¹ The Emperor Conrad caught at last the contagion from his subjects, and declared his intention to follow the cross.

The preparations were carried on so vigorously under the orders of Conrad, that in less than three months he found himself at the head of an army containing at least one hundred and fifty thousand effective men, besides a great number of women who followed their husbands and lovers to the war. One troop of them rode in the attitude and armour of men: their chief wore gilt spurs and buskins, and thence acquired the epithet of the golden-footed lady. Conrad was ready to set out long before the French monarch, and in the month of June 1147, he arrived before Constantinople, having passed through Hungary and Bulgaria without offence to the inhabitants.

PILGRIM'S STAFF.

Manuel Comnenus, the Greek emperor, successor not only to the throne but to the policy of Alexius, looked with alarm upon the new levies who had come to eat up his capital and imperil its tranquillity. Too weak to refuse them a passage through his dominions, too distrustful of them to make them welcome when they came, and too little assured of the advantages likely to result to himself from the war, to feign a friendship which he did not feel, the Greek emperor

gave offence at the very outset. His subjects, in the pride of superior civilisation, called the Germans barbarians; while the latter, who, if semi-barbarous, were at least honest and straightforward, retorted upon the Greeks by calling them double-faced knaves and traitors. Disputes continually arose between them, and Conrad, who had preserved so much good order among his followers during their passage, was unable to restrain their indignation when they arrived at Constantinople. For some offence or other which the Greeks had given them, but which is rather hinted at than stated by the scanty historians of the day, the Germans broke into the magnificent pleasure-garden of the emperor, where he had a valuable collection of tame animals, for which the grounds had been laid out in woods, caverns, groves, and streams, that each might follow in captivity his natural habits. The enraged Germans, meriting the name of barbarians that had been bestowed upon them, laid waste this pleasant retreat, and killed or let loose the valuable animals it contained. Manuel, who is said to have beheld the devastation from his palace windows without power or courage to prevent it, was completely disgusted with his guests, and resolved, like his predecessor Alexius, to get rid of them on the first opportunity. He sent a message to Conrad respectfully desiring an interview, but the German refused to trust himself within the walls of Constantinople. The Greek emperor, on his part, thought it compatible neither with his dignity nor his safety to seek the German, and several days were spent in insincere negotiations. Manuel at length agreed to furnish the crusading army with guides to conduct it through Asia Minor; and Conrad passed over the Hellespont with his forces, the advanced

guard being commanded by himself, and the rear by the warlike Bishop of Freysinghen.

Historians are almost unanimous in their belief that the wily Greek gave instructions to his guides to lead the army of the German emperor into dangers and difficulties. It is certain that, instead of guiding them through such districts of Asia Minor as afforded water and provisions, they led them into the wilds of Cappadocia, where neither was to be procured, and where they were suddenly attacked by the sultan of the Seljukian Turks, at the head of an immense force. The guides, whose treachery is apparent from this fact alone, fled at the first sight of the Turkish army, and the Christians were left to wage unequal warfare with their enemy, entangled and bewildered in desert wilds. Toiling in their heavy mail, the Germans could make but little effective resistance to the attacks of the Turkish light horse, who were down upon them one instant, and out of sight the next. Now in the front and now in the rear, the agile foe showered his arrows upon them, enticing them into swamps and hollows, from which they could only extricate themselves after long struggles and great losses. The Germans, confounded by this mode of warfare, lost all conception of the direction they were pursuing, and went back instead of forward. Suffering at the same time for want of provisions, they fell an easy prey to their pursuers. Count Bernhard, one of the bravest leaders of the German expedition, was surrounded, with his whole division, not one of whom escaped the Turkish arrows. The emperor himself had nearly fallen a victim, and was twice severely wounded. So persevering was the enemy, and so little able were the Germans to make even a shew of resistance, that when Conrad at last reached the city of Nice, he found that, instead of being at the head of

an imposing force of one hundred thousand foot and seventy thousand horse, he had but fifty or sixty thousand men, and these in the most worn and wearied condition.

Totally ignorant of the treachery of the Greek emperor, although he had been warned to beware of it, Louis VII. proceeded, at the head of his army, through Worms and Ratisbon, towards Constantinople. At Ratisbon he was met by a deputation from Manuel, bearing letters so full of hyperbole and flattery, that Louis is reported to have blushed when they were read to him by the Bishop of Langres. The object of the deputation was to obtain from the French king a promise to pass through the Grecian territories in a peaceable and friendly manner, and to yield to the Greek emperor any conquest he might make in Asia Minor. The first part of the proposition was immediately acceded to, but no notice was taken of the second and more unreasonable. Louis marched on, and, passing through Hungary, pitched his tents in the outskirts of Constantinople.

On his arrival, Manuel sent him a friendly invitation to enter the city at the head of a small train. Louis at once accepted it, and was met by the emperor at the porch of his palace. The fairest promises were made; every art that flattery could suggest was resorted to, and every argument employed, to induce him to yield his future conquests to the Greek. Louis obstinately refused to pledge himself, and returned to his army convinced that the emperor was a man not to be trusted. Negotiations were, however, continued for several days, to the great dissatisfaction of the French army. The news that arrived of a treaty entered into between Manuel and the Turkish sultan changed their dissatisfaction into fury, and the leaders demanded to be led against Constantinople, swearing that they

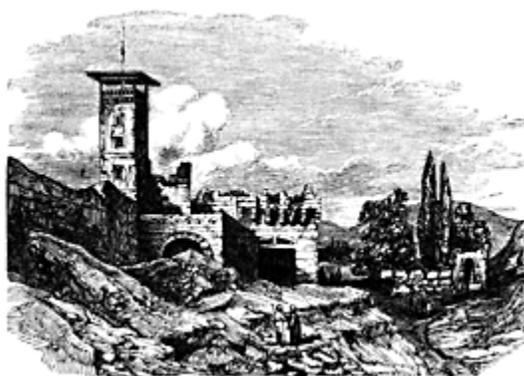

would raze the treacherous city to the ground. Louis did not feel inclined to accede to this proposal, and, breaking up his camp, he crossed over into Asia.

Here he heard, for the first time, of the mishaps of the German emperor, whom he found in a woful plight under the walls of Nice. The two monarchs united their forces, and marched together along the sea-coast to Ephesus; but Conrad, jealous, it would appear, of the superior numbers of the French, and not liking to sink into a vassal, for the time being, of his rival, withdrew abruptly with the remnant of his legions, and returned to Constantinople. Manuel was all smiles and courtesy. He condoled with the German so feelingly upon his losses, and cursed the stupidity or treachery of the guides with such apparent heartiness, that Conrad was half inclined to believe in his sincerity.

Louis, marching onward in the direction of Jerusalem, came up with the enemy on the banks of the Meander. The Turks contested the passage of the river, but the French bribed a peasant to point out a ford lower down: crossing the river without difficulty, they attacked the Turks with much vigour, and put them to flight. Whether the Turks were really defeated, or merely pretended to be so, is doubtful; but the latter supposition seems to be the true one. It is probable that it was part of a concerted plan to draw the invaders onwards to more unfavourable ground, where their destruction might be more certain. If such were the scheme, it succeeded to the heart's wish of its projectors. The Crusaders, on the third day after their victory, arrived at a steep mountain-pass, on the summit of which the Turkish host lay concealed so artfully, that not the slightest vestige of their presence could be perceived. "With labouring steps and slow,"

they toiled up the steep ascent, when suddenly a tremendous fragment of rock came bounding down the precipices with an awful crash, bearing dismay and death before it. At the same instant the Turkish archers started from their hiding-places, and discharged a shower of arrows upon the foot-soldiers, who fell by hundreds at a time. The arrows rebounded harmlessly against the iron mail of the knights, which the Turks observing, took aim at their steeds, and horse and rider fell down the steep into the rapid torrent which rushed below. Louis, who commanded the rear-guard, received the first intimation of the onslaught from the sight of the wounded and flying soldiers, and, not knowing the numbers of the enemy, he pushed vigorously forward to stay, by his presence, the panic which had taken possession of his army. All his efforts were in vain. Immense stones continued to be hurled upon them as they advanced, bearing men and horse before them; and those who succeeded in forcing their way to the top were met hand-to-hand by the Turks, and cast down headlong upon their companions. Louis himself fought with the energy of desperation, but had great difficulty to avoid falling into the enemy's hands. He escaped at last under cover of the night, with the remnant of his forces, and took up his position before Attalia. Here he restored the discipline and the courage of his disorganised and disheartened followers, and debated with his captains the plan that was to be pursued. After suffering severely both from disease and famine, it was resolved that they should march to Antioch, which still remained an independent principality under the successors of Bohemund of Tarentum. At this time the sovereignty was vested in the person of Raymond, the uncle of Eleanor of Aquitaine. This prince, presuming upon his relationship

to the French queen, endeavoured to withdraw Louis from the grand object of the Crusade—the defence of the kingdom of Jerusalem, and secure his co-operation in extending the limits and the power of his principality of Antioch. The Prince of Tripoli formed a similar design; but Louis rejected the offers of both, and marched, after a short delay, to Jerusalem. The Emperor Conrad was there before him, having left Constantinople with promises of assistance from Manuel Comnenus—assistance which never arrived, and was never intended.

DAMASCUS.

A great council of the Christian princes of Palestine, and the leaders of the Crusade, was then summoned, to discuss the future operations of the war. It was ultimately determined that it would further the cause of the cross in a greater degree if the united armies, instead of proceeding to Edessa, laid siege to the city of Damascus, and drove the Saracens from that strong position. This was a bold scheme, and, had it been boldly followed out, would have insured, in all probability, the success of the war. But the Christian leaders never learned from experience the necessity of union, that very soul of great enterprises. Though they all agreed upon the policy of the plan, yet every one had his own notions as to the means of executing it. The princes of Antioch and Tripoli were jealous of each other, and of

the king of Jerusalem. The Emperor Conrad was jealous of the king of France, and the king of France was disgusted with them all. But he had come out to Palestine in accordance with a solemn vow; his religion, though it may be called bigotry, was sincere; and he determined to remain to the very last moment that a chance was left of effecting any good for the cause he had set his heart on.

The siege of Damascus was accordingly commenced, and with so much ability and vigour that the Christians gained a considerable advantage at the very outset. For weeks the siege was pressed, till the shattered fortifications and diminishing resistance of the besieged gave evidence that the city could not hold out much longer. At that moment the insane jealousy of the leaders led to dissensions that soon caused the utter failure, not only of the siege but of the Crusade. A modern cookery-book, in giving a recipe for cooking a hare, says, "first catch your hare, and then kill it"—a maxim of indisputable wisdom. The Christian chiefs, on this occasion, had not so much sagacity, for they began a violent dispute among themselves for the possession of a city which was still unconquered. There being already a prince of Antioch and a prince of Tripoli, twenty claimants started for the principality of Damascus; and a grand council of the leaders was held to determine the individual on whom the honour should devolve. Many valuable days were wasted in this discussion, the enemy in the meanwhile gaining strength from their inactivity. It was at length, after a stormy deliberation, agreed that Count Robert of Flanders, who had twice visited the Holy Land, should be invested with the dignity. The other claimants refused to recognise him or to co-operate in the siege until a more equitable arrangement had been made. Suspicion filled the camp; the most sinister rumours of

intrigues and treachery were set afloat; and the discontented candidates withdrew at last to the other side of the city, and commenced operations on their own account without a probability of success. They were soon joined by the rest of the army. The consequence was that the weakest side of the city, and that on which they had already made considerable progress in the work of demolition, was left uncovered. The enemy was prompt to profit by the mistake, and received an abundant supply of provisions, and refortified the walls, before the Crusaders came to their senses again. When this desirable event happened, it was too late. Saph Eddin, the powerful emir of Mousoul, was in the neighbourhood, at the head of a large army, advancing by forced marches to the relief of the city. The siege was abruptly abandoned, and the foolish Crusaders returned to Jerusalem, having done nothing to weaken the enemy, but every thing to weaken themselves.

The freshness of enthusiasm had now completely subsided; even the meanest soldiers were sick at heart. Conrad, from whose fierce zeal at the outset so much might have been expected, was wearied with reverses, and returned to Europe with the poor remnant of his host. Louis lingered a short time longer, for very shame, but the pressing solicitations of his minister Suger induced him to return to France. Thus ended the second Crusade. Its history is but a chronicle of defeats. It left the kingdom of Jerusalem in a worse state than when it quitted Europe, and gained nothing but disgrace for its leaders, and discouragement for all concerned.

St. Bernard, who had prophesied a result so different, fell after this into some disrepute, and experienced, like many other prophets, the fate of being without honour in his own country. What made the

matter worse, he could not obtain it in any other. Still, however, there were not wanting zealous advocates to stand forward in his behalf, and stem the tide of incredulity, which, unopposed, would have carried away his reputation. The Bishop of Freysinghen declared that prophets were not always able to prophesy, and that the vices of the Crusaders drew down the wrath of heaven upon them. But the most ingenious excuse ever made for St. Bernard is to be found in his life by Geoffroi de Clairvaux, where he pertinaciously insists that the Crusade was not unfortunate. St. Bernard, he says, had prophesied a happy result, and that result could not be considered other than happy which had peopled heaven with so glorious an army of martyrs. Geoffroi was a cunning pleader, and, no doubt, convinced a few of the zealous; but plain people, who were not wanting even in those days, retained their own opinion, or, what amounts to the same thing, “were convinced against their will.”

We now come to the consideration of the third Crusade, and of the causes which rendered it necessary. The epidemic frenzy, which had been cooling ever since the issue of the first expedition, was now extinct, or very nearly so, and the nations of Europe looked with cold indifference upon the armaments of their princes. But chivalry had flourished in its natural element of war, and was now in all its glory. It continued to supply armies for the Holy Land when the popular ranks refused to deliver up their able-bodied swarms. Poetry, which, more than religion, inspired the third Crusade, was then but “*caviare* to the million,” who had other matters, of sterner import, to claim all their attention. But the knights and their retainers listened with delight to the martial and amatory strains of the minstrels, minnesängers, trouvères, and troubadours, and burned to win favour

in ladies' eyes by shewing prowess in the Holy Land. The third was truly the romantic era of the Crusades. Men fought then, not so much for the sepulchre of Jesus, and the maintenance of a Christian kingdom in the East, as to gain glory for themselves in the best and almost only field where glory could be obtained. They fought, not as zealots, but as soldiers; not for religion, but for honour; not for the crown of martyrdom, but for the favour of the lovely.

SEAL OF BARBAROSSA.

It is not necessary to enter into a detail of the events by which Saladin attained the sovereignty of the East, or how, after a succession of engagements, he planted the Moslem banner once more upon the battlements of Jerusalem. The Christian knights and population, including the grand orders of St. John, the Hospitallers, and the Templars, were sunk in an abyss of vice, and, torn by unworthy jealousies and dissensions, were unable to resist the well-trained armies which the wise and mighty Saladin brought forward to crush them. But the news of their fall created a painful sensation among the chivalry of Europe, whose noblest members were linked to the dwellers in Palestine by many ties, both of blood and friendship. The news of the great battle of Tiberias, in which Saladin defeated the Christian host with terrible slaughter, arrived first in Europe, and was followed in quick succession by that of the capture of Jerusalem, Antioch, Tripoli, and other cities. Dismay seized upon

the clergy. The Pope (Urban III.) was so affected by the news that he pined away for grief, and was scarcely seen to smile again, until he sank into the sleep of death.¹² His successor, Gregory VIII., felt the loss as acutely, but had better strength to bear it, and instructed all the clergy of the Christian world to stir up the people to arms for the recovery of the Holy Sepulchre. William Archbishop of Tyre, a humble follower in the path of Peter the Hermit, left Palestine to preach to the kings of Europe the miseries he had witnessed, and to incite them to the rescue. The renowned Frederick Barbarossa, the emperor of Germany, speedily collected an army, and passing over into Syria with less delay than had ever before awaited a crusading force, defeated the Saracens, and took possession of the city of Iconium. He was unfortunately cut off in the middle of his successful career, by imprudently bathing in the Cydnus¹³ while he was overheated, and the Duke of Suabia took the command of the expedition. The latter did not prove so able a general, and met with nothing but reverses, although he was enabled to maintain a footing at Antioch until assistance arrived from Europe.

HENRY II. OF ENGLAND.

Henry II. of England and Philip Augustus of France, at the head of their chivalry, supported the Crusade with all their influence, until wars and dissensions nearer home estranged them from it for a time. The two kings met at Gisors in Normandy in the month of January, 1188, accompanied by a brilliant train of knights and warriors. William of Tyre was present, and expounded the cause of the cross with considerable eloquence, and the whole assembly bound themselves by oath to proceed to Jerusalem. It was agreed at the same time that a tax, called Saladin's tithe, and consisting of the tenth part of all possessions, whether landed or personal, should be enforced over Christendom, upon every one who was either unable

or unwilling to assume the cross. The lord of every feof, whether lay or ecclesiastical, was charged to raise the tithe within his own jurisdiction; and any one who refused to pay his quota, became by that act the bondsman and absolute property of his lord. At the same time the greatest indulgence was shewn to those who assumed the cross; no man was at liberty to stay them by process of any kind, whether for debt, or robbery, or murder. The king of France, at the breaking up of the conference, summoned a parliament at Paris, where these resolutions were solemnly confirmed, while Henry II. did the same for his Norman possessions at Rouen, and for England at Geddington, in Northamptonshire. To use the words of an ancient chronicler,¹⁴ “he held a parliament about the voyage into the Holy Land, and troubled the whole land with the paying of tithes towards it.”

CHATEAU OF GISORS.

PHILIP AUGUSTUS.

But it was not England alone that was “troubled” by the tax. The people of France also looked upon it with no pleasant feelings, and appear from that time forth to have changed their indifference for the Crusade into aversion. Even the clergy, who were exceedingly willing that other people should contribute half, or even all their goods in furtherance of their favourite scheme, were not at all anxious to contribute a single sous themselves. Millot[15]¹⁵ relates that several of them cried out against the impost. Among the rest, the clergy of Rheims were called upon to pay their quota, but sent a deputation to the king, begging him to be contented with the aid of their prayers, as they were too poor to contribute in any other shape. Philip Augustus knew better, and by way of giving them a lesson, employed three nobles of the vicinity to lay waste the Church lands. The clergy, informed of the outrage, applied to the king for redress. “I will aid you with my prayers,” said the monarch condescendingly, “and will entreat those gentlemen to let the Church alone.” He did as he had promised, but in such a manner that the nobles, who appreciated the joke, continued their devastations as before. Again the clergy applied to the king. “What would you have of me?” he

replied, in answer to their remonstrances: “you gave me your prayers in my necessity, and I have given you mine in yours.” The clergy understood the argument, and thought it the wiser course to pay their quota of Saladin’s tithes without further parley.

This anecdote shews the unpopularity of the Crusade. If the clergy disliked to contribute, it is no wonder that the people felt still greater antipathy. But the chivalry of Europe was eager for the fray: the tithes were rigorously collected, and armies from England, France, Burgundy, Italy, Flanders, and Germany, were soon in the field. The two kings who were to have led it were, however, drawn into broils by an aggression of Richard duke of Guienne, better known as Richard Cœur de Lion, upon the territory of the Count of Toulouse, and the proposed journey to Palestine was delayed. War continued to rage between France and England, and with so little probability of a speedy termination, that many of the nobles, bound to the Crusade, left the two monarchs to settle the differences at their leisure, and proceeded to Palestine without them.

Death at last stepped in and removed Henry II. from the hostility of his foes, and the treachery and ingratitude of his children. His son Richard immediately concluded an alliance with Philip Augustus; and the two young, valiant, and impetuous monarchs united all their energies to forward the Crusade. They met with a numerous and brilliant retinue at Nonancourt in Normandy, where, in sight of their assembled chivalry, they embraced as brothers, and swore to live as friends and true allies, until a period of forty days after their return from the Holy Land. With a view of purging their camp from the follies and vices which had proved so ruinous to preceding expeditions, they drew up a code of laws for the government of the

army. Gambling had been carried to a great extent, and proved the fruitful source of quarrels and bloodshed; and one of their laws prohibited any person in the army, beneath the degree of a knight, from playing at any game for money.¹⁶ Knights and clergymen might play for money, but no one was permitted to lose or gain more than twenty shillings in a day, under a penalty of one hundred shillings. The personal attendants of the monarchs were also allowed to play to the same extent. The penalty in their case for infraction was that they should be whipped naked through the army for the space of three days. Any Crusader, who struck another and drew blood, was ordered to have his hand cut off; and whoever slew a brother Crusader was condemned to be tied alive to the corpse of his victim, and buried with him. No young women were allowed to follow the army, to the great sorrow of many vicious and of many virtuous dames, who had not courage to elude the decree by dressing in male attire. But many high-minded and affectionate maidens and matrons, bearing the sword or the spear, followed their husbands and lovers to the war in spite of King Richard, and in defiance of danger. The only women allowed to accompany the army in their own habiliments were washerwomen of fifty years complete, and any others of the fair sex who had reached the same age.

These rules having been promulgated, the two monarchs marched together to Lyons, where they separated, agreeing to meet again at Messina. Philip proceeded across the Alps to Genoa, where he took ship, and was conveyed in safety to the place of rendezvous. Richard turned in the direction of Marseilles, where he also took ship for Messina. His impetuous disposition hurried him into many squabbles by the way, and his knights and followers, for the most

part as brave and as foolish as himself, imitated him very zealously in this particular. At Messina the Sicilians charged the most exorbitant prices for every necessary of life. Richard's army in vain remonstrated. From words they came to blows, and, as a last resource, plundered the Sicilians, since they could not trade with them. Continual battles were the consequence, in one of which Lebrun, the favourite attendant of Richard, lost his life. The peasantry from far and near came flocking to the aid of the townspeople, and the battle soon became general. Richard, irritated at the loss of his favourite, and incited by report that Tancred, the king of Sicily, was fighting at the head of his own people, joined the *mêlée* with his boldest knights, and, beating back the Sicilians, attacked the city sword in hand, stormed the battlements, tore down the flag of Sicily, and planted his own in its stead. This collision gave great offence to the king of France, who became from that time jealous of Richard, and apprehensive that his design was not so much to re-establish the Christian kingdom of Jerusalem, as to make conquests for himself. He, however, exerted his influence to restore peace between the English and Sicilians, and shortly afterwards set sail for Acre, with distrust of his ally germinating in his heart.

THE ISLAND OF RHODES.

Richard remained behind for some weeks in a state of inactivity quite unaccountable in one of his temperaments. He appears to have had no more squabbles with the Sicilians, but to have lived an easy, luxurious life, forgetting, in the lap of pleasure, the objects for which he had quitted his own dominions and the dangerous laxity he was introducing into his army. The superstition of his soldiers recalled him at length to a sense of his duty: a comet was seen for several successive nights, which was thought to menace them with the vengeance of Heaven for their delay. Shooting stars gave them similar warning; and a fanatic, of the name of Joachim, with his drawn sword in his hand, and his long hair streaming wildly over his shoulders, went through the camp, howling all night long, and predicting plague, famine, and every other calamity, if they did not set out immediately. Richard did not deem it prudent to neglect the intimations; and, after doing humble penance for his remissness, he set sail for Acre.

A violent storm dispersed his fleet, but he arrived safely at Rhodes with the principal part of the armament. Here he learned that three of his ships had been stranded on the rocky coasts of Cyprus, and that the ruler of the island, Isaac Comnenus, had permitted his people to pillage the unfortunate crews, and had refused shelter to his betrothed bride, the Princess Berengaria, and his sister, who, in one of the vessels, had been driven by stress of weather into the port of Limisso. The fiery monarch swore to be revenged, and, collecting all his vessels, sailed back to Limisso. Isaac Comnenus refused to apologise or explain, and Richard, in no mood to be trifled with, landed on the island, routed with great loss the forces sent to oppose him, and laid the whole country under contribution.

RICHARD I. AND BERENGARIA.

On his arrival at Acre he found the whole of the chivalry of Europe there before him. Guy of Lusignan, the king of Jerusalem, had long before collected the bold Knights of the Temple, the Hospital, and St.

John, and had laid siege to Acre, which was resolutely defended by the Sultan Saladin, with an army magnificent both for its numbers and its discipline. For nearly two years the Crusaders had pushed the siege, and made efforts almost superhuman to dislodge the enemy. Various battles had taken place in the open fields with no decisive advantage to either party, and Guy of Lusignan had begun to despair of taking that strong position without aid from Europe. His joy was extreme on the arrival of Philip with all his chivalry, and he only awaited the coming of Cœur de Lion to make one last decisive attack upon the town. When the fleet of England was first seen approaching the shores of Syria, a universal shout arose from the Christian camp; and when Richard landed with his train, one louder still pierced to the very mountains of the south, where Saladin lay with all his army.

It may be remarked as characteristic of this Crusade, that the Christians and the Moslems no longer looked upon each other as barbarians, to whom mercy was a crime. Each host entertained the highest admiration for the bravery and magnanimity of the other, and, in their occasional truces, met upon the most friendly terms. The Moslem warriors were full of courtesy to the Christian knights, and had no other regret than to think that such fine fellows were not Mahomedans. The Christians, with a feeling precisely similar, extolled to the skies the nobleness of the Saracens, and sighed to think that such generosity and valour should be sullied by disbelief in the Gospel of Jesus. But when the strife began, all these feelings disappeared, and the struggle became mortal.

The jealousy excited in the mind of Philip by the events of Messina still rankled, and the two monarchs refused to act in concert. Instead of making a joint attack upon the town, the French monarch assailed

it alone, and was repulsed. Richard did the same, and with the same result. Philip tried to seduce the soldiers of Richard from their allegiance by the offer of three gold pieces per month to every knight who would forsake the banners of England for those of France. Richard endeavoured to neutralise the offer by a larger one, and promised four pieces to every French knight who should join the Lion of England. In this unworthy rivalry their time was wasted, to the great detriment of the discipline and efficiency of their followers. Some good was nevertheless effected; for the mere presence of two such armies prevented the besieged city from receiving supplies, and the inhabitants were reduced by famine to the most woful straits. Saladin did not deem it prudent to risk a general engagement by coming to their relief, but preferred to wait till dissension had weakened his enemy, and made him an easy prey. Perhaps if he had been aware of the real extent of the extremity in Acre, he would have changed his plan; but, cut off from the town, he did not know its misery till it was too late. After a short truce the city capitulated upon terms so severe that Saladin afterwards refused to ratify them. The chief conditions were, that the precious wood of the true cross, captured by the Moslems in Jerusalem, should be restored; that a sum of two hundred thousand gold pieces should be paid; and that all the Christian prisoners in Acre should be released, together with two hundred knights and a thousand soldiers detained in captivity by Saladin. The eastern monarch, as may be well conceived, did not set much store on the wood of the cross, but was nevertheless anxious to keep it, as he knew its possession by the Christians would do more than a victory to restore their courage. He refused, therefore, to deliver it up, or to accede to any of the conditions; and Richard, as he

had previously threatened, barbarously ordered all the Saracen prisoners in his power to be put to death.

The possession of the city only caused new and unhappy dissensions between the Christian leaders. The Archduke of Austria unjustifiably hoisted his flag on one of the towers of Acre, which Richard no sooner saw than he tore it down with his own hands, and trampled it under his feet. Philip, though he did not sympathise with the archduke, was piqued at the assumption of Richard, and the breach between the two monarchs became wider than ever. A foolish dispute arose at the same time between Guy of Lusignan and Conrad of Montferrat for the crown of Jerusalem. The inferior knights were not slow to imitate the pernicious example, and jealousy, distrust, and ill-will reigned in the Christian camp. In the midst of this confusion the king of France suddenly announced his intention to return to his own country. Richard was filled with indignation, and exclaimed, "Eternal shame light on him, and on all France, if, for any cause, he leave this work unfinished!" But Philip was not to be stayed. His health had suffered by his residence in the East; and, ambitious of playing a first part, he preferred to play none at all than to play second to King Richard. Leaving a small detachment of Burgundians behind, he returned to France with the remainder of his army; and Cœur de Lion, without feeling, in the multitude of his rivals, that he had lost the greatest, became painfully convinced that the right arm of the enterprise was lopped off.

After his departure, Richard re-fortified Acre, restored the Christian worship in the churches, and, leaving a Christian garrison to protect it, marched along the sea-coast towards Ascalon. Saladin was on the alert, and sent his light horse to attack the rear of the

Christian army, while he himself, miscalculating their weakness since the defection of Philip, endeavoured to force them to a general engagement. The rival armies met near Azotus. A fierce battle ensued, in which Saladin was defeated and put to flight, and the road to Jerusalem left free for the Crusaders.

Again discord exerted its baleful influence, and prevented Richard from following up his victory. His opinion was constantly opposed by the other leaders, all jealous of his bravery and influence; and the army, instead of marching to Jerusalem, or even to Ascalon, as was first intended, proceeded to Jaffa, and remained in idleness until Saladin was again in a condition to wage war against them.

BETHLEHEM.

Many months were spent in fruitless hostilities and as fruitless negotiations. Richard's wish was to recapture Jerusalem; but there were difficulties in the way, which even his bold spirit could not conquer. His own intolerable pride was not the least cause of the evil; for it estranged many a generous spirit, who would have been willing to co-operate with him in all cordiality. At length it was agreed to march to the Holy City; but the progress made was so slow and painful, that the soldiers murmured, and the leaders meditated

retreat. The weather was hot and dry, and there was little water to be procured. Saladin had choked up the wells and cisterns on the route, and the army had not zeal enough to push forward amid such privation. At Bethlehem a council was held, to debate whether they should retreat or advance. Retreat was decided upon, and immediately commenced. It is said, that Richard was first led to a hill, whence he could obtain a sight of the towers of Jerusalem, and that he was so affected at being so near it, and so unable to relieve it, that he hid his face behind his shield, and sobbed aloud.

The army separated into two divisions, the smaller falling back upon Jaffa, and the larger, commanded by Richard and the Duke of Burgundy, returning to Acre. Before the English monarch had made all his preparations for his return to Europe, a messenger reached Acre with the intelligence that Jaffa was besieged by Saladin, and that, unless relieved immediately, the city would be taken. The French, under the Duke of Burgundy, were so wearied with the war, that they refused to aid their brethren in Jaffa. Richard, blushing with shame at their pusillanimity, called his English to the rescue, and arrived just in time to save the city. His very name put the Saracens to flight, so great was their dread of his prowess. Saladin regarded him with the warmest admiration, and when Richard, after his victory, demanded peace, willingly acceded. A truce was concluded for three years and eight months, during which Christian pilgrims were to enjoy the liberty of visiting Jerusalem without hindrance or payment of any tax. The Crusaders were allowed to retain the cities of Tyre and Jaffa, with the country intervening. Saladin, with a princely generosity, invited many of the Christians to visit Jerusalem; and several of the leaders took advantage of his offer

to feast their eyes upon a spot which all considered so sacred. Many of them were entertained for days in the sultan's own palace, from which they returned with their tongues laden with the praises of the noble infidel. Richard and Saladin never met, though the impression that they did will remain on many minds, who have been dazzled by the glorious fiction of Sir Walter Scott. But each admired the prowess and nobleness of soul of his rival, and agreed to terms far less onerous than either would have accepted, had this mutual admiration not existed.¹⁷

The king of England no longer delayed his departure, for messengers from his own country brought imperative news that his presence was required to defeat the intrigues that were fomenting against his crown. His long imprisonment in the Austrian dominions and final ransom are too well known to be dwelt upon. And thus ended the third Crusade, less destructive of human life than the two first, but quite as useless.

The flame of popular enthusiasm now burned pale indeed, and all the efforts of popes and potentates were insufficient to rekindle it. At last, after flickering unsteadily, like a lamp expiring in the socket, it burned up brightly for one final instant, and was extinguished for ever.

The fourth Crusade, as connected with popular feeling, requires little or no notice. At the death of Saladin, which happened a year after the conclusion of his truce with Richard of England, his vast empire fell to pieces. His brother Saif Eddin, or Saphaddin, seized upon Syria, in the possession of which he was troubled by the sons of Saladin. When this intelligence reached Europe, the Pope, Celestine III., judged the moment favourable for preaching a new Crusade. But

every nation in Europe was unwilling and cold towards it. The people had no ardour, and kings were occupied with more weighty matters at home. The only monarch of Europe who encouraged it was the Emperor Henry of Germany, under whose auspices the Dukes of Saxony and Bavaria took the field at the head of a considerable force. They landed in Palestine, and found any thing but a welcome from the Christian inhabitants. Under the mild sway of Saladin, they had enjoyed repose and toleration, and both were endangered by the arrival of the Germans. They looked upon them in consequence as over-officious intruders, and gave them no encouragement in the warfare against Saphaddin. The result of this Crusade was even more disastrous than the last; for the Germans contrived not only to embitter the Saracens against the Christians of Judea, but to lose the strong city of Jaffa, and cause the destruction of nine-tenths of the army with which they had quitted Europe. And so ended the fourth Crusade.

The fifth was more important, and had a result which its projectors never dreamed of—no less than the sacking of Constantinople, and the placing of a French dynasty upon the imperial throne of the eastern Cæsars. Each succeeding pope, however much he may have differed from his predecessors on other points, zealously agreed in one, that of maintaining by every possible means the papal ascendancy. No scheme was so likely to aid in this endeavour as the Crusades. As long as they could persuade the kings and nobles of Europe to fight and die in Syria, their own sway was secured over the minds of men at home. Such being their object, they never inquired whether a Crusade was or was not likely to be successful, whether the time were well or ill chosen, or whether men and money could be

procured in sufficient abundance. Pope Innocent III. would have been proud if he could have bent the refractory monarchs of England and France into so much submission. But John and Philip Augustus were both engaged. Both had deeply offended the Church, and had been laid under her ban, and both were occupied in important reforms at home; Philip in bestowing immunities upon his subjects, and John in having them forced from him. The emissaries of the pope therefore plied them in vain; but as in the first and second Crusades, the eloquence of a powerful preacher incited the nobility, and through them a certain portion of the people; Foulque bishop of Neuilly, an ambitious and enterprising prelate, entered fully into the views of the court of Rome, and preached the Crusade wherever he could find an audience. Chance favoured him to a degree he did not himself expect, for he had in general found but few proselytes, and those few but cold in the cause. Theobald count of Champagne had instituted a grand tournament, to which he had invited all the nobles from far and near. Upwards of two thousand knights were present with their retainers, besides a vast concourse of people to witness the sports. In the midst of the festivities Foulque arrived upon the spot, and conceiving the opportunity to be a favourable one, he addressed the multitude in eloquent language, and passionately called upon them to enrol themselves for the new Crusade. The Count de Champagne, young, ardent, and easily excited, received the cross at his hands. The enthusiasm spread rapidly. Charles count of Blois followed the example, and of the two thousand knights present, scarcely one hundred and fifty refused. The popular phrensy seemed on the point of breaking out as in the days of yore. The Count of Flanders, the Count of Bar, the Duke of Burgundy, and the Marquis

of Montferrat, brought all their vassals to swell the train, and in a very short space of time an effective army was on foot and ready to march to Palestine.

The dangers of an overland journey were too well understood, and the Crusaders endeavoured to make a contract with some of the Italian states to convey them over in their vessels. Dandolo, the aged doge of Venice, offered them the galleys of the Republic; but the Crusaders, on their arrival in that city, found themselves too poor to pay even half the sum demanded. Every means was tried to raise money; the Crusaders melted down their plate, and ladies gave up their trinkets. Contributions were solicited from the faithful, but came in so slowly as to make it evident to all concerned, that the faithful of Europe were outnumbered by the prudent. As a last resource, Dandolo offered to convey them to Palestine at the expense of the Republic, if they would previously aid in the recapture of the city of Zara, which had been seized from the Venetians a short time previously by the king of Hungary. The Crusaders consented, much to the displeasure of the pope, who threatened excommunication upon all who should be turned aside from the voyage to Jerusalem. But notwithstanding the fulminations of the Church, the expedition never reached Palestine. The siege of Zara was speedily undertaken. After a long and brave defence, the city surrendered at discretion, and the Crusaders were free, if they had so chosen it, to use their swords against the Saracens. But the ambition of the chiefs had been directed, by unforeseen circumstances, elsewhere.

After the death of Manuel Comnenus, the Greek empire had fallen a prey to intestine divisions. His son Alexius II. had succeeded him, but was murdered after a short reign by his uncle Andronicus, who

seized upon the throne. His reign also was but of short duration. Isaac Angelus, a member of the same family, took up arms against the usurper, and having defeated and captured him in a pitched battle, had him put to death. He also mounted the throne only to be cast down from it. His brother Alexius deposed him, and to incapacitate him from reigning, put out his eyes, and shut him up in a dungeon. Neither was Alexius III. allowed to remain in peaceable possession of the throne; the son of the unhappy Isaac, whose name also was Alexius, fled from Constantinople, and hearing that the Crusaders had undertaken the siege of Zara, made them the most magnificent offers if they would afterwards aid him in deposing his uncle. His offers were, that if by their means he was re-established in his father's dominions, he would place the Greek Church under the authority of the Pope of Rome, lend the whole force of the Greek empire to the conquest of Palestine, and distribute two hundred thousand marks of silver among the crusading army. The offer was accepted, with a proviso on the part of some of the leaders, that they should be free to abandon the design, if it met with the disapproval of the pope. But this was not to be feared. The submission of the schismatic Greeks to the See of Rome was a greater bribe to the Pontiff than the utter annihilation of the Saracen power in Palestine would have been.

The Crusaders were soon in movement for the imperial city. Their operations were skilfully and courageously directed, and spread such dismay as to paralyse the efforts of the usurper to retain possession of his throne. After a vain resistance, he abandoned the city to its fate, and fled no one knew whither. The aged and blind Isaac was taken from his dungeon by his subjects, and placed upon the throne

ere the Crusaders were apprised of the flight of his rival. His son Alexius IV. was afterwards associated with him in the sovereignty.

But the conditions of the treaty gave offence to the Grecian people, whose prelates refused to place themselves under the dominion of the See of Rome. Alexius at first endeavoured to persuade his subjects to admission, and prayed the Crusaders to remain in Constantinople until they had fortified him in the possession of a throne which was yet far from secure. He soon became unpopular with his subjects; and breaking faith with regard to the subsidies, he offended the Crusaders. War was at length declared upon him by both parties; by his people for his tyranny, and by his former friends for his treachery. He was seized in his palace by his own guards and thrown into prison, while the Crusaders were making ready to besiege his capital. The Greeks immediately proceeded to the election of a new monarch; and looking about for a man of courage, energy, and perseverance, they fixed upon Alexius Ducas, who, with almost every bad quality, was possessed of the virtues they needed. He ascended the throne under the name of Murzuphlis. One of his first acts was to rid himself of his youngest predecessor—a broken heart had already removed the blind old Isaac, no longer a stumbling-block in his way—and the young Alexius was soon after put to death in his prison.

CONSTANTINOPLE.

War to the knife was now declared between the Greeks and the Franks; and early in the spring of the year 1204, preparations were commenced for an assault upon Constantinople. The French and Venetians entered into a treaty for the division of the spoils among their soldiery; for so confident were they of success, that failure never once entered into their calculations. This confidence led them on to victory; while the Greeks, cowardly as treacherous people always are, were paralysed by a foreboding of evil. It has been a matter of astonishment to all historians, that Murzuphlis, with the reputation for courage which he had acquired, and the immense resources at his disposal, took no better measures to repel the onset of the Crusaders. Their numbers were as a mere handful in comparison with those which he could have brought against them; and if they had the hopes of plunder to lead them on, the Greeks had their homes to fight for, and their very existence as a nation to protect. After an impetuous assault, repulsed for one day, but renewed with double impetuosity on another, the Crusaders lashed their vessels against the walls, slew every man who opposed them, and, with little loss to themselves, entered the city. Murzuphlis fled, and Constantinople was given over to be pillaged by the victors. The wealth they found was enormous. In money alone there was sufficient to distribute twenty marks of silver to each knight, ten to each squire or servant at arms, and five to each archer. Jewels, velvets, silks, and every luxury of attire, with rare wines and fruits, and valuable merchandise of every description, also fell into their hands, and were bought by the trading Venetians, and the proceeds distributed among the army. Two thousand persons were put to the

sword; but had there been less plunder to take up the attention of the victors, the slaughter would in all probability have been much greater.

In many of the bloody wars which defile the page of history, we find that soldiers, utterly reckless of the works of God, will destroy his masterpiece, man, with unsparing brutality, but linger with respect round the beautiful works of art. They will slaughter women and children, but spare a picture; will hew down the sick, the helpless, and the hoary-headed, but refrain from injuring a fine piece of sculpture. The Latins, on their entrance into Constantinople, respected neither the works of God nor man, but vented their brutal ferocity upon the one, and satisfied their avarice upon the other. Many beautiful bronze statues, above all price as works of art, were broken into pieces to be sold as old metal. The finely-chiselled marble, which could be put to no such vile uses, was also destroyed with a recklessness, if possible, still more atrocious.¹⁸

The carnage being over, and the spoil distributed, six persons were chosen from among the Franks and six from among the Venetians, who were to meet and elect an emperor, previously binding themselves by oath to select the individual best qualified among the candidates. The choice wavered between Baldwin count of Flanders and Boniface marquis of Montferrat, but fell eventually upon the former. He was straightway robed in the imperial purple, and became the founder of a new dynasty. He did not live long to enjoy his power, or to consolidate it for his successors, who, in their turn, were soon swept away. In less than sixty years the rule of the Franks at Constantinople was brought to as sudden and disastrous a

termination as the reign of Murzuphlis: and this was the grand result of the fifth Crusade.

Pope Innocent III., although he had looked with no very unfavourable eye upon these proceedings, regretted that nothing had been done for the relief of the Holy Land; still, upon every convenient occasion, he enforced the necessity of a new Crusade. Until the year 1213, his exhortations had no other effect than to keep the subject in the mind of Europe. Every spring and summer detachments of pilgrims continued to set out for Palestine to the aid of their brethren, but not in sufficient numbers to be of much service. These periodical passages were called the *passagium Martii*, or the passage of March, and the *passagium Johannis*, or the passage of the festival of St. John. These did not consist entirely of soldiers, armed against the Saracen, but of pilgrims led by devotion, and in performance of their vows, bearing nothing with them but their staff and their wallet. Early in the spring of 1213 a more extraordinary body of Crusaders was raised in France and Germany. An immense number of boys and girls, amounting, according to some accounts, to thirty thousand, were incited by the persuasion of two monks to undertake the journey to Palestine. They were no doubt composed of the idle and deserted children who generally swarm in great cities, nurtured in vice and daring, and ready for any thing. The object of the monks seems to have been the atrocious one of inveigling them into slave-ships, on pretence of sending them to Syria, and selling them for slaves on the coast of Africa.¹⁹ Great numbers of these poor victims were shipped at Marseilles; but the vessels, with the exception of two or three, were wrecked on the shores of Italy, and every soul perished. The remainder arrived safely in Africa, and were

bought up as slaves, and sent off into the interior of the country. Another detachment arrived at Genoa; but the accomplices in this horrid plot having taken no measures at that port, expecting them all at Marseilles, they were induced to return to their homes by the Genoese.

Fuller, in his quaint history of the *Holy Warre*, says that this Crusade was done by the instinct of the devil; and he adds a reason, which may provoke mirth now, but which was put forth by the worthy historian in all soberness and sincerity. He says, “the devil, being cloyed with the murdering of men, desired a cordial of children’s blood to comfort his weak stomach;” as epicures, when tired of mutton, resort to lamb for a change.

It appears from other authors that the preaching of the vile monks had such an effect upon these deluded children that they ran about the country, exclaiming, “O Lord Jesus, restore thy cross to us!” and that neither bolts nor bars, the fear of fathers, nor the love of mothers, was sufficient to restrain them from journeying to Jerusalem.

The details of these strange proceedings are exceedingly meagre and confused, and none of the contemporary writers who mention the subject have thought it worth while to state the names of the monks who originated the scheme, or the fate they met for their wickedness. Two merchants of Marseilles, who were to have shared in the profits, were, it is said, brought to justice for some other crime, and suffered death; but we are not informed whether they divulged any circumstances relating to this matter.

Pope Innocent III. does not seem to have been aware that the causes of this juvenile Crusade were such as have been stated, for,

upon being informed that numbers of them had taken the cross, and were marching to the Holy Land, he exclaimed, "These children are awake while we sleep!" He imagined, apparently, that the mind of Europe was still bent on the recovery of Palestine, and that the zeal of these children implied a sort of reproach upon his own lukewarmness. Very soon afterwards, he bestirred himself with more activity, and sent an encyclical letter to the clergy of Christendom, urging them to preach a new Crusade. As usual, a number of adventurous nobles, who had nothing else to do, enrolled themselves with their retainers. At a Council of Lateran, which was held while these bands were collecting, Innocent announced that he himself would take the Cross, and lead the armies of Christ to the defence of his sepulchre. In all probability he would have done so, for he was zealous enough; but death stepped in, and destroyed his project ere it was ripe. His successor encouraged the Crusade, though he refused to accompany it; and the armament continued in France, England, and Germany. No leaders of any importance joined it from the former countries. Andrew king of Hungary was the only monarch who had leisure or inclination to leave his dominions. The Dukes of Austria and Bavaria joined him with a considerable army of Germans, and marching to Spalatro, took ship for Cyprus, and from thence to Acre.

The whole conduct of the king of Hungary was marked by pusillanimity and irresolution. He found himself in the Holy Land at the head of a very efficient army; the Saracens were taken by surprise, and were for some weeks unprepared to offer any resistance to his arms. He defeated the first body sent to oppose him, and marched towards Mount Tabor with the intention of seizing upon an

important fortress which the Saracens had recently constructed. He arrived without impediment at the mount, and might have easily taken it; but a sudden fit of cowardice came over him, and he returned to Acre without striking a blow. He very soon afterwards abandoned the enterprise altogether, and returned to his own country.

Tardy reinforcements arrived at intervals from Europe; and the Duke of Austria, now the chief leader of the expedition, had still sufficient forces at his command to trouble the Saracens very seriously. It was resolved by him, in council with the other chiefs, that the whole energy of the Crusade should be directed upon Egypt, the seat of the Saracen power in its relationship to Palestine, and from whence were drawn the continual levies that were brought against them by the sultan. Damietta, which commanded the river Nile, and was one of the most important cities of Egypt, was chosen as the first point of attack. The siege was forthwith commenced, and carried on with considerable energy, until the Crusaders gained possession of a tower, which projected into the middle of the stream, and was looked upon as the very key of the city.

While congratulating themselves upon this success, and wasting in revelry the time which should have been employed in turning it to further advantage, they received the news of the death of the wise Sultan Saphaddin. His two sons, Camhel and Cohreddin, divided his empire between them. Syria and Palestine fell to the share of Cohreddin, while Egypt was consigned to the other brother, who had for some time exercised the functions of lieutenant of that country. Being unpopular among the Egyptians, they revolted against him, giving the Crusaders a finer opportunity for making a conquest than

they had ever enjoyed before. But, quarrelsome and licentious as they had been from time immemorial, they did not see that the favourable moment had come; or seeing, could not profit by it. While they were revelling or fighting among themselves, under the walls of Damietta, the revolt was suppressed, and Camhel firmly established on the throne of Egypt. In conjunction with his brother Cohreddin, his next care was to drive the Christians from Damietta, and for upwards of three months they bent all their efforts to throw in supplies to the besieged, or draw on the besiegers to a general engagement. In neither were they successful; and the famine in Damietta became so dreadful that vermin of every description were thought luxuries, and sold for exorbitant prices. A dead dog became more valuable than a live ox in time of prosperity. Unwholesome food brought on disease, and the city could hold out no longer for absolute want of men to defend the walls.

Cohreddin and Camhel were alike interested in the preservation of so important a position, and, convinced of the certain fate of the city, they opened a conference with the crusading chiefs, offering to yield the whole of Palestine to the Christians upon the sole condition of the evacuation of Egypt. With a blindness and wrong-headedness almost incredible, these advantageous terms were refused, chiefly through the persuasion of Cardinal Pelagius, an ignorant and obstinate fanatic, who urged upon the Duke of Austria and the French and English leaders, that infidels never kept their word; that their offers were deceptive, and merely intended to betray. The conferences were brought to an abrupt termination by the Crusaders, and a last attack made upon the walls of Damietta. The besieged made but slight resistance, for they had no hope, and the Christians

entered the city, and found, out of seventy thousand people, but three thousand remaining: so fearful had been the ravages of the twin fiends, plague and famine.

Several months were spent in Damietta. The climate either weakened the frames or obscured the understandings of the Christians; for, after their conquest, they lost all energy, and abandoned themselves more unscrupulously than ever to riot and debauchery. John of Brienne, who, by right of his wife, was the nominal sovereign of Jerusalem, was so disgusted with the pusillanimity, arrogance, and dissensions of the chiefs, that he withdrew entirely from them and retired to Acre. Large bodies also returned to Europe, and Cardinal Pelagius was left at liberty to blast the whole enterprise whenever it pleased him. He managed to conciliate John of Brienne, and marched forward with these combined forces to attack Cairo. It was only when he had approached within a few hours' march of that city that he discovered the inadequacy of his army. He turned back immediately; but the Nile had risen since his departure; the sluices were opened, and there was no means of reaching Damietta. In this strait, he sued for the peace he had formerly spurned, and, happily for himself, found the generous brothers Camhel and Cohreddin still willing to grant it. Damietta was soon afterwards given up, and the cardinal returned to Europe. John of Brienne retired to Acre, to mourn the loss of his kingdom, embittered against the folly of his pretended friends, who had ruined where they should have aided him. And thus ended the sixth Crusade.

The seventh was more successful. Frederic II., emperor of Germany, had often vowed to lead his armies to the defence of

Palestine, but was as often deterred from the journey by matters of more pressing importance. Cohreddin was a mild and enlightened monarch, and the Christians of Syria enjoyed repose and toleration under his rule: but John of Brienne was not willing to lose his kingdom without an effort; and the popes in Europe were ever willing to embroil the nations for the sake of extending their own power. No monarch of that age was capable of rendering more effective assistance than Frederic of Germany. To inspire him with more zeal, it was proposed that he should wed the young Princess Violante, daughter of John of Brienne, and heiress of the kingdom of Jerusalem. Frederic consented with joy and eagerness. The princess was brought from Acre to Rome without delay, and her marriage celebrated on a scale of great magnificence. Her father, John of Brienne, abdicated all his rights in favour of his son-in-law, and Jerusalem had once more a king, who had not only the will, but the power, to enforce his claims. Preparations for the new Crusade were immediately commenced, and in the course of six months the emperor was at the head of a well-disciplined army of sixty thousand men. Matthew Paris informs us, that an army of the same amount was gathered in England; and most of the writers upon the Crusades adopt his statement. When John of Brienne was in England, before his daughter's marriage with the emperor was thought of, praying for the aid of Henry III. and his nobles to recover his lost kingdom, he did not meet with much encouragement. Grafton, in his *Chronicle*, says, "he departed again without any great comfort." But when a man of more influence in European politics appeared upon the scene, the English nobles were as ready to sacrifice themselves in the cause as they had been in the time of Cœur de Lion.

The army of Frederic encamped at Brundisium; but a pestilential disease having made its appearance among them, their departure was delayed for several months. In the mean time the Empress Violante died in childbed. John of Brienne, who had already repented of his abdication, and was besides incensed against Frederic for many acts of neglect and insult, no sooner saw the only tie which bound them severed by the death of his daughter, than he began to bestir himself, and make interest with the pope to undo what he had done, and regain the honorary crown he had renounced. Pope Gregory IX., a man of a proud, unconciliating, and revengeful character, owed the emperor a grudge for many an act of disobedience to his authority, and encouraged the overtures of John of Brienne more than he should have done. Frederic, however, despised them both, and, as soon as his army was convalescent, set sail for Acre. He had not been many days at sea when he was himself attacked with the malady, and obliged to return to Otranto, the nearest port. Gregory, who had by this time decided in the interest of John of Brienne, excommunicated the emperor for returning from so holy an expedition on any pretext whatever. Frederic at first treated the excommunication with supreme contempt; but when he got well, he gave his holiness to understand that he was not to be outraged with impunity, and sent some of his troops to ravage the papal territories. This, however, only made the matter worse, and Gregory despatched messengers to Palestine forbidding the faithful, under severe pains and penalties, to hold any intercourse with the excommunicated emperor. Thus between them both, the scheme which they had so much at heart bade fair to be as effectually ruined as even the Saracens could have wished. Frederic still continued his

zeal in the Crusade, for he was now king of Jerusalem, and fought for himself, and not for Christendom, or its representative, Pope Gregory. Hearing that John of Brienne was preparing to leave Europe, he lost no time in taking his own departure, and arrived safely at Acre. It was here that he first experienced the evil effects of excommunication. The Christians of Palestine refused to aid him in any way, and looked with distrust, if not with abhorrence, upon him. The Templars, Hospitallers, and other knights, shared at first the general feeling; but they were not men to yield a blind obedience to a distant potentate, especially when it compromised their own interests. When, therefore, Frederic prepared to march upon Jerusalem without them, they joined his banners to a man.

TEMPLAR AND HOSPITALLER.

It is said that, previous to quitting Europe, the German emperor had commenced a negotiation with the Sultan Camhel for the restoration of the Holy Land, and that Camhel, who was jealous of the ambition of his brother Cohreddin, was willing to stipulate to that effect, on condition of being secured by Frederic in the possession of the more important territory of Egypt. But before the Crusaders reached Palestine, Camhel was relieved from all fears by the death of his brother. He nevertheless did not think it worth while to contest with the Crusaders the barren corner of the earth which had already been dyed with so much Christian and Saracen blood, and proposed a truce of three years, only stipulating, in addition, that the Moslems should be allowed to worship freely in the temple

of Jerusalem. This happy termination did not satisfy the bigoted Christians of Palestine. The tolerance they sought for themselves, they were not willing to extend to others, and they complained bitterly of the privilege of free worship allowed to their opponents. Unmerited good fortune had made them insolent, and they contested the right of the emperor to become a party to any treaty, as long as he remained under the ecclesiastical ban. Frederic was disgusted with his new subjects; but, as the Templars and Hospitallers remained true to him, he marched to Jerusalem to be crowned. All the churches were shut against him, and he could not even find a priest to officiate at his coronation. He had despised the papal authority too long to quail at it now, when it was so unjustifiably exerted, and, as there was nobody to crown him, he very wisely crowned himself. He took the royal diadem from the altar with his own hands, and boldly and proudly placed it on his brow. No shouts of an applauding populace made the welkin ring; no hymns of praise and triumph resounded from the ministers of religion; but a thousand swords started from their scabbards to testify that their owners would defend the new monarch to the death.

It was hardly to be expected that he would renounce for any long period the dominion of his native land for the uneasy crown and barren soil of Palestine. He had seen quite enough of his new subjects before he was six months among them, and more important interests called him home. John of Brienne, openly leagued with Pope Gregory against him, was actually employed in ravaging his territories at the head of a papal army. This intelligence decided his return. As a preliminary step, he made those who had contemned his authority feel, to their sorrow, that he was their master. He then set

sail, loaded with the curses of Palestine. And thus ended the seventh Crusade, which, in spite of every obstacle and disadvantage, had been productive of more real service to the Holy Land than any that had gone before; a result solely attributable to the bravery of Frederic and the generosity of the Sultan Camhel.

Soon after the emperor's departure a new claimant started for the throne of Jerusalem, in the person of Alice queen of Cyprus, and half-sister of the Mary who, by her marriage, had transferred her right to John of Brienne. The grand military orders, however, clung to Frederic, and Alice was obliged to withdraw.

So peaceful a termination to the Crusade did not give unmixed pleasure in Europe. The chivalry of France and England were unable to rest, and long before the conclusion of the truce, were collecting their armies for an eighth expedition. In Palestine also the contentment was far from universal. Many petty Mahomedan states in the immediate vicinity were not parties to the truce, and harassed the frontier towns incessantly. The Templars, ever turbulent, waged bitter war with the sultan of Aleppo, and in the end were almost exterminated. So great was the slaughter among them that Europe resounded with the sad story of their fate, and many a noble knight took arms to prevent the total destruction of an order associated with so many high and inspiring remembrances. Camhel, seeing the preparations that were making, thought that his generosity had been sufficiently shewn, and the very day the truce was at an end assumed the offensive, and marching forward to Jerusalem, took possession of it, after routing the scanty forces of the Christians. Before this intelligence reached Europe a large body of Crusaders was on the march, headed by the king of Navarre, the Duke of Burgundy, the

Count de Bretagne, and other leaders. On their arrival, they learned that Jerusalem had been taken, but that the sultan was dead, and his kingdom torn by rival claimants to the supreme power. The dissensions of their foes ought to have made them united, but as in all previous Crusades, each feudal chief was master of his own host, and acted upon his own responsibility, and without reference to any general plan. The consequence was that nothing could be done. A temporary advantage was gained by one leader, who had no means of improving it; while another was defeated, without means of retrieving himself. Thus the war lingered till the battle of Gaza, when the king of Navarre was defeated with great loss, and compelled to save himself from total destruction by entering into a hard and oppressive treaty with the emir of Karac.

At this crisis aid arrived from England, commanded by Richard earl of Cornwall, the namesake of Cœur de Lion, and inheritor of his valour. His army was strong and full of hope. They had confidence in themselves and in their leader, and looked like men accustomed to victory. Their coming changed the aspect of affairs. The new sultan of Egypt was at war with the sultan of Damascus, and had not forces to oppose two enemies so powerful. He therefore sent messengers to meet the English earl, offering an exchange of prisoners and the complete cession of the Holy Land. Richard, who had not come to fight for the mere sake of fighting, agreed at once to terms so advantageous, and became the deliverer of Palestine without striking a blow. The sultan of Egypt then turned his whole force against his Moslem enemies, and the Earl of Cornwall returned to Europe. Thus ended the eighth Crusade, the most beneficial of all. Christendom had no further pretence for sending her fierce levies to the East. To

all appearance the holy wars were at an end: the Christians had entire possession of Jerusalem, Tripoli, Antioch, Edessa, Acre, Jaffa, and, in fact, of nearly all Judea; and, could they have been at peace among themselves, they might have overcome, without great difficulty, the jealousy and hostility of their neighbours. A circumstance, as unforeseen as it was disastrous, blasted this fair prospect, and reillumed, for the last time, the fervour and fury of the Crusades.

Gengis Khan and his successors had swept over Asia like a tropical storm, overturning in their progress the landmarks of ages. Kingdom after kingdom was cast down as they issued, innumerable, from the far recesses of the North and East, and, among others, the empire of Korasmin was overrun by these all-conquering hordes. The Korasmins, a fierce, uncivilised race, thus driven from their homes, spread themselves, in their turn, over the south of Asia with fire and sword, in search of a resting-place. In their impetuous course they directed themselves towards Egypt, whose sultan, unable to withstand the swarm that had cast their longing eyes on the fertile valleys of the Nile, endeavoured to turn them from their course. For this purpose, he sent emissaries to Barbaquan, their leader, inviting them to settle in Palestine; and the offer being accepted by the wild horde, they entered the country before the Christians received the slightest intimation of their coming. It was as sudden as it was overwhelming. Onwards, like the simoom, they came, burning and slaying, and were at the walls of Jerusalem before the inhabitants had time to look round them. They spared neither life nor property; they slew women and children, and priests at the altar, and profaned even the graves of those who had slept for ages. They tore down

every vestige of the Christian faith, and committed horrors unparalleled in the history of warfare. About seven thousand of the inhabitants of Jerusalem sought safety in retreat; but before they were out of sight, the banner of the cross was hoisted upon the walls by the savage foe to decoy them back. The artifice was but too successful. The poor fugitives imagined that help had arrived from another direction, and turned back to regain their homes. Nearly the whole of them were massacred, and the streets of Jerusalem ran with blood.

JAFFA.

The Templars, Hospitallers, and Teutonic knights forgot their long and bitter animosities, and joined hand in hand to rout out this desolating foe. They entrenched themselves in Jaffa with all the chivalry of Palestine that yet remained, and endeavoured to engage the sultans of Emissa and Damascus to assist them against the common enemy. The aid obtained from the Moslems amounted at first to only four thousand men, but with these reinforcements Walter of Brienne, the lord of Jaffa, resolved to give battle to the Korasmins. The conflict was as deadly as despair on the one side, and unmitigated ferocity on the other, could make it. It lasted with

varying fortune for two days, when the sultan of Emissa fled to his fortifications, and Walter of Brienne fell into the enemy's hands. The brave knight was suspended by the arms to a cross in sight of the walls of Jaffa, and the Korasminian leader declared that he should remain in that position until the city surrendered. Walter raised his feeble voice, not to advise surrender, but to command his soldiers to hold out to the last. But his gallantry was unavailing. So great had been the slaughter, that out of the grand array of knights, there now remained but sixteen Hospitallers, thirty-three Templars, and three Teutonic cavaliers. These with the sad remnant of the army fled to Acre, and the Korasmins were masters of Palestine.

The sultans of Syria preferred the Christians to this fierce horde for their neighbours. Even the sultan of Egypt began to regret the aid he had given to such barbarous foes, and united with those of Emissa and Damascus to root them from the land. The Korasmins amounted to but twenty thousand men, and were unable to resist the determined hostility which encompassed them on every side. The sultans defeated them in several engagements, and the peasantry rose up in masses to take vengeance upon them. Gradually their numbers were diminished. No mercy was shewn them in defeat. Barbaquan their leader was slain; and after five years of desperate struggles, they were finally extirpated, and Palestine became once more the territory of the Mussulmans.

WILLIAM LONGSWORD.

A short time previous to this devastating eruption, Louis IX. fell sick in Paris, and dreamed in the delirium of his fever that he saw the Christian and Moslem host fighting before Jerusalem, and the Christians defeated with great slaughter. The dream made a great impression on his superstitious mind, and he made a solemn vow, that if ever he recovered his health, he would take a pilgrimage to the Holy Land. When the news of the misfortunes of Palestine, and the awful massacres at Jerusalem and Jaffa, arrived in Europe, St. Louis remembered him of his dream. More persuaded than ever that it was an intimation direct from heaven, he prepared to take the cross at the head of his armies, and march to the deliverance of the Holy Sepulchre. From that moment he doffed the royal mantle of purple and ermine, and dressed in the sober serge becoming a pilgrim. All his thoughts were directed to the fulfilment of his design, and although his kingdom could but ill spare him, he made every preparation to leave it. Pope Innocent IV. applauded his zeal and afforded him every assistance. He wrote to Henry III. of England to forward the cause in his dominions, and called upon the clergy and

laity all over Europe to contribute towards it. William Longsword, the celebrated Earl of Salisbury, took the cross at the head of a great number of valiant knights and soldiers. But the fanaticism of the people was not to be awakened either in France or England. Great armies were raised, but the masses no longer sympathised. Taxation had been the great cooler of zeal. It was no longer a disgrace even to a knight if he refused to take the cross. Rutebeuf, a French minstrel, who flourished about this time (1250), composed a dialogue between a Crusader and a non-Crusader, which the reader will find translated in *Way's Fabliaux*. The Crusader uses every argument to persuade the non-Crusader to take up arms, and forsake every thing, in the holy cause; but it is evident from the greater force of the arguments used by the non-Crusader, that he was the favourite of the minstrel. To a most urgent solicitation of his friend the Crusader, he replies:

“I read thee right, thou holdest good
To this same land I straight should hie,
And win it back with mickle blood,
Nor gaine one foot of soil thereby;
While here dejected and forlorn
My wife and babes are left to mourn;
My goodly mansion rudely marred,
All trusted to my dogs to guard.
But I, fair comrade, well I wot
An ancient saw of pregnant wit
Doth bid us keep what we have got;
And troth I mean to follow it.”

This being the general feeling, it is not to be wondered at that Louis IX. was occupied fully three years in organising his forces, and in making the necessary preparations for his departure. When all was ready he set sail for Cyprus, accompanied by his queen, his two brothers, the Counts d'Anjou and d'Artois, and a long train of the noblest chivalry of France. His third brother, the Count de Poitiers, remained behind to collect another corps of Crusaders, and followed him in a few months afterwards. The army united at Cyprus, and amounted to fifty thousand men, exclusive of the English Crusaders under William Longsword. Again, a pestilential disease made its appearance, to which many hundreds fell victims. It was in consequence found necessary to remain in Cyprus until the spring. Louis then embarked for Egypt with his whole host; but a violent tempest separated his fleet, and he arrived before Damietta with only a few thousand men. They were, however, impetuous and full of hope; and although the Sultan Melick Shah was drawn up on the shore with a force infinitely superior, it was resolved to attempt a landing without waiting the arrival of the rest of the army. Louis himself, in wild impatience, sprang from his boat, and waded on shore; while his army, inspired by his enthusiastic bravery, followed, shouting the old war-cry of the first Crusaders, *Dieu le veut! Dieu le veut!* A panic seized the Turks. A body of their cavalry attempted to bear down upon the Crusaders, but the knights fixed their large shields deep in the sands of the shore, and rested their lances upon them, so that they projected above, and formed a barrier so imposing, that the Turks, afraid to breast it, turned round and fairly took to flight. At the moment of this panic, a false report was spread in the Saracen host, that the sultan had been slain. The confusion

immediately became general—the *deroute* was complete: Damietta itself was abandoned, and the same night the victorious Crusaders fixed their head-quarters in that city. The soldiers who had been separated from their chief by the tempest arrived shortly afterwards; and Louis was in a position to justify the hope, not only of the conquest of Palestine, but of Egypt itself.

But too much confidence proved the bane of his army. They thought, as they had accomplished so much, that nothing more remained to be done, and gave themselves up to ease and luxury. When, by the command of Louis, they marched towards Cairo, they were no longer the same men; success, instead of inspiring, had unnerved them; debauchery had brought on disease, and disease was aggravated by the heat of a climate to which none of them were accustomed. Their progress towards Massoura, on the road to Cairo, was checked by the Thanisian canal, on the banks of which the Saracens were drawn up to dispute the passage. Louis gave orders that a bridge should be thrown across: and the operations commenced under cover of two cat-castles, or high movable towers. The Saracens soon destroyed them by throwing quantities of Greek fire, the artillery of that day, upon them, and Louis was forced to think of some other means of effecting his design. A peasant agreed, for a considerable bribe, to point out a ford where the army might wade across, and the Count d'Artois was despatched with fourteen hundred men to attempt it, while Louis remained to face the Saracens with the main body of the army. The Count d'Artois got safely over, and defeated the detachment that had been sent to oppose his landing. Flushed with the victory, the brave count forgot the inferiority of his numbers, and pursued the panic-stricken enemy

into Massoura. He was now completely cut off from the aid of his brother Crusaders, which the Moslems perceiving, took courage and returned upon him, with a force swollen by the garrison of Massoura, and by reinforcements from the surrounding districts. The battle now became hand to hand. The Christians fought with the energy of desperate men, but the continually increasing numbers of the foe surrounded them completely, and cut off all hope, either of victory or escape. The Count d'Artois was among the foremost of the slain; and when Louis arrived to the rescue, the brave advanced-guard was nearly cut to pieces. Of the fourteen hundred but three hundred remained. The fury of the battle was now increased threefold. The French king and his troops performed prodigies of valour, and the Saracens, under the command of the Emir Ceccidun, fought as if they were determined to exterminate, in one last decisive effort, the new European swarm that had settled upon their coast. At the fall of the evening dews the Christians were masters of the field of Massoura, and flattered themselves that they were the victors. Self-love would not suffer them to confess that the Saracens had withdrawn, and not retreated; but their leaders were too wofully convinced that that fatal field had completed the disorganisation of the Christian army, and that all hopes of future conquest were at an end.

Impressed with this truth, the Crusaders sued for peace. The sultan insisted upon the immediate evacuation of Damietta, and that Louis himself should be delivered as hostage for the fulfilment of the condition. His army at once refused, and the negotiations were broken off. It was now resolved to attempt a retreat; but the agile Saracens, now in the front and now in the rear, rendered it a matter of extreme difficulty, and cut off the stragglers in great numbers.

Hundreds of them were drowned in the Nile; and sickness and famine worked sad ravages upon those who escaped all other casualties. Louis himself was so weakened by disease, fatigue, and discouragement, that he was hardly able to sit upon his horse. In the confusion of the flight he was separated from his attendants, and left a total stranger upon the sands of Egypt, sick, weary, and almost friendless. One knight, Geffry de Sergines, alone attended him, and led him to a miserable hut in a small village, where for several days he lay in the hourly expectation of death. He was at last discovered and taken prisoner by the Saracens, who treated him with all the honour due to his rank and all the pity due to his misfortunes. Under their care his health rapidly improved, and the next consideration was that of his ransom.

The Saracens demanded, besides money, the cession of Acre, Tripoli, and other cities of Palestine. Louis unhesitatingly refused, and conducted himself with so much pride and courage that the sultan declared he was the proudest infidel he had ever beheld. After a good deal of haggling, the sultan agreed to waive these conditions, and a treaty was finally concluded. The city of Damietta was restored; a truce of ten years agreed upon, and ten thousand golden bezants paid for the release of Louis and the liberation of all the captives. Louis then withdrew to Jaffa, and spent two years in putting that city, and Cesarea, with the other possessions of the Christians in Palestine, into a proper state of defence. He then returned to his own country, with great reputation as a saint, but very little as a soldier.

Matthew Paris informs us that, in the year 1250, while Louis was in Egypt, “thousands of the English were resolved to go to the holy

war, had not the king strictly guarded his ports and kept his people from running out of doors.” When the news arrived of the reverses and captivity of the French king, their ardour cooled; and the Crusade was sung of only, but not spoken of.

In France, a very different feeling was the result. The news of the king’s capture spread consternation through the country. A fanatic monk of Citeaux suddenly appeared in the villages, preaching to the people, and announcing that the Holy Virgin, accompanied by a whole army of saints and martyrs, had appeared to him, and commanded him to stir up the shepherds and farm-labourers to the defence of the cross. To them only was his discourse addressed; and his eloquence was such, that thousands flocked around him, ready to follow wherever he should lead. The pastures and the corn-fields were deserted, and the shepherds, or *pastoureaux*, as they were termed, became at last so numerous as to amount to upwards of fifty thousand,—Milot says one hundred thousand men.²⁰ The Queen Blanche, who governed as regent during the absence of the king, encouraged at first the armies of the *pastoureaux*; but they soon gave way to such vile excesses that the peaceably disposed were driven to resistance. Robbery, murder, and violation marked their path; and all good men, assisted by the government, united in putting them down. They were finally dispersed, but not before three thousand of them had been massacred. Many authors say that the slaughter was still greater.

The ten years’ truce concluded in 1264, and St. Louis was urged by two powerful motives to undertake a second expedition for the relief of Palestine. These were, fanaticism on the one hand, and a desire of retrieving his military fame on the other, which had suffered more

than his parasites liked to remind him of. The pope, of course, encouraged his design, and once more the chivalry of Europe began to bestir themselves. In 1268, Edward, the heir of the English monarchy, announced his determination to join the Crusade; and the pope (Clement IV.) wrote to the prelates and clergy to aid the cause by their persuasions and their revenues. In England, they agreed to contribute a tenth of their possessions; and by a parliamentary order, a twentieth was taken from the corn and movables of all the laity at Michaelmas.

In spite of the remonstrances of the few clear-headed statesmen who surrounded him, urging the ruin that might in consequence fall upon his then prosperous kingdom, Louis made every preparation for his departure. The warlike nobility were nothing loath; and in the spring of 1270, the king set sail with an army of sixty thousand men. He was driven by stress of weather into Sardinia, and while there, a change in his plans took place. Instead of proceeding to Acre, as he originally intended, he shaped his course for Tunis, on the African coast. The king of Tunis had some time previously expressed himself favourably disposed towards the Christians and their religion, and Louis, it appears, had hopes of converting him, and securing his aid against the sultan of Egypt. "What honour would be mine," he used to say, "if I could become godfather to this Mussulman king!" Filled with this idea he landed in Africa, near the site of the city of Carthage, but found that he had reckoned without his host. The king of Tunis had no thoughts of renouncing his religion, nor intention of aiding the Crusaders in any way. On the contrary, he opposed their landing with all the forces that could be collected on so sudden an emergency. The French, however, made good their first position, and

defeated the Moslems with considerable loss. They also gained some advantage over the reinforcements that were sent to oppose them; but an infectious flux appeared in the army, and put a stop to all future victories. The soldiers died at the rate of a hundred in a day. The enemy, at the same time, made as great havoc as the plague. St. Louis himself was one of the first attacked by the disease. His constitution had been weakened by fatigues, and even before he left France he was unable to bear the full weight of his armour. It was soon evident to his sorrowing soldiers that their beloved monarch could not long survive. He lingered for some days, and died in Carthage in the fifty-sixth year of his age, deeply regretted by his army and his subjects, and leaving behind him one of the most singular reputations in history. He is the model-king of ecclesiastical writers, in whose eyes his very defects became virtues, because they were manifested in furtherance of their cause. More unprejudiced historians, while they condemn his fanaticism, admit that he was endowed with many high and rare qualities; that he was in no one point behind his age, and in many in advance of it.

His brother, Charles of Anjou, in consequence of a revolution in Sicily, had become king of that country. Before he heard of the death of Louis, he had sailed from Messina with large reinforcements. On his landing near Carthage, he advanced at the head of his army, amid the martial music of drums and trumpets. He was soon informed how inopportune was his rejoicing, and shed tears before his whole army, such as no warrior would have been ashamed to shed. A peace was speedily agreed upon with the king of Tunis, and the armies of France and Sicily returned to their homes.

SEAL OF EDWARD I.

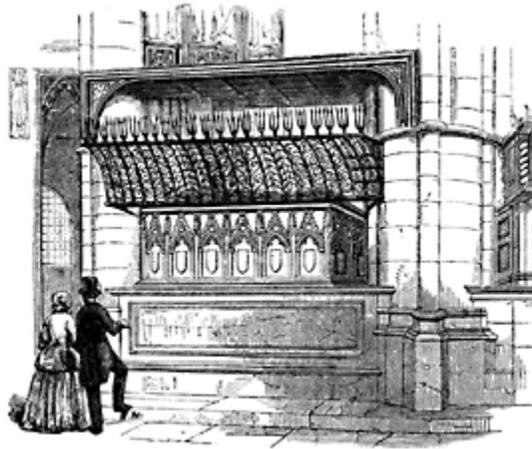

So little favour had the Crusade found in England, that even the exertions of the heir to the throne had only collected a small force of fifteen hundred men. With these few Prince Edward sailed from Dover to Bourdeaux, in the expectation that he would find the French king in that city. St. Louis, however, had left a few weeks previously; upon which Edward followed him to Sardinia, and afterwards to Tunis. Before his arrival in Africa, St. Louis was no more, and peace had been concluded between France and Tunis. He determined, however, not to relinquish the Crusade. Returning to Sicily, he passed the winter in that country, and endeavoured to augment his little army. In the spring he set sail for Palestine, and arrived in safety at Acre. The Christians were torn, as usual, by mutual jealousies and animosities. The two great military orders were as virulent and as intractable as ever; opposed to each other, and to all the world. The arrival of Edward had the effect of causing them to lay aside their unworthy contention, and of uniting heart to heart in one last effort for the deliverance of their adopted country. A force of six thousand effective warriors was soon formed to join those of the English prince, and preparations were made for the renewal of hostilities. The Sultan Bibars or Bendocdar,²¹ a fierce Mamluke, who had been placed on the throne by a bloody revolution, was at war

with all his neighbours, and unable, for that reason, to concentrate his whole strength against them. Edward took advantage of this, and marching boldly forward to Nazareth, defeated the Turks and gained possession of that city. This was the whole amount of his successes. The hot weather engendered disease among his troops, and he himself, the life and soul of the expedition, fell sick among the first. He had been ill for some time, and was slowly recovering, when a messenger desired to speak with him on important matters, and to deliver some despatches into his own hand. While the prince was occupied in examining them, the traitorous messenger drew a dagger from his belt and stabbed him in the breast. The wound fortunately was not deep, and Edward had regained a portion of his strength. He struggled with the assassin, and put him to death with his own dagger, at the same time calling loudly for assistance.²² His attendants came at his call, and found him bleeding profusely, and ascertained on inspection that the dagger was poisoned. Means were instantly taken to purify the wound, and an antidote was sent by the Grand Master of the Templars which removed all danger from the effects of the poison. Camden, in his history, has adopted the more popular, and certainly more beautiful version of this story, which says that the Princess Eleonora, in her love for her gallant husband, sucked the poison from his wound at the risk of her own life: to use the words of old Fuller, "it is a pity so pretty a story should not be true; and that so sovereign a remedy as a woman's tongue, anointed with the virtue of loving affection," should not have performed the good deed.

Edward suspected, and doubtless not without reason, that the assassin was employed by the sultan of Egypt. But it amounted to

suspicion only; and by the sudden death of the assassin the principal clue to the discovery of the truth was lost for ever. Edward, on his recovery, prepared to resume the offensive; but the sultan, embarrassed by the defence of interests which, for the time being, he considered of more importance, made offers of peace to the Crusaders. This proof of weakness on the part of the enemy was calculated to render a man of Edward's temperament more anxious to prosecute the war; but he had also other interests to defend. News arrived in Palestine of the death of his father, King Henry III.; and his presence being necessary in England, he agreed to the terms of the sultan. These were, that the Christians should be allowed to retain their possessions in the Holy Land, and that a truce of ten years should be proclaimed. Edward then set sail for England; and thus ended the last Crusade.

The after-fate of the Holy Land may be told in a few words. The Christians, unmindful of their past sufferings and of the jealous neighbours they had to deal with, first broke the truce by plundering some Egyptian traders near Margat. The sultan immediately revenged the outrage by taking possession of Margat, and war once more raged between the nations. Margat made a gallant defence, but no reinforcements arrived from Europe to prevent its fall. Tripoli was the next, and other cities in succession, until at last Acre was the only city of Palestine that remained in possession of the Christians.

TOMB OF QUEEN ELEANOR.

The Grand Master of the Templars collected together his small and devoted band, and, with the trifling aid afforded by the King of Cyprus, prepared to defend to the death the last possession of his order. Europe was deaf to his cry for aid, the numbers of the foe were overwhelming, and devoted bravery was of no avail. In that disastrous siege the Christians were all but exterminated. The king of Cyprus fled when he saw that resistance was vain, and the Grand Master fell at the head of his knights, pierced with a hundred wounds. Seven Templars, and as many Hospitallers, alone escaped from the dreadful carnage. The victorious Moslems then set fire to the city, and the rule of the Christians in Palestine was brought to a close for ever.

This intelligence spread alarm and sorrow among the clergy of Europe, who endeavoured to rouse once more the energy and enthusiasm of the nations in the cause of the Holy Land. But the popular mania had run its career; the spark of zeal had burned its appointed time, and was never again to be re-illuminated. Here and there a solitary knight announced his determination to take up arms, and now and then a king gave cold encouragement to the scheme;

but it dropped almost as soon as spoken of, to be renewed again, still more feebly, at some longer interval.

Now what was the grand result of all these struggles? Europe expended millions of her treasures, and the blood of two millions of her children; and a handful of quarrelsome knights retained possession of Palestine for about one hundred years! Even had Christendom retained it to this day, the advantage, if confined to that, would have been too dearly purchased. But notwithstanding the fanaticism that originated, and the folly that conducted them, the Crusades were not productive of unmitigated evil. The feudal chiefs became better members of society by coming in contact, in Asia, with a civilisation superior to their own; the people secured some small instalments of their rights; kings, no longer at war with their nobility, had time to pass some good laws; the human mind learned some little wisdom from hard experience, and, casting off the slough of superstition in which the Roman clergy had so long enveloped it, became prepared to receive the seeds of the approaching Reformation. Thus did the all-wise Disposer of events bring good out of evil, and advance the civilisation and ultimate happiness of the nations of the West by means of the very fanaticism that had led them against the East. But the whole subject is one of absorbing interest, and, if carried fully out in all its bearings, would consume more space than the plan of this work will allow. The philosophic student will draw his own conclusions; and he can have no better field for the exercise of his powers than this European madness—its advantages and disadvantages, its causes and results.

ARRAS.

THE WITCH MANIA.

What wrath of gods, or wicked influence
Of tears, conspiring wretched men t' afflict,
Hath pour'd on earth this noxious pestilence
That mortal minds doth inwardly infect
With love of blindness and of ignorance?

Spencer's Tears of the Muses.

Countrymen. Hang her! beat her! kill her!

Justice. How now? Forbear this violence!

Mother Sawyer. A crew of villains—a knot of bloody hangmen! set to torment me! I know not why.

Justice. Alas, neighbour Banks! are you a ringleader in mischief? Fie! to abuse an aged woman!

Banks. Woman! a she hell-cat, a witch! To prove her one, we no sooner set fire on the thatch of her house, but in she came running, as if the devil had sent her in a barrel of gunpowder.

Ford's Witch of Edmonton.

THE belief that disembodied spirits may be permitted to revisit this world has its foundation upon that sublime hope of immortality which is at once the chief solace and greatest triumph of our reason. Even if revelation did not teach us, we feel that we have that within us which shall never die; and all our experience of this life but makes us cling the more fondly to that one repaying hope. But in the early days of "little knowledge" this grand belief became the source of a whole train of superstitions, which, in their turn, became the fount from whence flowed a deluge of blood and horror. Europe, for a period of two centuries and a half, brooded upon the idea, not only that parted spirits walked the earth to meddle in the affairs of men, but that men had power to summon evil spirits to their aid to work woe

upon their fellows. An epidemic terror seized upon the nations; no man thought himself secure, either in his person or possessions, from the machinations of the devil and his agents. Every calamity that befell him he attributed to a witch. If a storm arose and blew down his barn, it was witchcraft; if his cattle died of a murrain—if disease fastened upon his limbs, or death entered suddenly and snatched a beloved face from his hearth—they were not visitations of Providence, but the works of some neighbouring hag, whose wretchedness or insanity caused the ignorant to raise their finger and point at her as a witch. The word was upon every body's tongue. France, Italy, Germany, England, Scotland, and the far north successively ran mad upon this subject, and for a long series of years furnished their tribunals with so many trials for witchcraft, that other crimes were seldom or never spoken of. Thousands upon thousands of unhappy persons fell victims to this cruel and absurd delusion. In many cities of Germany, as will be shewn more fully in its due place hereafter, the average number of executions for this pretended crime was six hundred annually, or two every day, if we leave out the Sundays, when it is to be supposed that even this madness refrained from its work.

A misunderstanding of the famous text of the Mosaic law, "Thou shalt not suffer a witch to live," no doubt led many conscientious men astray, whose superstition, warm enough before, wanted but a little corroboration to blaze out with desolating fury. In all ages of the world men have tried to hold converse with superior beings, and to pierce by their means the secrets of futurity. In the time of Moses, it is evident that there were impostors who trafficked upon the credulity of mankind, and insulted the supreme majesty of the true God by pretending to the power of divination. Hence the law which Moses, by Divine command, promulgated against these criminals; but it did not follow, as the superstitious monomaniacs of the middle ages imagined, that the Bible established the existence of the power of divination by its edicts against those who pretended to it. From the best authorities, it appears that the Hebrew word, which has been

rendered *venefica* and *witch*, means a poisoner and divineress, a dabbler in spells, or fortune-teller. The modern witch was a very different character, and joined to her pretended power of foretelling future events that of working evil upon the life, limbs, and possessions of mankind. This power was only to be acquired by an express compact, signed in blood, with the devil himself, by which the wizard or witch renounced baptism, and sold his or her immortal soul to the evil one, without any saving clause of redemption.

There are so many wondrous appearances in nature for which science and philosophy cannot even now account, that it is not surprising that, when natural laws were still less understood, men should have attributed to supernatural agency every appearance which they could not otherwise explain. The merest tyro now understands various phenomena which the wisest of old could not fathom. The schoolboy knows why, upon high mountains, there should on certain occasions appear three or four suns in the firmament at once, and why the figure of a traveller upon one eminence should be reproduced, inverted and of a gigantic stature, upon another. We all know the strange pranks which imagination can play in certain diseases; that the hypochondriac can see visions and spectres; and that there have been cases in which men were perfectly persuaded that they were teapots. Science has lifted up the veil, and rolled away all the fantastic horrors in which our forefathers shrouded these and similar cases. The man who now imagines himself a wolf is sent to the hospital instead of to the stake, as in the days of the witch mania; and earth, air, and sea are unpeopled of the grotesque spirits that were once believed to haunt them.

Before entering further into the history of Witchcraft, it may be as well if we consider the absurd impersonation of the evil principle formed by the monks in their legends. We must make acquaintance with the *primum mobile*, and understand what sort of a personage it was who gave the witches, in exchange for their souls, the power to torment their fellow-creatures. The popular notion of the devil was, that he was a large, ill-

formed, hairy sprite, with horns, a long tail, cloven feet, and dragon's wings. In this shape he was constantly brought on the stage by the monks in their early "miracles" and "mysteries." In these representations he was an important personage, and answered the purpose of the clown in the modern pantomime. The great fun for the people was to see him well belaboured by the saints with clubs or cudgels, and to hear him howl with pain as he limped off, maimed by the blow of some vigorous anchorite. St. Dunstan generally served him the glorious trick for which he is renowned, catching hold of his nose with a pair of red-hot pincers, till

"Rocks and distant dells resounded with his cries."

Some of the saints spat in his face, to his very great annoyance; and others chopped pieces off of his tail, which, however, always grew on again. This was paying him in his own coin, and amused the populace mightily, for they all remembered the scurvy tricks he had played them and their forefathers. It was believed that he endeavoured to trip people up by laying his long invisible tail in their way, and giving it a sudden whisk when their legs were over it;—that he used to get drunk, and swear like a trooper, and be so mischievous in his cups as to raise tempests and earthquakes, to destroy the fruits of the earth, and the barns and homesteads of true believers;—that he used to run invisible spits into people by way of amusing himself in the long winter evenings, and to proceed to taverns and regale himself with the best, offering in payment pieces of gold which, on the dawn of the following morning, invariably turned into slates. Sometimes, disguised as a large drake, he used to lurk among the bulrushes, and frighten the weary traveller out of his wits by his awful quack. The reader will remember the lines of Burns in his address to the "De'il," which so well express the popular notion on this point:

"Ae dreary, windy, winter night,

The stars shot down wi' sklentin light,
Wi' you mysel, I got a fright
 Ayont the lough;
Ye, like a rash-bush, stood in sight
 Wi' waving sough.

The cudgel in my nieve did shake,
Each bristled hair stood like a stake,
When wi' an eldritch stour, 'quaick! quaick!'
 Among the springs
Awa' ye squattered, like a drake,
 On whistling wings."

In all the stories circulated and believed about him, he was represented as an ugly, petty, mischievous spirit, who rejoiced in playing off all manner of fantastic tricks upon poor humanity. Milton seems to have been the first who succeeded in giving any but a ludicrous description of him. The sublime pride, which is the quintessence of evil, was unconceived before his time. All other limners made him merely grotesque, but Milton made him awful. In this the monks shewed themselves but miserable romancers; for their object undoubtedly was to represent the fiend as terrible as possible. But there was nothing grand about their Satan; on the contrary, he was a low, mean devil, whom it was easy to circumvent, and fine fun to play tricks with. But, as is well and eloquently remarked by a modern writer,²³ the subject has also its serious side. An Indian deity, with its wild distorted shape and grotesque attitude, appears merely ridiculous when separated from its accessories and viewed by daylight in a museum; but restore it to the darkness of its own hideous temple, bring back to our recollection the victims that have bled upon its altar or been crushed beneath its car, and our sense of the ridiculous subsides into aversion and horror. So, while the superstitious dreams of former times are regarded as

mere speculative insanities, we may be for a moment amused with the wild incoherencies of the patients; but when we reflect that out of these hideous misconceptions of the principle of evil arose the belief in witchcraft—that this was no dead faith, but one operating on the whole being of society, urging on the wisest and the mildest to deeds of murder, or cruelties scarcely less than murder—that the learned and the beautiful, young and old, male and female, were devoted by its influence to the stake and the scaffold—every feeling disappears, except that of astonishment that such things could be, and humiliation at the thought that the delusion was as lasting as it was universal.

Besides this chief personage, there was an infinite number of inferior demons, who played conspicuous parts in the creed of witchcraft. The pages of Bekker, Leloyer, Bodin, Delrio, and De Lancre, abound with descriptions of the qualities of these imps, and the functions which were assigned them. From these authors,—three of whom were commissioners for the trial of witches, and who wrote from the confessions made by the supposed criminals and the evidence delivered against them,—and from the more recent work of M. Jules Garinet, the following summary of the creed has been, with great pains, extracted. The student who is desirous of knowing more is referred to the works in question; he will find enough in every leaf to make his blood curdle with shame and horror: but the purity of these pages shall not be soiled by any thing so ineffably humiliating and disgusting as a complete exposition of them; what is here culled will be a sufficient sample of the popular belief, and the reader would but lose time who should seek in the writings of the demonologists for more ample details. He will gain nothing by lifting the veil which covers their unutterable obscenities, unless, like Sterne, he wishes to gather fresh evidence of “what a beast man is.” In that case, he will find plenty there to convince him that the beast would be libelled by the comparison.

It was thought that the earth swarmed with millions of demons of both sexes, many of whom, like the human race, traced their lineage up to

Adam, who after the fall was led astray by devils, assuming the forms of beautiful women to deceive him. These demons “increased and multiplied” among themselves with the most extraordinary rapidity. Their bodies were of the thin air, and they could pass through the hardest substances with the greatest ease. They had no fixed residence or abiding place, but were tossed to and fro in the immensity of space. When thrown together in great multitudes, they excited whirlwinds in the air and tempests in the waters, and took delight in destroying the beauty of nature and the monuments of the industry of man. Although they increased among themselves like ordinary creatures, their numbers were daily augmented by the souls of wicked men, of children still-born, of women who died in childbed, and of persons killed in duels. The whole air was supposed to be full of them, and many unfortunate men and women drew them by thousands into their mouths and nostrils at every inspiration; and the demons, lodging in their bowels or other parts of their bodies, tormented them with pains and diseases of every kind, and sent them frightful dreams. St. Gregory of Nice relates a story of a nun who forgot to say her *benedicite* and make the sign of the cross before she sat down to supper, and who in consequence swallowed a demon concealed among the leaves of a lettuce. Most persons said the number of these demons was so great that they could not be counted, but Wierus asserted that they amounted to no more than seven millions four hundred and five thousand nine hundred and twenty-six; and that they were divided into seventy-two companies or battalions, to each of which there was a prince or captain. They could assume any shape they pleased. When they were male, they were called incubi; and when female, succubi. They sometimes made themselves hideous; and at other times they assumed shapes of such transcendent loveliness, that mortal eyes never saw beauty to compete with theirs.

Although the devil and his legions could appear to mankind at any time, it was generally understood that he preferred the night between Friday and Saturday. If Satan himself appeared in human shape, he was never

perfectly and in all respects like a man. He was either too black or too white, too large or too small, or some of his limbs were out of proportion to the rest of his body. Most commonly his feet were deformed, and he was obliged to curl up and conceal his tail in some part of his habiliments; for, take what shape he would, he could not get rid of that encumbrance. He sometimes changed himself into a tree or a river; and upon one occasion he transformed himself into a barrister, as we learn from Wierus, book iv. chapter 9. In the reign of Philippe le Bel, he appeared to a monk in the shape of a dark man riding a tall black horse, then as a friar, afterwards as an ass and finally as a coach-wheel. Instances are not rare in which both he and his inferior demons have taken the form of handsome young men, and, successfully concealing their tails, have married beautiful young women, who have had children by them. Such children were easily recognisable by their continual shrieking, by their requiring five nurses to suckle them, and by their never growing fat.

All these demons were at the command of any individual who would give up his immortal soul to the prince of evil for the privilege of enjoying their services for a stated period. The wizard or witch could send them to execute the most difficult missions: whatever the witch commanded was performed, except it was a good action, in which case the order was disobeyed, and evil worked upon herself instead.

At intervals, according to the pleasure of Satan, there was a general meeting of the demons and all the witches. This meeting was called the Sabbath, from its taking place on the Saturday, or immediately after midnight on Fridays. These sabbaths were sometimes held for one district, sometimes for another, and once at least every year it was held on the Brocken, or among other high mountains, as a general sabbath of the fiends for the whole of Christendom.

The devil generally chose a place where four roads met as the scene of this assembly, or if that was not convenient, the neighbourhood of a lake. Upon this spot nothing would ever afterwards grow, as the hot feet of the

demons and witches burnt the principle of fecundity from the earth, and rendered it barren for ever. When orders had been once issued for the meeting of the sabbath, all the wizards and witches who failed to attend it were lashed by demons with a rod made of serpents or scorpions, as a punishment for their inattention or want of punctuality.

In France and England the witches were supposed to ride uniformly upon broomsticks; but in Italy and Spain, the devil himself, in the shape of a goat, used to transport them on his back, which lengthened or shortened according to the number of witches he was desirous of accommodating. No witch, when proceeding to the sabbath, could get out by a door or window, were she to try ever so much. Their general mode of ingress was by the keyhole, and of egress by the chimney, up which they flew, broom and all, with the greatest ease. To prevent the absence of the witches from being noticed by their neighbours, some inferior demon was commanded to assume their shapes and lie in their beds, feigning illness, until the sabbath was over.

When all the wizards and witches had arrived at the place of rendezvous, the infernal ceremonies of the sabbath began. Satan, having assumed his favourite shape of a large he-goat, with a face in front and another in his haunches, took his seat upon a throne; and all present, in succession, paid their respects to him, and kissed him in his face behind. This done, he appointed a master of the ceremonies, in company with whom he made a personal examination of all the wizards and witches, to see whether they had the secret mark about them by which they were stamped as the devil's own. This mark was always insensible to pain. Those who had not yet been marked, received the mark from the master of the ceremonies, the devil at the same time bestowing nicknames upon them. This done, they all began to sing and dance in the most furious manner, until some one arrived who was anxious to be admitted into their society. They were then silent for a while, until the new-comer had denied his salvation, kissed the devil, spat

upon the Bible, and sworn obedience to him in all things. They then began dancing again with all their might, and singing these words,

“Alegremos, Alegremos!
Que gente va tenemos!”

In the course of an hour or two they generally became wearied of this violent exercise, and then they all sat down and recounted the evil deeds they had done since their last meeting. Those who had not been malicious and mischievous enough towards their fellow-creatures, received personal chastisement from Satan himself, who flogged them with thorns or scorpions till they were covered with blood, and unable to sit or stand.

When this ceremony was concluded, they were all amused by a dance of toads. Thousands of these creatures sprang out of the earth, and standing on their hind legs, danced, while the devil played the bagpipes or the trumpet. These toads were all endowed with the faculty of speech, and entreated the witches to reward them with the flesh of unbaptised babes for their exertions to give them pleasure. The witches promised compliance. The devil bade them remember to keep their word; and then stamping his foot, caused all the toads to sink into the earth in an instant. The place being thus cleared, preparation was made for the banquet, where all manner of disgusting things were served up and greedily devoured by the demons and witches; although the latter were sometimes regaled with choice meats and expensive wines from golden plates and crystal goblets; but they were never thus favoured unless they had done an extraordinary number of evil deeds since the last period of meeting.

After the feast, they began dancing again; but such as had no relish for any more exercise in that way, amused themselves by mocking the holy sacrament of baptism. For this purpose, the toads were again called up, and sprinkled with filthy water; the devil making the sign of the cross, and

all the witches calling out, “*In nomine Patricâ, Aragueaco Petrica, agora! agora! Valentia, jouando goure gaits goustia!*” which meant, “In the name of Patrick, Petrick of Aragon, now, now, all our ills are over!”

When the devil wished to be particularly amused, he made the witches strip off their clothes and dance before him, each with a cat tied round her neck, and another dangling from her body in form of a tail. When the cock crew, they all disappeared, and the sabbath was ended.

This is a summary of the belief which prevailed for many centuries nearly all over Europe, and which is far from eradicated even at this day. It was varied in some respects in several countries, but the main points were the same in France, Germany, Great Britain, Italy, Spain, and the far North of Europe.

The early annals of France abound with stories of supposed sorcery, but it was not until the time of Charlemagne that the crime acquired any great importance. “This monarch,” says M. Jules Garinet,²⁴ “had several times given orders that all necromancers, astrologers, and witches should be driven from his states; but as the number of criminals augmented daily, he found it necessary at last to resort to severer measures. In consequence, he published several edicts, which may be found at length in the *Capitulaire de Baluse*. By these, every sort of magic, enchantment, and witchcraft was forbidden; and the punishment of death decreed against those who in any way evoked the devil, compounded love-philters, afflicted either man or woman with barrenness, troubled the atmosphere, excited tempests, destroyed the fruits of the earth, dried up the milk of cows, or tormented their fellow-creatures with sores and diseases. All persons found guilty of exercising these execrable arts were to be executed immediately upon conviction, that the earth might be rid of the burden and curse of their presence; and those even who consulted them might also be punished with death.”²⁵

After this time, prosecutions for witchcraft are continually mentioned, especially by the French historians. It was a crime imputed with so much

ease, and repelled with so much difficulty, that the powerful, whenever they wanted to ruin the weak, and could fix no other imputation upon them, had only to accuse them of witchcraft to ensure their destruction. Instances in which this crime was made the pretext for the most violent persecution, both of individuals and of communities, whose real offences were purely political or religious, must be familiar to every reader. The extermination of the Stedinger in 1234, of the Templars from 1307 to 1313, the execution of Joan of Arc in 1429, and the unhappy scenes of Arras in 1459, are the most prominent. The first of these is perhaps the least known, but is not among the least remarkable. The following account, from Dr. Kortüm's interesting history ²⁶ of the republican confederacies of the middle ages, will shew the horrible convenience of imputations of witchcraft when royal or priestly wolves wanted a pretext for a quarrel with the sheep.

The Frieslanders, inhabiting the district from the Weser to the Zuydersee, had long been celebrated for their attachment to freedom, and their successful struggles in its defence. As early as the eleventh century they had formed a general confederacy against the encroachments of the Normans and the Saxons, which was divided into seven *seelands*, holding annually a diet under a large oak-tree at Aurich, near the Upstalboom. Here they managed their own affairs, without the control of the clergy and ambitious nobles who surrounded them, to the great scandal of the latter. They already had true notions of a representative government. The deputies of the people levied the necessary taxes, deliberated on the affairs of the community, and performed, in their simple and patriarchal manner, nearly all the functions of the representative assemblies of the present day. Finally, the Archbishop of Bremen, together with the Count of Oldenburg and other neighbouring potentates, formed a league against that section of the Frieslanders known by the name of the Stedinger, and succeeded, after harassing them and sowing dissensions among them for many years, in bringing them under the yoke. But the Stedinger, devotedly attached to

their ancient laws, by which they had attained a degree of civil and religious liberty very uncommon in that age, did not submit without a violent struggle. They arose in insurrection in the year 1204, in defence of the ancient customs of their country, refused to pay taxes to the feudal chiefs or tithes to the clergy—who had forced themselves into their peaceful retreats—and drove out many of their oppressors. For a period of eight-and-twenty years the brave Stedinger continued the struggle single-handed against the forces of the Archbishops of Bremen and the Counts of Oldenburg, and destroyed, in the year 1232, the strong castle of Slutterberg, near Delmenhorst, built by the latter nobleman as a position from which he could send out his marauders to plunder and destroy the possessions of the peasantry.

The invincible courage of these poor people proving too strong for their oppressors to cope with by the ordinary means of warfare, the Archbishop of Bremen applied to Pope Gregory IX. for his spiritual aid against them. That prelate entered cordially into the cause, and launching forth his anathema against the Stedinger as heretics and witches, encouraged all true believers to assist in their extermination. A large body of thieves and fanatics broke into their country in the year 1233, killing and burning wherever they went, and not sparing either women or children, the sick or the aged, in their rage. The Stedinger, however, rallied in great force, routed their invaders, and killed in battle their leader, Count Burckhardt of Oldenburg, with many inferior chieftains.

Again the pope was applied to, and a crusade against the Stedinger was preached in all that part of Germany. The pope wrote to all the bishops and leaders of the faithful an exhortation to arm, to root out from the land those abominable witches and wizards. “The Stedinger,” said his holiness, “seduced by the devil, have abjured all the laws of God and man, slandered the Church, insulted the holy sacraments, consulted witches to raise evil spirits, shed blood like water, taken the lives of priests, and concocted an infernal scheme to propagate the worship of the devil, whom they adore

under the name of Asmodi. The devil appears to them in different shapes,—sometimes as a goose or a duck, and at others in the figure of a pale black-eyed youth, with a melancholy aspect, whose embrace fills their hearts with eternal hatred against the holy Church of Christ. This devil presides at their sabbaths, when they all kiss him and dance around him. He then envelopes them in total darkness, and they all, male and female, give themselves up to the grossest and most disgusting debauchery.”

In consequence of these letters of the pope, the emperor of Germany, Frederic II., also pronounced his ban against them. The Bishops of Ratzebourg, Lubeck, Osnabrück, Munster, and Minden took up arms to exterminate them, aided by the Duke of Brabant, the Counts of Holland, of Clèves, of the Mark, of Oldenburg, of Egmond, of Diest, and many other powerful nobles. An army of forty thousand men was soon collected, which marched, under the command of the Duke of Brabant, into the country of the Stedinger. The latter mustered vigorously in defence of their lives and liberties, but could raise no greater force, including every man capable of bearing arms, than eleven thousand men to cope against the overwhelming numbers of their foe. They fought with the energy of despair, but all in vain. Eight thousand of them were slain on the field of battle; the whole race was exterminated; and the enraged conquerors scoured the country in all directions, slew the women and children and old men, drove away the cattle, fired the woods and cottages, and made a total waste of the land.

PHILIP IV.

Just as absurd and effectual was the charge brought against the Templars in 1307, when they had rendered themselves obnoxious to the potentates and prelacy of Christendom. Their wealth, their power, their pride, and their insolence had raised up enemies on every side; and every sort of accusation was made against them, but failed to work their overthrow, until the terrible cry of witchcraft was let loose upon them. This effected its object, and the Templars were extirpated. They were accused of having sold their souls to the devil, and of celebrating all the infernal mysteries of the witches' sabbath. It was pretended that, when they admitted a novice into their order, they forced him to renounce his salvation and curse Jesus Christ; that they then made him submit to many unholy and disgusting ceremonies, and forced him to kiss the superior on the cheek, the navel, and the breech, and spit three times upon a crucifix; that all the members were forbidden to have connexion with women, but might give themselves up without restraint to every species of unmentionable debauchery; that when by any mischance a Templar infringed this order, and a child was born, the whole order met, and tossed it about like a shuttlecock from one to the other until it expired; that they then roasted it by a slow fire, and with the fat which trickled from it anointed the hair and beard of a large image of the devil. It was also said that when one of the knights died, his body was burnt into a powder, and then mixed with wine and drunk by every member of the order. Philip IV., who, to exercise his own implacable hatred, invented, in all probability, the greater part of these charges, issued orders for the immediate arrest of all the Templars in his dominions. The pope afterwards took up the cause with almost as much fervour as the king of France; and in every part of Europe the Templars were thrown into prison, and their goods and estates confiscated. Hundreds of them, when put to the rack, confessed even the most preposterous of the charges against them, and by so doing increased the popular clamour and the hopes of their enemies. It is true that, when removed from the rack, they denied all they had previously confessed; but

this circumstance only increased the outcry, and was numbered as an additional crime against them. They were considered in a worse light than before, and condemned forthwith to the flames as relapsed heretics. Fifty-nine of these unfortunate victims were all burned together by a slow fire in a field in the suburbs of Paris, protesting to the very last moment of their lives their innocence of the crimes imputed to them, and refusing to accept of pardon upon condition of acknowledging themselves guilty. Similar scenes were enacted in the provinces; and for four years hardly a month passed without witnessing the execution of one or more of these unhappy men. Finally, in 1313, the last scene of this tragedy closed by the burning of the Grand-Master, Jacques de Molay, and his companion Guy, the commander of Normandy. Any thing more atrocious it is impossible to conceive,—disgraceful alike to the monarch who originated, the pope who supported, and the age which tolerated the monstrous iniquity. That the malice of a few could invent such a charge is a humiliating thought for the lover of his species; but that millions of mankind should credit it is still more so.

The execution of Joan of Arc is the next most notorious example which history affords us of the imputation of witchcraft against a political enemy. Instances of similar persecution, in which this crime was made the pretext for the gratification of political or religious hatred, might be multiplied to a great extent. But it is better to proceed at once to the consideration of the bull of Pope Innocent, the torch that set fire to the long-laid train, and caused so fearful an explosion over the Christian world. It will be necessary, however, to go back for some years anterior to that event, the better to understand the motives that influenced the Church in the promulgation of that fearful document.

Towards the close of the fourteenth and beginning of the fifteenth century, many witches were burned in different parts of Europe. As a natural consequence of the severe persecution, the crime, or the pretenders to it, increased. Those who found themselves accused and threatened with

the penalties, if they happened to be persons of a bad and malicious disposition, wished they had the power imputed to them, that they might be revenged upon their persecutors. Numerous instances are upon record of half-crazed persons being found muttering the spells which were supposed to raise the evil one. When religion and law alike recognised the crime, it is no wonder that the weak in reason and the strong in imagination, especially when they were of a nervous temperament, fancied themselves endued with the terrible powers of which all the world was speaking. The belief of their neighbours did not lag behind their own, and execution was the speedy consequence.

JOAN OF ARC.

As the fear of witchcraft increased, the Catholic clergy strove to fix the imputation of it upon those religious sects, the pioneers of the Reformation, who began about this time to be formidable to the Church of Rome. If a charge of heresy could not ensure their destruction, that of sorcery and witchcraft never failed. In the year 1459, a devoted congregation of the Waldenses at Arras, who used to repair at night to worship God in their own manner in solitary places, fell victims to an accusation of sorcery. It was rumoured in Arras that in the desert places to which they retired the devil appeared before them in human form, and read from a large book his laws and ordinances, to which they all promised obedience; that he then distributed money and food among them, to bind them to his service, which done, they gave themselves up to every species of lewdness and debauchery. Upon these rumours several creditable persons in Arras were seized and imprisoned, together with a number of

decrepit and idiotic old women. The rack, that convenient instrument for making the accused confess any thing, was of course put in requisition. Monstrelet, in his chronicle, says that they were tortured until some of them admitted the truth of the whole accusations, and said, besides, that they had seen and recognised in their nocturnal assemblies many persons of rank; many prelates, seigneurs, governors of bailliages, and mayors of cities, being such names as the examiners had themselves suggested to the victims. Several who had been thus informed against were thrown into prison, and so horribly tortured, that reason fled, and in their ravings of pain they also confessed their midnight meetings with the devil, and the oaths they had taken to serve him. Upon these confessions judgment was pronounced. The poor old women, as usual in such cases, were hanged and burned in the market-place; the more wealthy delinquents were allowed to escape upon payment of large sums. It was soon after universally recognised that these trials had been conducted in the most odious manner, and that the judges had motives of private vengeance against many of the more influential persons who had been implicated. The parliament of Paris afterwards declared the sentence illegal, and the judges iniquitous; but its *arrêt* was too late to be of service even to those who had paid the fine, or to punish the authorities who had misconducted themselves, for it was not delivered until thirty-two years after the executions had taken place.

In the mean time, accusations of witchcraft spread rapidly in France, Italy, and Germany. Strange to say, that although in the first instance chiefly directed against heretics, the latter were as firm believers in the crime as even the Catholics themselves. In after times we also find that the Lutherans and Calvinists became greater witch-burners than ever the Romanists had been, so deeply was the prejudice rooted. Every other point of belief was in dispute, but that was considered by every sect to be as well established as the authenticity of the Scriptures or the existence of a God.

But at this early period of the epidemic the persecutions were directed by the heads of the Catholic Church. The spread of heresy betokened, it was thought, the coming of Antichrist. Florimond, in his work concerning Antichrist, exposed the secret of these prosecutions. He says: "All who have afforded us some signs of the approach of Antichrist agree that the increase of sorcery and witchcraft is to distinguish the melancholy period of his advent; and was ever age so afflicted as ours? The seats destined for criminals in our courts of justice are blackened with persons accused of this guilt. There are not judges enough to try them. Our dungeons are gorged with them. No day passes that we do not render our tribunals bloody by the dooms which we pronounce, or in which we do not return to our homes discountenanced and terrified at the horrible confessions which we have heard. And the devil is accounted so good a master, that we cannot commit so great a number of his slaves to the flames but what there shall arise from their ashes a sufficient number to supply their place."

Florimond here spoke the general opinion of the Church of Rome; but it never suggested itself to the mind of any person engaged in these trials, that if it were indeed a devil who raised up so many new witches to fill the places of those consumed, it was no other than one in their own employ—the devil of persecution. But so it was. The more they burned, the more they found to burn, until it became a common prayer with women in the humbler walks of life, that they might never live to grow old. It was sufficient to be aged, poor, and half-crazed, to ensure death at the stake or the scaffold.

GATE OF CONSTANCE.

In the year 1487 there was a severe storm in Switzerland, which laid waste the country for four miles around Constance. Two wretched old women, whom the popular voice had long accused of witchcraft, were arrested on the preposterous charge of having raised the tempest. The rack was displayed, and the two poor creatures were extended upon it. In reply to various questions from their tormentors, they owned in their agony that they were in the constant habit of meeting the devil; that they had sold their souls to him; and that at their command he had raised the tempest. Upon this insane and blasphemous charge they were condemned to die. In the criminal registers of Constance there stands against the name of each the simple but significant phrase, "*convicta et combusta.*"

This case and hundreds of others were duly reported to the ecclesiastical powers. There happened at that time to be a pontiff at the head of the Church who had given much of his attention to the subject of witchcraft, and who, with the intention of rooting out the supposed crime, did more to increase it than any other man that ever lived. John Baptist Cibo, elected to the papacy in 1485, under the designation of Innocent VIII., was sincerely alarmed at the number of witches, and launched forth his terrible manifesto against them. In his celebrated bull of 1488, he called the nations of Europe to the rescue of the Church of Christ upon earth, imperilled by the arts of Satan, and set forth the horrors that had reached

his ears; how that numbers of both sexes had intercourse with the infernal fiends; how by their sorceries they afflicted both man and beast; how they blighted the marriage-bed, destroyed the births of women and the increase of cattle; and how they blasted the corn on the ground, the grapes of the vineyard, the fruits of the trees, and the herbs of the field. In order that criminals so atrocious might no longer pollute the earth, he appointed inquisitors in every country, armed with the apostolic power to convict and punish.

It was now that the *Witch Mania*, properly so called, may be said to have fairly commenced. Immediately a class of men sprang up in Europe, who made it the sole business of their lives to discover and burn the witches. Sprenger, in Germany, was the most celebrated of these national scourges. In his notorious work, the *Malleus Maleficarum*, he laid down a regular form of trial, and appointed a course of examination by which the inquisitors in other countries might best discover the guilty. The questions, which were always enforced by torture, were of the most absurd and disgusting nature. The inquisitors were required to ask the suspected whether they had midnight meetings with the devil? whether they attended the witches' sabbath on the Brocken? whether they had their familiar spirits? whether they could raise whirlwinds and call down the lightning? and whether they had had sexual intercourse with Satan?

Straightway the inquisitors set to work: Cumanus, in Italy, burned forty-one poor women in one province alone; and Sprenger, in Germany, burned a number which can never be ascertained correctly, but which, it is agreed on all hands, amounted to more than five hundred in a year. The great resemblance between the confessions of the unhappy victims was regarded as a new proof of the existence of the crime. But this is not astonishing. The same questions from the *Malleus Maleficarum* were put to them all, and torture never failed to educe the answer required by the inquisitor. Numbers of people, whose imaginations were filled with these horrors, went further in the way of confession than even their tormentors

anticipated, in the hope that they would thereby be saved from the rack, and put out of their misery at once. Some confessed that they had had children by the devil; but no one who had ever been a mother gave utterance to such a frantic imagining, even in the extremity of her anguish. The childless only confessed it, and were burned instanter as unworthy to live.

For fear the zeal of the enemies of Satan should cool, successive popes appointed new commissions. One was appointed by Alexander VI. in 1494, another by Leo X. in 1521, and a third by Adrian VI. in 1522. They were all armed with the same powers to hunt out and destroy, and executed their fearful functions but too rigidly. In Geneva alone five hundred persons were burned in the years 1515 and 1516, under the title of Protestant witches. It would appear that their chief crime was heresy, and their witchcraft merely an aggravation. Bartolomeo de Spina has a list still more fearful. He informs us that in the year 1524 no less than a thousand persons suffered death for witchcraft in the district of Como, and that for several years afterwards the average number of victims exceeded a hundred annually. One inquisitor, Remigius, took great credit to himself for having, during fifteen years, convicted and burned nine hundred.

In France, about the year 1520, fires for the execution of witches blazed in almost every town. Danæus, in his *Dialogues of Witches*, says they were so numerous that it would be next to impossible to tell the number of them. So deep was the thralldom of the human mind, that the friends and relatives of the accused parties looked on and approved. The wife or sister of a murderer might sympathise in his fate, but the wives and husbands of sorcerers and witches had no pity. The truth is that pity was dangerous, for it was thought no one could have compassion on the sufferings of a witch who was not a dabbler in sorcery: to have wept for a witch would have insured the stake. In some districts, however, the exasperation of the people broke out, in spite of superstition. The inquisitor of a rural township in Piedmont burned the victims so plentifully and so fast, that there was

not a family in the place which did not lose a member. The people at last arose, and the inquisitor was but too happy to escape from the country with whole limbs. The archbishop of the diocese proceeded afterwards to the trial of such as the inquisitor had left in prison.

Some of the charges were so utterly preposterous that the poor wretches were at once liberated; others met a harder, but the usual fate. Some of them were accused of having joined the witches' dance at midnight under a blasted oak, where they had been seen by creditable people. The husbands of several of these women (two of whom were young and beautiful) swore positively that at the time stated their wives were comfortably asleep in their arms; but it was all in vain. Their word was taken, but the archbishop told them they had been deceived by the devil and their own senses. It was true they might have had the semblance of their wives in their beds, but the originals were far away at the devil's dance under the oak. The honest fellows were confounded, and their wives burned forthwith.

CHARLES IX.

In the year 1561, five poor women of Verneuil were accused of transforming themselves into cats, and in that shape attending the sabbath of the fiends—prowling around Satan, who presided over them in the form of a goat, and dancing, to amuse him, upon his back. They were found guilty, and burned.²⁷

In 1564, three wizards and a witch appeared before the Presidents Salvert and D'Avanton: they confessed, when extended on the rack, that they anointed the sheep-pens with infernal unguents to kill the sheep; that they attended the sabbath, where they saw a great black goat, which spoke to them, and made them kiss him, each holding a lighted candle in his hand while he performed the ceremony. They were all executed at Poitiers.

In 1571 the celebrated sorcerer Trois Echelles was burned in the Place de Grève in Paris. He confessed, in the presence of Charles IX., and of the Marshals de Montmorency, De Retz, and the Sieur du Mazille, physician to the king, that he could perform the most wonderful things by the aid of a devil to whom he had sold himself. He described at great length the saturnalia of the fiends, the sacrifices which they offered up, the debaucheries they committed with the young and handsome witches, and the various modes of preparing the infernal unguent for blighting cattle. He said he had upwards of twelve hundred accomplices in the crime of witchcraft in various parts of France, whom he named to the king, and many of whom were afterwards arrested and suffered execution.

At Dôle, two years afterwards, Gilles Garnier, a native of Lyons, was indicted for being a *loup-garou*, or man-wolf, and for prowling in that shape about the country at night to devour little children. The indictment against him, as read by Henri Camus, doctor of laws and counsellor of the king, was to the effect that he, Gilles Garnier, had seized upon a little girl, twelve years of age, whom he drew into a vineyard and there killed, partly with his teeth and partly with his hands, seeming like wolf's paws; that from thence he trailed her bleeding body along the ground with his teeth into the wood of La Serre, where he ate the greatest portion of her at one meal, and carried the remainder home to his wife; that upon another occasion, eight days before the festival of All Saints, he was seen to seize another child in his teeth, and would have devoured her had she not been rescued by the country people, and that the said child died a few days afterwards of the injuries he had inflicted; that fifteen days after the same festival of All Saints, being again in the shape of a

wolf, he devoured a boy thirteen years of age, having previously torn off his leg and thigh with his teeth, and hid them away for his breakfast on the morrow. He was furthermore indicted for giving way to the same diabolical and unnatural propensities even in his shape of a man; and that he had strangled a boy in a wood with the intention of eating him, which crime he would have effected if he had not been seen by the neighbours and prevented.

Gilles Garnier was put to the rack after fifty witnesses had deposed against him. He confessed every thing that was laid to his charge. He was thereupon brought back into the presence of his judges, when Dr. Camus, in the name of the parliament of Dôle, pronounced the following sentence:

“Seeing that Gilles Garnier has, by the testimony of credible witnesses, and by his own spontaneous confession, been proved guilty of the abominable crimes of lycanthropy and witchcraft, this court condemns him, the said Gilles, to be this day taken in a cart from this spot to the place of execution, accompanied by the executioner (*maître exécuteur de la haute justice*), where he, by the said executioner, shall be tied to a stake and burned alive, and that his ashes be then scattered to the winds. The court further condemns him, the said Gilles, to the costs of this prosecution.”

“Given at Dôle, this 18th day of January, 1573.”

In 1578, the parliament of Paris was occupied for several days with the trial of a man named Jacques Rollet. He also was found guilty of being a *loup-garou*, and in that shape devouring a little boy. He was burnt alive in the Place de Grève.

In 1579, so much alarm was excited in the neighbourhood of Melun by the increase of witches and *loup-garous*, that a council was held to devise some measures to stay the evil. A decree was passed that all witches and consulters with witches should be punished with death; and not only those, but fortune-tellers and conjurors of every kind. The parliament of Rouen took up the same question in the following year, and decreed that the possession of a *grimoire*, or book of spells, was sufficient evidence of witchcraft, and that all persons on whom such books were found should be burned alive. Three councils were held in different parts of France in the year 1583, all in relation to the same subject. The parliament of Bourdeaux issued strict injunctions to all curates and clergy whatever to use redoubled efforts to root out the crime of witchcraft. The parliament of Tours was equally peremptory, and feared the judgments of an offended God if all these dealers with the devil were not swept from the face of the land. The parliament of Rheims was particularly severe against the *nouveurs d'aiguillette*, or “tyers of the knot”—people of both sexes who took pleasure in preventing the consummation of marriage, that they might counteract the command of God to our first parents to increase and multiply. This parliament held it to be sinful to wear amulets to preserve from witchcraft; and that this practice might not be continued within its jurisdiction, drew up a form of exorcism, which would more effectually defeat the agents of the devil, and put them to flight.

A case of witchcraft, which created a great sensation in its day, occurred in 1588, at a village in the mountains of Auvergne, about two leagues from Apchon. A gentleman of that place being at his window, there passed a friend of his who had been out hunting, and

who was then returning to his own house. The gentleman asked his friend what sport he had had; upon which the latter informed him that he had been attacked in the plain by a large and savage wolf, which he had shot at without wounding, and that he had then drawn out his hunting-knife and cut off the animal's fore-paw as it sprang upon his neck to devour him. The huntsman upon this put his hand into his bag to pull out the paw, but was shocked to find that it was a woman's hand, with a wedding-ring on the finger. The gentleman immediately recognised his wife's ring, "which," says the indictment against her, "made him begin to suspect some evil of her." He immediately went in search of her, and found her sitting by the fire in the kitchen, with her arm hidden underneath her apron. He tore off her apron with great vehemence, and found that she had no hand, and that the stump was even then bleeding. She was given into custody, and burnt at Riom in presence of some thousands of spectators.²⁸

In the midst of these executions, rare were the gleams of mercy. Few instances are upon record of any acquittal taking place when the crime was witchcraft. The discharge of fourteen persons by the parliament of Paris, in the year 1589, is almost a solitary example of a return to reason. Fourteen persons condemned to death for witchcraft appealed against the judgment to the parliament of Paris, which for political reasons had been exiled to Tours. The parliament named four commissioners—Pierre Pigray, the king's surgeon, and Messieurs Leroi, Renard, and Falaiseau, the king's physicians—to visit and examine these witches, and see whether they had the mark of the devil upon them. Pigray, who relates the circumstance in his work on Surgery (book vii. chap. 10), says the visit was made in

presence of two counsellors of the court. The witches were all stripped naked, and the physicians examined their bodies very diligently, pricking them in all the marks they could find to see whether they were insensible to pain, which was always considered a certain proof of guilt. They were, however, very sensible of the pricking, and some of them called out very lustily when the pins were driven into them. “We found them,” continues Pierre Pigray, “to be very poor, stupid people, and some of them insane. Many of them were quite indifferent about life, and one or two of them desired death as a relief for their sufferings. Our opinion was, that they stood more in need of medicine than of punishment; and so we reported to the parliament. Their case was thereupon taken into further consideration; and the parliament, after mature counsel amongst all the members, ordered the poor creatures to be sent to their homes, without inflicting any punishment upon them.”

Such was the dreadful state of Italy, Germany, and France during the sixteenth century, which was far from being the worst crisis of the popular madness with regard to witchcraft. Let us see what was the state of England during the same period. The Reformation, which in its progress had rooted out so many errors, stopped short at this, the greatest error of all. Luther and Calvin were as firm believers in witchcraft as Pope Innocent himself; and their followers shewed themselves more zealous persecutors than the Romanists. Dr. Hutchinson, in his work on Witchcraft, asserts that the mania manifested itself later in England, and raged with less virulence than on the continent. The first assertion only is true; for though the persecution began later both in England and Scotland, its progress was as fearful as elsewhere.

It was not until more than fifty years after the issuing of the bull of Innocent VIII. that the legislature of England thought fit to make any more severe enactments against sorcery than those already in operation. The statute of 1541 was the first that specified the particular crime of witchcraft. At a much earlier period many persons had suffered death for sorcery, in addition to other offences; but no executions took place for attending the witches' sabbath, raising tempests, afflicting cattle with barrenness, and all the fantastic trumpery of the continent. Two statutes were passed in 1551: the first relating to false prophecies, caused mainly, no doubt, by the impositions of Elizabeth Barton, the holy maid of Kent, in 1534; and the second against conjuration, witchcraft, and sorcery. But even this enactment did not consider witchcraft as penal in itself, and only condemned to death those who, by means of spells, incantations, or contracts with the devil, attempted the lives of their neighbours. The statute of Elizabeth, in 1562, at last recognised witchcraft as a crime of the highest magnitude, whether exerted or not to the injury of the lives, limbs, and possessions of the community. From that date the persecution may be fairly said to have commenced in England. It reached its climax in the early part of the seventeenth century, which was the hottest period of the mania all over Europe.

A few cases of witch persecution in the sixteenth century will enable the reader to form a more accurate idea of the progress of this great error than if he plunged at once into that busy period of its history when Matthew Hopkins and his coadjutors exercised their infernal calling. Several instances occur in England during the latter years of the reign of Elizabeth. At this time the public mind had

become pretty familiar with the details of the crime. Bishop Jewell, in his sermons before her majesty, used constantly to conclude them by a fervent prayer that she might be preserved from witches. Upon one occasion, in 1598, his words were, “It may please your grace to understand that witches and sorcerers within these last four years are marvellously increased within this your grace’s realm. Your grace’s subjects pine away even unto the death; their colour fadeth—their flesh rotteth—their speech is benumbed—their senses are bereft! I pray God they may never practise further than upon the *subject!*”

JEWELL.

By degrees, an epidemic terror of witchcraft spread into the villages. In proportion as the doctrine of the Puritans took root, this dread increased, and, of course, brought persecution in its train. The Church of England has claimed, and is entitled to the merit, of having been less influenced in these matters than any other sect of Christians; but still they were tainted with the superstition of the age. One of the most flagrant instances of cruelty and delusion upon record was consummated under the authority of the Church, and commemorated till a very late period by an annual lecture at the University of Cambridge.

This is the celebrated case of the witches of Warbois, who were executed about thirty-two years after the passing of the statute of Elizabeth. Although in the interval but few trials are recorded, there is, unfortunately, but too much evidence to shew the extreme length to which the popular prejudice was carried. Many women lost their lives in every part of England without being brought to trial at all, from the injuries received at the hands of the people. The number of these can never be ascertained.

The case of the witches of Warbois merits to be detailed at length, not only from the importance attached to it for so many years by the learned of the University, but from the singular absurdity of the evidence upon which men, sensible in all other respects, could condemn their fellow-creatures to the scaffold.

The principal actors in this strange drama were the families of Sir Samuel Cromwell and a Mr. Throgmorton, both gentlemen of landed property near Warbois in the county of Huntingdon. Mr. Throgmorton had several daughters, the eldest of whom, Mistress Joan, was an imaginative and melancholy girl, whose head was filled with stories of ghosts and witches. Upon one occasion she chanced to pass the cottage of one Mrs., or, as she was called, Mother Samuel, a very aged, a very poor, and a very ugly woman. Mother Samuel was sitting at her door knitting, with a black cap upon her head, when this silly young lady passed, and taking her eyes from her work she looked stedfastly at her. Mistress Joan immediately fancied that she felt sudden pains in all her limbs, and from that day forth never ceased to tell her sisters, and every body about her, that Mother Samuel had bewitched her. The other children took up the cry, and

actually frightened themselves into fits whenever they passed within sight of this terrible old woman.

Mr. and Mrs. Throgmorton, not a whit wiser than their children, believed all the absurd tales they had been told; and Lady Cromwell, a gossip of Mrs. Throgmorton, made herself very active in the business, and determined to bring the witch to the ordeal. The sapient Sir Samuel joined in the scheme; and the children, thus encouraged, gave loose reins to their imaginations, which seem to have been of the liveliest. They soon invented a whole host of evil spirits, and names for them besides, which they said were sent by Mother Samuel to torment them continually. Seven spirits especially, they said, were raised from hell by this wicked woman to throw them into fits; and as the children were actually subject to fits, their mother and her commeres gave the more credit to the story. The names of these spirits were, "First Smack," "Second Smack," "Third Smack," "Blue," "Catch," "Hardname," and "Pluck."

Throgmorton, the father, was so pestered by these idle fancies, and yet so well inclined to believe them, that he marched valiantly forth to the hut where Mother Samuel resided with her husband and daughter, and dragged her forcibly into his own grounds. Lady Cromwell, Mrs. Throgmorton, and the girls were in waiting, armed with long pins to prick the witch, and see if they could draw blood from her. Lady Cromwell, who seems to have been the most violent of the party, tore the old woman's cap off her head, and plucking out a handful of her grey hair, gave it to Mrs. Throgmorton to burn, as a charm which would preserve them all from her future machinations. It was no wonder that the poor creature, subjected to this rough usage, should give vent to an involuntary curse upon her tormentors.

She did so, and her curse was never forgotten. Her hair, however, was supposed to be a grand specific, and she was allowed to depart, half dead with terror and ill-usage. For more than a year the families of Cromwell and Throgmorton continued to persecute her, and to assert that her imps afflicted them with pains and fits, turned the milk sour in their pans, and prevented their cows and ewes from bearing. In the midst of these fooleries, Lady Cromwell was taken ill and died. It was then remembered that her death had taken place exactly a year and a quarter since she was cursed by Mother Samuel, and that on several occasions she had dreamed of the witch and a black cat, the latter being of course the arch-enemy of mankind himself.

Sir Samuel Cromwell now conceived himself bound to take more energetic measures against the sorceress, since he had lost his wife by her means. The year and a quarter and the black cat were proofs positive. All the neighbours had taken up the cry of witchcraft against Mother Samuel; and her personal appearance, unfortunately for her, the very ideal of what a witch ought to be, increased the popular suspicion. It would appear that at last the poor woman believed, even to her own disadvantage, that she was what every body represented her to be. Being forcibly brought into Mr. Throgmorton's house, when his daughter Joan was in one of her customary fits, she was commanded by him and Sir Samuel Cromwell to expel the devil from the young lady. She was told to repeat her exorcism, and to add, "as I am a witch, and the causer of Lady Cromwell's death, I charge thee, fiend, to come out of her!" She did as was required of her; and moreover confessed that her husband and daughter were leagued with her in witchcraft, and had, like her, sold their souls to the devil.

The whole family were immediately arrested, and sent to Huntingdon to prison.

The trial was instituted shortly afterwards before Mr. Justice Fenner, when all the crazy girls of Mr. Throgmorton's family gave evidence against Mother Samuel and her family. They were all three put to the torture. The old woman confessed in her anguish that she was a witch; that she had cast her spells upon the young ladies; and that she had caused the death of Lady Cromwell. The father and daughter, stronger in mind than their unfortunate wife and parent, refused to confess any thing, and asserted their innocence to the last. They were all three condemned to be hanged, and their bodies burned. The daughter, who was young and good-looking, excited the pity of many persons, and she was advised to plead pregnancy, that she might gain at least a respite from death. The poor girl refused proudly, on the ground that she would not be accounted both a witch and a strumpet. Her half-witted old mother caught at the idea of a few weeks' longer life, and asserted that she was pregnant. The court was convulsed with laughter, in which the wretched victim herself joined; and this was accounted an additional proof that she was a witch. The whole family were executed on the 7th of April, 1593.

Sir Samuel Cromwell, as lord of the manor, received the sum of 40*l.* out of the confiscated property of the Samuels, which he turned into a rent-charge of 40*s.* yearly, for the endowment of an annual sermon or lecture upon the enormity of witchcraft, and this case in particular, to be preached by a doctor or bachelor of divinity of Queen's College, Cambridge. I have not been able to ascertain the exact date at which this annual lecture was discontinued; but it

appears to have been preached so late as 1718, when Dr. Hutchinson published his work upon witchcraft.

To carry on in proper chronological order the history of the witch delusion in the British isles, it will be necessary to examine into what was taking place in Scotland during all that part of the sixteenth century anterior to the accession of James VI. to the crown of England. We naturally expect that the Scotch—a people renowned from the earliest times for their powers of imagination—should be more deeply imbued with this gloomy superstition than their neighbours of the south. The nature of their soil and climate tended to encourage the dreams of early ignorance. Ghosts, goblins, wraiths, kelpies, and a whole host of spiritual beings, were familiar to the dwellers by the misty glens of the Highlands and the romantic streams of the Lowlands. Their deeds, whether of good or ill, were enshrined in song, and took a greater hold upon the imagination because “verse had sanctified them.” But it was not till the religious reformers began the practice of straining Scripture to the severest extremes that the arm of the law was called upon to punish witchcraft as a crime *per se*. What Pope Innocent VIII. had done for Germany and France, the preachers of the Reformation did for the Scottish people. Witchcraft, instead of being a mere article of faith, became enrolled in the statute-book; and all good subjects and true Christians were called upon to take arms against it. The ninth parliament of Queen Mary passed an act in 1563, which decreed the punishment of death against witches and consulters with witches, and immediately the whole bulk of the people were smitten with an epidemic fear of the devil and his mortal agents. Persons in the highest ranks of life shared and encouraged the delusion of the

vulgar. Many were themselves accused of witchcraft; and noble ladies were shewn to have dabbled in mystic arts, and proved to the world that if they were not witches, it was not for want of the will.

Among the dames who became notorious for endeavouring to effect their wicked ends by the devil's aid may be mentioned the celebrated Lady Buccleugh of Bransholme (familiar to all the readers of Sir Walter Scott), the Countess of Lothian, the Countess of Angus, the Countess of Athol, Lady Kerr, the Countess of Huntley, Euphemia Macalzean (the daughter of Lord Cliftonhall), and Lady Fowlis. Among the celebrated of the other sex who were accused of wizardism was Sir Lewis Ballantyne, the Lord Justice-Clerk for Scotland, who, if we may believe Scot of Scotstarvet, "dealt by curiosity with a warlock called Richard Grahame," and prayed him to raise the devil. The warlock consented, and raised him *in propria personâ* in the yard of his house in the Canongate, "at sight of whom the Lord Justice-Clerk was so terrified, that he took sickness and thereof died." By such idle reports as these did the envious ruin the reputation of those they hated; though it would appear in this case that Sir Lewis had been fool enough to make the attempt of which he was accused, and that the success of the experiment was the only apocryphal part of the story.

JOHN KNOX.

The enemies of John Knox invented a similar tale, which found ready credence among the Roman Catholics, glad to attach any stigma to that grand scourge of the vices of their Church. It was reported that he and his secretary went into the churchyard of St. Andrew's with the intent to raise "some sanctes;" but that, by a mistake in their conjurations, they raised the great fiend himself instead of the saints they wished to consult. The popular rumour added, that Knox's secretary was so frightened at the great horns, goggle eyes, and long tail of Satan, that he went mad, and shortly afterwards died. Knox himself was built of sterner stuff, and was not to be frightened.

The first name that occurs in the records of the High Court of Justiciary of persons tried or executed for witchcraft, is that of Janet Bowman in 1572, nine years after the passing of the act of Mary. No particulars of her crimes are given, and against her name there only stands the words, "convict and brynt." It is not, however, to be inferred, that in this interval no trials or executions took place; for it appears, on the authority of documents of unquestioned authenticity in the Advocates' Library at Edinburgh,²⁹ that the Privy Council made a practice of granting commissions to resident gentlemen and ministers in every part of Scotland to examine, try, and execute witches within their own parishes. No records of those who suffered from the sentence of these tribunals have been preserved; but if popular tradition may be believed even to the amount of one-fourth of its assertions, their number was fearful. After the year 1572, the entries of executions for witchcraft in the records of the High Court become more frequent, but do not average more than one per annum,—another proof that trials for this offence were in general

entrusted to the local magistracy. The latter appear to have ordered witches to the stake with as little compunction, and after as summary a mode, as modern justices of the peace order a poacher to the stocks.

As James VI. advanced in manhood, he took great interest in the witch trials. One of them especially—that of Gellie Duncan, Dr. Fian, and their accomplices, in the year 1591—engrossed his whole attention, and no doubt suggested in some degree the famous work on Demonology, which he wrote shortly afterwards. As these witches had made an attempt upon his own life, it is not surprising, with his habits, that he should have watched the case closely, or become strengthened in his prejudice and superstition by its singular details. No other trial that could be selected would give so fair an idea of the delusions of the Scottish people as this. Whether we consider the number of victims, the absurdity of the evidence, and the real villany of some of the persons implicated, it is equally extraordinary.

Gellie Duncan, the prime witch in these proceedings, was servant to the deputy bailiff of Tranent, a small town in Haddingtonshire, about ten miles from Edinburgh. Though neither old nor ugly (as witches usually were), but young and good-looking, her neighbours, from some suspicious parts of her behaviour, had long considered her a witch. She had, it appears, some pretensions to the healing art. Some cures which she effected were so sudden, that the worthy bailiff, her master, who, like his neighbours, mistrusted her, considered them no less than miraculous. In order to discover the truth, he put her to the torture; but she obstinately refused to confess that she had dealings with the devil. It was the popular belief that no witch would confess as long as the mark which Satan had put upon

her remained undiscovered upon her body. Somebody present reminded the torturing bailie of this fact, and on examination, the devil's mark was found upon the throat of poor Gellie. She was put to the torture again, and her fortitude giving way under the extremity of her anguish, she confessed that she was indeed a witch—that she had sold her soul to the devil, and effected all her cures by his aid. This was something new in the witch creed, according to which, the devil delighted more in laying diseases on than in taking them off; but Gellie Duncan fared no better on that account. The torture was still applied, until she had named all her accomplices, among whom were one Cunningham, a reputed wizard, known by the name of Dr. Fian; a grave and matron-like witch, named Agnes Sampson; Euphemia Macalzean, the daughter of Lord Cliftonhall, already mentioned, and nearly forty other persons, some of whom were the wives of respectable individuals in the city of Edinburgh. Every one of these persons was arrested, and the whole realm of Scotland thrown into commotion by the extraordinary nature of the disclosures which were anticipated.

About two years previous to this time, James had suddenly left his kingdom, and proceeded gallantly to Denmark, to fetch over his bride, the Princess of Denmark, who had been detained by contrary weather in the harbour of Upslo. After remaining for some months in Copenhagen, he set sail with his young bride, and arrived safely in Leith, on the 1st of May 1590, having experienced a most boisterous passage, and been nearly wrecked. As soon as the arrest of Gellie Duncan and Fian became known in Scotland, it was reported by every body who pretended to be well-informed, that these witches and their associates had, by the devil's means, raised the storms

which had endangered the lives of the king and queen. Gellie, in her torture, had confessed that such was the fact, and the whole kingdom waited aghast and open-mouthed for the corroboration about to be furnished by the trial.

Agnes Sampson, the “grave and matron-like” witch implicated by Gellie Duncan, was put to the horrible torture of the *pilliewinkis*. She laid bare all the secrets of the sisterhood before she had suffered an hour, and confessed that Gellie Duncan, Dr. Fian, Marian Lincup, Euphemia Macalzean, herself, and upwards of two hundred witches and warlocks, used to assemble at midnight in the kirk of North Berwick, where they met the devil; that they had plotted there to attempt the king’s life; that they were incited to this by the old fiend himself, who had asserted with a thundering oath that James was the greatest enemy he ever had, and that there would be no peace for the devil’s children upon earth until he were got rid of; that the devil upon these occasions always liked to have a little music, and that Gellie Duncan used to play a reel before him on a trump or Jew’s harp, to which all the witches danced.

James was highly flattered at the idea that the devil should have said that he was the greatest enemy he ever had. He sent for Gellie Duncan to the palace, and made her play before him the same reel which she had played at the witches’ dance in the kirk.

TORTURE OF THE BOOTS.

Dr. Fian, or rather Cunningham, a petty schoolmaster of Tranent, was put to the torture among the rest. He was a man who had led an infamous life, was a compounder of and dealer in poisons, and a pretender to magic. Though not guilty of the preposterous crimes laid to his charge, there is no doubt that he was a sorcerer in will, though not in deed, and that he deserved all the misery he endured. When put on the rack, he would confess nothing, and held out so long unmoved, that the severe torture of the *boots* was resolved upon. He endured this till exhausted nature could bear no longer, when insensibility kindly stepped in to his aid. When it was seen that he was utterly powerless, and that his tongue cleaved to the roof of his mouth, he was released. Restoratives were administered; and during the first faint gleam of returning consciousness, he was prevailed upon to sign, ere he well knew what he was about, a full confession, in strict accordance with those of Gellie Duncan and Agnes Sampson. He was then remanded to his prison, from which, after two days, he managed, some how or other, to escape. He was soon recaptured, and brought before the Court of Justiciary, James himself being present. Fian now denied all the circumstances of the written confession which he had signed; whereupon the king, enraged at his “stubborn wilfulness,” ordered him once more to the torture. His finger nails were riven out with pincers, and long needles thrust up to the eye into the quick; but he did not wince. He was then consigned again to the *boots*, in which, to quote a pamphlet published at the time,³⁰ he continued “so long, and abode so many blows in them, that his legs were crushed and beaten together as small as might be, and the bones and flesh so bruised, that the blood

and marrow spouted forth in great abundance, whereby they were made unserviceable for ever.”

The astonishing similarity of the confessions of all the persons implicated in these proceedings has often been remarked. It would appear that they actually endeavoured to cause the king's death by their spells and sorceries. Fian, who was acquainted with all the usual tricks of his profession, deceived them with pretended apparitions, so that many of them were really convinced that they had seen the devil. The sum of their confessions was to the following effect:

Satan, who was, of course, a great foe of the reformed religion, was alarmed that King James should marry a Protestant princess. To avert the consequences to the realms of evil, he had determined to put an end to the king and his bride by raising a storm on their voyage home. Satan, first of all, sent a thick mist over the waters, in the hope that the king's vessel might be stranded on the coast amid the darkness. This failing, Dr. Fian, who, from his superior scholarship, was advanced to the dignity of the devil's secretary, was commanded to summon all the witches to meet their master, each one sailing on a sieve on the high seas.

On All Hallowmas Eve, they assembled to the number of upwards of two hundred, including Gellie Duncan, Agnes Sampson, Euphemia Macalzean, one Barbara Napier, and several warlocks; and each embarking in a riddle or sieve, they sailed “over the ocean very substantially.” After cruising about for some time, they met with the fiend, bearing in his claws a cat, which had been previously drawn nine times through the fire. This he delivered to one of the warlocks, telling him to cast it into the sea and cry “Hola!” This was done with

all solemnity, and immediately the ocean became convulsed, the waters hissed loudly, and the waves rose mountains high,

“Twisting their arms to the dun-coloured heaven.”

The witches sailed gallantly through the tempest they had raised, and landing on the coast of Scotland, took their sieves in their hands and marched on in procession to the haunted kirk of North Berwick, where the devil had resolved to hold a preaching. Gellie Duncan, the musician of the party, tripped on before, playing on her Jew’s harp and singing,

“Cummer, go ye before, cummer, go ye;
Gif ye will not go before, cummer, let me!”

Arrived at the kirk, they paced around it *withershins*, that is, in reverse of the apparent motion of the sun. Dr. Fian then blew into the keyhole of the door, which opened immediately, and all the witches entered. As it was pitch dark, Fian blew with his mouth upon the candles, which immediately lighted, and the devil was seen occupying the pulpit. He was attired in a black gown and hat, and the witches saluted him by crying “All hail, master!” His body was hard, like iron; his face terrible; his nose, like the beak of an eagle; he had great burning eyes; his hands and legs were hairy; and he had long claws upon his hands and feet, and spake with an exceedingly gruff voice. Before commencing his sermon he called over the names of his congregation, demanding whether they had been good servants, and

what success had attended their operations against the life of the king and his bride.

Gray Meill, a crazy old warlock, who acted as beadle or door-keeper, was silly enough to answer “that nothing ailed the king yet, God be thanked;” upon which the devil, in a rage, stepped down from the pulpit and boxed his ears for him. He then remounted and commenced the preaching, commanding them to be dutiful servants to him and do all the evil they could. Euphemia Macalzean and Agnes Sampson, bolder than the rest, asked him whether he had brought the image or picture of King James, that they might, by pricking it, cause pains and diseases to fall upon him. “The father of lies” spoke truth for once, and confessed that he had forgotten it; upon which Euphemia Macalzean upbraided him loudly for his carelessness. The devil, however, took it all in good part, although Agnes Sampson and several other women let loose their tongues at him immediately. When they had done scolding, he invited them all to a grand entertainment. A newly buried corpse was dug up and divided among them, which was all they had in the way of edibles. He was more liberal in the matter of drink, and gave them so much excellent wine that they soon became jolly. Gellie Duncan then played the old tune upon her trump, and the devil himself led off the dance with Euphemia Macalzean. Thus they kept up the sport till the cock crew.

JAMES THE DEMONOLOGIST.

Agnes Sampson, the wise woman of Keith, as she was called, added some other particulars in her confession. She stated, that on a previous occasion, she had raised an awful tempest in the sea by throwing a cat into it, with four joints of men tied to its feet. She said also, that on their grand attempt to drown King James, they did not meet with the devil after cruising about, but that he had accompanied them from the first, and that she had seen him dimly in the distance, rolling himself before them over the great waves, in shape and size not unlike a huge haystack. They met with a foreign ship richly laden with wines and other good things, which they boarded, and sunk after they had drunk all the wine and made themselves quite merry.

Some of these disclosures were too much even for the abundant faith of King James, and he more than once exclaimed, that the witches were like their master, "extreme lyars." But they confessed many other things of a less preposterous nature, and of which they were no doubt really guilty. Agnes Sampson said she was to have taken the king's life by anointing his linen with a strong poison. Gellie Duncan used to threaten her neighbours by saying she would send the devil after them; and many persons of weaker minds than usual were frightened into fits by her, and rendered subject to them

for the remainder of their lives. Dr. Fian also made no scruple in aiding and abetting murder, and would rid any person of an enemy by means of poison, who could pay him his fee for it. Euphemia Macalzean also was far from being pure. There is no doubt that she meditated the king's death, and used such means to compass it as the superstition of the age directed. She was a devoted partisan of Bothwell, who was accused by many of the witches as having consulted them on the period of the king's death. They were all found guilty, and sentenced to be hanged and burned. Barbara Napier, though found guilty upon other counts, was acquitted upon the charge of having been present at the great witch meeting in Berwick kirk. The king was highly displeased, and threatened to have the jury indicted for a wilful error upon an assize. They accordingly reconsidered their verdict, and threw themselves upon the king's mercy for the fault they had committed. James was satisfied, and Barbara Napier was hanged along with Gellie Duncan, Agnes Sampson, Dr. Fian, and five-and-twenty others. Euphemia Macalzean met a harder fate. Her connexion with the bold and obnoxious Bothwell, and her share in poisoning one or two individuals who had stood in her way, were thought deserving of the severest punishment the law could inflict. Instead of the ordinary sentence, directing the criminal to be first strangled and then burned, the wretched woman was doomed "to be bound to a stake, and burned in ashes, *quick* to the death." This cruel sentence was executed on the 25th of June, 1591.

These trials had the most pernicious consequences all over Scotland. The lairds and ministers in their districts, armed with due power from the privy council, tried and condemned old women after

the most summary fashion. Those who still clung to the ancient faith of Rome were the severest sufferers, as it was thought, after the disclosures of the fierce enmity borne by the devil towards a Protestant king and his Protestant wife, that all the Catholics were leagued with the powers of evil to work woe on the realm of Scotland. Upon a very moderate calculation, it is presumed that from the passing of the act of Queen Mary till the accession of James to the throne of England, a period of thirty-nine years, the average number of executions for witchcraft in Scotland was two hundred annually, or upwards of seventeen thousand altogether. For the first nine years the number was not one quarter so great; but towards the years 1590 to 1593, the number must have been more than four hundred. The case last cited was one of an extraordinary character. The general aspect of the trials will be better seen from that of Isabel Gowdie, which, as it would be both wearisome and disgusting to go through them all, is given as a fair specimen, although it took place at a date somewhat later than the reign of James. This woman, wearied of her life by the persecutions of her neighbours, voluntarily gave herself up to justice, and made a confession, embodying the whole witch-creed of the period. She was undoubtedly a monomaniac of the most extraordinary kind. She said that she deserved to be stretched upon an iron rack, and that her crimes could never be atoned for, even if she were to be drawn asunder by wild horses. She named a long list of her associates, including nearly fifty women and a few warlocks. They dug up the graves of unchristened infants, whose limbs were serviceable in their enchantments. When they wanted to destroy the crops of an enemy, they yoked toads to his plough, and on the following night Satan himself ploughed the land with his team, and

blasted it for the season. The witches had power to assume almost any shape; but they generally chose either that of a cat or a hare, oftenest the latter. Isabel said, that on one occasion, when she was in this disguise, she was sore pressed by a pack of hounds, and had a very narrow escape with her life. She reached her own door at last, feeling the hot breath of the pursuing dogs at her haunches. She managed, however, to hide herself behind a chest, and got time to pronounce the magic words that could alone restore her to her proper shape. They were:

“Hare! hare!

God send thee care!

I am in a hare’s likeness now;

But I shall be a woman e’en now!

Hare! hare!

God send thee care!”

If witches, when in this shape, were bitten by the dogs, they always retained the marks in their human form; but she had never heard that any witch had been bitten to death. When the devil appointed any general meeting of the witches, the custom was that they should proceed through the air mounted on broomsticks, or on corn or bean-straws, pronouncing as they went:

“Horse and paddock, horse and go,

Horse and pellats, ho! ho! ho!”

They generally left behind them a broom or a three-legged stool, which, when placed in their beds and duly charmed, assumed the human shape till their return. This was done that the neighbours might not know when they were absent.

She added that the devil furnished his favourite witches with servant imps to attend upon them. These imps were called, "The Roaring Lion," "Thief of Hell," "Wait-upon-Herself," "Ranting Roarer," "Care-for-Naught," &c., and were known by their liveries, which were generally yellow, sad-dun, sea-green, pea-green, or grass-green. Satan never called the witches by the names they had received at baptism; neither were they allowed, in his presence, so to designate each other. Such a breach of the infernal etiquette assuredly drew down his most severe displeasure. But as some designation was necessary, he re-baptised them in their own blood by the names of "Able-and-Stout," "Over-the-dike-with-it," "Raise-the-wind," "Pickle-nearest-the-wind," "Batter-them-down-Maggy," "Blow-Kale," and such like. The devil himself was not very particular what name they called him, so that it was not "Black John." If any witch was unthinking enough to utter these words, he would rush out upon her and beat and buffet her unmercifully, or tear her flesh with a wool-card. Other names he did not care about; and once gave instructions to a noted warlock that whenever he wanted his aid, he was to strike the ground three times and exclaim, "Rise up, foul thief!"

SIR G. MACKENZIE.

Upon this confession many persons were executed. So strong was the popular feeling, that no one once accused of witchcraft was acquitted; at least acquittals did not average one in a hundred trials. Witch-finding, or witch-pricking, became a trade, and a set of mercenary vagabonds roamed about the country provided with long pins to run into the flesh of supposed criminals. It was no unusual thing then, nor is it now, that in aged persons there should be some spot on the body totally devoid of feeling. It was the object of the witch-pricker to discover this spot, and the unhappy wight who did not bleed when pricked upon it was doomed to the death. If not immediately cast into prison, her life was rendered miserable by the persecution of her neighbours. It is recorded of many poor women, that the annoyances they endured in this way were so excessive, that they preferred death. Sir George Mackenzie, the Lord Advocate, at the time when witch trials were so frequent, and himself a devout

believer in the crime, relates, in his *Criminal Law*, first published in 1678, some remarkable instances of it. He says, "I went, when I was a justice-depute, to examine some women who had confessed judicially; and one of them, who was a silly creature, told me, under secrecy, that she had not confessed because she was guilty, but being a poor creature, who wrought for her meat, and being defamed for a witch, she knew she should starve, for no person thereafter would either give her meat or lodging, and that all men would beat her and set dogs at her, and that, therefore, she desired to be out of the world; whereupon she wept most bitterly, and upon her knees called God to witness to what she said." Sir George, though not wholly elevated above the prejudices of his age upon this subject, was clear-sighted enough to see the danger to society of the undue encouragement given to the witch prosecutions. He was convinced that three-fourths of them were unjust and unfounded. He says, in the work already quoted, that the persons who were in general accused of this crime were poor ignorant men and women who did not understand the nature of the accusation, and who mistook their own superstitious fears for witchcraft. One poor wretch, a weaver, confessed that he was a warlock, and, being asked why, he replied, because "he had seen the devil dancing, like a fly, about the candle!" A simple woman, who, because she was called a witch, believed that she was, asked the judge upon the bench whether a person might be a witch and not know it? Sir George adds, that all the supposed criminals were subjected to severe torture in prison from their gaolers, who thought they did God good service by vexing and tormenting them; "and I know," says this humane and enlightened magistrate, "that this usage was the ground of all their confession;

and albeit, the poor miscreants cannot prove this usage, the actors in it being the only witnesses; yet the judge should be jealous of it, as that which did at first elicit the confession, and for fear of which they dare not retract it.” Another author,³¹ also a firm believer in witchcraft, gives a still more lamentable instance of a woman who preferred execution as a witch to live on under the imputation. This woman, who knew that three others were to be strangled and burned on an early day, sent for the minister of the parish, and confessed that she had sold her soul to Satan. “Whereupon being called before the judges, she was condemned to die with the rest. Being carried forth to the place of execution, she remained silent during the first, second, and third prayer, and then, perceiving that there remained no more but to rise and go to the stake, she lifted up her body, and, with a loud voice, cried out, ‘Now all you that see me this day, know that I am now to die as a witch, by my own confession; and I free all men, especially the ministers and magistrates, of the guilt of my blood. I take it wholly upon myself. My blood be upon my own head. And, as I must make answer to the God of heaven presently, I declare I am as free of witchcraft as any child. But, being delated by a malicious woman, and put in prison under the name of a witch, disowned by my husband and friends, and seeing no ground of hope of ever coming out again, I made up that confession to destroy my own life, being weary of it, and choosing rather to die than to live.’” As a proof of the singular obstinacy and blindness of the believers in witches, it may be stated that the minister who relates this story only saw in the dying speech of the unhappy woman an additional proof that she was a witch. True, indeed is it, that “none are so blind as those who will not see.”

It is time, however, to return to James VI., who is fairly entitled to share with Pope Innocent, Sprenger, Bodinus, and Matthew Hopkins the glory or the odium of being at the same time a chief enemy and chief encourager of witchcraft. Towards the close of the sixteenth century, many learned men, both on the continent and in the isles of Britain, had endeavoured to disabuse the public mind on this subject. The most celebrated were Wierus, in Germany; Pietro d'Apone, in Italy; and Reginald Scot, in England. Their works excited the attention of the zealous James, who, mindful of the involuntary compliment which his merits had extorted from the devil, was ambitious to deserve it by still continuing "his greatest enemy." In the year 1597, he published in Edinburgh his famous treatise on Demonology. Its design may be gathered from the following passage in the introduction: "The fearful abounding," says the king, "at this time and in this country of these detestable slaves of the devil, the witches or enchanters, hath moved me, beloved reader, to despatch in post this following treatise of mine, not in any wise, as I protest, to serve for a show of mine own learning and ingene [ingenuity], but only (moved of conscience) to press thereby, so far as I can, to resolve the doubting hearts of many, both that such assaults of Satan are most certainly practised, and that the instrument thereof merits most severely to be punished, against the damnable opinions of two, principally in our age; whereof the one called Scot, an Englishman, is not ashamed in public print to deny that there can be such thing as witchcraft, and so maintains the old error of the Sadducees in denying of spirits. The other, called Wierus, a German physician, sets out a public apology for all these crafts-folks, whereby procuring for them impunity, he plainly betrays himself to have been one of that

profession.” In other parts of this treatise, which the author had put into the form of a dialogue, to “make it more pleasant and facile,” he says: “Witches ought to be put to death, according to the law of God, the civil and imperial law, and the municipal law of all Christian nations: yea, to spare the life, and not strike whom God bids strike and so severely punish in so odious a treason against God, is not only unlawful, but doubtless as great a sin in the magistrate as was Saul’s sparing Agag.” He says also that the crime is so abominable, that it may be proved by evidence which would not be received against any other offenders,—young children, who knew not the nature of an oath, and persons of an infamous character, being sufficient witnesses against them; but lest the innocent should be accused of a crime so difficult to be acquitted of, he recommends that in all cases the ordeal should be resorted to. He says, “Two good helps may be used: the one is the finding of their mark, and the trying the insensibleness thereof; the other is their floating on the water,—for, as in a secret murder, if the dead carcass be at any time thereafter handled by the murderer, it will gush out of blood, as if the blood were crying to Heaven for revenge of the murderer (God having appointed that secret supernatural sign for trial of that secret unnatural crime), so that it appears that God hath appointed (for a supernatural sign of the monstrous impiety of witches) that the water shall refuse to receive them in her bosom that have shaken off them the sacred water of baptism, and wilfully refused the benefit thereof;—no, not so much as their eyes are able to shed tears (threaten and torture them as you please), while first they repent (God not permitting them to dissemble their obstinacy in so horrible a crime); albeit, the womenkind especially, be able otherwise to shed tears at

every light occasion when they will, yea, although it were dissembling like the crocodiles.”

PIETRO D'APONE.

When such doctrines as these were openly promulgated by the highest authority in the realm, and who, in promulgating them, flattered, but did not force the public opinion, it is not surprising that the sad delusion should have increased and multiplied until the race of wizards and witches replenished the earth. The reputation which he lost by being afraid of a naked sword, he more than regained by his courage in combating the devil. The Kirk shewed itself a most zealous coadjutor, especially during those halcyon days when it was not at issue with the king upon other matters of doctrine and prerogative.

On his accession to the throne of England in 1603, James came amongst a people who had heard with admiration of his glorious deeds against the witches. He himself left no part of his ancient prejudices behind him; and his advent was the signal for the persecution to burst forth in England with a fury equal to that in Scotland. It had languished a little during the latter years of the reign of Elizabeth; but the very first parliament of King James brought

forward the subject. James was flattered by their promptitude, and the act passed in 1604. On the second reading in the House of Lords, the bill passed into a committee, in which were twelve bishops. By it was enacted, "That if any person shall use, practise, or exercise any conjuration of any wicked or evil spirit, or shall consult, covenant with, or feed any such spirit, the first offence to be imprisonment for a year, and standing in the pillory once a quarter; the second offence to be death."

The minor punishment seems but rarely to have been inflicted. Every record that has been preserved mentions that the witches were hanged and burned, or burned, without the previous strangling, "alive and quick." During the whole of James's reign, amid the civil wars of his successor, the sway of the Long Parliament, the usurpation of Cromwell, and the reign of Charles II., there was no abatement of the persecution. If at any time it raged with less virulence, it was when Cromwell and the Independents were masters. Dr. Zachary Grey, the editor of an edition of "Hudibras," informs us, in a note to that work, that he himself perused a list of three thousand witches who were executed in the time of the Long Parliament alone. During the first eighty years of the seventeenth century, the number executed has been estimated at five hundred annually, making the frightful total of forty thousand. Some of these cases deserve to be cited. The great majority resemble closely those already mentioned; but two or three of them let in a new light upon the popular superstition.

Every one has heard of the "Lancashire witches," a phrase now used to compliment the ladies of that county for their bewitching beauty; but it is not every one who has heard the story in which it

originated. A villanous boy, named Robinson, was the chief actor in the tragedy. He confessed many years afterwards that he had been suborned by his father and other persons to give false evidence against the unhappy witches whom he brought to the stake. The time of this famous trial was about the year 1634. This boy Robinson, whose father was a wood-cutter, residing on the borders of Pendle Forest, in Lancashire, spread abroad many rumours against one Mother Dickenson, whom he accused of being a witch. These rumours coming to the ears of the local magistracy, the boy was sent for and strictly examined. He told the following extraordinary story without hesitation or prevarication, and apparently in so open and honest a manner, that no one who heard him doubted the truth of it. He said, that as he was roaming about in one of the glades of the forest, amusing himself by gathering blackberries, he saw two greyhounds before him, which he thought at the time belonged to some gentleman of the neighbourhood. Being fond of sport, he proposed to have a course; and a hare being started, he incited the hounds to run. Neither of them would stir. Angry at the beasts, he seized hold of a switch, with which he was about to punish them, when one of them suddenly started up in the form of a woman, and the other of a little boy. He at once recognised the woman to be the witch Mother Dickenson. She offered him some money to induce him to sell his soul to the devil; but he refused. Upon this she took a bridle out of her pocket, and shaking it over the head of the other little boy, he was instantly turned into a horse. Mother Dickenson then seized him in her arms, sprang upon the horse, and placing him before her, rode with the swiftness of the wind over forests, fields, bogs, and rivers, until they came to a large barn. The witch alighted

at the door, and, taking him by the hand, led him inside. There he saw seven old women pulling at seven halters which hung from the roof. As they pulled, large pieces of meat, lumps of butter, loaves of bread, basins of milk, hot puddings, black puddings, and other rural dainties, fell from the halters on to the floor. While engaged in this charm, they made such ugly faces, and looked so fiendish, that he was quite frightened. After they had pulled in this manner enough for an ample feast, they set-to, and shewed, whatever might be said of the way in which their supper was procured, that their epicurism was a little more refined than that of the Scottish witches, who, according to Gellie Duncan's confession, feasted upon dead men's flesh in the old kirk of Berwick. The boy added, that as soon as supper was ready, many other witches came to partake of it, several of whom he named.

In consequence of this story, many persons were arrested, and the boy Robinson was led about from church to church, in order that he might point out to the officers by whom he was accompanied the hags he had seen in the barn. Altogether, about twenty persons were thrown into prison; eight of them were condemned to die, including Mother Dickenson, upon this evidence alone, and executed accordingly. Among the wretches who concocted this notable story, not one was ever brought to justice for his perjury; and Robinson, the father, gained considerable sums by threatening persons who were rich enough to buy off exposure.

Among the ill-weeds which flourished amid the long dissensions of the civil war, Matthew Hopkins, the witch-finder, stands eminent in his sphere. This vulgar fellow resided, in the year 1644, at the town of Manningtree, in Essex, and made himself very conspicuous in

discovering the devil's marks upon several unhappy witches. The credit he gained by his skill in this instance seems to have inspired him to renewed exertions. In the course of a very short time, whenever a witch was spoken of in Essex, Matthew Hopkins was sure to be present, aiding the judges with his knowledge of "such cattle," as he called them. As his reputation increased, he assumed the title of "Witch-finder General," and travelled through the counties of Norfolk, Essex, Huntingdon, and Sussex, for the sole purpose of finding out witches. In one year he brought sixty poor creatures to the stake. The test he commonly adopted was that of swimming, so highly recommended by King James in his *Demonologie*. The hands and feet of the suspected persons were tied together crosswise, the thumb of the right hand to the toe of the left foot, and *vice versa*. They were then wrapped up in a large sheet or blanket, and laid upon their backs in a pond or river. If they sank, their friends and relatives had the poor consolation of knowing they were innocent; but there was an end of them: if they floated, which, when laid carefully on the water, was generally the case, there was also an end of them; for they were deemed guilty of witchcraft, and burned accordingly.

Another test was to make them repeat the Lord's prayer and creed. It was affirmed that no witch could do so correctly. If she missed a word, or even pronounced one incoherently, which in her trepidation it was most probable she would, she was accounted guilty. It was thought that witches could not weep more than three tears, and those only from the left eye. Thus the conscious innocence of many persons, which gave them fortitude to bear unmerited torture without flinching, was construed by their unmerciful tormentors into proofs of guilt. In some districts the test resorted to was to weigh the

culprit against the church Bible. If the suspected witch proved heavier than the Bible, she was set at liberty. This mode was far too humane for the witch-finders by profession. Hopkins always maintained that the most legitimate modes were pricking and swimming.

Hopkins used to travel through his counties like a man of consideration, attended by his two assistants, always putting up at the chief inn of the place, and always at the cost of the authorities. His charges were twenty shillings a town, his expenses of living while there, and his carriage thither and back. This he claimed whether he found witches or not. If he found any, he claimed twenty shillings a head in addition when they were brought to execution. For about three years he carried on this infamous trade, success making him so insolent and rapacious that high and low became his enemies. The Rev. Mr. Gaul, a clergyman of Houghton, in Huntingdonshire, wrote a pamphlet impugning his pretensions, and accusing him of being a common nuisance. Hopkins replied in an angry letter to the functionaries of Houghton, stating his intention to visit their town; but desiring to know whether it afforded many such sticklers for witchcraft as Mr. Gaul, and whether they were willing to receive and entertain him with the customary hospitality, if he so far honoured them. He added, by way of threat, that in case he did not receive a satisfactory reply, "he would waive their shire altogether, and betake himself to such places where he might do and punish, not only without control, but with thanks and recompense." The authorities of Houghton were not much alarmed at this awful threat of letting them alone. They very wisely took no notice either of him or his letter.

Mr. Gaul describes in his pamphlet one of the modes employed by Hopkins, which was sure to swell his revenues very considerably. It was a proof even more atrocious than the swimming. He says, that the “Witch-finder General” used to take the suspected witch and place her in the middle of a room, upon a stool or table, cross-legged, or in some other uneasy posture. If she refused to sit in this manner, she was bound with strong cords. Hopkins then placed persons to watch her for four-and-twenty hours, during which time she was to be kept without meat or drink. It was supposed that one of her imps would come during that interval and suck her blood. As the imp might come in the shape of a wasp, a moth, a fly, or other insect, a hole was made in the door or window to let it enter. The watchers were ordered to keep a sharp look out, and endeavour to kill any insect that appeared in the room. If any fly escaped, and they could not kill it, the woman was guilty; the fly was her imp, and she was sentenced to be burned, and twenty shillings went into the pockets of Master Hopkins. In this manner he made one old woman confess, because four flies had appeared in the room, that she was attended by four imps, named “Ilemazar,” “Pye-wackett,” “Peck-in-the-crown,” and “Grizel-Greedigut.”

MATTHEW HOPKINS.³²

It is consoling to think that this impostor perished in his own snare. Mr. Gaul's exposure and his own rapacity weakened his influence among the magistrates; and the populace, who began to find that not even the most virtuous and innocent were secure from his persecution, looked upon him with undisguised aversion. He was beset by a mob at a village in Suffolk, and accused of being himself a wizard. An old reproach was brought against him, that he had, by means of sorcery, cheated the devil out of a certain memorandum-book, in which he, Satan, had entered the names of all the witches in England. "Thus," said the populace, "you find out witches, not by God's aid, but by the devil's." In vain he denied his guilt. The populace longed to put him to his own test. He was speedily stripped, and his thumbs and toes tied together. He was then placed in a blanket, and cast into a pond. Some say that he floated, and that he was taken out, tried, and executed upon no other proof of his guilt.

Others assert that he was drowned. This much is positive, that there was an end of him. As no judicial entry of his trial and execution is to be found in any register, it appears most probable that he expired by the hands of the mob. Butler has immortalised this scamp in the following lines of his *Hudibras*:

“Hath not this present Parliament
A lieger to the devil sent,
Fully empower’d to treat about
Finding revolted witches out?
And has he not within a year
Hang’d threescore of them in one shire?
Some only for not being drown’d,
And some for sitting above ground
Whole days and nights upon their breeches,
And feeling pain, were hang’d for witches;
And some for putting knavish tricks
Upon green geese or turkey chicks;
Or pigs that suddenly deceased
Of griefs unnatural, as he guessed;
Who proved himself at length a witch,
And made a rod for his own breech.”

In Scotland also witch-finding became a trade. They were known under the designation of “common prickers,” and, like Hopkins, received a fee for each witch they discovered. At the trial of Janet Peaston, in 1646, the magistrates of Dalkeith “caused John Kincaid of Tranent, the common pricker, to exercise his craft upon her. He

found two marks of the devil's making; for she could not feel the pin when it was put into either of the said marks, nor did the marks bleed when the pin was taken out again. When she was asked where she thought the pins were put in her, she pointed to a part of her body distant from the real place. They were pins of three inches in length.”³³

These common prickers became at last so numerous that they were considered nuisances. The judges refused to take their evidence; and in 1678 the privy council of Scotland condescended to hear the complaint of an honest woman who had been indecently exposed by one of them, and expressed their opinion that common prickers were common cheats.

But such an opinion was not formed in high places before hundreds of innocent persons had fallen victims. The parliaments had encouraged the delusion both in England and Scotland; and by arming these fellows with a sort of authority, had in a manner forced the magistrates and ministers to receive their evidence. The fate of one poor old gentleman, who fell a victim to the arts of Hopkins in 1646, deserves to be recorded. Mr. Louis, a venerable clergyman, upwards of seventy years of age, and who had been rector of Framlingham, in Suffolk, for fifty years, excited suspicion that he was a wizard. Being a violent royalist, he was likely to meet with no sympathy at that time; and even his own parishioners, whom he had served so long and so faithfully, turned their backs upon him as soon as he was accused. Placed under the hands of Hopkins, who knew so well how to bring the refractory to confession, the old man, the light of whose intellect had become somewhat dimmed from age, confessed that he was a wizard. He said he had two imps that

continually excited him to do evil; and that one day, when he was walking on the sea-coast, one of them prompted him to express a wish that a ship, whose sails were just visible in the distance, might sink. He consented, and saw the vessel sink before his eyes. He was, upon this confession, tried and condemned. On his trial, the flame of reason burned up as brightly as ever. He denied all that had been alleged against him, and cross-examined Hopkins with great tact and severity. After his condemnation, he begged that the funeral service of the Church might be read for him. The request was refused, and he repeated it for himself from memory as he was led to the scaffold.

A poor woman in Scotland was executed upon evidence even less strong than this. John Bain, a common pricker, swore that, as he passed her door, he heard her talking to the devil. She said, in defence, that it was a foolish practice she had of talking to herself, and several of her neighbours corroborated her statement; but the evidence of the pricker was received. He swore that none ever talked to themselves who were not witches. The devil's mark being found upon her, the additional testimony of her guilt was deemed conclusive, and she was "convict and brynt."

From the year 1652 to 1682, these trials diminished annually in number, and acquittals were by no means so rare as they had been. To doubt in witchcraft was no longer dangerous. Before country justices, condemnations on the most absurd evidence still continued; but when the judges of the land had to charge the jury, they took a more humane and philosophical view. By degrees, the educated classes (comprised in those days within very narrow limits) openly expressed their unbelief of modern witchcraft, although they were not bold enough to deny its existence altogether. Between them and

the believers in the old doctrine fierce arguments ensued, and the sceptics were designated Sadducees. To convince them, the learned and Reverend Joseph Glanvil wrote his well-known work, *Sadducismus Triumphatus*, and *The Collection of Relations*; the first part intended as a philosophical inquiry into witchcraft, and the power of the devil “to assume a mortal shape:” the latter containing what he considered a multitude of well-authenticated modern instances.

SIR MATTHEW HALE.

But though progress was made, it was slow. In 1664, the venerable Sir Matthew Hale condemned two women, named Amy Duny and Rose Cullender, to the stake at St. Edmondsbury, upon evidence the most ridiculous. These two old women, whose ugliness gave their neighbours the first idea that they were witches, went to a shop to purchase herrings, and were refused. Indignant at the prejudice against them, they were not sparing of their abuse. Shortly afterward, the daughter of the herring-dealer fell sick, and a cry was raised that she was bewitched by the old women who had been refused the herrings. This girl was subject to epileptic fits. To discover the guilt of Amy Duny and Rose Cullender, the girl's eyes were blinded closely with a shawl, and the witches were commanded to touch her. They

did so, and she was immediately seized with a fit. Upon this evidence they were sent to prison. The girl was afterwards touched by an indifferent person, and the force of her imagination was so great, that, thinking it was again the witches, she fell down in a violent fit as before. This, however, was not received in favour of the accused.

The following extract, from the published reports of the trial, will shew the sort of evidence which was received:

“Samuel Pacey, of Leystoff (a good, sober man), being sworn, said that, on Thursday the 10th of October last, his younger daughter, Deborah, about nine years old, was suddenly taken so lame that she could not stand on her legs, and so continued till the 17th of the same month, when the child desired to be carried to a bank on the east side of the house, looking towards the sea; and, while she was sitting there, Amy Duny came to this examinant’s house to buy some herrings, but was denied. Then she came twice more, but, being as often denied, she went away discontented and grumbling. At this instant of time, the child was taken with terrible fits, complaining of a pain in her stomach, as if she was pricked with pins, shrieking out with a voice like a whelp, and thus continued till the 30th of the same month. This examinant further saith, that Amy Duny, having long had the reputation of a witch, and his child having, in the intervals of her fits, constantly cried out on her as the cause of her disorder, saying, that the said Amy did appear to her and fright her; he himself did suspect the said Amy to be a witch, and charged her with being the cause of his child’s illness, and set her in the stocks. Two days after, his daughter Elizabeth was taken with such strange fits, that they could not force open her

mouth without a tap; and the younger child being in the same condition, they used to her the same remedy. Both children grievously complained that Amy Duny and another woman, whose habit and looks they described, did appear to them and torment them, and would cry out, 'There stands Amy Duny! There stands Rose Cullender!' the other person who afflicted them. Their fits were not alike. Sometimes they were lame on the right side; sometimes on the left; and sometimes so sore, that they could not bear to be touched. Sometimes they were perfectly well in other respects, but they could not *hear*; at other times they could not *see*. Sometimes they lost their speech for one, two, and once for eight days together. At times they had swooning fits, and, when they could speak, were taken with a fit of coughing, and vomited phlegm and crooked pins; and once a great twopenny nail, with above forty pins; which nail he, the examinant, saw vomited up, with many of the pins. The nail and pins were produced in the court. Thus the children continued for two months, during which time the examinant often made them read in the New Testament, and observed, when they came to the words *Lord Jesus*, or *Christ*, they could not pronounce them, but fell into a fit. When they came to the word *Satan*, or *devil*, they would point, and say, 'This bites, but makes me speak right well.' Finding his children thus tormented without hopes of recovery, he sent them to his sister, Margaret Arnold, at Yarmouth, being willing to try whether change of air would help them.

“Margaret Arnold was the next witness. Being sworn, she said, that about the 30th of November, Elizabeth and Deborah Pacey

came to her house, with her brother, who told her what had happened, and that he thought his children bewitched. She, this examinant, did not much regard it, supposing the children had played tricks, and put the pins into their mouths themselves. She therefore took all the pins from their clothes, sewing them with thread instead of pinning them. But, notwithstanding, they raised, at times, at least thirty pins in her presence, and had terrible fits; in which fits they would cry out upon Amy Duny and Rose Cullender, saying, that they saw them and heard them threatening, as before; that they saw things like mice running about the house; and one of them caught one, and threw it into the fire, which made a noise like a rat. Another time the younger child, being out of doors, a thing like a bee would have forced itself into her mouth, at which the child ran screaming into the house, and before this examinant could come at her, fell into a fit, and vomited a twopenny nail, with a broad head. After that, this examinant asked the child how she came by this nail, when she answered, 'The bee brought the nail, and forced it into my mouth.' At other times, the eldest child told this examinant that she saw flies bring her crooked pins. She would then fall into a fit, and vomit such pins. One time the said child said she saw a mouse, and crept under the table to look for it; and afterwards, the child seemed to put something into her apron, saying, 'She had caught it.' She then ran to the fire, and threw it in, on which there did appear to this examinant something like a flash of gunpowder, although she does own she saw nothing in the child's hand. Once the child, being speechless, but otherwise very sensible, ran up and down the house, crying, 'Hush! hush!'

as if she had seen poultry; but this examinant saw nothing. At last the child caught at something, and threw it into the fire. Afterwards, when the child could speak, this examinant asked her what she saw at the time? She answered that she saw a duck. Another time the youngest child said, after a fit, that Amy Duny had been with her, and tempted her to drown herself, or cut her throat, or otherwise destroy herself. Another time they both cried out upon Amy Duny and Rose Cullender, saying, ‘Why don’t you come yourselves? Why do you send your imps to torment us?’”

SIR THOMAS BROWN.

The celebrated Sir Thomas Brown, the author of *Vulgar Errors*, was also examined as a witness upon the trial. Being desired to give his opinion of the three persons in court, he said he was clearly of opinion that they were bewitched. He said there had lately been a discovery of witches in Denmark, who used the same way of tormenting persons, by conveying crooked pins, needles, and nails into their bodies. That he thought, in such cases, the devil acted upon human bodies by natural means, namely, by exciting and stirring up the superabundant humours; he did afflict them in a more surprising manner by the same diseases their bodies were usually subject to;

that these fits might be natural, only raised to a great degree by the subtlety of the devil, co-operating with the malice of these witches.

The evidence being concluded, Sir Matthew Hale addressed the jury. He said, he would waive repeating the evidence, to prevent any mistake, and told the jury there were two things they had to inquire into. First, Whether or not these children were bewitched; secondly, Whether these women did bewitch them. He said, he did not in the least doubt there were witches; first, Because the Scriptures affirmed it; secondly, Because the wisdom of all nations, particularly our own, had provided laws against witchcraft, which implied their belief of such a crime. He desired them strictly to observe the evidence, and begged of God to direct their hearts in the weighty concern they had in hand, since, to condemn the innocent and let the guilty go free are both an abomination to the Lord.

The jury then retired, and in about half an hour returned a verdict of guilty upon all the indictments, being thirteen in number. The next morning the children came with their father to the lodgings of Sir Matthew Hale, very well, and quite restored to their usual health. Mr. Pacey, being asked at what time their health began to improve, replied, that they were quite well in half an hour after the conviction of the prisoners.

Many attempts were made to induce the unfortunate women to confess their guilt; but in vain, and they were both hanged.

Eleven trials were instituted before Chief Justice Holt for witchcraft, between the years 1694 and 1701. The evidence was of the usual character; but Holt appealed so successfully in each case to the common sense of the jury, that they were every one acquitted. A general feeling seemed to pervade the country that blood enough had

been shed upon these absurd charges. Now and then, the flame of persecution burnt up in a remote district; but these instances were no longer looked upon as mere matters of course. They appear, on the contrary, to have excited much attention; a sure proof, if no other were to be obtained, that they were becoming unfrequent.

A case of witchcraft was tried in 1711, before Lord Chief Justice Powell; in which, however, the jury persisted in a verdict of guilty, though the evidence was of the usual absurd and contradictory character, and the enlightened judge did all in his power to bring them to a right conclusion. The accused person was one Jane Wenham, better known as the Witch of Walkerne; and the persons who were alleged to have suffered from her witchcraft were two young women, named Thorne and Street. A witness, named Mr. Arthur Chauncy, deposed, that he had seen Ann Thorne in several of her fits, and that she always recovered upon prayers being said, or if Jane Wenham came to her. He related, that he had pricked the prisoner several times in the arms, but could never fetch any blood from her; that he had seen her vomit pins, when there were none in her clothes or within her reach; and that he had preserved several of them, which he was ready to produce. The judge, however, told him that was needless, *as he supposed they were crooked pins*.

Mr. Francis Bragge, another witness, deposed, that strange “cakes” of bewitched feathers having been taken from Ann Thorne’s pillow, he was anxious to see them. He went into a room where some of these feathers were, and took two of the cakes, and compared them together. They were both of a circular figure, something larger than a crown piece; and he observed that the small feathers were placed in a nice and curious order, at equal distances from each other, making

so many radii of the circle, in the centre of which the quill-ends of the feathers met. He counted the number of these feathers, and found them to be exactly thirty-two in each cake. He afterwards endeavoured to pull off two or three of them, and observed that they were all fastened together by a sort of viscous matter, which would stretch seven or eight times in a thread before it broke. Having taken off several of these feathers, he removed the viscous matter with his fingers, and found under it, in the centre, some short hairs, black and grey, matted together, which he verily believed to be cat's hair. He also said, that Jane Wenham confessed to him that she had bewitched the pillow, and had practised witchcraft for sixteen years.

The judge interrupted the witness at this stage, and said, he should very much like to see an enchanted feather, and seemed to wonder when he was told that none of these strange cakes had been preserved. His lordship asked the witness why he did not keep one or two of them, and was informed that they had all been burnt, in order to relieve the bewitched person of the pains she suffered, which could not be so well effected by any other means.

A man, named Thomas Ireland, deposed, that hearing several times a great noise of cats crying and screaming about his house, he went out and frightened them away, and they all ran towards the cottage of Jane Wenham. One of them he swore positively had a face very like Jane Wenham's. Another man, named Burville, gave similar evidence, and swore that he had often seen a cat with Jane Wenham's face. Upon one occasion he was in Ann Thorne's chamber, when several cats came in, and among them the cat above stated. This witness would have favoured the court with a much longer

statement, but was stopped by the judge, who said he had heard quite enough.

The prisoner, in her defence, said nothing, but that “she was a clear woman.” The learned judge then summed up, leaving it to the jury to determine whether such evidence as they had heard was sufficient to take away the prisoner’s life upon the indictment. After a long deliberation they brought in their verdict, that she was guilty upon the evidence. The judge then asked them whether they found her guilty upon the indictment of conversing with the devil in the shape of a cat? The sapient foreman very gravely answered, “We find her guilty of *that*.” The learned judge then very reluctantly proceeded to pass sentence of death; but, by his persevering exertions, a pardon was at last obtained, and the wretched old woman was set at liberty.

In the year 1716, a woman and her daughter—the latter only nine years of age—were hanged at Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings and making a lather of soap. This appears to have been the last judicial execution in England. From that time to the year 1736, the populace raised at intervals the old cry, and more than once endangered the lives of poor women by dragging them through ponds on suspicion; but the philosophy of those who, from their position, sooner or later give the tone to the opinions and morals of the poor, was silently working a cure for the evil. The fear of witches ceased to be epidemic, and became individual, lingering only in minds fettered by inveterate prejudice or brutalising superstition. In the year 1736, the penal statute of James I. was finally blotted from the statute-book, and suffered no longer to disgrace the advancing intelligence of the country. Pretenders to witchcraft, fortune-tellers, conjurors, and all

their train, were liable only to the common punishment of rogues and impostors—imprisonment and the pillory.

In Scotland, the delusion also assumed the same phases, and was gradually extinguished in the light of civilisation. As in England, the progress of improvement was slow. Up to the year 1665, little or no diminution of the mania was perceptible. In 1643, the General Assembly recommended that the privy council should institute a standing commission, composed of any “understanding gentlemen or magistrates,” to try the witches, who were stated to have increased enormously of late years. In 1649, an act was passed, confirmatory of the original statute of Queen Mary, explaining some points of the latter which were doubtful, and enacting severe penalties, not only against witches themselves, but against all who covenanted with them, or sought by their means to pry into the secrets of futurity, or cause any evil to the life, lands, or limbs of their neighbours. For the next ten years, the popular madness upon this subject was perhaps more furious than ever; upwards of four thousand persons suffered for the crime during that interval. This was the consequence of the act of parliament and the unparalleled severity of the magistrates; the latter frequently complained that for two witches they burned one day, there were ten to burn the next: they never thought that they themselves were the cause of the increase. In a single circuit, held at Glasgow, Ayr, and Stirling, in 1659, seventeen unhappy creatures were burned by judicial sentence for trafficking with Satan. In one day (November 7, 1661), the privy council issued no less than fourteen commissions for trials in the provinces. Next year, the violence of the persecution seems to have abated. From 1662 to 1668, although “the understanding gentlemen and magistrates” already

mentioned, continued to try and condemn, the High Court of Justiciary had but one offender of this class to deal with, and she was acquitted. James Welsh, a common pricker, was ordered to be publicly whipped through the streets of Edinburgh for falsely accusing a woman of witchcraft; a fact which alone proves that the superior court sifted the evidence in these cases with much more care and severity than it had done a few years previously. The enlightened Sir George Mackenzie, styled by Dryden "the noble wit of Scotland," laboured hard to introduce this rule into court, that the confessions of the witches should be held of little worth, and that the evidence of the prickers and other interested persons should be received with distrust and jealousy. This was reversing the old practice, and saved many innocent lives. Though a firm believer both in ancient and modern witchcraft, he could not shut his eyes to the atrocities daily committed under the name of justice. In his work on the Criminal Law of Scotland, published in 1678, he says, "From the horridness of this crime, I do conclude that, of all others, it requires the clearest relevancy and most convincing probature; and I condemn, next to the witches themselves, those cruel and too forward judges who burn persons by thousands as guilty of this crime." In the same year, Sir John Clerk plumply refused to serve as a commissioner on trials for witchcraft, alleging, by way of excuse, "that he was not himself good conjuror enough to be duly qualified." The views entertained by Sir George Mackenzie were so favourably received by the Lords of Session, that he was deputed, in 1680, to report to them on the cases of a number of poor women who were then in prison awaiting their trial. Sir George stated that there was no evidence against them whatever but their own confessions, which

were absurd and contradictory, and drawn from them by severe torture. They were immediately discharged.

For the next sixteen years the Lords of Session were unoccupied with trials for witchcraft. Not one is entered upon the record. But in 1697 a case occurred which equalled in absurdity any of those that signalled the dark reign of King James. A girl named Christiana Shaw, eleven years of age, the daughter of John Shaw of Bargarran, was subject to fits; and being of a spiteful temper, she accused her maid-servant, with whom she had frequent quarrels, of bewitching her. Her story unfortunately was believed. Encouraged to tell all the persecutions of the devil which the maid had sent to torment her, she in the end concocted a romance that involved twenty-one persons. There was no other evidence against them but the fancies of this lying child, and the confessions which pain had extorted from them; but upon this no less than five women were condemned before Lord Blantyre and the rest of the commissioners, appointed specially by the privy council to try this case. They were burned on the Green at Paisley. The warlock of the party, one John Reed, who was also condemned, hanged himself in prison. It was the general belief in Paisley that the devil had strangled him lest he should have revealed in his last moments too many of the unholy secrets of witchcraft. This trial excited considerable disgust in Scotland. The Rev. Mr. Bell, a contemporary writer, observed that, in this business, “persons of more goodness and esteem than most of their calumniators were defamed for witches.” He adds, that the persons chiefly to blame were “certain ministers of too much forwardness and absurd credulity, and some topping professors in and about Glasgow.”³⁴

After this trial, there again occurs a lapse of seven years, when the subject was painfully forced upon public attention by the brutal cruelty of the mob at Pittenween. Two women were accused of having bewitched a strolling beggar who was subject to fits, or who pretended to be so, for the purpose of exciting commiseration. They were cast into prison, and tortured until they confessed. One of them, named Janet Cornfoot, contrived to escape, but was brought back to Pittenween next day by a party of soldiers. On her approach to the town she was unfortunately met by a furious mob, composed principally of fishermen and their wives, who seized upon her with the intention of swimming her. They forced her away to the sea-shore, and tying a rope around her body, secured the end of it to the mast of a fishing-boat lying alongside. In this manner they ducked her several times. When she was half dead, a sailor in the boat cut away the rope, and the mob dragged her through the sea to the beach. Here, as she lay quite insensible, a brawny ruffian took down the door of his hut, close by, and placed it on her back. The mob gathered large stones from the beach and piled them upon her till the wretched woman was pressed to death. No magistrate made the slightest attempt to interfere; and the soldiers looked on, delighted spectators. A great outcry was raised against this culpable remissness, but no judicial inquiry was set on foot. This happened in 1704.

The next case we hear of is that of Elspeth Rule, found guilty of witchcraft before Lord Anstruther, at the Dumfries circuit, in 1708. She was sentenced to be marked in the cheek with a red-hot iron, and banished the realm of Scotland for life.

Again there is a long interval. In 1718, the remote county of Caithness, where the delusion remained in all its pristine vigour for years after it had ceased elsewhere, was startled from its propriety by the cry of witchcraft. A silly fellow, named William Montgomery, a carpenter, had a mortal antipathy to cats; and somehow or other these animals generally chose his back-yard as the scene of their catterwaulings. He puzzled his brains for a long time to know why he, above all his neighbours, should be so pestered. At last he came to the sage conclusion that his tormentors were no cats, but witches. In this opinion he was supported by his maid-servant, who swore a round oath that she had often heard the aforesaid cats talking together in human voices. The next time the unlucky tabbies assembled in his back-yard, the valiant carpenter was on the alert. Arming himself with an axe, a dirk, and a broadsword, he rushed out among them. One of them he wounded in the back, a second in the hip, and the leg of a third he maimed with his axe; but he could not capture any of them. A few days afterwards, two old women of the parish died; and it was said, that when their bodies were laid out, there appeared upon the back of one the mark as of a recent wound, and a similar scar upon the hip of the other. The carpenter and his maid were convinced that they were the very cats, and the whole county repeated the same story. Every one was upon the look-out for proofs corroborative; a very remarkable one was soon discovered. Nanny Gilbert, a wretched old creature of upwards of seventy years of age, was found in bed with her leg broken. As she was ugly enough for a witch, it was asserted that she also was one of the cats that had fared so ill at the hands of the carpenter. The latter, when informed of the popular suspicion, asserted that he distinctly remembered to

have struck one of the cats a blow with the back of his broadsword, which ought to have broken her leg. Nanny was immediately dragged from her bed and thrown into prison. Before she was put to the torture, she explained in a very natural and intelligible manner how she had broken her limb; but this account did not give satisfaction. The professional persuasions of the torturer made her tell a different tale, and she confessed that she was indeed a witch, and had been wounded by Montgomery on the night stated; that the two old women recently deceased were witches also, besides about a score of others whom she named. The poor creature suffered so much by the removal from her own home, and the tortures inflicted upon her, that she died the next day in prison. Happily for the persons she had named in her confession, Dundas of Arniston, at that time the king's advocate-general, wrote to the sheriff-depute, one Captain Ross of Littledean, cautioning him not to proceed to trial, the "thing being of too great difficulty, and beyond the jurisdiction of an inferior court." Dundas himself examined the precognition with great care, and was so convinced of the utter folly of the whole case, that he quashed all further proceedings.

We find this same sheriff-depute of Caithness very active four years afterwards in another trial for witchcraft. In spite of the warning he had received that all such cases were to be tried in future by the superior courts, he condemned to death an old woman at Dornoch, upon the charge of bewitching the cows and pigs of her neighbours. This poor creature was insane, and actually laughed and clapped her hands at sight of "the bonnie fire" that was to consume her. She had a daughter who was lame both of her hands and feet, and one of the charges brought against her was, that she had used

this daughter as a pony in her excursions to join the devil's sabbath, and that the devil himself had shod her, and produced lameness.

This was the last execution that took place in Scotland for witchcraft. The penal statutes were repealed in 1736; and, as in England, whipping, the pillory, or imprisonment, were declared the future punishments of all pretenders to magic or witchcraft.

Still for many years after this the superstition lingered both in England and Scotland, and in some districts is far from being extinct even at this day. But before we proceed to trace it any further than to its legal extinction, we have yet to see the frightful havoc it made in continental Europe from the commencement of the seventeenth to the middle of the eighteenth century. France, Germany, and Switzerland were the countries which suffered most from the epidemic. The number of victims in these countries during the sixteenth century has already been mentioned; but at the early part of the seventeenth, the numbers are so great, especially in Germany, that were they not to be found in the official records of the tribunals, it would be almost impossible to believe that mankind could ever have been so maddened and deluded. To use the words of the learned and indefatigable Horst,³⁵ "the world seemed to be like a large madhouse for witches and devils to play their antics in." Satan was believed to be at every body's call to raise the whirlwind, draw down the lightning, blight the productions of the earth, or destroy the health and paralyse the limbs of man. This belief, so insulting to the majesty and beneficence of the Creator, was shared by the most pious ministers of religion. Those who in their morning and evening prayers acknowledged the one true God, and praised him for the blessings of the seed-time and the harvest, were convinced that frail

humanity could enter into a compact with the spirits of hell to subvert his laws and thwart all his merciful intentions. Successive popes, from Innocent VIII. downwards, promulgated this degrading doctrine, which spread so rapidly, that society seemed to be divided into two great factions, the bewitching and the bewitched.

The commissioners named by Innocent VIII. to prosecute the witch-trials in Germany were, Jacob Sprenger, so notorious for his work on demonology, entitled the *Malleus Maleficarum, or Hammer to knock down Witches*; Henry Institor, a learned jurisconsult; and the Bishop of Strasburgh. Bamberg, Trèves, Cologne, Paderborn, and Würzburg, were the chief seats of the commissioners, who, during their lives alone, condemned to the stake, on a very moderate calculation, upwards of three thousand victims. The number of witches so increased, that new commissioners were continually appointed in Germany, France, and Switzerland. In Spain and Portugal the Inquisition alone took cognisance of the crime. It is impossible to search the records of those dark, but now happily non-existing tribunals; but the mind recoils with affright even to form a guess of the multitudes who perished.

The mode of trial in the other countries is more easily ascertained. Sprenger in Germany, and Bodinus and Delrio in France, have left but too ample a record of the atrocities committed in the much-abused names of justice and religion. Bodinus, of great repute and authority in the seventeenth century, says, "The trial of this offence must not be conducted like other crimes. Whoever adheres to the ordinary course of justice perverts the spirit of the law, both divine and human. He who is accused of sorcery should never be acquitted, unless the malice of the prosecutor be clearer than the sun; for it is

so difficult to bring full proof of this secret crime, that out of a million of witches not one would be convicted if the usual course were followed!” Henri Boguet, a witch-finder, who styled himself “The Grand Judge of Witches for the Territory of St. Claude,” drew up a code for the guidance of all persons engaged in the witch-trials, consisting of seventy articles, quite as cruel as the code of Bodinus. In this document he affirms, that a mere suspicion of witchcraft justifies the immediate arrest and torture of the suspected person. If the prisoner muttered, looked on the ground, and did not shed any tears, all these were proofs positive of guilt! In all cases of witchcraft, the evidence of the child ought to be taken against its parent; and persons of notoriously bad character, although not to be believed upon their oaths on the ordinary occasions of dispute that might arise between man and man, were to be believed, if they swore that any person had bewitched them! Who, when he hears that this diabolical doctrine was the universally received opinion of the ecclesiastical and civil authorities, can wonder that thousands upon thousands of unhappy persons should be brought to the stake? that Cologne should for many years burn its three hundred witches annually? the district of Bamberg its four hundred? Nuremberg, Geneva, Paris, Toulouse, Lyons, and other cities, their two hundred?

A few of these trials may be cited, taking them in the order of priority, as they occurred in different parts of the Continent. In 1595, an old woman residing in a village near Constance, angry at not being invited to share the sports of the country people on a day of public rejoicing, was heard to mutter something to herself, and was afterwards seen to proceed through the fields towards a hill, where she was lost sight of. A violent thunder-storm arose about two hours

afterwards, which wet the dancers to the skin, and did considerable damage to the plantations. This woman, suspected before of witchcraft, was seized and imprisoned, and accused of having raised the storm, by filling a hole with wine, and stirring it about with a stick. She was tortured till she confessed, and was burned alive the next evening.

CITY OF LYONS.

About the same time two sorcerers in Toulouse were accused of having dragged a crucifix about the streets at midnight, stopping at times to spit upon and kick it, and uttering at intervals an exorcism to raise the devil. The next day a hail-storm did considerable damage to the crops; and a girl, the daughter of a shoemaker in the town, remembered to have heard in the night the execrations of the wizards. Her story led to their arrest. The usual means to produce confession were resorted to. The wizards owned that they could raise tempests whenever they pleased, and named several persons who possessed similar powers. They were hanged, and then burned in the market-place, and seven of the persons they had mentioned shared the same fate.

Hoppo and Stadlin, two noted wizards of Germany, were executed in 1599. They implicated twenty or thirty witches, who went about causing women to miscarry, bringing down the lightning of heaven, and making maidens bring forth toads. To this latter fact several girls were found to swear most positively! Stadlin confessed that he had killed seven infants in the womb of one woman.

Bodinus highly praises the exertions of a witch-finder named Nider, in France, who prosecuted so many that he could not calculate them. Some of these witches could, by a single word, cause people to fall down dead; others made women go with child three years instead of nine months; while others, by certain invocations and ceremonies, could turn the faces of their enemies upside down, or twist them round to their backs. Although no witness was ever procured who saw persons in this horrible state, the witches confessed that they had the power and exercised it. Nothing more was wanting to ensure the stake.

At Amsterdam a crazy girl confessed that she could cause sterility in cattle, and bewitch pigs and poultry by merely repeating the magic words *Turius und Shurius Inturius!* She was hanged and burned. Another woman in the same city, named Kornelis van Purmerund, was arrested in consequence of some disclosures the former had made. A witness came forward and swore that she one day looked through the window of her hut, and saw Kornelis sitting before a fire muttering something to the devil. She was sure it was to the devil, because she heard him answer her. Shortly afterwards twelve black cats ascended out of the floor, and danced on their hind legs around the witch for the space of about half an hour. They then vanished

with a horrid noise, and leaving a disagreeable smell behind them. She also was hanged and burned.

At Bamberg, in Bavaria, the executions from the year 1610 to 1640 were at the rate of about a hundred annually. One woman, suspected of witchcraft, was seized because, having immoderately praised the beauty of a child, it had shortly afterwards fallen ill and died. She confessed upon the rack that the devil had given her the power to work evil upon those she hated, by speaking words in their praise. If she said with unwonted fervour, "What a strong man!" "What a lovely woman!" "What a sweet child!" the devil understood her, and afflicted them with diseases immediately. It is quite unnecessary to state the end of this poor creature. Many women were executed for causing strange substances to lodge in the bodies of those who offended them. Bits of wood, nails, hair, egg-shells, bits of glass, shreds of linen and woollen cloth, pebbles, and even hot cinders and knives, were the articles generally chosen. These were believed to remain in the body till the witches confessed or were executed, when they were voided from the bowels, or by the mouth, nostrils, or ears. Modern physicians have often had cases of a similar description under their care, where girls have swallowed needles, which have been voided on the arms, legs, and other parts of the body. But the science of that day could not account for these phenomena otherwise than by the power of the devil; and every needle swallowed by a servant-maid cost an old woman her life. Nay, if no more than one suffered in consequence, the district might think itself fortunate. The commissioners seldom stopped short at one victim. The revelations of the rack in most cases implicated half a score.

BAMBERG.

Of all the records of the witch-trials preserved for the wonder of succeeding ages, that of Würzburg, from 1627 to 1629, is the most frightful. Hauber, who has preserved this list in his *Acta et Scripta Magica*, says, in a note at the end, that it is far from complete, and that there were a great many other burnings too numerous to specify. This record, which relates to the city only, and not to the province of Würzburg, contains the names of one hundred and fifty-seven persons who were burned in two years in twenty-nine burnings, averaging from five to six at a time. The list comprises three play-actors, four innkeepers, three common councilmen of Würzburg, fourteen vicars of the cathedral, the burgomaster's lady, an apothecary's wife and daughter, two choristers of the cathedral, Göbel Babelin, the prettiest girl in the town, and the wife, the two little sons and the daughter of the councillor Stolzenberg. Rich and poor, young and old, suffered alike. At the seventh of these recorded burnings, the victims are described as a wandering boy, twelve years of age, and four strange men and women found sleeping in the

market-place. Thirty-two of the whole number appear to have been vagrants, of both sexes, who, failing to give a satisfactory account of themselves, were accused and found guilty of witchcraft. The number of children on the list is horrible to think upon. The thirteenth and fourteenth burnings comprised four persons, who are stated to have been a little maiden nine years of age, a maiden still less, her sister, their mother, and their aunt, a pretty young woman of twenty-four. At the eighteenth burning the victims were two boys of twelve, and a girl of fifteen; at the nineteenth, the young heir of the noble house of Rotenhahn, aged nine, and two other boys, one aged ten, and the other twelve. Among other entries appear the names of Baunach, the fattest, and Steinacher, the richest burgher in Würzburg. What tended to keep up the delusion in this unhappy city, and, indeed, all over Europe, was the number of hypochondriac and diseased persons who came voluntarily forward and made confession of witchcraft. Several of the victims in the foregoing list had only themselves to blame for their fate. Many again, including the apothecary's wife and daughter already mentioned, pretended to sorcery, and sold poisons, or attempted by means of charms and incantations to raise the devil. But throughout all this fearful period the delusion of the criminals was as great as that of the judges. Depraved persons who in ordinary times would have been thieves or murderers, added the desire of sorcery to their depravity, sometimes with the hope of acquiring power over their fellows, and sometimes with the hope of securing impunity in this world by the protection of Satan. One of the persons executed at the first burning, a prostitute, was heard repeating the exorcism which was supposed to have the power of raising the arch enemy in the form of a goat. This precious

specimen of human folly has been preserved by Horst in his *Zauberbibliothek*. It ran as follows, and was to be repeated slowly, with many ceremonies and wavings of the hand:

“Lalle, Bachera, Magotte, Baphia, Dajam,
Vagoth Heneche Ammi Nagaz, Adomator
Raphael Immanuel Christus, Tetragrammaton
Agra Jod Loi. König! König!”

The two last words were uttered quickly, and with a sort of scream, and were supposed to be highly agreeable to Satan, who loved to be called a king. If he did not appear immediately, it was necessary to repeat a further exorcism. The one in greatest repute was as follows, and was to be read backwards, with the exception of the last two words:

“Anion, Lalle, Sabolos, Sado, Pater, Aziel
Adonai Sado Vagoth Agra, Jod,
Baphra! Komm! Komm!”

When the witch wanted to get rid of the devil, who was sometimes in the habit of prolonging his visits to an unconscionable length, she had only to repeat the following, also backwards, when he generally disappeared, leaving behind him a suffocating smell:

“Zellianelle Heotti Bonus Vagotha
Plisos sother oseh unicus Beelzebub

Dax! Komm! Komm!”

This nonsensical jargon soon became known to all the idle and foolish boys of Germany. Many an unhappy urchin, who in a youthful frolic had repeated it, paid for his folly the penalty of his life. Three, whose ages varied from ten to fifteen, were burned alive at Würzburg for no other offence. Of course every other boy in the city became still more convinced of the power of the charm. One boy confessed that he would willingly have sold himself to the devil, if he could have raised him, for a good dinner and cakes every day of his life, and a pony to ride upon. This luxurious youngster, instead of being horsewhipped for his folly, was hanged and burned.

The small district of Lindheim was, if possible, even more notorious than Würzburg for the number of its witch-burnings. In the year 1633 a famous witch, named Pomp Anna, who could cause her foes to fall sick by merely looking at them, was discovered and burned, along with three of her companions. Every year in this parish, consisting at most of a thousand persons, the average number of executions was five. Between the years 1660 and 1664, the number consumed was thirty. If the executions all over Germany had been in this frightful proportion, hardly a family could have escaped losing one of its members.

In 1627, a ballad entitled the *Druten Zeitung*, or the *Witches' Gazette*, was very popular in Germany. It detailed, according to the title-page of a copy printed at Smalcald in 1627, “An account of the remarkable events which took place in Franconia, Bamberg, and Würzburg, with those wretches who from avarice or ambition have sold themselves to the devil, and how they had their reward at last:

set to music, and to be sung to the tune of Dorothea.” The sufferings of the witches at the stake are explained in it with great minuteness, the poet waxing extremely witty when he describes the horrible contortions of pain upon their countenances, and the shrieks that rent the air when any one of more than common guilt was burned alive. A trick resorted to in order to force one witch to confess, is told in this doggrel as an excellent joke. As she obstinately refused to own that she was in league with the powers of evil, the commissioners suggested that the hangman should dress himself in a bear’s skin, with the horns, tail, and all the et-ceteras, and in this form penetrate into her dungeon. The woman, in the darkness of her cell, could not detect the imposture, aided as it was by her own superstitious fears. She thought she was actually in the presence of the prince of hell; and when she was told to keep up her courage, and that she should be relieved from the power of her enemies, she fell on her knees before the supposed devil, and swore to dedicate herself hereafter, body and soul, to his service. Germany is, perhaps, the only country in Europe where the delusion was so great as to have made such detestable verses as these the favourites of the people:

“Man shickt ein Henkersknecht
Zu ihr in Gefängniss n’unter,
Den man hat kleidet recht,
Mit einer Bärnhaute,
Als wenns der Teufel wär;
Als ihm die Drut anschaute
Meints ihr Buhl kam daher.

Sie sprach zu ihm behende,
Wie lässt du mich so lang
In der Obrigkeit Hände?
Hilf mir aus ihren Zwang,
Wie du mir hast verheissen,
Ich bin ja eben dein,
Thu mich aus der Angst entreissen
O liebster Buhle mein!”³⁶

This rare poet adds, that in making such an appeal to the hangman, the witch never imagined the roast that was to be made of her, and puts in, by way of parenthesis, “was not that fine fun!—*was das war für ein Spiel!*” As feathers thrown into the air shew how the wind blows, so this trumpery ballad serves to shew the current of popular feeling at the time of its composition.

All readers of history are familiar with the celebrated trial of the Maréchale d’Ancre, who was executed in Paris in the year 1617. Although witchcraft was one of the accusations brought against her, the real crime for which she suffered was her ascendancy over the mind of Mary of Medicis, and the consequent influence she exercised indirectly over the unworthy king, Louis XIII. Her coachman gave evidence that she had sacrificed a cock at midnight in one of the churches, and others swore they had seen her go secretly into the house of a noted witch named Isabella. When asked by what means she had acquired so extraordinary an influence over the mind of the Queen Mother, she replied boldly that she exercised no other power over her than that which a strong mind can always exercise over the weak. She died with great firmness.

In two years afterwards, scenes far more horrible than any that had yet taken place in France were enacted at Labourt, at the foot of the Pyrenees. The parliament of Bourdeaux, scandalised at the number of witches who were said to infest Labourt and its neighbourhood, deputed one of its own members, the noted Pierre de l'Ancre, and its president, Espaignel, to inquire into the matter, with full powers to punish the offenders. They arrived at Labourt in May, 1619. De l'Ancre wrote a book setting forth all his great deeds in this battle against the powers of evil. It is full of obscenity and absurdity, but the facts may be relied on as far as they relate to the number of trials and executions, and the strange confessions which torture forced from the unhappy criminals.

De l'Ancre states as a reason why so many witches were to be found at Labourt, that the country was mountainous and sterile! He discovered many of them from their partiality to smoking tobacco. It may be inferred from this that he was of the opinion of King James, that tobacco was the "devil's weed." When the commission first sat, the number of persons brought to trial was about forty a day. The acquittals did not average so many as five per cent. All the witches confessed that they had been present at the great Domdaniel, or Sabbath. At these saturnalia the devil sat upon a large gilded throne, sometimes in the form of a goat; sometimes as a gentleman, dressed all in black, with boots, spurs, and sword; and very often as a shapeless mass, resembling the trunk of a blasted tree, seen indistinctly amid the darkness. They generally proceeded to the Domdaniel, riding on spits, pitchforks, or broomsticks, and on their arrival indulged with the fiends in every species of debauchery. Upon one occasion they had had the audacity to celebrate this festival in

the very heart of the city of Bourdeaux. The throne of the arch fiend was placed in the middle of the Place de Gallienne, and the whole space was covered with the multitude of witches and wizards who flocked to it from far and near, some arriving even from distant Scotland.

After two hundred poor wretches had been hanged and burned, there seemed no diminution in the number of criminals to be tried. Many of the latter were asked upon the rack what Satan had said when he found that the commissioners were proceeding with such severity? The general reply was, that he did not seem to care much about it. Some of them asserted that they had boldly reproached him for suffering the execution of their friends, saying, "*Out upon thee, false fiend! thy promise was that they should not die! Look, how thou hast kept thy word! They have been burned, and are a heap of ashes!*" Upon these occasions he was never offended: he would give orders that the sports of the Domdaniel should cease, and producing illusory fires that did not burn, he encouraged them to walk through, assuring them that the fires lighted by the executioner gave no more pain than those. They would then ask him, where their friends were, since they had not suffered; to which the "Father of Lies" invariably replied, that they were happy in a far country, and could see and hear all that was then passing; and that, if they called by name those they wished to converse with, they might hear their voices in reply. Satan then imitated the voices of the defunct witches so successfully that they were all deceived. Having answered all objections, the orgies recommenced and lasted till the cock crew.

De l'Ancre was also very zealous in the trial of unhappy monomaniacs for the crime of lycanthropy. Several who were

arrested confessed, without being tortured, that they were *weir-wolves*, and that at night they rushed out among the flocks and herds killing and devouring. One young man at Besançon, with the full consciousness of the awful fate that awaited him, voluntarily gave himself up to the commissioner Espaignel, and confessed that he was the servant of a strong fiend, who was known by the name of “Lord of the Forests:” by his power he was transformed into the likeness of a wolf. The “Lord of the Forests” assumed the same shape; but was much larger, fiercer, and stronger. They prowled about the pastures together at midnight, strangling the watch-dogs that defended the folds, and killing more sheep than they could devour. He felt, he said, a fierce pleasure in these excursions, and howled in excess of joy as he tore with his fangs the warm flesh of the sheep asunder. This youth was not alone in this horrid confession; many others voluntarily owned that they were *weir-wolves*, and many more were forced by torture to make the same avowal. Such criminals were thought to be too atrocious to be hanged first and then burned: they were generally sentenced to be burned alive, and their ashes to be scattered to the winds. Grave and learned doctors of divinity openly sustained the possibility of these transformations, relying mainly upon the history of Nebuchadnezzar. They could not imagine why, if he had been an ox, modern men could not become wolves by Divine permission and the power of the devil. They also contended that, if men should confess, it was evidence enough, if there had been no other. Delrio mentions that one gentleman accused of lycanthropy was put to the torture no less than twenty times; but still he would not confess. An intoxicating draught was then given him, and under its influence he confessed that he was a *weir-wolf*. Delrio cites this to

shew the extreme equity of the commissioners. They never burned any body till he confessed; and if one course of torture would not suffice, their patience was not exhausted, and they tried him again and again, even to the twentieth time! Well may we exclaim, when such atrocities have been committed in the name of religion,

“Quel lion, quel tigre égale en cruauté,
Une injuste fureur qu’arme la piété?”

The trial of the unhappy Urbain Grandier, the curate of Loudun, for bewitching a number of girls in the convent of the Ursulines in that town, was, like that of the Maréchale d’Ancre, an accusation resorted to by his enemies to ruin one against whom no other charge could be brought so readily. This noted affair, which kept France in commotion for months, and the true character of which was known even at that time, merits no more than a passing notice in this place. It did not spring from the epidemic dread of sorcery then so prevalent, but was carried on by wretched intriguers, who had sworn to have the life of their foe. Such a charge could not be refuted in 1634: the accused could not, as Bodinus expresses it, “make the malice of the prosecutors more clear than the sun;” and his own denial, however intelligible, honest, and straightforward, was held as nothing in refutation of the testimony of the crazy women who imagined themselves bewitched. The more absurd and contradictory their assertions, the stronger the argument employed by his enemies that the devil was in them. He was burned alive, under circumstances of great cruelty. ³⁷

A singular instance of the epidemic fear of witchcraft occurred at Lille, in 1639. A pious but not very sane lady, named Antoinette Bourignon, founded a school, or *hospice*, in that city. One day, on entering the schoolroom, she imagined that she saw a great number of little black angels flying about the heads of the children. In great alarm she told her pupils of what she had seen, warning them to beware of the devil whose imps were hovering about them. The foolish woman continued daily to repeat the same story, and Satan and his power became the only subject of conversation, not only between the girls themselves, but between them and their instructors. One of them at this time ran away from the school. On being brought back and interrogated, she said she had not run away, but had been carried away by the devil; she was a witch, and had been one since the age of seven. Some other little girls in the school went into fits at this announcement, and, on their recovery, confessed that they also were witches. At last the whole of them, to the number of fifty, worked upon each other's imaginations to such a degree that they also confessed that they were witches—that they attended the Domdaniel, or meeting of the fiends—that they could ride through the air on broom-sticks, feast on infants' flesh, or creep through a key-hole.

The citizens of Lille were astounded at these disclosures. The clergy hastened to investigate the matter; many of them, to their credit, openly expressed their opinion that the whole affair was an imposture—not so the majority; they strenuously insisted that the confessions of the children were valid, and that it was necessary to make an example by burning them all for witches. The poor parents, alarmed for their offspring, implored the examining Capuchins with

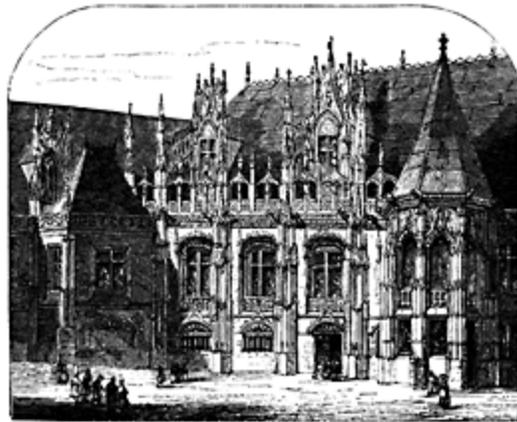

tears in their eyes to save their young lives, insisting that they were bewitched, and not bewitching. This opinion also gained ground in the town. Antoinette Bourignon, who had put these absurd notions into the heads of the children, was accused of witchcraft, and examined before the council. The circumstances of the case seemed so unfavourable towards her that she would not stay for a second examination. Disguising herself as she best could, she hastened out of Lille and escaped pursuit. If she had remained four hours longer, she would have been burned by judicial sentence as a witch and a heretic. It is to be hoped that, wherever she went, she learned the danger of tampering with youthful minds, and was never again entrusted with the management of children.

The Duke of Brunswick and the Elector of Menz were struck with the great cruelty exercised in the torture of suspected persons, and convinced, at the same time, that no righteous judge would consider a confession extorted by pain, and contradictory in itself, as sufficient evidence to justify the execution of any accused person. It is related of the Duke of Brunswick that he invited two learned Jesuits to his house, who were known to entertain strong opinions upon the subject of witchcraft, with a view of shewing them the cruelty and absurdity of such practices. A woman lay in the dungeon of the city accused of witchcraft, and the duke, having given previous instructions to the officiating torturers, went with the two Jesuits to hear her confession. By a series of artful leading questions the poor creature, in the extremity of her anguish, was induced to confess that she had often attended the sabbath of the fiends upon the Brocken; that she had seen two Jesuits there, who had made themselves notorious, even among witches, for their abominations; that she had

seen them assume the form of goats, wolves, and other animals; and that many noted witches had borne them five, six, and seven children at a birth, who had heads like toads, and legs like spiders. Being asked if the Jesuits were far from her, she replied that they were in the room beside her. The Duke of Brunswick led his astounded friends away, and explained the stratagem. This was convincing proof to both of them that thousands of persons had suffered unjustly; they knew their own innocence, and shuddered to think what their fate might have been if an enemy instead of a friend had put such a confession into the mouth of a criminal. One of these Jesuits was Frederick Spee, the author of the *Cautio Criminalis*, published in 1631. This work, exposing the horrors of the witch-trials, had a most salutary effect in Germany: Schonbrunn, Archbishop and Elector of Menz, abolished the torture entirely within his dominions, and his example was imitated by the Duke of Brunswick and other potentates. The number of supposed witches immediately diminished, and the violence of the mania began to subside. The Elector of Brandenburg issued a rescript, in 1654, with respect to the case of Anna of Ellerbrock, a supposed witch, forbidding the use of torture, and stigmatising the swimming of witches as an unjust, cruel, and deceitful test.

This was the beginning of the dawn after the long-protracted darkness. The tribunals no longer condemned witches to execution by hundreds in a year. Würzburg, the grand theatre of the burnings, burned but one where, forty years previously, it had burned three score. From 1660 to 1670 the electoral chambers, in all parts of Germany, constantly commuted the sentence of death passed by the

provincial tribunals into imprisonment for life, or burning on the cheek.

ROUEN.

A truer philosophy had gradually disabused the public mind. Learned men freed themselves from the trammels of a debasing superstition, and governments, both civil and ecclesiastical, repressed the popular delusion they had so long encouraged. The parliament of Normandy condemned a number of women to death, in the year 1670, on the old charge of riding on broomsticks to the Domdaniel; but Louis XIV. commuted the sentence into banishment for life. The parliament remonstrated, and sent the king the following remarkable request. The reader will perhaps be glad to see this document at length. It is of importance, as the last effort of a legislative assembly to uphold this great error; and the arguments they used and the instances they quoted are in the highest degree curious. It reflects honour upon the memory of Louis XIV. that he was not swayed by it.

“REQUEST OF THE PARLIAMENT OF ROUEN TO THE KING, IN 1670.

“SIRE,—Emboldened by the authority which your majesty has committed into our hands in the province of Normandy, to try

and punish offences, and more particularly those offences of the nature of witchcraft, which tend to the destruction of religion and the ruin of nations, we, your parliament, remonstrate humbly with your majesty upon certain cases of this kind which have been lately brought before us. We cannot permit the letter addressed by your majesty's command to the attorney-general of this district, for the reprieve of certain persons condemned to death for witchcraft, and for the staying of proceedings in several other cases, to remain unnoticed, and without remarking upon the consequences which may ensue. There is also a letter from your secretary of state, declaring your majesty's intention to commute the punishment of these criminals into one of perpetual banishment, and to submit to the opinion of the procureur-general, and of the most learned members of the parliament of Paris, whether, in the matter of witchcraft, the jurisprudence of the parliament of Rouen is to be followed in preference to that of the parliament of Paris, and of the other parliaments of the kingdom which judge differently.

“Although by the ordinances of the kings your predecessors, parliaments have been forbidden to pay any attention to *lettres de cachet*; we, nevertheless, from the knowledge which we have, in common with the whole kingdom, of the care bestowed by your majesty for the good of your subjects, and from the submission and obedience to your commandments which we have always manifested, have stayed all proceedings, in conformity to your orders; hoping that your majesty, considering the importance of the crime of witchcraft, and the consequences likely to ensue from its impunity, will be

graciously pleased to grant us once more your permission to continue the trials, and execute judgment upon those found guilty. And as, since we received the letter of your secretary of state, we have also been made acquainted with the determination of your majesty, not only to commute the sentence of death passed upon these witches into one of perpetual banishment from the province, but to re-establish them in the possession of their goods and chattels, and of their good fame and character, your parliament have thought it their duty, on occasion of these crimes, the greatest which men can commit, to make you acquainted with the general and uniform feelings of the people of this province with regard to them; it being, moreover, a question in which are concerned the glory of God and the relief of your suffering subjects, who groan under their fears from the threats and menaces of this sort of persons, and who feel the effects of them every day in the mortal and extraordinary maladies which attack them, and the surprising damage and loss of their possessions.

“Your majesty knows well that there is no crime so opposed to the commands of God as witchcraft, which destroys the very foundation of religion, and draws strange abominations after it. It is for this reason, sire, that the Scriptures pronounce the punishment of death against offenders, and that the Church and the holy fathers have fulminated their anathemas, and that canonical decisions have one and all decreed the most severe punishments, to deter from this crime; and that the Church of France, animated by the piety of the kings your predecessors, has expressed so great a horror at it, that, not judging the

punishment of perpetual imprisonment, the highest it has the power to inflict, sufficiently severe, it has left such criminals to be dealt with by the secular power.

“It has been the general feeling of all nations that such criminals ought to be condemned to death, and all the ancients were of the same opinion. The law of the ‘Twelve Tables,’ which was the principal of the Roman laws, ordains the same punishment. All juris-consults agreed in it, as well as the constitutions of the emperors, and more especially those of Constantine and Theodosius, who, enlightened by the Gospel, not only renewed the same punishment, but also deprived, expressly, all persons found guilty of witchcraft of the right of appeal, and declared them to be unworthy of a prince’s mercy. And Charles VIII., sire, inspired by the same sentiments, passed that beautiful and severe ordinance (*cette belle et sévère ordonnance*), which enjoined the judges to punish witches according to the exigencies of the case, under a penalty of being themselves fined or imprisoned, or dismissed from their office; and decreed, at the same time, that all persons who refused to denounce a witch, should be punished as accomplices; and that all, on the contrary, who gave evidence against one should be rewarded.

“From these considerations, sire, and in the execution of so holy an ordinance, your parliaments, by their decrees, proportion their punishments to the guilt of the offenders; and your parliament of Normandy has never, until the present time, found that its practice was different from that of other courts; for all the books which treat upon this matter cite an infinite

number of decrees condemning witches to be burnt, or broken on the wheel, or to other punishments. The following are examples:—In the time of Chilperic, as may be seen in Gregory of Tours, b. vi. c. 35 of his *History of France*; all the decrees of the parliament of Paris passed according to, and in conformity with, this ancient jurisprudence of the kingdom, cited by Imbert, in his *Judicial Practice*; all those cited by Monstrelet, in 1459, against the witches of Artois; the decrees of the same parliament, of the 13th of October 1573, against Mary Le Fief, native of Saumur; of the 21st of October 1596, against the Sieur de Beaumont, who pleaded, in his defence, that he had only sought the aid of the devil for the purpose of unbewitching the afflicted and of curing diseases; of the 4th of July 1606, against Francis du Bose; of the 20th of July 1582, against Abel de la Rue, native of Coulommiers; of the 2d of October 1593, against Rousseau and his daughter; of 1608, against another Rousseau and one Peley, for witchcraft and adoration of the devil at the Sabbath, under the figure of a he-goat, as confessed by them; the decree of 4th of February 1615, against Leclerc, who appealed from the sentence of the parliament of Orleans, and who was condemned for having attended the Sabbath, and confessed, as well as two of his accomplices, who died in prison, that he had adored the devil, renounced his baptism and his faith in God, danced the witches' dance, and offered up unholy sacrifices; the decrees of the 6th of May 1616, against a man named Leger, on a similar accusation; the pardon granted by Charles IX. to Trois Echelles, upon condition of revealing his accomplices, but afterwards revoked for renewed sorcery on his part; the decree

of the parliament of Paris, cited by Mornac in 1595; the judgments passed in consequence of the commission given by Henry IV. to the Sieur de l'Ancre, councillor of the parliament of Bourdeaux; of the 20th of March 1619, against Etienne Audibert; those passed by the chamber of Nerac, on the 26th of June 1620, against several witches; those passed by the parliament of Toulouse in 1577, as cited by Gregory Tolosanus, against four hundred persons accused of this crime, and who were all marked with the sign of the devil. Besides all these, we might recal to your majesty's recollection the various decrees of the parliament of Provence, especially in the case of Gaufrédy in 1611; the decrees of the parliament of Dijon, and those of the parliament of Rennes, following the example of the condemnation of the Marshal de Rays, who was burned in 1441, for the crime of witchcraft, in presence of the Duke of Brittany;— all these examples, sire, prove that the accusation of witchcraft has always been punished with death by the parliaments of your kingdom, and justify the uniformity of their practice.

“These, sire, are the motives upon which your parliament of Normandy has acted in decreeing the punishment of death against the persons lately brought before it for this crime. If it has happened that, on any occasion, these parliaments, and the parliament of Normandy among the rest, have condemned the guilty to a less punishment than that of death, it was for the reason that their guilt was not of the deepest dye; your majesty, and the kings your predecessors, having left full liberty to the various tribunals to whom they delegated the administration of

justice, to decree such punishment as was warranted by the evidence brought before them.

“After so many authorities, and punishments ordained by human and divine laws, we humbly supplicate your majesty to reflect once more upon the extraordinary results which proceed from the malevolence of this sort of people; on the deaths from unknown diseases, which are often the consequences of their menaces, on the loss of the goods and chattels of your subjects, on the proofs of guilt continually afforded by the insensibility of the marks upon the accused, on the sudden transportation of bodies from one place to another, on the sacrifices and nocturnal assemblies, and other facts, corroborated by the testimony of ancient and modern authors, and verified by so many eye-witnesses, composed partly of accomplices, and partly of people who had no interest in the trials beyond the love of truth, and confirmed, moreover, by the confessions of the accused parties themselves; and that, sire, with so much agreement and conformity between the different cases, that the most ignorant persons convicted of this crime have spoken to the same circumstances, and in nearly the same words, as the most celebrated authors who have written about it, all of which may be easily proved to your majesty’s satisfaction by the records of various trials before your parliaments.

“These, sire, are truths so intimately bound up with the principles of our religion, that, extraordinary although they be, no person has been able to this time to call them in question. If some have cited, in opposition to these truths, the pretended canon of the Council of Ancyre, and a passage from St. Augustin,

in a treatise upon the *Spirit and the Soul*, it has been without foundation; and it would be easy to convince your majesty that neither the one nor the other ought to be accounted of any authority; and, besides that, the canon, in this sense, would be contrary to the opinion of all succeeding councils of the Church, Cardinal Baronius, and all learned commentators agree that it is not to be found in any old edition. In effect, in those editions wherein it is found, it is in another language, and is in direct contradiction to the twenty-third canon of the same council, which condemns sorcery, according to all preceding constitutions. Even supposing that this canon was really promulgated by the Council of Ancyre, we must observe that it was issued in the second century, when the principal attention of the Church was directed to the destruction of paganism. For this reason, it condemns that class of women who said they could pass through the air, and over immense regions, with Diana and Herodias, and enjoins all preachers to teach the falsehood of such an opinion, in order to deter people from the worship of these false divinities; but it does not question the power of the devil over the human body, which is, in fact, proved by the holy Gospel of Jesus Christ himself. And with regard, sire, to the pretended passage of St. Augustin, everybody knows that it was not written by him, because the writer, whoever he was, cites Boetius, who died more than eighty years after the time of St. Augustin. Besides, there is still more convincing proof in the fact, that the same father establishes the truth of witchcraft in all his writings, and more particularly in his *City of God*; and in his first volume, question the 25th, wherein he states that sorcery is

a communion between man and the devil, which all good Christians ought to look upon with horror.

“Taking all these things into consideration, sire, the officers of your parliament hope, from the justice of your majesty, that you will be graciously pleased to receive the humble remonstrances they have taken the liberty to make. They are compelled, for the acquittal of their own consciences and in discharge of their duty, to make known to your majesty, that the decrees they passed against the sorcerers and witches brought before them, were passed after a mature deliberation on the part of all the judges present, and that nothing has been done therein which is not conformable to the universal jurisprudence of the kingdom, and for the general welfare of your majesty’s subjects, of whom there is not one who can say that he is secure from the malevolence of such criminals. We therefore supplicate your majesty to suffer us to carry into effect the sentences we passed, and to proceed with the trial of the other persons accused of the same crime; and that the piety of your majesty will not suffer to be introduced during your reign an opinion contrary to the principles of that holy religion for which you have always employed so gloriously both your cares and your arms.”

Louis, as we have already mentioned, paid no attention to this appeal. The lives of the old women were spared, and prosecutions for mere witchcraft, unconnected with other offences, were discontinued throughout France. In 1680 an act was passed for the punishment, not of witches, but of pretenders to witchcraft, fortune-tellers, divineresses, and poisoners.

Thus the light broke in upon Germany, France, England, and Scotland about the same time, gradually growing clearer and clearer till the middle of the eighteenth century, when witchcraft was finally reckoned amongst exploded doctrines, and the belief in it confined to the uttermost vulgar. Twice, however, did the madness burst forth again as furious, while it lasted, as ever it had been. The first time in Sweden, in 1669, and the second in Germany so late as 1749. Both these instances merit particular mention. The first is one of the most extraordinary upon record, and for atrocity and absurdity is unsurpassed in the annals of any nation.

LOUIS XIV.

It having been reported to the king of Sweden that the little village of Mohra, in the province of Dalecarlia, was troubled exceedingly with witches, he appointed a commission of clergy and laymen to trace the rumour to its source, with full powers to punish the guilty. On the 12th of August 1669, the commissioners arrived in the bewitched village, to the great joy of the credulous inhabitants. On the following day the whole population, amounting to three thousand persons, assembled in the church. A sermon was preached, “declaring the miserable case of those people that suffered

themselves to be deluded by the devil,” and fervent prayer was offered up that God would remove the scourge from among them.

The whole assembly then adjourned to the rector’s house, filling all the street before it, when the king’s commission was read, charging every person who knew any thing of the witchery, to come forward and declare the truth. A passion of tears seized upon the multitude; men, women, and children began to weep and sob, and all promised to divulge what they had heard or knew. In this frame of mind they were dismissed to their homes. On the following day they were again called together, when the depositions of several persons were taken publicly before them all. The result was that seventy persons, including fifteen children, were taken into custody. Numbers also were arrested in the neighbouring district of Elfdale. Being put to the torture, they all confessed their guilt. They said they used to go to a gravel-pit, that lay hard by the cross-way, where they put a vest upon their heads, and danced “round and round and round about.” They then went to the cross-way, and called three times upon the devil; the first time in a low still voice; the second, somewhat louder; and the third, very loudly, with these words, “Antecessor, come, and carry us to Blockula!” This invocation never failed to bring him to their view. He generally appeared as a little old man, in a grey coat, with red and blue stockings, with exceedingly long garters. He had besides a very high-crowned hat, with bands of many-coloured linen enfolded about it, and a long red beard that hung down to his middle.

The first question he put to them was, whether they would serve him soul and body? On their answering in the affirmative, he told them to make ready for the journey to Blockula. It was necessary to procure, in the first place, “some scrapings of altars and filings of

church clocks.” Antecessor then gave them a horn with some salve in it, wherewith they anointed themselves. These preparations ended, he brought beasts for them to ride upon,—horses, asses, goats, and monkeys; and giving them a saddle, a hammer, and a nail, uttered the word of command, and away they went. Nothing stopped them. They flew over churches, high walls, rocks, and mountains, until they came to the green meadow where Blockula was situated. Upon these occasions they carried as many children with them as they could; for the devil, they said, “did plague and whip them if they did not procure him children, insomuch that they had no peace or quiet for him.”

Many parents corroborated a part of this evidence, stating that their children had repeatedly told them that they had been carried away in the night to Blockula, where the devil had beaten them black and blue. They had seen the marks in the morning, but they soon disappeared. One little girl was examined, who swore positively that she was carried through the air by the witches, and when at a great height she uttered the holy name of Jesus. She immediately fell to the ground, and made a great hole in her side. “The devil, however, picked her up, healed her side, and carried her away to Blockula.” She added (and her mother confirmed her statement), that she had till that day “an exceeding great pain in her side.” This was a clencher, and the nail of conviction was driven home to the hearts of the judges.

The place called Blockula, whither they were carried, was a large house, with a gate to it, “in a delicate meadow, whereof they could see no end.” There was a very long table in it, at which the witches sat

down; and in other rooms “there were very lovely and delicate beds for them to sleep upon.”

After a number of ceremonies had been performed, by which they bound themselves body and soul to the service of Antecessor, they sat down to a feast composed of broth, made of colworts and bacon, oatmeal, bread and butter, milk and cheese. The devil always took the chair, and sometimes played to them on the harp or the fiddle while they were eating. After dinner they danced in a ring, sometimes naked, and sometimes in their clothes, cursing and swearing all the time. Some of the women added particulars too horrible and too obscene for repetition.

Once the devil pretended to be dead, that he might see whether his people regretted him. They instantly set up a loud wail, and wept three tears each for him; at which he was so pleased, that he jumped up among them, and hugged in his arms those who had been most obstreperous in their sorrow.

Such were the principal details given by the children, and corroborated by the confessions of the full-grown witches. Any thing more absurd was never before stated in a court of justice. Many of the accused contradicted themselves most palpably; but the commissioners gave no heed to discrepancies. One of them, the parson of the district, stated in the course of the inquiry, that on a particular night, which he mentioned, he had been afflicted with a headache so agonising, that he could not account for it otherwise than by supposing he was bewitched. In fact, he thought a score of witches must have been dancing on the crown of his head. This announcement excited great horror among the pious dames of the auditory, who loudly expressed their wonder that the devil should

have power to hurt so good a man. One poor witch, who lay in the very jaws of death, confessed that she knew too well the cause of the minister's headache. The devil had sent her with a sledge hammer and a large nail to drive into the good man's skull. She had hammered at it for some time, but the skull was so enormously *thick*, that she made no impression upon it. Every hand was held up in astonishment. The pious minister blessed God that his skull was so solid, and he became renowned for his thick head all the days of his life. Whether the witch intended a joke does not appear, but she was looked upon as a criminal more than usually atrocious. Seventy persons were condemned to death on these so awful, yet so ridiculous confessions. Twenty-three of them were burned together in one fire in the village of Mohra, in the presence of thousands of delighted spectators. On the following day fifteen children were murdered in the same manner, offered up in sacrifice to the bloody Moloch of superstition. The remaining thirty-two were executed at the neighbouring town of Fahluna. Besides these, fifty-six children were found guilty of witchcraft in a minor degree, and sentenced to various punishments, such as running the gauntlet, imprisonment, and public whipping once a week for a twelvemonth.

Long after the occurrence of this case, it was cited as one of the most convincing proofs upon record of the prevalence of witchcraft. When men wish to construct or support a theory, how they torture facts into their service! The lying whimsies of a few sick children, encouraged by foolish parents, and drawn out by superstitious neighbours, were sufficient to set a country in a flame. If, instead of commissioners as deeply sunk in the slough of ignorance as the people they were sent amongst, there had been deputed a few men

firm in courage and clear in understanding, how different would have been the result! Some of the poor children who were burned would have been sent to an infirmary; others would have been well flogged; the credulity of the parents would have been laughed at; and the lives of seventy persons spared. The belief in witchcraft remains in Sweden to this day; but happily the annals of that country present no more such instances of lamentable aberration of intellect as the one just cited.

In New England, about the same time, the colonists were scared by similar stories of the antics of the devil. All at once a fear seized upon the multitude, and supposed criminals were arrested day after day in such numbers, that the prisons were found too small to contain them. A girl named Goodwin, the daughter of a mason, who was hypochondriac and subject to fits, imagined that an old Irish woman, named Glover, had bewitched her. Her two brothers, in whose constitutions there was apparently a predisposition to similar fits, went off in the same way, crying out that the devil and Dame Glover were tormenting them. At times their joints were so stiff that they could not be moved; while at others, said the neighbours, they were so flexible, that the bones appeared softened into sinews. The supposed witch was seized, and as she could not repeat the Lord's Prayer without making a mistake in it, she was condemned and executed.

But the popular excitement was not allayed. One victim was not enough; the people waited agape for new disclosures. Suddenly two hysteric girls in another family fell into fits daily, and the cry of witchcraft resounded from one end of the colony to the other. The feeling of suffocation in the throat, so common in cases of hysteria,

was said by the patients to be caused by the devil himself, who had stuck balls in the windpipe to choke them. They felt the pricking of thorns in every part of the body, and one of them vomited needles. The case of these girls, who were the daughter and niece of a Mr. Parvis, the minister of a Calvinist chapel, excited so much attention, that all the weak women in the colony began to fancy themselves similarly afflicted. The more they brooded on it, the more convinced they became. The contagion of this mental disease was as great as if it had been a pestilence. One after the other the women fainted away, asserting on their recovery that they had seen the spectres of witches. Where there were three or four girls in a family, they so worked each upon the diseased imagination of the other, that they fell into fits five or six times in a day. Some related that the devil himself appeared to them, bearing in his hand a parchment-roll, and promising that if they would sign an agreement, transferring to him their immortal souls, they should be immediately relieved from fits and all the ills of the flesh. Others asserted that they saw witches only, who made them similar promises, threatening that they should never be free from aches and pains till they had agreed to become the devil's. When they refused, the witches pinched, or bit, or pricked them with long pins and needles. More than two hundred persons named by these mischievous visionaries were thrown into prison. They were of all ages and conditions of life, and many of them of exemplary character. No less than nineteen were condemned and executed before reason returned to the minds of the colonists. The most horrible part of this lamentable history is, that among the victims there was a little child only five years old. Some women swore that they had seen it repeatedly in company with the devil, and that it had

bitten them often with its little teeth for refusing to sign a compact with the evil one. It can hardly increase our feelings of disgust and abhorrence when we learn that this insane community actually tried and executed a dog for the same offence!

One man, named Cory, stoutly refused to plead to the preposterous indictment against him. As was the practice in such cases, he was pressed to death. It is told of the Sheriff of New England, who superintended the execution, that when this unhappy man thrust out his tongue in his mortal agony, he seized hold of a cane, and crammed it back again into the mouth. If ever there were a fiend in human form, it was this sheriff: a man who, if the truth were known, perhaps plumed himself upon his piety—thought he was doing God good service, and

“Hoped to merit heaven by making earth a hell!”

Arguing still in the firm belief of witchcraft, the bereaved people began to inquire, when they saw their dearest friends snatched away from them by these wide-spreading accusations, whether the whole proceedings were not carried on by the agency of the devil. Might not the great enemy have put false testimony into the mouths of the witnesses, or might not the witnesses be witches themselves? Every man who was in danger of losing his wife, his child, or his sister, embraced this doctrine with avidity. The revulsion was as sudden as the first frenzy. All at once, the colonists were convinced of their error. The judges put a stop to the prosecutions, even of those who had confessed their guilt. The latter were no sooner at liberty than they retracted all they had said, and the greater number hardly remembered the avowals which agony had extorted from them. Eight

persons, who had been tried and condemned, were set free; and gradually girls ceased to have fits and to talk of the persecutions of the devil. The judge who had condemned the first criminal executed on this charge, was so smitten with sorrow and humiliation at his folly, that he set apart the anniversary of that day as one of solemn penitence and fasting. He still clung to the belief in witchcraft; no new light had broken in upon him on that subject, but, happily for the community, the delusion had taken a merciful turn. The whole colony shared the feeling; the jurors on the different trials openly expressed their penitence in the churches; and those who had suffered were regarded as the victims, and not as the accomplices of Satan.

It is related that the Indian tribes in New England were sorely puzzled at the infatuation of the settlers, and thought them either a race inferior to, or more sinful than the French colonists in the vicinity, amongst whom, as they remarked, “the Great Spirit sent no witches.”

Returning again to the continent of Europe, we find that, after the year 1680, men became still wiser upon this subject. For twenty years the populace were left to their belief, but governments in general gave it no aliment in the shape of executions. The edict of Louis XIV. gave a blow to the superstition, from which it never recovered. The last execution in the Protestant cantons of Switzerland was at Geneva, in 1652. The various potentates of Germany, although they could not stay the trials, invariably commuted the sentence into imprisonment, in all cases where the pretended witch was accused of pure witchcraft, unconnected with any other crime. In the year 1701, Thomasius, the learned professor

at the University of Halle, delivered his inaugural thesis, *De Crimine Magiæ* which struck another blow at the falling monster of popular error. But a faith so strong as that in witchcraft was not to be eradicated at once: the arguments of learned men did not penetrate to the villages and hamlets; but still they achieved great things; they rendered the belief an unworking faith, and prevented the supply of victims, on which for so many ages it had battered and grown strong.

Once more the delusion broke out; like a wild beast wounded to the death, it collected all its remaining energies for the final convulsion, which was to shew how mighty it had once been. Germany, which had nursed the frightful error in its cradle, tended it on its death-bed, and Würzburg, the scene of so many murders on the same pretext, was destined to be the scene of the last. That it might lose no portion of its bad renown, the last murder was as atrocious as the first. This case offers a great resemblance to that of the witches of Mohra and New England, except in the number of its victims. It happened so late as the year 1749, to the astonishment and disgust of the rest of Europe.

VIEW IN WÜRZBURG.

A number of young women in a convent at Würzburg fancied themselves bewitched; they felt, like all hysteric subjects, a sense of suffocation in the throat. They went into fits repeatedly; and one of them, who had swallowed needles, evacuated them at abscesses, which formed in different parts of the body. The cry of sorcery was raised, and a young woman, named Maria Renata Sängler, was arrested on the charge of having leagued with the devil, to bewitch five of the young ladies. It was sworn on the trial that Maria had been frequently seen to clamber over the convent walls in the shape of a

pig—that, proceeding to the cellar, she used to drink the best wine till she was intoxicated; and then start suddenly up in her own form. Other girls asserted that she used to prowl about the roof like a cat, and often penetrate into their chamber, and frighten them by her dreadful howlings. It was also said that she had been seen in the shape of a hare, milking the cows dry in the meadows belonging to the convent; that she used to perform as an actress on the boards of Drury Lane theatre in London, and, on the very same night, return upon a broomstick to Würzburg, and afflict the young ladies with pains in all their limbs. Upon this evidence she was condemned, and burned alive in the market-place of Würzburg.

Here ends this frightful catalogue of murder and superstition. Since that day, the belief in witchcraft has fled from the populous abodes of men, and taken refuge in remote villages and districts too wild, rugged, and inhospitable to afford a resting-place for the foot of civilisation. Rude fishers and uneducated labourers still attribute every phenomenon of nature which they cannot account for, to the devil and witches. Catalepsy, that wondrous disease, is still thought by ignorant gossips to be the work of Satan; and hypochondriacs, uninformed by science of the nature of their malady, devoutly believe in the reality of their visions. The reader would hardly credit the extent of the delusion upon this subject in the very heart of England at this day. Many an old woman leads a life of misery from the unfeeling insults of her neighbours, who raise the scornful finger and hooting voice at her, because in her decrepitude she is ugly, spiteful, perhaps insane, and realises in her personal appearance the description preserved by tradition of the witches of yore. Even in the neighbourhood of great towns the taint remains of this once widely-

spread contagion. If no victims fall beneath it, the enlightenment of the law is all that prevents a recurrence of scenes as horrid as those of the seventeenth century. Hundreds upon hundreds of witnesses could be found to swear to absurdities as great as those asserted by the infamous Matthew Hopkins.

In the *Annual Register* for 1760, an instance of the belief in witchcraft is related, which shews how superstition lingers. A dispute arose in the little village of Glen, in Leicestershire, between two old women, each of whom vehemently accused the other of witchcraft. The quarrel at last ran so high that a challenge ensued, and they both agreed to be tried by the ordeal of swimming. They accordingly stripped to their shifts—procured some men, who tied their thumbs and great toes together, cross-wise, and then, with a cart-rope about their middle, suffered themselves to be thrown into a pool of water. One of them sank immediately, but the other continued struggling a short time upon the surface of the water, which the mob deeming an infallible sign of her guilt, pulled her out, and insisted that she should immediately impeach all her accomplices in the craft. She accordingly told them that, in the neighbouring village of Burton, there were several old women as “much witches as she was.” Happily for her, this negative information was deemed sufficient, and a student in astrology, or “white-witch,” coming up at the time, the mob, by his direction, proceeded forthwith to Burton in search of all the delinquents. After a little consultation on their arrival, they went to the old woman’s house on whom they had fixed the strongest suspicion. The poor old creature on their approach locked the outer door, and from the window of an upstairs room asked what they wanted. They informed her that she was charged with being guilty of

witchcraft, and that they were come to duck her; remonstrating with her at the same time upon the necessity of submission to the ordeal, that, if she were innocent, all the world might know it. Upon her persisting in a positive refusal to come down, they broke open the door and carried her out by force, to a deep gravel-pit full of water. They tied her thumbs and toes together and threw her into the water, where they kept her for several minutes, drawing her out and in two or three times by the rope round her middle. Not being able to satisfy themselves whether she were a witch or no, they at last let her go, or, more properly speaking, they left her on the bank to walk home by herself, if she ever recovered. Next day, they tried the same experiment upon another woman, and afterwards upon a third; but, fortunately, neither of the victims lost her life from this brutality. Many of the ringleaders in the outrage were apprehended during the week, and tried before the justices at quarter-sessions. Two of them were sentenced to stand in the pillory and to be imprisoned for a month; and as many as twenty more were fined in small sums for the assault, and bound over to keep the peace for a twelvemonth.

“So late as the year 1785,” says Arnot, in his collection and abridgment of *Criminal Trials in Scotland*, “it was the custom among the sect of Seceders to read from the pulpit an annual confession of sins, national and personal; amongst the former of which was particularly mentioned the ‘Repeal by parliament of the penal statute against witches, contrary to the express laws of God.’”

LADY HATTON'S HOUSE, CROSS STREET, HATTON GARDEN.

Many houses are still to be found in England with the horse-shoe (the grand preservative against witchcraft) nailed against the threshold. If any over-wise philosopher should attempt to remove them, the chances are that he would have more broken bones than thanks for his interference. Let any man walk into Cross Street, Hatton Garden, and from thence into Bleeding-heart Yard, and learn the tales still told and believed of one house in that neighbourhood, and he will ask himself in astonishment if such things can be in the nineteenth century. The witchcraft of Lady Hatton, the wife of the famous Sir Christopher, so renowned for his elegant dancing in the days of Elizabeth, is as devoutly believed as the Gospels. The room is to be seen where the devil seized her after the expiration of the contract he had made with her, and bore her away bodily to the pit of Tophet: the pump against which he dashed her is still pointed out, and the spot where her heart was found, after he had torn it out of her bosom with his iron claws, has received the name of Bleeding-heart Yard, in confirmation of the story. Whether the horse-shoe still remains upon the door of the haunted house, to keep away other witches, is uncertain. A former inmate relates that, "about twenty years ago, more than one old woman begged for admittance

repeatedly, to satisfy themselves that it was in its proper place. One poor creature, apparently insane, and clothed in rags, came to the door with a tremendous double-knock, as loud as that of a fashionable footman, and walked straight along the passage to the horse-shoe. Great was the wonderment of the inmates, especially when the woman spat upon the horse-shoe, and expressed her sorrow that she could do no harm while it remained there. After spitting upon, and kicking it again and again, she coolly turned round and left the house, without saying a word to any body. This poor creature perhaps intended a joke, but the probability is that she imagined herself a witch. In Saffron Hill, where she resided, her ignorant neighbours gave her that character, and looked upon her with no little fear and aversion.”

More than one example of the popular belief in witchcraft occurred in the neighbourhood of Hastings so lately as the year 1830. An aged woman, who resided in the Rope-walk of that town, was so repulsive in her appearance, that she was invariably accused of being a witch by all the ignorant people who knew her. She was bent completely double; and though very old, her eye was unusually bright and malignant. She wore a red cloak, and supported herself on a crutch: she was, to all outward appearance, the very *beau ideal* of a witch. So dear is power to the human heart, that this old woman actually encouraged the popular superstition; she took no pains to remove the ill impression, but seemed to delight that she, old and miserable as she was, could keep in awe so many happier and stronger fellow-creatures. Timid girls crouched with fear when they met her, and many would go a mile out of their way to avoid her. Like the witches of the olden time, she was not sparing of her curses against those

who offended her. The child of a woman who resided within two doors of her was afflicted with lameness, and the mother constantly asserted that the old woman had bewitched her. All the neighbours credited the tale. It was believed, too, that she could assume the form of a cat. Many a harmless puss has been hunted almost to the death by mobs of men and boys, upon the supposition that the animal would start up before them in the true shape of Mother —.

In the same town there resided a fisherman, who was the object of unceasing persecution, because it was said that he had sold himself to the devil. It was currently reported that he could creep through a keyhole, and that he had made a witch of his daughter, in order that he might have the more power over his fellows. It was also believed that he could sit on the points of pins and needles and feel no pain. His brother fishermen put him to this test whenever they had an opportunity. In the alehouses which he frequented, they often placed long needles in the cushions of the chairs in such a manner that he could not fail to pierce himself when he sat down. The result of these experiments tended to confirm their faith in his supernatural powers. It was asserted that he never flinched. Such was the popular feeling in the fashionable town of Hastings a few years ago; very probably it is the same now.

In the north of England, the superstition lingers to an almost inconceivable extent. Lancashire abounds with witch-doctors, a set of quacks who pretend to cure diseases inflicted by the devil. The practices of these worthies may be judged of by the following case, reported in the *Hertford Reformer* of the 23d of June 1838. The witch-doctor alluded to is better known by the name of the *cunning man*, and has a large practice in the counties of Lincoln and

Nottingham. According to the writer in the *Reformer*, the dupe, whose name is not mentioned, had been for about two years afflicted with a painful abscess, and had been prescribed for without relief by more than one medical gentleman. He was urged by some of his friends, not only in his own village but in neighbouring ones, to consult the witch-doctor, as they were convinced he was under some evil influence. He agreed, and sent his wife to the *cunning man*, who lived in New St. Swithin's, in Lincoln. She was informed by this ignorant impostor that her husband's disorder was an infliction of the devil, occasioned by his next-door neighbours, who had made use of certain charms for that purpose. From the description he gave of the process, it appears to be the same as that employed by Dr. Fian and Gellie Duncan to work woe upon King James. He stated that the neighbours, instigated by a witch, whom he pointed out, took some wax and moulded it before the fire into the form of her husband, as near as they could represent him; they then pierced the image with pins on all sides, repeated the Lord's Prayer backwards, and offered prayers to the devil that he would fix his stings into the person whom that figure represented, in like manner as they pierced *it* with pins. To counteract the effects of this diabolical process, the witch-doctor prescribed a certain medicine, and a charm to be worn next the body, on that part where the disease principally lay. The patient was to repeat the 109th and 119th Psalms every day, or the cure would not be effectual. The fee which he claimed for this advice was a guinea.

So efficacious is faith in the cure of any malady, that the patient actually felt much better after a three weeks' course of this prescription. The notable charm which the quack had given was

afterwards opened, and found to be a piece of parchment covered with some cabalistic characters and signs of the planets.

The next-door neighbours were in great alarm that the witch-doctor would, on the solicitation of the recovering patient, employ some means to punish them for their pretended witchcraft. To escape the infliction, they feed another cunning man, in Nottinghamshire, who told them of a similar charm, which would preserve them from all the malice of their enemies. The writer concludes by saying, that “the doctor, not long after he had been thus consulted, wrote to say, that he had discovered that his patient was not afflicted by Satan, as he had imagined, but by God, and would continue more or less in the same state till his life’s end.”

An impostor carried on a similar trade in the neighbourhood of Tunbridge Wells about the year 1830. He had been in practice for several years, and charged enormous fees for his advice. This fellow pretended to be the seventh son of a seventh son, and to be endowed in consequence with miraculous powers for the cure of all diseases, but especially of those resulting from witchcraft. It was not only the poor who employed him, but ladies who rode in their carriages. He was often sent for from a distance of sixty or seventy miles by these people, who paid all his expenses to and fro, besides rewarding him handsomely. He was about eighty years of age, and his extremely venerable appearance aided his imposition in no slight degree. His name was Okey or Oakley.

In France, the superstition at this day is even more prevalent than it is in England. Garinet, in his history of Magic and Sorcery in that country, cites upwards of twenty instances which occurred between the years 1805 and 1818. In the latter year no less than three

tribunals were occupied with trials originating in this humiliating belief: we shall cite only one of them. Julian Desbourdes, aged fifty-three, a mason, and inhabitant of the village of Thilouze, near Bourdeaux, was taken suddenly ill, in the month of January 1818. As he did not know how to account for his malady, he suspected at last that he was bewitched. He communicated this suspicion to his son-in-law Bridier, and they both went to consult a sort of idiot, named Baudouin, who passed for a conjuror or *white-witch*. This man told them that Desbourdes was certainly bewitched, and offered to accompany them to the house of an old man named Renard, who, he said, was undoubtedly the criminal. On the night of the 23d of January all three proceeded stealthily to the dwelling of Renard, and accused him of afflicting persons with diseases by the aid of the devil. Desbourdes fell on his knees and earnestly entreated to be restored to his former health, promising that he would take no measures against him for the evil he had done. The old man denied in the strongest terms that he was a wizard; and when Desbourdes still pressed him to remove the spell from him, he said he knew nothing about the spell, and refused to remove it. The idiot Baudouin, the *white-witch*, now interfered, and told his companions that no relief for the malady could ever be procured until the old man confessed his guilt. To force him to confession they lighted some sticks of sulphur which they had brought with them for the purpose, and placed them under the old man's nose. In a few moments he fell down suffocated and apparently lifeless. They were all greatly alarmed; and thinking that they had killed the man, they carried him out and threw him into a neighbouring pond, hoping to make it appear that he had fallen in accidentally. The pond, however, was not

very deep, and the coolness of the water reviving the old man, he opened his eyes and sat up. Desbourdes and Bridier, who were still waiting on the bank, were now more alarmed than before, lest he should recover and inform against them. They therefore waded into the pond, seized their victim by the hair of the head, beat him severely, and then held him under water till he was drowned.

They were all three apprehended on the charge of murder a few days afterwards. Desbourdes and Bridier were found guilty of aggravated manslaughter only, and sentenced to be burnt on the back, and to work in the galleys for life. The *white-witch* Baudouin was acquitted on the ground of insanity.

M. Garinet further informs us that France, at the time he wrote (1818), was overrun by a race of fellows who made a trade of casting out devils and finding out witches. He adds also, that many of the priests in the rural districts encouraged the superstition of their parishioners by resorting frequently to exorcisms whenever any foolish persons took it into their heads that a spell had been thrown over them. He recommended, as a remedy for the evil, that all these exorcists, whether lay or clerical, should be sent to the galleys, and felt assured that the number of witches would then very sensibly diminish.

Many other instances of this lingering belief might be cited both in France and Great Britain, and indeed in every other country in Europe. So deeply rooted are some errors, that ages cannot remove them. The poisonous tree that once overshadowed the land may be cut down by the sturdy efforts of sages and philosophers; the sun may shine clearly upon spots where venomous things once nestled in security and shade; but still the entangled roots are stretched

beneath the surface, and may be found by those who dig. Another king like James I. might make them vegetate again; and, more mischievous still, another pope like Innocent VIII. might raise the decaying roots to strength and verdure. Still it is consoling to think that the delirium has passed away; that the raging madness has given place to a milder folly; and that we may now count by units the votaries of a superstition which in former ages numbered its victims by tens of thousands, and its votaries by millions.

FLOATING A WITCH.

PLACE DE GREVE.

THE SLOW POISONERS.

Pescara. The like was never read of.

Stephano. In my judgment,
To all that shall but hear it, 'twill appear
A most impossible fable.

Pescara. Troth, I'll tell you,
And briefly as I can, by what degrees
They fell into this madness.—*Duke of Milan.*

THE atrocious system of poisoning by poisons so slow in their operation as to make the victim appear, to ordinary observers, as if dying from a gradual decay of nature, has been practised in all ages. Those who are curious in the matter may refer to Beckmann on secret poisons, in his *History of Inventions*, in which he has collected several instances of it from the Greek and Roman writers. Early in the sixteenth century the crime seems to have gradually increased, till in the seventeenth it spread over Europe like a pestilence. It was often exercised by pretended witches and sorcerers, and finally became a branch of education amongst all who laid any claim to magical and supernatural arts. In the twenty-first year of Henry VIII. an act was passed rendering it high treason. Those found guilty of it were to be boiled to death.

One of the first in point of date, and hardly second to any in point of atrocity, is the murder by this means of Sir Thomas Overbury; which disgraced the court of James I. in the year 1613. A slight sketch of it will be a fitting introduction to the history of the poisoning mania, which was so prevalent in France and Italy fifty years later.

Robert Kerr, a Scottish youth, was early taken notice of by James I., and loaded with honours, for no other reason that the world could ever discover than the beauty of his person. James, even in his own day, was suspected of being addicted to the most abominable of all offences; and the more we examine his history now, the stronger the suspicion becomes. However that may be, the handsome Kerr, lending his smooth cheek even in public to the disgusting kisses of his royal master, rose rapidly in favour. In the year 1613, he was made Lord High Treasurer of Scotland, and created an English peer by the style and title of Viscount Rochester. Still further honours were in store for him.

In this rapid promotion he had not been without a friend. Sir Thomas Overbury, the king's secretary—who appears, from some threats in his own letters, to have been no better than a pander to the vices of the king, and privy to his dangerous secrets—exerted all his backstair influence to forward the promotion of Kerr, by whom he was doubtless repaid in some way or other. Overbury did not confine his friendship to this—if friendship ever could exist between two such men—but acted the part of an *entremetteur*, and assisted Rochester to carry on an adulterous intrigue with the Lady Frances Howard, the wife of the Earl of Essex. This woman was a person of violent passions, and lost to all sense of shame. Her husband was in her way, and to be freed from him she instituted proceedings for a divorce, on grounds which a woman of any modesty or delicacy of feeling would die rather than avow. Her scandalous suit was successful, and was no sooner decided than preparations on a scale of the greatest magnificence were made for her marriage with Lord Rochester.

Sir Thomas Overbury, who had willingly assisted his patron to intrigue with the Countess of Essex, seems to have imagined that his marriage with so vile a woman might retard his advancement. He accordingly employed all his influence to dissuade him from it; but Rochester was bent on the match, and his passions were as violent as those of the countess. On one occasion, when Overbury and the viscount were walking in the gallery of

Whitehall, Overbury was overheard to say, "Well, my lord, if you do marry that base woman, you will utterly ruin your honour and yourself. You shall never do it with my advice or consent; and if you do, you had best look to stand fast." Rochester flung from him in a rage, exclaiming with an oath, "I will be even with you for this." These words were the death-warrant of the unfortunate Overbury. He had mortally wounded the pride of Rochester in insinuating that by his (Overbury's) means he might be lowered in the king's favour; and he had endeavoured to curb the burning passions of a heartless, dissolute, and reckless man.

Overbury's imprudent remonstrances were reported to the countess; and from that moment she also vowed the most deadly vengeance against him. With a fiendish hypocrisy, however, they both concealed their intentions; and Overbury, at the solicitation of Rochester, was appointed ambassador to the court of Russia. This apparent favour was but the first step in a deep and deadly plot. Rochester, pretending to be warmly attached to the interests of Overbury, advised him to refuse the embassy, which he said was but a trick to get him out of the way. He promised, at the same time, to stand between him and any evil consequences which might result from his refusal. Overbury fell into the snare, and declined the embassy. James, offended, immediately ordered his committal to the Tower.

He was now in safe custody, and his enemies had opportunity to commence the work of vengeance. The first thing Rochester did was to procure, by his influence at court, the dismissal of the Lieutenant of the Tower, and the appointment of Sir Jervis Elwes, one of his creatures, to the vacant post. This man was but one instrument; and another being necessary, was found in Richard Weston, a fellow who had formerly been shopman to a druggist. He was installed in the office of under-keeper, and as such had the direct custody of Overbury. So far all was favourable to the designs of the conspirators.

In the mean time the insidious Rochester wrote the most friendly letters to Overbury, requesting him to bear his ill-fortune patiently, and promising

that his imprisonment should not be of long duration; for that his friends were exerting themselves to soften the king's displeasure. Still pretending the extreme of sympathy for him, he followed up the letters by presents of pastry and other delicacies, which could not be procured in the Tower. These articles were all poisoned. Occasionally, presents of a similar description were sent to Sir Jervis Elwes, with the understanding that these articles were not poisoned, when they were unaccompanied by letters: of these the unfortunate prisoner never tasted. A woman named Turner, who had formerly kept a house of ill-fame, and who had more than once lent it to further the guilty intercourse of Rochester and Lady Essex, was the agent employed to procure the poisons. They were prepared by Dr. Forman, a pretended fortune-teller of Lambeth, assisted by an apothecary named Franklin. Both these persons knew for what purposes the poisons were needed, and employed their skill in mixing them in the pastry and other edibles, in such small quantities as gradually to wear out the constitution of their victim. Mrs. Turner regularly furnished the poisoned articles to the under-keeper, who placed them before Overbury. Not only his food but his drink was poisoned. Arsenic was mixed with the salt he ate, and cantharides with the pepper. All this time his health declined sensibly. Daily he grew weaker and weaker; and with a sickly appetite craved for sweets and jellies. Rochester continued to condole with him, and anticipated all his wants in this respect, sending him abundance of pastry, and occasionally partridges and other game, and young pigs. With the sauce for the game, Mrs. Turner mixed a quantity of cantharides, and poisoned the pork with lunar-caustic. As stated on the trial, Overbury took in this manner poison enough to have poisoned twenty men; but his constitution was strong, and he still lingered. Franklin, the apothecary, confessed that he prepared with Dr. Forman seven different sorts of poisons, viz. aquafortis, arsenic, mercury, powder of diamonds, lunar caustic, great spiders, and cantharides. Overbury held out so long that Rochester became impatient, and in a letter to Lady Essex, expressed his

wonder that things were not sooner despatched. Orders were immediately sent by Lady Essex to the keeper to finish with the victim at once. Overbury had not been all this time without suspicion of treachery, although he appears to have had no idea of poison. He merely suspected that it was intended to confine him for life, and to set the king still more bitterly against him. In one of his letters he threatened Rochester that unless he were speedily liberated, he would expose his villany to the world. He says, "You and I, ere it be long, will come to a public trial of another nature." * * * "Drive me not to extremities, lest I should say something that both you and I should repent." * * * "Whether I live or die, your shame shall never die, but ever remain to the world, to make you the most odious man living." * * * "I wonder much you should neglect him to whom such secrets of all kinds have passed." * * * "Be these the fruits of common secrets, common dangers?"

SIR THOMAS OVERBURY.

All these remonstrances, and hints as to the dangerous secrets in his keeping, were ill calculated to serve him with a man so reckless as Lord Rochester: they were more likely to cause him to be sacrificed than to be saved. Rochester appears to have acted as if he thought so. He doubtless employed the murderer's reasoning, that "dead men tell no tales," when, after receiving letters of this description, he complained to his paramour of

the delay. Weston was spurred on to consummate the atrocity; and the patience of all parties being exhausted, a dose of corrosive sublimate was administered to him in October 1613, which put an end to his sufferings, after he had been for six months in their hands. On the very day of his death, and before his body was cold, he was wrapped up carelessly in a sheet, and buried without any funeral ceremony in a pit within the precincts of the Tower.

Sir Anthony Weldon, in his *Court and Character of James I.*, gives a somewhat different account of the closing scene of this tragedy. He says, "Franklin and Weston came into Overbury's chamber, and found him in infinite torment, with contention between the strength of nature and the working of the poison; and it being very like that nature had gotten the better in this contention, by the thrusting out of boils, blotches, and blains, they, fearing it might come to light by the judgment of physicians, the foul play that had been offered him, consented to stifle him with the bedclothes, which accordingly was performed; and so ended his miserable life, with the assurance of the conspirators that he died by the poison; none thinking otherwise than these two murderers."

The sudden death, the indecent haste of the funeral, and the non-holding of an inquest upon the body, strengthened the suspicions that were afloat. Rumour, instead of whispering, began to speak out; and the relatives of the deceased openly expressed their belief that their kinsman had been murdered. But Rochester was still all powerful at court, and no one dared to utter a word to his discredit. Shortly afterwards, his marriage with the Countess of Essex was celebrated with the utmost splendour, the king himself being present at the ceremony.

It would seem that Overbury's knowledge of James's character was deeper than Rochester had given him credit for, and that he had been a true prophet when he predicted that his marriage would eventually estrange James from his minion. At this time, however, Rochester stood higher than ever in the royal favour; but it did not last long—conscience,

that busy monitor, was at work. The tongue of rumour was never still; and Rochester, who had long been a guilty, became at last a wretched man. His cheeks lost their colour—his eyes grew dim; and he became moody, careless, and melancholy. The king, seeing him thus, took at length no pleasure in his society, and began to look about for another favourite. George Villiers, Duke of Buckingham, was the man to his mind: quick-witted, handsome, and unscrupulous. The two latter qualities alone were sufficient to recommend him to James I. In proportion as the influence of Rochester declined, that of Buckingham increased. A falling favourite has no friends; and rumour wagged her tongue against Rochester louder and more pertinaciously than ever. A new favourite, too, generally endeavours to hasten by a kick the fall of the old one; and Buckingham, anxious to work the complete ruin of his forerunner in the king's good graces, encouraged the relatives of Sir Thomas Overbury to prosecute their inquiries into the strange death of their kinsman.

James was rigorous enough in the punishment of offences when he was not himself involved. He piqued himself, moreover, on his dexterity in unravelling mysteries. The affair of Sir Thomas Overbury found him congenial occupation. He set to work by ordering the arrest of Sir Jervis Elwes. James, at this early stage of the proceedings, does not seem to have been aware that Rochester was so deeply implicated. Struck with horror at the atrocious system of slow poisoning, the king sent for all the judges. According to Sir Anthony Weldon, he knelt down in the midst of them, and said, "My lords the judges, it is lately come to my hearing that you have now in examination a business of poisoning. Lord! in what a miserable condition shall this kingdom be (the only famous nation for hospitality in the world) if our tables should become such a snare, as that none could eat without danger of life, and that Italian custom should be introduced among us! Therefore, my lords, I charge you, as you will answer it at that great and dreadful day of judgment, that you examine it strictly, without favour, affection, or partiality. And if you shall spare any guilty of this crime, God's

curse light on you and your posterity! and if I spare any that are guilty, God's curse light on me and my posterity for ever!"

DUKE OF BUCKINGHAM.

The imprecation fell but too surely upon the devoted house of Stuart. The solemn oath was broken, and God's curse *did* light upon him and his posterity!

The next person arrested after Sir Jervis Elwes, was Weston, the under-keeper; then Franklin and Mrs. Turner; and lastly, the Earl and Countess of Somerset, to which dignity Rochester had been advanced since the death of Overbury.

Weston was first brought to trial. Public curiosity was on the stretch. Nothing else was talked of, and the court on the day of trial was crowded to suffocation. The *State Trials* report, that Lord Chief Justice Coke "laid open to the jury the baseness and cowardliness of poisoners, who attempt that secretly against which there is no means of preservation or defence for a man's life; and how rare it was to hear of any poisoning in England, so detestable it was to our nation. But the devil had taught divers to be cunning in it, so that they can poison in what distance of space they please, by consuming the *nativum calidum*, or *humidum radicale*, in one month, two or three, or more, as they list, which they four manner of ways do execute, viz. *haustu*, *gustu*, *odore*, and *contactu*."

LORD COKE.

When the indictment was read over, Weston made no other reply than “Lord have mercy upon me! Lord have mercy upon me!” On being asked how he would be tried, he refused to throw himself upon a jury of his country, and declared that he would be tried by God alone. In this he persisted for some time. The fear of the dreadful punishment for contumacy³⁸ induced him at length to plead “Not guilty,” and take his trial in due course of law.

All the circumstances against him were fully proved, and he was found guilty and executed at Tyburn. Mrs. Turner, Franklin, and Sir Jervis Elwes were also brought to trial, found guilty, and executed between the 19th of October and the 4th of December 1615; but the grand trial of the Earl and Countess of Somerset did not take place till the month of May following.

On the trial of Sir Jervis Elwes, circumstances had transpired, shewing a guilty knowledge of the poisoning on the part of the Earl of Northampton, the uncle of Lady Somerset, and the chief falconer Sir Thomas Monson. The former was dead; but Sir Thomas Monson was arrested and brought to trial. It appeared, however, that he was too dangerous a man to be brought to the scaffold. He knew too many of the odious secrets of James I., and his dying speech might contain disclosures which would compromise the king. To conceal old guilt it was necessary to incur new: the trial of Sir Thomas Monson was brought to an abrupt conclusion, and himself set at liberty.

THE EARL OF SOMERSET.

Already James had broken his oath. He now began to fear that he had been rash in engaging so zealously to bring the poisoners to punishment. That Somerset would be declared guilty there was no doubt, and that he looked for pardon and impunity was equally evident to the king. Somerset, while in the Tower, asserted confidently that James would not *dare* to bring him to trial. In this he was mistaken; but James was in an agony. What the secret was between them will now never be known with certainty; but it may be surmised. Some have imagined it to be the vice to which the king was addicted; while others have asserted that it related to the death of Prince Henry, a virtuous young man, who had held Somerset in especial abhorrence. This prince died early, unlamented by his father, and, as public opinion whispered at the time, poisoned by Somerset. Probably some crime or other lay heavy upon the soul of the king; and Somerset, his accomplice, could not be brought to public execution with safety. Hence the dreadful tortures of James when he discovered that his favourite was so deeply implicated in the murder of Overbury. Every means was taken by the agonised king to bring the prisoner into what was called a safe frame of mind. He was secretly advised to plead guilty, and trust to the clemency of the king. The same advice was conveyed to the countess. Bacon was instructed by the king to draw up a paper of all the points of “mercy and favour” to Somerset which might result from the evidence; and Somerset was again recommended to plead guilty, and promised that no evil should ensue to him.

The countess was first tried. She trembled and shed tears during the reading of the indictment, and, in a low voice, pleaded guilty. On being

asked why sentence of death should not be passed against her, she replied meekly, "I can much aggravate, but nothing extenuate my fault. I desire mercy, and that the lords will intercede for me with the king." Sentence of death was passed upon her.

Next day the earl was brought to trial. He appears to have mistrusted the promises of James, and he pleaded not guilty. With a self-possession and confidence which he felt, probably, from his knowledge of the king's character, he rigorously cross-examined the witnesses, and made a stubborn defence. After a trial which lasted eleven hours he was found guilty, and condemned to the felon's death.

THE COUNTESS OF SOMERSET.

Whatever may have been the secrets between the criminal and the king, the latter, notwithstanding his terrific oath, was afraid to sign the death-warrant. It might, perchance, have been his own. The earl and countess were committed to the Tower, where they remained for nearly five years. At the end of this period, to the surprise and scandal of the community, and the disgrace of its chief magistrate, they both received the royal pardon, but were ordered to reside at a distance from the court. Having been found guilty of felony, the estates of the earl had become forfeited; but James granted him out of their revenues an income of 4000*l.* per annum! Shamelessness could go no further.

Of the after-life of these criminals nothing is known, except that the love they had formerly borne each other was changed into aversion, and that they lived under the same roof for months together without the interchange of a word.

The exposure of their atrocities did not put a stop to the practice of poisoning. On the contrary, as we shall see hereafter, it engendered that insane imitation which is so strange a feature of the human character. James himself is supposed, with great probability, to have fallen a victim to it. In the notes to Harris's *Life and Writings of James I.*, there is a good deal of information on the subject. The guilt of Buckingham, although not fully established, rests upon circumstances of suspicion stronger than have been sufficient to lead hundreds to the scaffold. His motives for committing the crime are stated to have been a desire of revenge for the coldness with which the king, in the latter years of his reign, began to regard him; his fear that James intended to degrade him; and his hope that the great influence he possessed over the mind of the heir-apparent would last through a new reign, if the old one were brought to a close.

In the second volume of the *Harleian Miscellany*, there is a tract, entitled the *Forerunner of Revenge*, written by George Eglisam, doctor of medicine, and one of the physicians to King James. Harris, in quoting it, says that it is full of rancour and prejudice. It is evidently exaggerated, but forms nevertheless a link in the chain of evidence. Eglisam says, "The king being sick of an ague, the duke took this opportunity, when all the king's doctors of physic were at dinner, and offered to him a white powder to take, the which he a long time refused; but, overcome with his flattering importunity, he took it in wine, and immediately became worse and worse, falling into many swoonings and pains, and violent fluxes of the belly, so tormented, that his majesty cried out aloud of this white powder, 'Would to God I had never taken it!'" He then tells us "of the Countess of Buckingham (the duke's mother) applying the plaister to the king's heart and breast, whereupon he grew faint and short-breathed, and in agony; that the physicians exclaimed that the king was poisoned; that Buckingham commanded them out of the room, and committed one of them close prisoner to his own chamber, and another to be removed from court; and that, after his majesty's death, his body and head swelled above measure;

his hair, with the skin of his head, stuck to his pillow, and his nails became loose on his fingers and toes.” Clarendon, who, by the way, was a partisan of the duke’s, gives a totally different account of James’s death. He says, “It was occasioned by an ague (after a short indisposition by the gout), which, meeting many humours in a fat unwieldy body of fifty-eight years old, in four or five fits carried him out of the world,—after whose death many scandalous and libellous discourses were raised, without the least colour or ground, as appeared upon the strictest and most malicious examination that could be made, long after, in a time of license, when nobody was afraid of offending majesty, and when prosecuting the highest reproaches and contumelies against the royal family was held very meritorious.” Notwithstanding this confident declaration, the world will hardly be persuaded that there was not some truth in the rumours that were abroad. The inquiries which were instituted were not strict, as he asserts, and all the unconstitutional influence of the powerful favourite was exerted to defeat them. In the celebrated accusations brought against Buckingham by the Earl of Bristol, the poisoning of King James was placed last on the list; and the pages of history bear evidence of the summary mode in which they were, for the time, got rid of.

The man from whom Buckingham is said to have procured his poisons was one Dr. Lamb, a conjuror and empiric, who, besides dealing in poisons, pretended to be a fortune-teller. The popular fury, which broke with comparative harmlessness against his patron, was directed against this man, until he could not appear with safety in the streets of London. His fate was melancholy. Walking one day in Cheapside, disguised, as he thought, from all observers, he was recognised by some idle boys, who began to hoot and pelt him with stones, calling out, “The poisoner! the poisoner! Down with the wizard! down with him!” A mob very soon collected, and the doctor took to his heels and ran for his life. He was pursued and seized in Wood Street, and from thence dragged by the hair

through the mire to St. Paul's Cross; the mob beating him with sticks and stones, and calling out, "Kill the wizard! kill the poisoner!"

PAUL'S CROSS; SEVENTEENTH CENTURY.

Charles I., on hearing of the riot, rode from Whitehall to quell it; but he arrived too late to save the victim. Every bone in his body was broken, and he was quite dead. Charles was excessively indignant, and fined the city six hundred pounds for its inability to deliver up the ring-leaders to justice.

But it was in Italy that poisoning was most prevalent. From a very early period, it seems to have been looked upon in that country as a perfectly justifiable means of getting rid of an enemy. The Italians of the sixteenth and seventeenth centuries poisoned their opponents with as little compunction as an Englishman of the present day brings an action at law against any one who has done him an injury. The writings of contemporary authors inform us that, when La Spara and La Tophania carried on their infernal trade, ladies put poison-bottles on their dressing-tables as openly, and used them with as little scruple upon others, as modern dames use *Eau de Cologne* or lavender-water upon themselves. So powerful is the influence of fashion, it can even cause murder to be regarded as a venial peccadillo.

In the memoirs of the last Duke of Guise, who made a Quixotic attempt, in 1648, to seize upon the government of Naples, we find some curious particulars relative to the popular feeling with regard to poisoning. A man named Gennaro Annese, who, after the short and extraordinary career of Masaniello the fisherman, had established himself as a sort of captain-

general of the populace, rendered himself so obnoxious to the Duke of Guise, that the adherents of the latter determined to murder him. The captain of the guard, as the duke himself very coolly informs us, was requested to undertake this office. It was suggested to him that the *poniard* would be the most effectual instrument, but the man turned up his eyes with pious horror at the proposition. He was ready to *poison* Gennaro Annese whenever he might be called upon to do so; but to *poniard* him, he said, would be disgraceful, and unbecoming an officer of the guards! At last, poison was agreed upon, and Augustino Molla, an attorney in the duke's confidence, brought the bottle containing the liquid to shew it to his master. The following is the Duke's own account:

“Augustino came to me at night, and told me: ‘I have brought you something which will free you from Gennaro. He deserves death, and it is no great matter after what fashion justice is done upon him. Look at this vial, full of clear and beautiful water: in four days' time, it will punish all his treasons. The captain of the guard has undertaken to give it him; and as it has no taste at all, Gennaro will suspect nothing.’”

The duke further informs us that the dose was duly administered; but that Gennaro, fortunately for himself, ate nothing for dinner that day but cabbage dressed with oil, which acting as an antidote, caused him to vomit profusely, and saved his life. He was exceedingly ill for five days, but never suspected that he had been poisoned.

In process of time, poison-vending became a profitable trade. Eleven years after this period, it was carried on at Rome to such an extent, that the sluggish government was roused to interference. Beckmann, in his *History of Inventions*, and Leuret, in his *Magazin zum Gebrauche der Staaten Kirche Geschichte*, or *Magazine of Materials for a History of a State Church*, relates that, in the year 1659, it was made known to Pope Alexander VII. that great numbers of young women had avowed in the

confessional that they had poisoned their husbands with slow poisons. The Catholic clergy, who in general hold the secrets of the confessional so sacred, were shocked and alarmed at the extraordinary prevalence of the crime. Although they refrained from revealing the names of the penitents, they conceived themselves bound to apprise the head of the Church of the enormities that were practised. It was also the subject of general conversation in Rome that young widows were unusually abundant. It was remarked, too, that if any couple lived unhappily together, the husband soon took ill and died. The papal authorities, when once they began to inquire, soon learned that a society of young wives had been formed, and met nightly, for some mysterious purpose, at the house of an old woman named Hieronyma Spara. This hag was a reputed witch and fortune-teller, and acted as president of the young viragos, several of whom, it was afterwards ascertained, belonged to the first families of Rome.

In order to have positive evidence of the practices of this female conclave, a lady was employed by the government to seek an interview with them. She dressed herself out in the most magnificent style; and having been amply provided with money, she found but little difficulty, when she had stated her object, of procuring an audience of La Spara and her sisterhood. She pretended to be in extreme distress of mind on account of the infidelities and ill-treatment of her husband, and implored La Spara to furnish her with a few drops of the wonderful elixir, the efficacy of which in sending cruel husbands to “their last long sleep” was so much vaunted by the ladies of Rome. La Spara fell into the snare, and sold her some of her “drops” at a price commensurate with the supposed wealth of the purchaser.

The liquor thus obtained was subjected to an analysis, and found to be, as was suspected, a slow poison; clear, tasteless, and limpid, like that spoken of by the Duke of Guise. Upon this evidence, the house was surrounded by the police, and La Spara and her companions taken into custody. La Spara, who is described as having been a little ugly old woman,

was put to the torture, but obstinately refused to confess her guilt. Another of the women, named La Gratiosa, had less firmness, and laid bare all the secrets of the infernal sisterhood. Taking a confession extorted by anguish on the rack at its true value (nothing at all), there is still sufficient evidence to warrant posterity in the belief of their guilt. They were found guilty, and condemned, according to their degrees of culpability, to various punishments. La Spara, Gratiosa, and three young women, who had poisoned their husbands, were hanged together at Rome. Upwards of thirty women were whipped publicly through the streets; and several, whose high rank screened them from more degrading punishment, were banished from the country, and mulcted in heavy fines. In a few months afterwards, nine women more were hanged for poisoning; and another bevy, including many young and beautiful girls, were whipped half naked through the streets of Rome.

This severity did not put a stop to the practice, and jealous women and avaricious men, anxious to step into the inheritance of fathers, uncles, or brothers, resorted to poison. As it was quite free from taste, colour, and smell, it was administered without exciting suspicion. The skilful vendors compounded it of different degrees of strength, so that the poisoners had only to say whether they wanted their victims to die in a week, a month, or six months, and they were suited with corresponding doses. The vendors were chiefly women, of whom the most celebrated was a hag named Tophania, who was in this way accessory to the death of upwards of six hundred persons. This woman appears to have been a dealer in poisons from her girlhood, and resided first at Palermo and then at Naples. That entertaining traveller, Father Lebat, has given, in his letters from Italy, many curious particulars relating to her. When he was at Civita Vecchia, in 1719, the Viceroy of Naples discovered that poison was extensively sold in the latter city, and that it went by the name of *aqueta*, or little-water. On making further inquiry, he ascertained that Tophania (who was by this time near seventy years of age, and who seems to have begun her evil

courses very soon after the execution of La Spara,) sent large quantities of it to all parts of Italy in small vials, with the inscription, "Manna of St. Nicholas of Barri."

The tomb of St. Nicholas of Barri was celebrated throughout Italy. A miraculous oil was said to ooze from it, which cured nearly all the maladies that flesh is heir to, provided the recipient made use of it with the due degree of *faith*. La Tophania artfully gave this name to her poison to elude the vigilance of the custom-house officers, who, in common with every body else, had a pious respect for St. Nicholas de Barri and his wonderful oil.

The poison was similar to that manufactured by La Spara. Hahnemann the physician, and father of the homœopathic doctrine, writing upon this subject, says it was compounded of arsenical neutral salts, occasioning in the victim a gradual loss of appetite, faintness, gnawing pains in the stomach, loss of strength, and wasting of the lungs. The Abbé Gagliardi says, that a few drops of it were generally poured into tea, chocolate, or soup, and its effects were slow, and almost imperceptible. Garelli, physician to the Emperor of Austria, in a letter to Hoffmann, says it was crystallised arsenic, dissolved in a large quantity of water by decoction, with the addition (for some unexplained purpose) of the herb *cymbalaria*. The Neapolitans called it *Aqua Toffnina*; and it became notorious all over Europe under the name of *Aqua Tophania*.

Although this woman carried on her infamous traffic so extensively, it was extremely difficult to meet with her. She lived in continual dread of discovery. She constantly changed her name and residence; and pretending to be a person of great godliness, resided in monasteries for months together. Whenever she was more than usually apprehensive of detection she sought ecclesiastical protection. She was soon apprised of the search made for her by the Viceroy of Naples, and, according to her practice, took refuge in a monastery. Either the search after her was not very rigid, or her measures were exceedingly well taken; for she contrived to elude the

vigilance of the authorities for several years. What is still more extraordinary, as shewing the ramifications of her system, her trade was still carried on to as great an extent as before. Lebat informs us that she had so great a sympathy for poor wives who hated their husbands and wanted to get rid of them, but could not afford to buy her wonderful *aqua*, that she made them presents of it.

She was not allowed, however, to play at this game for ever; she was at length discovered in a nunnery, and her retreat cut off. The viceroy made several representations to the superior to deliver her up, but without effect. The abbess, supported by the archbishop of the diocese, constantly refused. The public curiosity was in consequence so much excited at the additional importance thus thrust upon the criminal, that thousands of persons visited the nunnery in order to catch a glimpse of her.

The patience of the viceroy appears to have been exhausted by these delays. Being a man of sense, and not a very zealous Catholic, he determined that even the Church should not shield a criminal so atrocious. Setting the privileges of the nunnery at defiance, he sent a troop of soldiers, who broke over the walls, and carried her away *vi et armis*. The archbishop, Cardinal Pignatelli, was highly indignant, and threatened to excommunicate and lay the whole city under interdict. All the inferior clergy, animated by the *esprit du corps*, took up the question, and so worked upon the superstitious and bigoted people, that they were ready to rise in a mass to storm the palace of the viceroy and rescue the prisoner.

These were serious difficulties; but the viceroy was not a man to be daunted. Indeed, he seems to have acted throughout with a rare union of astuteness, coolness, and energy. To avoid the evil consequences of the threatened excommunication, he placed a guard round the palace of the archbishop, judging that the latter would not be so foolish as to launch out an anathema which would cause the city to be starved, and himself in it. The market-people would not have dared to come to the city with provisions so long as it remained under the ban. There would have been

too much inconvenience to himself and his ghostly brethren in such a measure; and, as the viceroy anticipated, the good cardinal reserved his thunders for some other occasion.

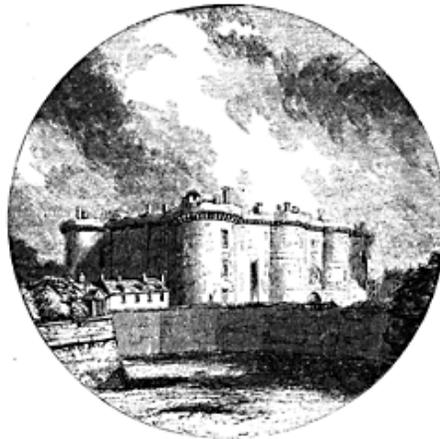

Still there was the populace. To quiet their clamour and avert the impending insurrection, the agents of the government adroitly mingled with the people, and spread abroad a report that Tophania had poisoned all the wells and fountains of the city. This was enough. The popular feeling was turned against her immediately. Those who, but a moment before, had looked upon her as a saint, now reviled her as a devil, and were as eager for her punishment as they had before been for her escape. Tophania was then put to the torture. She confessed the long catalogue of her crimes, and named all the persons who had employed her. She was shortly afterwards strangled, and her corpse thrown over the wall into the garden of the convent from whence she had been taken. This appears to have been done to conciliate the clergy, by allowing them, at least, the burial of one who had taken refuge within their precincts.

After her death the mania for poisoning seems to have abated; but we have yet to see what hold it took upon the French people at a somewhat earlier period. So rooted had it become in France between the years 1670 and 1680, that Madame de Sevigné, in one of her letters, expresses her fear that Frenchman and poisoner would become synonymous terms.

As in Italy, the first notice the government received of the prevalence of this crime was given by the clergy, to whom females of high rank, and some among the middle and lower classes, had avowed in the confessional that they had poisoned their husbands. In consequence of these disclosures, two Italians, named Exili and Glaser, were arrested, and thrown into the Bastille, on the charge of compounding and selling the drugs used for these murders. Glaser died in prison, but Exili remained without trial for several months; and there, shortly afterwards, he made the acquaintance of another prisoner, named Sainte Croix, by whose example the crime was still further disseminated among the French people.

The most notorious of the poisoners that derived their pernicious knowledge from this man was Madame de Brinvilliers, a young woman connected both by birth and marriage with some of the noblest families of France. She seems, from her very earliest years, to have been heartless and depraved; and, if we may believe her own confession, was steeped in wickedness ere she had well entered her teens. She was, however, beautiful and accomplished; and, in the eye of the world, seemed exemplary and kind. Guyot de Pitaval, in the *Causes Célèbres*, and Madame de Sevigné, in her letters, represent her as mild and agreeable in her manners, and offering no traces on her countenance of the evil soul within. She was married in 1651 to the Marquis de Brinvilliers, with whom she lived unhappily for some years. He was a loose, dissipated character, and was the means of introducing Sainte Croix to his wife, a man who cast a blight upon her life, and dragged her on from crime to crime, till her offences became so great that the mind shudders to dwell upon them. For this man she conceived a guilty passion, to gratify which she plunged at once into the gulf of sin. She was drawn to its most loathsome depths ere retribution overtook her.

She had as yet shewn a fair outside to the world, and found but little difficulty in effecting a legal separation from her husband, who had not the art to conceal his vices. The proceeding gave great offence to her family. She appears, after this, to have thrown off the mask completely, and carried on her intrigues so openly with her lover, Sainte Croix, that her father, M. D'Aubray, scandalised at her conduct, procured a *lettre de cachet*, and had him imprisoned in the Bastille for a twelvemonth.

THE BASTILLE.

Sainte Croix, who had been in Italy, was a dabbler in poisons. He knew something of the secrets of the detestable La Spara, and improved himself in them from the instructions of Exili, with whom he speedily contracted a sort of friendship. By him he was shewn how to prepare, not only the liquid poisons employed in Italy, but that known as *succession powder*, which afterwards became so celebrated in France. Like his mistress, he appeared amiable, witty, and intelligent, and shewed no signs to the world of the two fierce passions, revenge and avarice, which were gnawing at his heart. Both these passions were to be sated on the unfortunate family of D'Aubray; his revenge, because they had imprisoned him; and his avarice, because they were rich. Reckless and extravagant, he was always in want of money, and he had no one to supply him but Madame de Brinvilliers, whose own portion was far from sufficient to satisfy his need. Groaning to think that any impediment should stand between him and wealth, he conceived the horrid idea of poisoning M. D'Aubray her father, and her two brothers, that she might inherit the property. Three murders were nothing to such a villain. He communicated his plan to Madame de Brinvilliers; and she, without the slightest scruple, agreed to aid him: he undertook to compound the poisons, and she to administer them. The zeal and alacrity with which she set to work seem hardly credible. Sainte Croix found her an apt scholar; and she soon became as expert as himself in the manufacture of poisons.

To try the strength of the first doses, she used to administer them to dogs, rabbits, and pigeons. Afterwards, wishing to be more certain of their effects, she went round to the hospitals, and administered them to the sick poor in the soups which she brought in apparent charity.³⁹ None of the poisons were intended to kill at the first dose; so that she could try them once upon an individual without fear of murder. She tried the same atrocious experiment upon the guests at her father's table, by poisoning a pigeon-pie! To be more certain still, she next poisoned herself! When convinced by this desperate essay of the potency of the draught, she procured an antidote from Sainte Croix, and all doubts being removed, commenced operations upon her grey-headed father. She administered the first dose with her own hands, in his chocolate. The poison worked well. The old man was taken ill, and his daughter, apparently full of tenderness and anxiety, watched by his bedside. The next day she gave him some broth, which she recommended as highly nourishing. This also was poisoned. In this manner she gradually wore out his frame, and in less than ten days he was a corpse! His death seemed so much the result of disease, that no suspicions were excited.

When the two brothers arrived from the provinces to render the last sad duties to their sire, they found their sister as grieved, to all outward appearance, as even filial affection could desire: but the young men only came to perish. They stood between Sainte Croix and the already half-clutched gold, and their doom was sealed. A man, named La Chaussée, was hired by Sainte Croix to aid in administering the poisons; and, in less than six weeks time, they had both gone to their long home.

Suspicion was now excited; but so cautiously had all been done, that it found no one upon whom to attach itself. The marquise had a sister, and she was entitled, by the death of her relatives, to half the property. Less than the whole would not satisfy Sainte Croix, and he determined that she should die the same death as her father and brothers. She was too

distrustful, however; and, by quitting Paris, she escaped the destruction that was lurking for her.

The marquise had undertaken these murders to please her lover. She was now anxious to perpetrate another on her own account. She wished to marry Sainte Croix; but, though separated from her husband, she was not divorced. She thought it would be easier to poison him than to apply to the tribunals for a divorce, which might, perhaps, be refused. But Sainte Croix had no longer any love for his guilty instrument. Bad men do not admire others who are as bad as themselves. Though a villain himself, he had no desire to marry one, and was not at all anxious for the death of the marquis. He seemed, however, to enter into the plot, and supplied her with poison for her husband; but he took care to provide a remedy. La Brinvilliers poisoned him one day, and Sainte Croix gave him an antidote the next. In this manner he was buffeted about between them for some time, and finally escaped, with a ruined constitution and a broken heart.

But the day of retribution was at hand, and a terrible mischance brought the murders to light. The nature of the poisons compounded by Sainte Croix was so deadly, that, when working in his laboratory, he was obliged to wear a mask, to preserve himself from suffocation. One day, the mask slipped off, and the miserable wretch perished in his crimes. His corpse was found, on the following morning, in the obscure lodging where he had fitted up his laboratory. As he appeared to be without friends or relatives, the police took possession of his effects. Among other things, was found a small box, to which was affixed the following singular document:

“I humbly beg, that those into whose hands this box may fall, will do me the favour to deliver it into the hands only of the Marchioness de Brinvilliers, who resides in the Rue Neuve St. Paul, as every thing it contains concerns her, and belongs to her alone; and as, besides, there is nothing in it that can be of use to any person but her. In case she shall be dead before me, it is my wish that it be burned, with every

thing it contains, without opening or altering any thing. In order that no one may plead ignorance, I swear by the God that I adore, and by all that is held most sacred, that I assert nothing but the truth: and if my intentions, just and reasonable as they are, be thwarted in this point by any persons, I charge their consciences with it, both in this world and that which is to come, in order that I may unload mine. I protest that this is my last will. Done at Paris, May 25, 1672.

(Signed) SAINTE CROIX.”

This earnest solicitation, instead of insuring respect, as was intended, excited curiosity. The box was opened, and found to contain some papers, and several vials and powders. The latter were handed to a chemist for analysis, and the documents were retained by the police, and opened. Among them was found a promissory note of the Marchioness de Brinvilliers, for thirty thousand francs, to the order of Sainte Croix. The other papers were of greater importance, as they implicated both her and her servant, La Chaussée, in the recent murders. As soon as she was informed of the death of Sainte Croix, she made an attempt to gain possession of his papers and the box; but, being refused, she saw that there was no time to be lost, and immediately quitted. Next morning the police were on her trail; but she succeeded in escaping to England. La Chaussée was not so fortunate. Altogether ignorant of the fatal mischance which had brought his villanies to light, he did not dream of danger. He was arrested and brought to trial: being put to the torture, he confessed that he had administered poison to the Messieurs d’Aubray, and that he had received a hundred pistoles, and the promise of an annuity for life, from Sainte Croix and Madame de Brinvilliers, for the job. He was condemned to be broken alive on the wheel, and the marchioness was, by default, sentenced to be beheaded. He was executed accordingly, in March 1673, on the Place de Grève, in Paris.

La Brinvilliers appears to have resided for nearly three years in England. Early in 1676, thinking that the rigour of pursuit was over, and that she might venture to return to the Continent, she proceeded secretly to Liège. Notwithstanding her care, the French authorities were soon apprised of her return; and arrangements were promptly made with the municipality of that city to permit the agents of the French police to arrest her within the limits of their jurisdiction. Desgrais, an officer of the *maréchaussée*, accordingly left Paris for that purpose. On his arrival in Liège, he found that she had sought shelter within the walls of a convent. Here the arm of the law, long as it is said to be, could not reach her: but Desgrais was not a man to be baffled, and he resorted to stratagem to accomplish what force could not. Having disguised himself as a priest, he sought admission to the convent, and obtained an interview with La Brinvilliers. He said, that being a Frenchman, and passing through Liège, he could not leave that city without paying a visit to a lady whose beauty and misfortunes were so celebrated. Her vanity was flattered by the compliment. Desgrais saw, to use a vulgar but forcible expression, “that he had got on the blind side of her;” and he adroitly continued to pour out the language of love and admiration till the deluded marchioness was thrown completely off her guard. She agreed, without much sollicitation, to meet him outside the walls of the convent, where their amorous intrigue might be carried on more conveniently than within. Faithful to her appointment with her supposed new lover, she came, and found herself, not in the embrace of a gallant, but in the custody of a policeman.

Her trial was not long delayed. The proofs against her were abundant. The dying declaration of La Chaussée would have been alone enough to convict her; but besides that, there were the mysterious document attached to the box of St. Croix, her flight from France, and, stronger and more damning proof than all, a paper, in her own handwriting, found among the effects of St. Croix, in which she detailed to him the misdeeds of her life, and spoke of the murder of her father and brothers in terms that left no

doubt of her guilt. During the trial, all Paris was in commotion. La Brinvilliers was the only subject of conversation. All the details of her crimes were published, and greedily devoured; and the idea of secret poisoning first put into the heads of hundreds, who afterwards became guilty of it.

On the 16th of July, 1676, the Superior Criminal Court of Paris pronounced a verdict of guilty against her, for the murder of her father and brothers, and the attempt upon the life of her sister. She was condemned to be drawn on a hurdle, with her feet bare, a rope about her neck, and a burning torch in her hand, to the great entrance of the cathedral of Notre Dame, where she was to make the *amende honorable* in sight of all the people; to be taken from thence to the Place de Grève, and there to be beheaded. Her body was afterwards to be burned, and her ashes scattered to the winds.

After her sentence, she made a full confession of her guilt. She seems to have looked upon death without fear; but it was recklessness, not courage, that supported her. Madame de Sevigné says, that when on the hurdle, on her way to the scaffold, she entreated her confessor to exert his influence with the executioner to place himself next to her, that his body might hide from her view “that scoundrel Desgrais, who had entrapped her.” She also asked the ladies, who had been drawn to their windows to witness the procession, what they were looking at? adding, “a pretty sight you have come to see, truly!” She laughed when on the scaffold, dying as she had lived, impenitent and heartless. On the morrow, the populace came in crowds to collect her ashes to preserve them as relics. She was regarded as a martyred saint, and her ashes were supposed to be endowed, by divine grace, with the power of curing all diseases. Popular folly has often canonised persons whose pretensions to sanctity were extremely equivocal; but the disgusting folly of the multitude, in this instance, has never been surpassed.

Before her death, proceedings were instituted against M. de Penautier, treasurer of the province of Languedoc, and receiver-general for the clergy, who was accused by a lady, named St. Laurent, of having poisoned her husband, the late receiver-general, in order to obtain his appointment. The circumstances of this case were never divulged, and the greatest influence was exerted to prevent it from going to trial. He was known to have been intimate with Sainte Croix and Madame de Brinvilliers, and was thought to have procured his poisons from them. The latter, however, refused to say any thing which might implicate him. The inquiry was eventually stifled, after Penautier had been several months in the Bastille.

The Cardinal de Bonzy was accused by the gossips of the day of being an accomplice of Penautier. The cardinal's estates were burdened with the payment of several heavy annuities; but, about the time that poisoning became so fashionable, all the annuitants died off, one after the other. The cardinal, in talking of these annuitants, afterwards used to say, "Thanks to my star, I have outlived them all!" A wit, seeing him and Penautier riding in the same carriage, cried out, in allusion to this expression, "There go the Cardinal de Bonzy and his *star*!"

It was now that the mania for poisoning began to take hold of the popular mind. From this time until the year 1682, the prisons of France teemed with persons accused of this crime; and it is very singular that other offences decreased in a similar proportion. We have already seen the extent to which it was carried in Italy. It was, if possible, surpassed in France. The diabolical ease with which these murders could be effected, by means of these scentless and tasteless poisons, enticed the evil-minded. Jealousy, revenge, avarice, even petty spite, alike resorted to them. Those who would have been deterred, by fear of detection, from using the pistol or the dagger, or even strong doses of poison, which kill at once, employed slow poisons without dread. The corrupt government of the day, although it could wink at the atrocities of a wealthy and influential courtier like Penautier, was scandalised to see the crime spreading among the people.

Disgrace was, in fact, entailed, in the eyes of Europe, upon the name of Frenchman. Louis XIV., to put a stop to the evil, instituted what was called the *Chambre Ardente*, or Burning Chamber, with extensive powers for the trial and punishment of the prisoners.

Two women, especially, made themselves notorious at this time, and were instrumental to the deaths of hundreds of individuals. They both resided in Paris, and were named Lavoisin and Lavigoreux. Like Spara and Tophania, of whom they were imitators, they chiefly sold their poisons to women who wanted to get rid of their husbands; and, in some few instances, to husbands who wanted to get rid of their wives. Their ostensible occupation was that of midwives. They also pretended to be fortune-tellers, and were visited by persons of every class of society. The rich and poor thronged alike to their *mansardes* to learn the secrets of the future. Their prophecies were principally of death. They foretold to women the approaching dissolution of husbands, and to needy heirs the end of rich relatives, who had made them, as Byron expresses it, “wait too, too long already.” They generally took care to be instrumental in fulfilling their own predictions. They used to tell their wretched employers that some sign of the approaching death would take place in the house, such as the breaking of glass or china; and they paid servants considerable fees to cause a breakage, as if by accident, exactly at the appointed time. Their occupation as midwives made them acquainted with the secrets of many families, which they afterwards turned to dreadful account.

It is not known how long they had carried on this awful trade before they were discovered. Detection finally overtook them at the close of the year 1679. They were both tried, found guilty, and burned alive on the *Place de Grève*, on the 22d of February, 1680, after their hands had been bored through with a red-hot iron, and then cut off. Their numerous accomplices in Paris and in the provinces were also discovered and brought to trial. According to some authors, thirty, and to others, fifty of them, chiefly women, were hanged in the principal cities.

Lavoisin kept a list of the visitors who came to her house to purchase poisons. This paper was seized by the police on her arrest, and examined by the tribunals. Among the names were found those of the Marshal de Luxembourg, the Countess de Soissons, and the Duchess de Bouillon. The marshal seems only to have been guilty of a piece of discreditable folly in visiting a woman of this description, but the popular voice at the time imputed to him something more than folly. The author of the *Memoirs of the Affairs of Europe since the Peace of Utrecht*, says, "The miserable gang who dealt in poison and prophecy alleged that he had sold himself to the devil, and that a young girl of the name of Dupin had been poisoned by his means. Among other stories, they said he had made a contract with the devil, in order to marry his son to the daughter of the Marquis of Louvois. To this atrocious and absurd accusation the marshal, who had surrendered himself at the Bastille on the first accusation against him, replied with the mingled sentiment of pride and innocence, 'When Mathieu de Montmorenci, my ancestor, married the widow of Louis le Gros, he did not have recourse to the devil, but to the states-general, in order to obtain for the minor king the support of the house of Montmorenci.' This brave man was imprisoned in a cell six feet and a half long, and his trial, which was interrupted for several weeks, lasted altogether fourteen months. No judgment was pronounced upon him."

The Countess of Soissons fled to Brussels, rather than undergo the risk of a trial; and was never able to clear herself from the stigma that attached to her, of having made an attempt to poison the Queen of Spain by doses of succession-powder. The Duchess of Bouillon was arrested, and tried by the *Chambre Ardente*. It would appear, however, that she had nothing to do with the slow poisons, but had merely endeavoured to pry into the secrets of futurity, and gratify her curiosity with a sight of the devil. One of the presidents of the *Chambre*, La Reynie, an ugly little old man, very seriously asked her whether she had really seen the devil; to which the lady replied, looking him full in the face, "Oh, yes! I see him now. He is in the form of a

little ugly old man, exceedingly illnatured, and is dressed in the robes of a Counsellor of State.” M. la Reynie prudently refrained from asking any more questions of a lady with so sharp and ready a tongue. The duchess was imprisoned for several months in the Bastille; and nothing being proved against her, she was released at the intercession of her powerful friends. The severe punishment of criminals of this note might have helped to abate the fever of imitation among the vulgar;—their comparative impunity had a contrary tendency. The escape of Penautier, and the wealthy Cardinal de Bonzy his employer, had the most pernicious effect. For two years longer the crime continued to rage, and was not finally suppressed till the stake had blazed, or the noose dangled, for upwards of a hundred individuals.⁴⁰

PALACE OF WOODSTOCK.

HAUNTED HOUSES.

Here's a knocking indeed!... Knock! knock! knock!... Who's there, i' the name o' Beelzebub?... Who's there, i' the devil's name? Knock! knock! knock!—Never at quiet?—*Macbeth*.

WHO has not either seen or heard of some house, shut up and uninhabitable, fallen into decay, and looking dusty and dreary, from which, at midnight, strange sounds have been heard to issue—aerial knockings—the rattling of chains, and the groaning of perturbed spirits?—a house that people have thought it unsafe to pass after dark, and which has remained for years without a tenant, and which no tenant would occupy, even were he paid to do so? There are hundreds of such houses in England at the present day; hundreds in France, Germany, and almost every country of Europe, which are marked with the mark of fear—places for the timid to avoid, and the pious to bless themselves at, and ask protection from, as they pass—the abodes of ghosts and evil spirits. There are many such houses in London; and if any vain boaster of the march of intellect would but take the trouble to find them out and count them, he would be convinced that intellect must yet make some enormous strides before such old superstitions can be eradicated.

The idea that such houses exist is a remnant of the witch creed, which merits separate notice from its comparative harmlessness, and from its being not so much a madness as a folly of the people. Unlike other notions that sprang from the belief in witchcraft, and which we have already dwelt upon at sufficient length, it has sent no wretches to the stake or the gibbet, and but a few to the pillory only.

Many houses have been condemned as haunted, and avoided by the weak and credulous, from circumstances the most trifling in themselves,

and which only wanted a vigorous mind to clear up, at once, and dissipate all alarm. A house in Aix-la-Chapelle, a large desolate-looking building, remained uninhabited for five years, on account of the mysterious knockings that there were heard within it at all hours of the day and night. Nobody could account for the noises; and the fear became at last so excessive, that the persons who inhabited the houses on either side relinquished their tenancy, and went to reside in other quarters of the town, where there was less chance of interruption from evil spirits. From being so long without an inhabitant, the house at last grew so ruinous, so dingy, and so miserable in its outward appearance, and so like the place that ghosts might be supposed to haunt, that few persons cared to go past it after sunset. The knocking that was heard in one of the upper rooms was not very loud, but it was very regular. The gossips of the neighbourhood asserted that they often heard groans from the cellars, and saw lights moved about from one window to another immediately after the midnight bell had tolled. Spectres in white habiliments were reported to have gibed and chattered from the windows; but all these stories could bear no investigation. The knocking, however, was a fact which no one could dispute, and several ineffectual attempts were made by the proprietor to discover the cause. The rooms were sprinkled with holy water; the evil spirits were commanded in due form, by a priest, to depart thence to the Red Sea; but the knockings still continued, in spite of all that could be done in that way. Accident at last discovered the cause, and restored tranquillity to the neighbourhood. The proprietor, who suffered not only in his mind but in his pocket, had sold the building at a ruinously small price, to get rid of all future annoyance. The new proprietor was standing in a room on the first floor when he heard the door driven to at the bottom with a considerable noise, and then fly open immediately, about two inches and no more. He stood still a minute and watched, and the same thing occurred a second and a third time. He examined the door attentively, and all the mystery was unravelled. The latch of the door was broken, so that it could

not be fastened, and it swung chiefly upon the bottom hinge. Immediately opposite was a window, in which one pane of glass was broken; and when the wind was in a certain quarter, the draught of air was so strong that it blew the door to with some violence. There being no latch, it swung open again; and when there was a fresh gust, was again blown to. The new proprietor lost no time in sending for a glazier, and the mysterious noises ceased for ever. The house was replastered and repainted, and once more regained its lost good name. It was not before two or three years, however, that it was thoroughly established in popular favour; and many persons, even then, would always avoid passing it, if they could reach their destination by any other street.

A similar story is narrated by Sir Walter Scott, in his *Letters on Demonology and Witchcraft*, the hero of which was a gentleman of birth and distinction, well known in the political world. Shortly after he succeeded to his title and estates, there was a rumour among the servants concerning a strange noise that used to be heard at night in the family mansion, and the cause of which no one could ascertain. The gentleman resolved to discover it himself, and to watch for that purpose with a domestic who had grown old in the family, and who, like the rest, had whispered strange things about the knocking having begun immediately upon the death of his old master. These two watched until the noise was heard, and at last traced it to a small store-room, used as a place for keeping provisions of various kinds for the family, and of which the old butler had the key. They entered this place, and remained for some time without hearing the noises which they had traced thither. At length the sound was heard, but much lower than it seemed to be while they were farther off, and their imaginations were more excited. They then discovered the cause without difficulty. A rat, caught in an old-fashioned trap, had occasioned the noise by its efforts to escape, in which it was able to raise the trap-door of its prison to a certain height, but was then obliged to drop it. The noise of the fall resounding through the house had

occasioned the mysterious rumours, which, but for the investigation of the proprietor, would, in all probability, have acquired so bad a name for the dwelling that no servants would have inhabited it. The circumstance was told to Sir Walter Scott by the gentleman to whom it happened.

SAINT LOUIS.

But, in general, houses that have acquired this character have been more indebted for it to the roguery of living men than to accidents like these. Six monks played off a clever trick of the kind upon that worthy king, Louis, whose piety has procured him in the annals of his own country the designation of “the Saint.” Having heard his confessor speak in terms of warm eulogy of the goodness and learning of the monks of the order of St. Bruno, he expressed his wish to establish a community of them near Paris. Bernard de la Tour, the superior, sent six of the brethren, and the king gave them a handsome house to live in in the village of Chantilly. It so happened that from their windows they had a very fine view of the ancient palace of Vauvert, which had been built for a royal residence by King Robert, but deserted for many years. The worthy monks thought the palace would just suit them; but their modesty was so excessive that they were ashamed to ask the king for a grant of it in due form. This difficulty was not to be overcome, and the monks set their ingenuity to work to discover another plan. The palace of Vauvert had never laboured under any imputation upon

its character until they became its neighbours; but, somehow or other, it almost immediately afterwards began to acquire a bad name. Frightful shrieks were heard to proceed from it at night; blue, red, and green lights were suddenly seen to glimmer from the windows, and as suddenly to disappear; the clanking of chains was heard, and the howling as of persons in great pain. These disturbances continued for several months, to the great terror of all the country round, and even of the pious King Louis, to whom, at Paris, all the rumours were regularly carried with whole heaps of additions that accumulated on the way. At last a great spectre, clothed all in pea-green, with a long white beard and a serpent's tail, took his station regularly at midnight in the principal window of the palace, and howled fearfully, and shook his fists at the passengers. The six monks at Chantilly, to whom all these things were duly narrated, were exceedingly wrath that the devil should play such antics right opposite their dwelling, and hinted to the commissioners sent down by Saint Louis to investigate the matter, that if they were allowed to inhabit the palace, they would very soon make a clearance of the evil spirits. The king was quite charmed with their piety, and expressed to them how grateful he felt for their disinterestedness. A deed was forthwith drawn up, the royal sign-manual was affixed to it, and the palace of Vauvert became the property of the monks of St. Bruno. The deed is dated 1259. The disturbances ceased immediately, the lights disappeared, and the green ghost (so said the monks) was laid at rest for ever under the waves of the Red Sea.⁴¹

In the year 1580, one Gilles Blacre had taken the lease of a house in the suburbs of Tours, but repenting him of his bargain with the landlord, Peter Piquet, he endeavoured to prevail upon him to cancel the agreement. Peter, however, was satisfied with his tenant and his terms, and would listen to no compromise. Very shortly afterwards, the rumour was spread all over Tours that the house of Gilles Blacre was haunted. Gilles himself asserted that he verily believed his house to be the general rendezvous of all the witches and evil spirits of France. The noise they made was awful, and

quite prevented him from sleeping. They knocked against the wall, howled in the chimneys, broke his window-glass, scattered his pots and pans all over his kitchen, and set his chairs and tables a dancing the whole night through. Crowds of persons assembled round the house to hear the mysterious noises: and the bricks were observed to detach themselves from the wall, and fall into the streets upon the heads of those who had not said their paternoster before coming out in the morning. These things having continued for some time, Gilles Blacre made his complaint to the Civil Court of Tours, and Peter Piquet was summoned to shew cause why the lease should not be annulled. Poor Peter could make no defence, and the court unanimously agreed that no lease could hold good under such circumstances, and annulled it accordingly, condemning the unlucky owner to all the expenses of the suit. Peter appealed to the parliament of Paris; and after a long examination, the parliament confirmed the lease. “Not,” said the judge, “because it has not been fully and satisfactorily proved that the house is troubled by evil spirits, but that there was an informality in the proceedings before the Civil Court of Tours, that rendered its decision null and of no effect.”

A similar cause was tried before the Parliament of Bourdeaux, in the year 1595, relative to a house in that city which was sorely troubled by evil spirits. The parliament appointed certain ecclesiastics to examine and report to them, and on their report in the affirmative that the house was haunted, the lease was annulled, and the tenant absolved from all payment of rent and taxes.⁴²

One of the best stories of a haunted house is that of the royal palace of Woodstock, in the year 1649, when the commissioners sent from London by the Long Parliament to take possession of it, and efface all the emblems of royalty about it, were fairly driven out by their fear of the devil, and the annoyances they suffered from a roguish cavalier, who played the imp to admiration. The commissioners, dreading at that time no devil, arrived at Woodstock on the 13th of October, 1649. They took up their lodgings in the

late king's apartments—turned the beautiful bedrooms and withdrawing-rooms into kitchens and sculleries—the council-hall into a brew-house, and made the dining-room a place to keep firewood in. They pulled down all the insignia of royal state, and treated with the utmost indignity every thing that recalled to their memory the name or the majesty of Charles Stuart. One Giles Sharp accompanied them in the capacity of clerk, and seconded their efforts, apparently with the greatest zeal. He aided them to uproot a noble old tree, merely because it was called the *King's Oak*, and tossed the fragments into the dining-room to make cheerful fires for the commissioners. During the first two days, they heard some strange noises about the house, but they paid no great attention to them. On the third, however, they began to suspect they had got into bad company; for they heard, as they thought, a supernatural dog under their bed, which gnawed their bed-clothes. On the next day, the chairs and tables began to dance, apparently of their own accord. On the fifth day, something came into the bedchamber and walked up and down; and fetching the warming-pan out of the withdrawing-room, made so much noise with it that they thought five church-bells were ringing in their ears. On the sixth day, the plates and dishes were thrown up and down the dining-room. On the seventh, they penetrated into the bedroom in company with several logs of wood, and usurped the soft pillows intended for the commissioners. On the eighth and ninth nights, there was a cessation of hostilities; but on the tenth, the bricks in the chimneys became locomotive, and rattled and danced about the floors, and round the heads of the commissioners, all the night long. On the eleventh, the demon ran away with their breeches; and on the twelfth filled their beds so full of pewter platters that they could not get into them. On the thirteenth night, the glass became unaccountably seized with a fit of cracking, and fell into shivers in all parts of the house. On the fourteenth, there was a noise as if forty pieces of artillery had been fired off, and a shower of pebble-stones, which so alarmed the commissioners that, “struck with great horror, they cried out to one another for help.”

They first of all tried the efficacy of prayers to drive away the evil spirits; but these proving unavailing, they began seriously to reflect whether it would not be much better to leave the place altogether to the devils that inhabited it. They ultimately resolved, however, to try it a little longer; and having craved forgiveness of all their sins, betook themselves to bed. That night they slept in tolerable comfort, but it was merely a trick of their tormentor to lull them into false security. When, on the succeeding night, they heard no noises, they began to flatter themselves that the devil was driven out, and prepared accordingly to take up their quarters for the whole winter in the palace. These symptoms on their part became the signal for renewed uproar among the fiends. On the 1st of November, they heard something walking with a slow and solemn pace up and down the withdrawing-room, and immediately afterwards a shower of stones, bricks, mortar, and broken glass pelted about their ears. On the 2d the steps were again heard in the withdrawing-room, sounding to their fancy very much like the treading of an enormous bear, which continued for about a quarter of an hour. This noise having ceased, a large warming-pan was thrown violently upon the table, followed by a number of stones and the jawbone of a horse. Some of the boldest walked valiantly into the withdrawing-room, armed with swords and pistols; but could discover nothing. They were afraid that night to go to sleep, and sat up, making fires in every room, and burning candles and lamps in great abundance; thinking that, as the fiends loved darkness, they would not disturb a company surrounded with so much light. They were deceived, however: buckets of water came down the chimneys and extinguished the fires; and the candles were blown out, they knew not how. Some of the servants who had betaken themselves to bed were drenched with putrid ditch-water as they lay, and arose in great fright, muttering incoherent prayers, and exposing to the wondering eyes of the commissioners their linen all dripping with green moisture, and their knuckles red with the blows they had at the same time received from some invisible tormentors. While they were still speaking, there was a

noise like the loudest thunder, or the firing of a whole park of artillery, upon which they all fell down upon their knees and implored the protection of the Almighty. One of the commissioners then arose, the others still kneeling, and asked in a courageous voice, and in the name of God, who was there, and what they had done that they should be troubled in that manner. No answer was returned, and the noises ceased for a while. At length, however, as the commissioners said, “the devil came again, and brought with it seven devils worse than itself.” Being again in darkness, they lighted a candle and placed it in the doorway, that it might throw a light upon the two chambers at once; but it was suddenly blown out, and one commissioner said that he had “seen the similitude of a horse’s hoof striking the candle and candlestick into the middle of the chamber, and afterwards making three scrapes on the snuff to put it out.” Upon this, the same person was so bold as to draw his sword; but he asserted positively that he had hardly withdrawn it from the scabbard before an invisible hand seized hold of it and tugged with him for it, and prevailing, struck him so violent a blow with the pommel that he was quite stunned. Then the noises began again; upon which, with one accord, they all retired into the presence-chamber, where they passed the night, praying and singing psalms.

They were by this time convinced that it was useless to struggle any longer with the powers of evil that seemed determined to make Woodstock their own. These things happened on the Saturday night; and being repeated on the Sunday, they determined to leave the place immediately, and return to London. By Tuesday morning early, all their preparations were completed; and, shaking the dust off their feet, and devoting Woodstock and all its inhabitants to the infernal gods, they finally took their departure.⁴³

Many years elapsed before the true cause of these disturbances was discovered. It was ascertained at the Restoration, that the whole was the work of Giles Sharp, the trusty clerk of the commissioners. This man,

whose real name was Joseph Collins, was a concealed royalist, and had passed his early life within the bowers of Woodstock; so that he knew every hole and corner of the place, and the numerous trap-doors and secret passages that abounded in the building. The commissioners, never suspecting the true state of his opinions, but believing him to be revolutionary to the back-bone, placed the utmost reliance upon him; a confidence which he abused in the manner above detailed, to his own great amusement and that of the few cavaliers whom he let into the secret.

Quite as extraordinary and as cleverly managed was the trick played off at Tedworth, in 1661, at the house of Mr. Mompesson, and which is so circumstantially narrated by the Rev. Joseph Glanvil, under the title of *The Demon of Tedworth*, and appended, among other proofs of witchcraft, to his noted work called *Sadducismus Triumphatus*. About the middle of April, in the year above mentioned, Mr. Mompesson, having returned to his house at Tedworth from a journey he had taken to London, was informed by his wife, that during his absence they had been troubled with the most extraordinary noises. Three nights afterwards he heard the noise himself; and it appeared to him to be that of “a great knocking at his doors, and on the outside of his walls.” He immediately arose, dressed himself, took down a pair of pistols, and walked valiantly forth to discover the disturber, under the impression that it must be a robber; but, as he went, the noise seemed to travel before or behind him; and when he arrived at the door from which he thought it proceeded, he saw nothing, but still heard “a strange hollow sound.” He puzzled his brains for a long time, and searched every corner of the house; but discovering nothing, he went to bed again. He was no sooner snug under the clothes than the noise began again more furiously than ever, sounding very much like a “thumping and drumming on the top of his house, and then by degrees going off into the air.”

These things continued for several nights, when it came to the recollection of Mr. Mompesson that some time before he had given orders

for the arrest and imprisonment of a wandering drummer, who went about the country with a large drum, disturbing quiet people and soliciting alms, and that he had detained the man's drum, and that probably the drummer was a wizard, and had sent evil spirits to haunt his house to be revenged of him. He became strengthened in his opinion every day, especially when the noises assumed, to his fancy, a resemblance to the beating of a drum, "like that at the breaking up of a guard." Mrs. Mompesson being brought to bed, the devil, or the drummer, very kindly and considerately refrained from making the usual riot; but, as soon as she recovered strength, began again "in a ruder manner than before, following and vexing the young children, and beating their bedsteads with so much violence that every one expected they would fall in pieces." For an hour together, as the worthy Mr. Mompesson repeated to his wondering neighbours, this infernal drummer "would beat 'Roundheads and Cuckolds,' the 'Tat-too,' and several other points of war, as cleverly as any soldier." When this had lasted long enough, he changed his tactics, and scratched with his iron talons under the children's bed. "On the 5th of November," says the Rev. Joseph Glanvil, "it made a mighty noise; and a servant observing two boards in the children's room seeming to move, he bid it give him one of them. Upon which the board came (nothing moving it that he saw) within a yard of him. The man added, 'Nay, let me have it in my hand;' upon which the spirit, devil, or drummer pushed it towards him so close that he might touch it." "This," continues Glanvil, "was in the day-time, and was seen by a whole room full of people. That morning it left a sulphureous smell behind it, which was very offensive. At night the minister, one Mr. Cragg, and several of the neighbours came to the house on a visit. Mr. Cragg went to prayers with them, kneeling at the children's bedside, where it then became very troublesome and loud. During prayer-time, the spirit withdrew into the cock-loft, but returned as soon as prayers were done; and then, in sight of the company, the chairs walked about the room of themselves, the children's shoes were hurled over their heads, and every loose thing moved

about the chamber. At the same time, a bed-staff was thrown at the minister, which hit him on the leg, but so favourably, that a lock of wool could not have fallen more softly.” On another occasion, the blacksmith of the village, a fellow who cared neither for ghost nor devil, slept with John the footman, that he also might hear the disturbances and be cured of his incredulity, when there “came a noise in the room as if one had been shoeing a horse, and somewhat came, as it were, with a pair of pincers,” snipping and snapping at the poor blacksmith’s nose the greater part of the night. Next day it came panting like a dog out of breath; upon which some woman present took a bed-staff to knock at it, “which was caught suddenly out of her hand and thrown away; and company coming up, the room was presently filled with a *bloomy noisome smell*, and was very hot, though without fire, in a very sharp and severe winter. It continued in the bed, panting and scratching for an hour and a half, and then went into the next room, where it knocked a little, and seemed to rattle a chain.”

The rumour of these wonderful occurrences soon spread all over the country, and people from far and near flocked to the haunted house of Tedworth, to believe or doubt as their natures led them, but all filled with intense curiosity. It appears, too, that the fame of these events reached the royal ear, and that some gentlemen were sent by the king to investigate the circumstances, and draw up a report of what they saw or heard. Whether the royal commissioners were more sensible men than the neighbours of Mr. Mompesson, and required more clear and positive evidence than they, or whether the powers with which they were armed to punish any body who might be found carrying on this deception frightened the evil-doers, is not certain; but Glanvil himself reluctantly confesses that all the time they were in the house the noises ceased, and nothing was heard or seen. “However,” says he, “as to the quiet of the house when the courtiers were there, the intermission may have been accidental, or perhaps the demon was not willing to give so public a testimony of those transactions which

might possibly convince those who he had rather should continue in unbelief of his existence.”

As soon as the royal commissioners took their departure, the infernal drummer recommenced his antics, and hundreds of persons were daily present to hear and wonder. Mr. Mompesson’s servant was so fortunate as not only to hear, but to see this pertinacious demon, for it came and stood at the foot of his bed. “The exact shape and proportion of it he could not discover; but he saw a great body, with two red and glaring eyes, which, for some time, were fixed steadily on him, and at length disappeared.” Innumerable were the antics it played. Once it purred like a cat; beat the children’s legs black and blue; put a long spike into Mr. Mompesson’s bed, and a knife into his mother’s; filled the porringers with ashes; hid a Bible under the grate; and turned the money black in people’s pockets. “One night,” said Mr. Mompesson, in a letter to Mr. Glanvil, “there were seven or eight of these devils in the shape of men, who, as soon as a gun was fired, would shuffle away into an arbour;” a circumstance which might have convinced Mr. Mompesson of the mortal nature of his persecutors, if he had not been of the number of those worse than blind, who shut their eyes and refuse to see.

In the mean time the drummer, the supposed cause of all the mischief, passed his time in Gloucester gaol, whither he had been committed as a rogue and a vagabond. Being visited one day by some person from the neighbourhood of Tedworth, he asked what was the news in Wiltshire, and whether people did not talk a great deal about a drumming in a gentleman’s house there? The visitor replied that he heard of nothing else; upon which the drummer observed, “I have done it; I have thus plagued him; and he shall never be quiet until he hath made me satisfaction for taking away my drum.” No doubt the fellow, who seems to have been a gipsy, spoke the truth, and that the gang of which he was a member knew more about the noises at Mr. Mompesson’s house than any body else. Upon these words, however, he was brought to trial at Salisbury for witchcraft;

and, being found guilty, was sentenced to transportation; a sentence which, for its leniency, excited no little wonder in that age, when such an accusation, whether proved or not, generally insured the stake or the gibbet. Glanvil says that the noises ceased immediately the drummer was sent beyond the seas; but that, somehow or other, he managed to return from transportation; “by raising storms and affrighting the seamen, it was said;” when the disturbances were forthwith renewed, and continued at intervals for several years. Certainly, if the confederates of this roving gipsy were so pertinacious in tormenting poor weak Mr. Mompesson, their pertinacity is a most extraordinary instance of what revenge is capable of. It was believed by many, at the time, that Mr. Mompesson himself was privy to the whole matter, and permitted and encouraged these tricks in his house for the sake of notoriety; but it seems more probable that the gipsies were the real delinquents, and that Mr. Mompesson was as much alarmed and bewildered as his credulous neighbours, whose excited imaginations conjured up no small portion of these stories,

“Which rolled, and as they rolled grew larger visibly.”

Many instances of a similar kind, during the seventeenth century, might be gleaned from Glanvil and other writers of that period; but they do not differ sufficiently from these to justify a detail of them. The most famous of all haunted houses acquired its notoriety much nearer our own time; and the circumstances connected with it are so curious, and afford so fair a specimen of the easy credulity even of well-informed and sensible people, as to merit a little notice in this chapter. The Cock-Lane Ghost, as it was called, kept London in commotion for a considerable time, and was the theme of conversation among the learned and the illiterate, and in every circle, from that of the prince to that of the peasant.

THE HAUNTED HOUSE IN COCK LANE.

At the commencement of the year 1760, there resided in Cock Lane, near West Smithfield, in the house of one Parsons, the parish clerk of St. Sepulchre's, a stockbroker, named Kent. The wife of this gentleman had died in child-bed during the previous year, and his sister-in-law, Miss Fanny, had arrived from Norfolk to keep his house for him. They soon conceived a mutual affection, and each of them made a will in the other's favour. They lived some months in the house of Parsons, who, being a needy man, borrowed money of his lodger. Some difference arose betwixt them, and Mr. Kent left the house, and instituted legal proceedings against the parish-clerk for the recovery of his money.

While this matter was yet pending, Miss Fanny was suddenly taken ill of the small-pox; and, notwithstanding every care and attention, she died in a few days, and was buried in a vault under Clerkenwell church. Parsons now began to hint that the poor lady had come unfairly by her death, and that Mr. Kent was accessory to it, from his too great eagerness to enter into possession of the property she had bequeathed him. Nothing further was said for nearly two years; but it would appear that Parsons was of so revengeful a character, that he had never forgotten or forgiven his differences with Mr. Kent, and the indignity of having been sued for the borrowed money. The strong passions of pride and avarice were silently at work during all that interval, hatching schemes of revenge, but dismissing

them one after the other as impracticable, until, at last, a notable one suggested itself. About the beginning of the year 1762, the alarm was spread over all the neighbourhood of Cock Lane, that the house of Parsons was haunted by the ghost of poor Fanny, and that the daughter of Parsons, a girl about twelve years of age, had several times seen and conversed with the spirit, who had, moreover, informed her, that she had not died of the small-pox, as was currently reported, but of poison, administered by Mr. Kent. Parsons, who originated, took good care to countenance these reports; and, in answer to numerous inquiries, said his house was every night, and had been for two years, in fact, ever since the death of Fanny, troubled by a loud knocking at the doors and in the walls. Having thus prepared the ignorant and credulous neighbours to believe or exaggerate for themselves what he had told them, he sent for a gentleman of a higher class in life, to come and witness these extraordinary occurrences. The gentleman came accordingly, and found the daughter of Parsons, to whom the spirit alone appeared, and whom alone it answered, in bed, trembling violently, having just seen the ghost, and been again informed that she had died from poison. A loud knocking was also heard from every part of the chamber, which so mystified the not very clear understanding of the visitor, that he departed, afraid to doubt and ashamed to believe, but with a promise to bring the clergyman of the parish and several other gentlemen on the following day, to report upon the mystery.

On the following night he returned, bringing with him three clergymen, and about twenty other persons, including two negroes, when, upon a consultation with Parsons, they resolved to sit up the whole night, and await the ghost's arrival. It was then explained by Parsons, that although the ghost would never render itself visible to any body but his daughter, it had no objection to answer the questions that might be put to it, by any person present, and that it expressed an affirmation by one knock, a negative by two, and its displeasure by a kind of scratching. The child was then put into bed along with her sister, and the clergymen examined the

bed and bed-clothes to satisfy themselves that no trick was played, by knocking upon any substance concealed among the clothes. As on the previous night, the bed was observed to shake violently.

ROOM IN THE HAUNTED HOUSE IN COCK LANE.⁴⁴

After some hours, during which they all waited with exemplary patience, the mysterious knocking was heard in the wall, and the child declared that she saw the ghost of poor Fanny. The following questions were then gravely put by the clergyman, through the medium of one Mary Frazer, the servant of Parsons, and to whom it was said the deceased lady had been much attached. The answers were in the usual fashion, by a knock or knocks:

“Do you make this disturbance on account of the ill-usage you received from Mr. Kent?”—“Yes.”

“Were you brought to an untimely end by poison?”—“Yes.”

“How was the poison administered, in beer or purl?”—“In purl.”

“How long was that before your death?”—“About three hours.”

“Can your former servant, Carrots, give any information about the poison?”—“Yes.”

“Are you Kent’s wife’s sister?”—“Yes.”

“Were you married to Kent after your sister’s death?”—“No.”

“Was any body else, besides Kent, concerned in your murder?”—“No.”

“Can you, if you like, appear visibly to any one?”—“Yes.”

“Will you do so?”—“Yes.”

“Can you go out of this house?”—“Yes.”

“Is it your intention to follow this child about every where?”—“Yes.”

“Are you pleased in being asked these questions?”—“Yes.”

“Does it ease your troubled soul?”—“Yes.”

[Here there was heard a mysterious noise, which some wiseacre present compared to the fluttering of wings.]

“How long before your death did you tell your servant, Carrots, that you were poisoned? An hour?”—“Yes.”

[Carrots, who was present, was appealed to; but she stated positively that such was not the fact, as the deceased was quite speechless an hour before her death. This shook the faith of some of the spectators, but the examination was allowed to continue.]

“How long did Carrots live with you?”—“Three or four days.”

[Carrots was again appealed to, and said that this was true.]

“If Mr. Kent is arrested for this murder, will he confess?”—“Yes.”

“Would your soul be at rest if he were hanged for it?”—“Yes.”

“Will he be hanged for it?”—“Yes.”

“How long a time first?”—“Three years.”

“How many clergymen are there in this room?”—“Three.”

“How many negroes?”—“Two.”

“Is this watch (held up by one of the clergymen) white?”—“No.”

“Is it yellow?”—“No.”

“Is it blue?”—“No.”

“Is it black?”—“Yes.”

[The watch was in a black shagreen case.]

“At what time this morning will you take your departure?”

The answer to this question was four knocks, very distinctly heard by every person present; and accordingly, at four o'clock precisely the ghost took its departure to the Wheatsheaf public-house close by, where it frightened mine host and his lady almost out of their wits, by knocking in the ceiling right above their bed.

The rumour of these occurrences very soon spread over London, and every day Cock Lane was rendered impassable by the crowds of people who assembled around the house of the parish clerk, in expectation of either seeing the ghost or of hearing the mysterious knocks. It was at last found necessary, so clamorous were they for admission within the haunted precincts, to admit those only who would pay a certain fee, an arrangement which was very convenient to the needy and money-loving Mr. Parsons. Indeed, things had taken a turn greatly to his satisfaction; he not only had his revenge, but he made a profit out of it. The ghost, in consequence, played its antics every night, to the great amusement of many hundreds of people and the great perplexity of a still greater number.

Unhappily, however, for the parish clerk, the ghost was induced to make some promises which were the means of utterly destroying its reputation. It promised, in answer to the questions of the Rev. Mr. Aldritch of Clerkenwell, that it would not only follow the little Miss Parsons wherever she went, but would also attend him, or any other gentleman, into the vault under St. John's Church, where the body of the murdered woman was deposited, and would there give notice of its presence by a distinct knock upon the coffin. As a preliminary, the girl was conveyed to the house of Mr. Aldritch near the church, where a large party of ladies and gentlemen, eminent for their acquirements, their rank, or their wealth, had assembled. About ten o'clock on the night of the first of February, the girl having been brought from Cock Lane in a coach, was put to bed by several ladies in the house of Mr. Aldritch; a strict examination having been previously made that nothing was hidden in the bed-clothes. While the gentlemen in an adjoining chamber were deliberating whether they should proceed in a body to the vault, they were summoned into the bedroom by the ladies, who affirmed, in great alarm, that the ghost was come, and that they heard the knocks and scratches. The gentlemen entered accordingly, with a determination to suffer no deception. The little girl, on being asked whether she saw the ghost, replied, "No; but she felt it on her back like a

mouse." She was then required to put her hands out of bed, and they being held by some of the ladies, the spirit was summoned in the usual manner to answer, if it were in the room. The question was several times put with great solemnity; but the customary knock was not heard in reply in the walls, neither was there any scratching. The ghost was then asked to render itself visible, but it did not choose to grant the request. It was next solicited to give some token of its presence by a sound of any sort, or by touching the hand or cheek of any lady or gentleman in the room; but even with this request the ghost would not comply.

There was now a considerable pause, and one of the clergymen went down stairs to interrogate the father of the girl, who was waiting the result of the experiment. He positively denied that there was any deception, and even went so far as to say that he himself, upon one occasion, had seen and conversed with the awful ghost. This having been communicated to the company, it was unanimously resolved to give the ghost another trial; and the clergyman called out in a loud voice to the supposed spirit, that the gentleman to whom it had promised to appear in the vault was about to repair to that place, where he claimed the fulfilment of its promise. At one hour after midnight they all proceeded to the church, and the gentleman in question, with another, entered the vault alone, and took up their position alongside of the coffin of poor Fanny. The ghost was then summoned to appear, but it appeared not; it was summoned to knock, but it knocked not; it was summoned to scratch, but it scratched not; and the two retired from the vault, with a firm belief that the whole business was a deception practised by Parsons and his daughter. There were others, however, who did not wish to jump so hastily to a conclusion, and who suggested that they were perhaps trifling with this awful and supernatural being, which, being offended with them for their presumption, would not condescend to answer them. Again, after serious consultation, it was agreed on all hands that if the ghost answered any body at all, it would answer Mr. Kent, the supposed murderer; and he was accordingly requested to go down into the

vault. He went with several others, and summoned the ghost to answer whether he had indeed poisoned her. There being no answer, the question was put by Mr. Aldritch, who conjured it, if it were indeed a spirit, to end their doubts, make a sign of its presence, and point out the guilty person. There being still no answer for the space of half an hour, during which time all these boobies waited with the most praiseworthy perseverance, they returned to the house of Mr. Aldritch, and ordered the girl to get up and dress herself. She was strictly examined, but persisted in her statement that she used no deception, and that the ghost had really appeared to her.

So many persons had, by their openly expressed belief of the reality of the visitation, identified themselves with it, that Parsons and his family were far from being the only persons interested in the continuance of the delusion. The result of the experiment convinced most people; but these were not to be convinced by any evidence, however positive, and they therefore spread abroad the rumour, that the ghost had not appeared in the vault because Mr. Kent had taken care beforehand to have the coffin removed. That gentleman, whose position was a very painful one, immediately procured competent witnesses, in whose presence the vault was entered, and the coffin of poor Fanny opened. Their depositions were then published; and Mr. Kent indicted Parsons and his wife, his daughter, Mary Frazer the servant, the Rev. Mr. Moor, and a tradesman, two of the most prominent patrons of the deception, for a conspiracy. The trial came on in the Court of King's Bench, on the 10th of July, before Lord Chief-Justice Mansfield, when, after an investigation which lasted twelve hours, the whole of the conspirators were found guilty. The Rev. Mr. Moor and his friend were severely reprimanded in open court, and recommended to make some pecuniary compensation to the prosecutor for the aspersions they had been instrumental in throwing upon his character. Parsons was sentenced to stand three times in the pillory, and to be imprisoned for two years; his wife to one year's, and his servant to six months' imprisonment in the Bridewell. A printer, who had been employed by them to publish an

account of the proceedings for their profit, was also fined fifty pounds, and discharged.

The precise manner in which the deception was carried on has never been explained. The knocking in the wall appears to have been the work of Parsons' wife, while the scratching part of the business was left to the little girl. That any contrivance so clumsy could have deceived any body cannot fail to excite our wonder. But thus it always is. If two or three persons can only be found to take the lead in any absurdity, however great, there is sure to be plenty of imitators. Like sheep in a field, if one clears the stile, the rest will follow.

About ten years afterwards, London was again alarmed by the story of a haunted house. Stockwell, near Vauxhall, the scene of the antics of this new ghost, became almost as celebrated in the annals of superstition as Cock Lane. Mrs. Golding, an elderly lady, who resided alone with her servant, Anne Robinson, was sorely surprised on the evening of Twelfth-Day, 1772, to observe a most extraordinary commotion among her crockery. Cups and saucers rattled down the chimney—pots and pans were whirled down stairs, or through the windows; and hams, cheeses, and loaves of bread disported themselves upon the floor as if the devil were in them. This, at least, was the conclusion that Mrs. Golding came to; and being greatly alarmed, she invited some of her neighbours to stay with her, and protect her from the evil one. Their presence, however, did not put a stop to the insurrection of china, and every room in the house was in a short time strewed with the fragments. The chairs and tables joined, at last, in the tumult, and things looked altogether so serious and inexplicable, that the neighbours, dreading that the house itself would next be seized with a fit of motion, and tumble about their ears, left poor Mrs. Golding to bear the brunt of it by herself. The ghost in this case was solemnly remonstrated with, and urged to take its departure; but the demolition continuing as great as before, Mrs. Golding finally made up her mind to quit the house altogether. She took refuge with Anne Robinson in the house of a

neighbour; but his glass and crockery being immediately subjected to the same persecution, he was reluctantly compelled to give her notice to quit. The old lady thus forced back to her own house, endured the disturbance for some days longer, when suspecting that Anne Robinson was the cause of all the mischief, she dismissed her from her service. The extraordinary appearances immediately ceased, and were never afterwards renewed; a fact which is of itself sufficient to point out the real disturber. A long time afterwards, Anne Robinson confessed the whole matter to the Reverend Mr. Brayfield. This gentleman confided the story to Mr. Hone, who has published an explanation of the mystery. Anne, it appears, was anxious to have a clear house, to carry on an intrigue with her lover, and resorted to this trick to effect her purpose. She placed the china on the shelves in such a manner that it fell on the slightest motion, and attached horse-hairs to other articles, so that she could jerk them down from an adjoining room without being perceived by any one. She was exceedingly dexterous at this sort of work, and would have proved a formidable rival to many a juggler by profession. A full explanation of the whole affair may be found in the *Every-day Book*.

The latest instance of the popular panic occasioned by a house supposed to be haunted, occurred in Scotland, in the winter of the year 1838. On the 5th of December, the inmates of the farm-house of Baldarroch, in the district of Banchory, Aberdeenshire, were alarmed by observing a great number of sticks, pebble-stones, and clods of earth flying about their yard and premises. They endeavoured, but in vain, to discover who was the delinquent; and the shower of stones continuing for five days in succession, they came at last to the conclusion that the devil and his imps were alone the cause of it. The rumour soon spread over all that part of the country, and hundreds of persons came from far and near to witness the antics of the devils of Baldarroch. After the fifth day, the shower of clods and stones ceased on the outside of the premises, and the scene shifted to the interior. Spoons, knives, plates, mustard-pots, rolling-pins, and flat-irons appeared

suddenly endued with the power of self-motion, and were whirled from room to room, and rattled down the chimneys in a manner which nobody could account for. The lid of a mustard-pot was put into a cupboard by the servant-girl in the presence of scores of people, and in a few minutes afterwards came bouncing down the chimney, to the consternation of every body. There was also a tremendous knocking at the doors and on the roof, and pieces of stick and pebble-stones rattled against the windows and broke them. The whole neighbourhood was a scene of alarm; and not only the vulgar, but persons of education, respectable farmers, within a circle of twenty miles, expressed their belief in the supernatural character of these events, and offered up devout prayers to be preserved from the machinations of the Evil One. The note of fear being once sounded, the visitors, as is generally the case in all tales of wonder, strove with each other who should witness the most extraordinary occurrences; and within a week, it was generally believed in the parishes of Banchory-Ternan, Drumoak, Durris, Kincardine-O'Neil, and all the circumjacent districts of Mearns and Aberdeenshire, that the devil had been seen in the act of hammering upon the house-top of Baldarroch. One old man asserted positively that, one night, after having been to see the strange gambols of the knives and mustard-pots, he met the phantom of a great black man, "who wheeled round his head with a whizzing noise, making a wind about his ears that almost blew his bonnet off," and that he was haunted by him in this manner for three miles. It was also affirmed and believed, that all horses and dogs that approached this enchanted ground were immediately affected; that a gentleman, slow of faith, had been cured of his incredulity by meeting the butter-churn jumping in at the door as he himself was going out; that the roofs of houses had been torn off, and that several ricks in the corn-yard had danced a quadrille together, to the sound of the devil's bagpipes re-echoing from the mountain-tops. The women in the family of the persecuted farmer of Baldarroch also kept their tongues in perpetual motion; swelling with their strange stories the tide of popular wonder. The

goodwife herself, and all her servants, said that, whenever they went to bed, they were attacked with stones and other missiles, some of which came below the blankets and gently tapped their toes. One evening, a shoe suddenly darted across a garret where some labourers were sitting, and one of the men, who attempted to catch it, swore positively that it was so hot and heavy he was unable to hold it. It was also said that the bearbeater (a sort of mortar used to bruise barley in)—an object of such weight that it requires several men to move it—spontaneously left the barn and flew over the house-top, alighting at the feet of one of the servant-maids, and hitting her, but without hurting her in the least, or even causing her any alarm; it being a fact well known to her, that all objects thus thrown about by the devil lost their specific gravity, and could harm nobody, even though they fell upon a person's head.

Among the persons drawn to Baldarroch by these occurrences were the heritor, the minister, and all the elders of the Kirk, under whose superintendence an investigation was immediately commenced. Their proceedings were not promulgated for some days; and, in the mean time, rumour continued to travel through all the Highlands, magnifying each mysterious incident the farther it got from home. It was said, that when the goodwife put her potato-pot on the fire, each potato, as the water boiled, changed into a demon, and grinned horribly at her as she lifted the lid; that not only chairs and tables, but carrots and turnips, skipped along the floor in the merriest manner imaginable; that shoes and boots went through all the evolutions of the Highland fling without any visible wearers directing their motions; and that a piece of meat detached itself from the hook on which it hung in the pantry, and placed itself before the fire, whence all the efforts of the people of the house were unable to remove it until it was thoroughly roasted; and that it then flew up the chimney with a tremendous bang. At Baldarroch itself the belief was not quite so extravagant; but the farmer was so convinced that the devil and his imps were alone the cause of all the disturbance, that he travelled a distance of

forty miles to an old conjuror, named Willie Foreman, to induce him, for a handsome fee, to remove the enchantment from his property. There were, of course, some sensible and educated people, who, after stripping the stories circulated of their exaggeration, attributed all the rest to one or other of two causes; first, that some gipsies, or strolling mendicants, hidden in the neighbouring plantation, were amusing themselves by working on the credulity of the country people; or, secondly, that the inmates of Baldarroch carried on this deception themselves, for some reason or other, which was not very clear to any body. The last opinion gained but few believers, as the farmer and his family were much respected; and so many persons had, in the most open manner, expressed their belief in the supernatural agency, that they did not like to stultify themselves by confessing that they had been deceived.

At last, after a fortnight's continuance of the noises, the whole trick was discovered. The two servant lasses were strictly examined, and then committed to prison. It appeared that they were alone at the bottom of the whole affair, and that the extraordinary alarm and credulity of their master and mistress, in the first instance, and of the neighbours and country people afterwards, made their task comparatively easy. A little common dexterity was all they had used; and, being themselves unsuspected, they swelled the alarm by the wonderful stories they invented. It was they who loosened the bricks in the chimneys, and placed the dishes in such a manner on the shelves, that they fell on the slightest motion. In short, they played the same tricks as those used by the servant girl at Stockwell, with the same results, and for the same purpose—the gratification of a love of mischief. They were no sooner secured in the county gaol than the noises ceased, and most people were convinced that human agency alone had worked all the wonder. Some few of the most devoutly superstitious still held out in their first belief, and refused to listen to any explanation.

These tales of haunted houses, especially those of the last and present century, however they may make us blush for popular folly, are yet

gratifying in their results; for they shew that society has made a vast improvement. Had Parsons and his wife, and the other contrivers of the Cock Lane deception, lived two hundred years earlier, they would not perhaps have found a greater number of dupes, but they would have been hanged as witches, instead of being imprisoned as vagabonds. The ingenious Anne Robinson and the sly lasses of Baldarroch would doubtless have met a similar fate. Thus it is pleasant to reflect, that though there may be as much folly and credulity in the world as ever in one class of society, there is more wisdom and mercy in another than ever were known before. Lawgivers, by blotting from the statute-book the absurd or sanguinary enactments of their predecessors, have made one step towards teaching the people. It is to be hoped that the day is not far distant when lawgivers will teach the people by some more direct means, and prevent the recurrence of delusions like these, and many worse, which might be cited, by securing to every child born within their dominions an education in accordance with the advancing state of civilisation. If ghosts and witches are not yet altogether exploded, it is the fault, not so much of the ignorant people, as of the law and the government that have neglected to enlighten them.

POPULAR FOLLIES OF GREAT CITIES.

La faridondaine—la faridondon,
Vive la faridondaine!—*Beranger.*

THE popular humours of a great city are a never-failing source of amusement to the man whose sympathies are hospitable enough to embrace all his kind, and who, refined though he may be himself, will not sneer at the humble wit or grotesque peculiarities of the boozing mechanic, the squalid beggar, the vicious urchin, and all the motley group of the idle, the reckless, and the imitative that swarm in the alleys and broadways of a metropolis. He who walks through a great city to find subjects for weeping, may find plenty at every corner to wring his heart; but let such a man walk on his course, and enjoy his grief alone—we are not of those who would accompany him. The miseries of us poor earth-dwellers gain no alleviation from the sympathy of those who merely hunt them out to be pathetic over them. The weeping philosopher too often impairs his eyesight by his woe, and becomes unable from his tears to see the remedies for the evils which he deploras. Thus it will often be found

that the man of no tears is the truest philanthropist, as he is the best physician who wears a cheerful face, even in the worst of cases.

So many pens have been employed to point out the miseries, and so many to condemn the crimes and vices, and more serious follies of the multitude, that ours shall not increase the number, at least in this chapter. Our present task shall be less ungracious, and wandering through the busy haunts of great cities, we shall seek only for amusement, and note as we pass a few of the harmless follies and whimsies of the poor.

And, first of all, walk where we will, we cannot help hearing from every side a phrase repeated with delight, and received with laughter, by men with hard hands and dirty faces, by saucy butcher lads and errand-boys, by loose women, by hackney coachmen, cabriolet-drivers, and idle fellows who loiter at the corners of streets. Not one utters this phrase without producing a laugh from all within hearing. It seems applicable to every circumstance, and is the universal answer to every question; in short, it is the favourite slang phrase of the day, a phrase that, while its brief season of popularity lasts, throws a dash of fun and frolicsomeness over the existence of squalid poverty and ill-requited labour, and gives them reason to laugh as well as their more fortunate fellows in a higher stage of society.

London is peculiarly fertile in this sort of phrases, which spring up suddenly, no one knows exactly in what spot, and pervade the whole population in a few hours, no one knows how. Many years ago the favourite phrase (for, though but a monosyllable, it was a phrase in itself) was Quoz. This odd word took the fancy of the multitude in an extraordinary degree, and very soon acquired an almost boundless meaning. When vulgar wit wished to mark its incredulity, and raise a

laugh at the same time, there was no resource so sure as this popular piece of slang. When a man was asked a favour which he did not choose to grant, he marked his sense of the suitor's unparalleled presumption by exclaiming *Quoz!* When a mischievous urchin wished to annoy a passenger, and create mirth for his comrades, he looked him in the face, and cried out *Quoz!* and the exclamation never failed in its object. When a disputant was desirous of throwing a doubt upon the veracity of his opponent, and getting summarily rid of an argument which he could not overturn, he uttered the word *Quoz*, with a contemptuous curl of his lip, and an impatient shrug of his shoulders. The universal monosyllable conveyed all his meaning, and not only told his opponent that he lied, but that he erred egregiously if he thought that any one was such a nincompoop as to believe him. Every alehouse resounded with *Quoz*; every street-corner was noisy with it, and every wall for miles around was chalked with it.

But, like all other earthly things, *Quoz* had its season, and passed away as suddenly as it arose, never again to be the pet and the idol of the populace. A new claimant drove it from its place, and held undisputed sway till, in its turn, it was hurled from its pre-eminence, and a successor appointed in its stead.

“*What a shocking bad hat!*” was the phrase that was next in vogue. No sooner had it become universal, than thousands of idle but sharp eyes were on the watch for the passenger whose hat shewed any signs, however slight, of ancient service. Immediately the cry arose, and, like the war-whoop of the Indians, was repeated by a hundred discordant throats. He was a wise man who, finding himself under these circumstances “the observed of all observers,” bore his honours

meekly. He who shewed symptoms of ill-feeling at the imputations cast upon his hat, only brought upon himself redoubled notice. The mob soon perceive whether a man is irritable, and, if of their own class, they love to make sport of him. When such a man, and with such a hat, passed in those days through a crowded neighbourhood, he might think himself fortunate if his annoyances were confined to the shouts and cries of the populace. The obnoxious hat was often snatched from his head and thrown into the gutter by some practical joker, and then raised, covered with mud, upon the end of a stick, for the admiration of the spectators, who held their sides with laughter, and exclaimed, in the pauses of their mirth, "*Oh, what a shocking bad hat!*" "*What a shocking bad hat!*" Many a nervous poor man, whose purse could but ill spare the outlay, doubtless purchased a new hat before the time, in order to avoid exposure in this manner.

The origin of this singular saying, which made fun for the metropolis for months, is not involved in the same obscurity as that which shrouds the origin of *Quoz* and some others. There had been a hotly contested election for the borough of Southwark, and one of the candidates was an eminent hatter. This gentleman, in canvassing the electors, adopted a somewhat professional mode of conciliating their good-will, and of bribing them without letting them perceive that they were bribed. Whenever he called upon or met a voter whose hat was not of the best material, or, being so, had seen its best days, he invariably said, "*What a shocking bad hat you have got; call at my warehouse, and you shall have a new one!*" Upon the day of election this circumstance was remembered, and his opponents made the most of it, by inciting the crowd to keep up an incessant cry of "*What a shocking bad hat!*" all the time the honourable candidate was

addressing them. From Southwark the phrase spread over all London, and reigned for a time the supreme slang of the season.

Hookey Walker, derived from the chorus of a popular ballad, was also high in favour at one time, and served, like its predecessor *Quoz*, to answer all questions. In the course of time, the latter word alone became the favourite, and was uttered with a peculiar drawl upon the first syllable, and a sharp turn upon the last. If a lively servant girl was importuned for a kiss by a fellow she did not care about, she cocked her little nose, and cried "*Walker!*" If a dustman asked his friend for the loan of a shilling, and his friend was either unable or unwilling to accommodate him, the probable answer he would receive was, "*Walker!*" If a drunken man was reeling about the streets, and a boy pulled his coat-tails, or a man knocked his hat over his eyes to make fun of him, the joke was always accompanied by the same exclamation. This lasted for two or three months, and "*Walker!*" walked off the stage, never more to be revived for the entertainment of that or any future generation.

The next phrase was a most preposterous one. Who invented it, how it arose, or where it was first heard, are alike unknown. Nothing about it is certain, but that for months it was *the slang par excellence* of the Londoners, and afforded them a vast gratification. "*There he goes with his eye out!*" or "*There she goes with her eye out!*" as the sex of the party alluded to might be, was in the mouth of every body who knew the town. The sober part of the community were as much puzzled by this unaccountable saying as the vulgar were delighted with it. The wise thought it very foolish, but the many thought it very funny, and the idle amused themselves by chalking it upon walls, or scribbling it upon monuments. But "all that's bright must fade," even

in slang. The people grew tired of their hobby, and "*There he goes with his eye out!*" was heard no more in its accustomed haunts.

Another very odd phrase came into repute in a brief space afterwards, in the form of the impertinent and not universally apposite query, "*Has your mother sold her mangle?*" But its popularity was not of that boisterous and cordial kind which ensures a long continuance of favour. What tended to impede its progress was, that it could not be well applied to the older portions of society. It consequently ran but a brief career, and then sank into oblivion. Its successor enjoyed a more extended fame, and laid its foundations so deep, that years and changing fashions have not sufficed to eradicate it. This phrase was "*Flare up!*" and it is, even now, a colloquialism in common use. It took its rise in the time of the Reform riots, when Bristol was nearly half burned by the infuriated populace. The flames were said to have *flared up* in the devoted city. Whether there was any thing peculiarly captivating in the sound, or in the idea of these words, is hard to say; but whatever was the reason, it tickled the mob-fancy mightily, and drove all other slang out of the field before it. Nothing was to be heard all over London but "*flare up!*" It answered all questions, settled all disputes, was applied to all persons, all things, and all circumstances, and became suddenly the most comprehensive phrase in the English language. The man who had overstepped the bounds of decorum in his speech was said to have *flared up*; he who had paid visits too repeated to the gin-shop, and got damaged in consequence, had *flared up*. To put one's self into a passion; to stroll out on a nocturnal frolic, and alarm a neighbourhood, or to create a disturbance in any shape, was to *flare up*. A lovers' quarrel was a *flare up*; so was a boxing-match

between two blackguards in the streets; and the preachers of sedition and revolution recommended the English nation to *flare up*, like the French. So great a favourite was the word, that people loved to repeat it for its very sound. They delighted apparently in hearing their own organs articulate it; and labouring men, when none who could respond to the call were within hearing, would often startle the aristocratic echoes of the West by the well-known slang phrase of the East. Even in the dead hours of the night, the ears of those who watched late, or who could not sleep, were saluted with the same sound. The drunkard reeling home shewed that he was still a man and a citizen, by calling "*flare up!*" in the pauses of his hiccough. Drink had deprived him of the power of arranging all other ideas; his intellect was sunk to the level of the brute's; but he clung to humanity by the one last link of the popular cry. While he could vociferate that sound, he had rights as an Englishman, and would not sleep in a gutter, like a dog! Onwards he went, disturbing quiet streets and comfortable people by his whoop, till exhausted nature could support him no more, and he rolled powerless into the road. When, in due time afterwards, the policeman stumbled upon him as he lay, that guardian of the peace turned the full light of his lantern on his face, and exclaimed, "Here's a poor devil who has been *flaring up!*" Then came the stretcher, on which the victim of deep potations was carried to the watch-house, and pitched into a dirty cell, among a score of wretches about as far gone as himself, who saluted their new comrade by a loud, long shout of *flare up!*

So universal was this phrase, and so enduring seemed its popularity, that a speculator, who knew not the evanescence of slang, established a weekly newspaper under its name. But he was like the

man who built his house upon the sand; his foundation gave way under him, and the phrase and the newspaper were washed into the mighty sea of the things that were. The people grew at last weary of the monotony, and "*flare up*" became vulgar even among them. Gradually it was left to little boys who did not know the world, and in process of time sank altogether into neglect. It is now heard no more as a piece of popular slang; but the words are still used to signify any sudden outburst either of fire, disturbance, or ill-nature.

The next phrase that enjoyed the favour of the million was less concise, and seems to have been originally aimed against precocious youths who gave themselves the airs of manhood before their time. "*Does your mother know you're out?*" was the provoking query addressed to young men of more than reasonable swagger, who smoked cigars in the streets, and wore false whiskers to look irresistible. We have seen many a conceited fellow who could not suffer a woman to pass him without staring her out of countenance, reduced at once into his natural insignificance by the mere utterance of this phrase. Apprentice lads and shopmen in their Sunday clothes held the words in abhorrence, and looked fierce when they were applied to them. Altogether the phrase had a very salutary effect, and in a thousand instances shewed young Vanity that it was not half so pretty and engaging as it thought itself. What rendered it so provoking was the doubt it implied as to the capability of self-guidance possessed by the individual to whom it was addressed. "*Does your mother know you're out?*" was a query of mock concern and solicitude, implying regret and concern that one so young and inexperienced in the ways of a great city should be allowed to wander abroad without the guidance of a parent. Hence the great wrath of

those who verged on manhood, but had not reached it, whenever they were made the subject of it. Even older heads did not like it; and the heir of a ducal house, and inheritor of a warrior's name, to whom they were applied by a cabriolet-driver who was ignorant of his rank, was so indignant at the affront, that he summoned the offender before the magisterial bench. The fellow had wished to impose upon his lordship by asking double the fare he was entitled to; and when his lordship resisted the demand, he was insultingly asked "if his mother knew he was out?" All the drivers on the stand joined in the query, and his lordship was fain to escape their laughter by walking away with as much haste as his dignity would allow. The man pleaded ignorance that his customer was a lord, but offended justice fined him for his mistake.

When this phrase had numbered its appointed days, it died away like its predecessors, and "*Who are you?*" reigned in its stead. This new favourite, like a mushroom, seems to have sprung up in a night, or, like a frog in Cheapside, to have come down in a sudden shower. One day it was unheard, unknown, uninvented; the next it pervaded London. Every alley resounded with it; every highway was musical with it,

"And street to street, and lane to lane flung back
The one unvarying cry."

The phrase was uttered quickly, and with a sharp sound upon the first and last words, leaving the middle one little more than an aspiration. Like all its compeers which had been extensively popular, it was applicable to almost every variety of circumstance. The lovers

of a plain answer to a plain question did not like it at all. Insolence made use of it to give offence; ignorance to avoid exposing itself; and waggery to create laughter. Every new comer into an alehouse tap-room was asked unceremoniously, "*Who are you?*" and if he looked foolish, scratched his head, and did not know what to reply, shouts of boisterous merriment resounded on every side. An authoritative disputant was not unfrequently put down, and presumption of every kind checked by the same query. When its popularity was at its height, a gentleman, feeling the hand of a thief in his pocket, turned suddenly round and caught him in the act, exclaiming, "*Who are you?*" The mob which gathered round applauded to the very echo, and thought it the most capital joke they had ever heard, the very acmé of wit, the very essence of humour. Another circumstance of a similar kind gave an additional fillip to the phrase, and infused new life and vigour into it just as it was dying away. The scene occurred in the chief criminal court of the kingdom. A prisoner stood at the bar; the offence with which he had been charged was clearly proved against him; his counsel had been heard, not in his defence, but in extenuation, insisting upon his previous good life and character as reasons for the lenity of the court. "And where are your witnesses?" inquired the learned judge who presided. "Please you, my lord, I know the prisoner at the bar, and a more honest feller never breathed," said a rough voice in the gallery. The officers of the court looked aghast, and the strangers tittered with ill-suppressed laughter. "*Who are you?*" said the judge, looking suddenly up, but with imperturbable gravity. The court was convulsed; the titter broke out into a laugh; and it was several minutes before silence and decorum could be restored. When the ushers recovered their self-

possession, they made diligent search for the profane transgressor; but he was not to be found. Nobody knew him; nobody had seen him. After a while the business of the court again proceeded. The next prisoner brought up for trial augured favourably of his prospects when he learned that the solemn lips of the representative of justice had uttered the popular phrase as if he felt and appreciated it. There was no fear that such a judge would use undue severity. His heart was with the people; he understood their language and their manners, and would make allowances for the temptations which drove them into crime. So thought many of the prisoners, if we may infer it from the fact that the learned judge suddenly acquired an immense increase of popularity. The praise of his wit was in every mouth, and "*Who are you?*" renewed its lease, and remained in possession of public favour for another term in consequence.

But it must not be supposed that there were no interregna between the dominion of one slang phrase and another. They did not arise in one long line of unbroken succession, but shared with song the possession of popular favour. Thus, when the people were in the mood for music, slang advanced its claims to no purpose; and when they were inclined for slang, the sweet voice of music wooed them in vain. About thirty years ago London resounded with one chorus, with the love of which every body seemed to be smitten. Girls and boys, young men and old, maidens and wives and widows, were all alike musical. There was an absolute mania for singing; and the worst of it was, that, like good Father Philip in the romance of *The Monastery*, they seemed utterly unable to change their tune. "Cherry ripe!" "Cherry ripe!" was the universal cry of all the idle in the town. Every unmelodious voice gave utterance to it; every crazy fiddle, every

cracked flute, every wheezy pipe, every street-organ was heard in the same strain, until studious and quiet men stopped their ears in desperation, or fled miles away into the fields or woodlands to be at peace. This plague lasted for a twelvemonth, until the very name of cherries became an abomination in the land. At last the excitement wore itself away, and the tide of favour set in a new direction. Whether it was another song or a slang phrase is difficult to determine at this distance of time; but certain it is, that very shortly afterwards people went mad upon a dramatic subject, and nothing was to be heard of but "*Tommy and Jerry.*" Verbal wit had amused the multitude long enough, and they became more practical in their recreation. Every youth on the town was seized with the fierce desire of distinguishing himself by knocking down the "*charlies,*" being locked up all night in a watch-house, or kicking up a row among loose women and blackguard men in the low dens of St. Giles's. Imitative boys vied with their elders in similar exploits, until this unworthy passion (for such it was) had lasted, like other follies, its appointed time, and the town became merry after another fashion. It was next thought the height of vulgar wit to answer all questions by placing the point of the thumb upon the tip of the nose, and twirling the fingers in the air. If one man wished to insult or annoy another, he had only to make use of this cabalistic sign in his face, and his object was accomplished. At every street-corner where a group was assembled, the spectator who was curious enough to observe their movements would be sure to see the fingers of some of them at their noses, either as a mark of incredulity, surprise, refusal, or mockery, before he had watched two minutes. There is some remnant of this

absurd custom to be seen to this day; but it is thought low even among the vulgar.

About sixteen years ago, London became again most preposterously musical. The *vox populi* wore itself hoarse by singing the praises of “The Sea, the Sea!” If a stranger (and a philosopher) had walked through London, and listened to the universal chorus, he might have constructed a very pretty theory upon the love of the English for the sea-service, and our acknowledged superiority over all other nations upon that element. “No wonder,” he might have said, “that this people is invincible upon the ocean. The love of it mixes with their daily thoughts; they celebrate it even in the market-place; their street-minstrels excite charity by it; and high and low, young and old, male and female, chant *lo pæans* in its praise. Love is not honoured in the national songs of this warlike race—Bacchus is no god to them; they are men of sterner mould, and think only of ‘the Sea, the Sea!’ and the means of conquering upon it.”

Such would, doubtless, have been his impression if he had taken the evidence only of his ears. Alas, in those days for the refined ears that *were* musical! great was their torture when discord, with its thousand diversities of tone, struck up this appalling anthem—there was no escape from it. The migratory minstrels of Savoy caught the strain, and pealed it down the long vistas of quiet streets, till their innermost and snuggest apartments re-echoed with the sound. Men were obliged to endure this crying evil for full six months, wearied to desperation, and made *sea-sick* on the dry land.

Several other songs sprang up in due succession, afterwards, but none of them, with the exception of one, entitled “All round my Hat,” enjoyed any extraordinary share of favour, until an American actor

introduced a vile song called “Jim Crow.” The singer sang his verses in appropriate costume, with grotesque gesticulations, and a sudden whirl of his body at the close of each verse. It took the taste of the town immediately, and for months the ears of orderly people were stunned by the senseless chorus—

“Turn about and wheel about,
And do just so—
Turn about and wheel about,
And jump, Jim Crow!”

Street-minstrels blackened their faces in order to give proper effect to the verses; and fatherless urchins, who had to choose between thieving and singing for their livelihood, took the latter course, as likely to be the more profitable, as long as the public taste remained in that direction. The uncouth dance, its accompaniment, might be seen in its full perfection on market nights in any great thoroughfare; and the words of the song might be heard, piercing above all the din and buzz of the ever-moving multitude. He, the calm observer, who during the hey-day popularity of this doggrel,

“Sate beside the public way,
Thick strewn with summer dust, and saw the stream
Of people there was hurrying to and fro,
Numerous as gnats upon the evening gleam,”

might have exclaimed with Shelley, that

“The million, with fierce song and maniac dance,
Did rage around.”

The philosophic theorist we have already supposed soliloquising upon the English character, and forming his opinion of it from their exceeding love for a sea-song, might, if he had again dropped suddenly into London, have formed another very plausible theory to account for our unremitting efforts for the abolition of the slave-trade. “Benevolent people!” he might have said, “how unbounded are your sympathies! Your unhappy brethren of Africa, differing from you only in the colour of their skins, are so dear to you, and you begrudge so little the twenty millions you have paid on their behalf, that you love to have a memento of them continually in your sight. Jim Crow is the representative of that injured race, and as such is the idol of your populace! See how they all sing his praises! how they imitate his peculiarities! how they repeat his name in their moments of leisure and relaxation! They even carve images of him to adorn their hearths, that his cause and his sufferings may never be forgotten! Oh, philanthropic England! oh, vanguard of civilisation!”

Such are a few of the peculiarities of the London multitude, when no riot, no execution, no murder, no balloon, disturbs the even current of their thoughts. These are the whimsies of the mass—the harmless follies by which they unconsciously endeavour to lighten the load of care which presses upon their existence. The wise man, even though he smile at them, will not altogether withhold his sympathy, and will say, “Let them enjoy their slang phrases and their choruses if they will; and if they cannot be happy, at least let them be merry.” To the Englishman, as well as to the Frenchman of whom

Beranger sings, there may be some comfort in so small a thing as a song, and we may own with him that

“Au peuple attristé
Ce qui rendra la gaîté,
C’est la GAUDRIOLE!
O gué!
C’est la GAUDRIOLE!”

SHERWOOD FOREST.

POPULAR ADMIRATION OF GREAT THIEVES.

Jack. Where shall we find such another set of practical philosophers, who,
to a man, are above the fear of death!

Wat. Sound men and true!

Robin. Of tried courage and indefatigable industry!

Ned. Who is there here that would not die for his friend?

Harry. Who is there here that would betray him for his interest?

Mat. Shew me a gang of courtiers that could say as much!

Dialogue of Thieves in the Beggar's Opera.

WHETHER it be that the multitude, feeling the pangs of poverty, sympathise with the daring and ingenious depredators who take away the rich man's superfluity, or whether it be the interest that mankind in general feel for the records of perilous adventure, it is certain that the populace of all countries look with admiration upon great and successful thieves. Perhaps both these causes combine to invest their career with charms in the popular eye. Almost every country in Europe has its traditional thief, whose exploits are recorded with all the graces of poetry, and whose trespasses

“Are cited up in rhymes,
And sung by children in succeeding tunes.”⁴⁵

Those travellers who have made national manners and characteristics their peculiar study, have often observed and remarked upon this feeling. The learned Abbé le Blanc, who resided for some time in England at the commencement of the eighteenth century, says, in his amusing letters on the English and French nations, that he continually met with Englishmen

who were not less vain in boasting of the success of their highwaymen than of the bravery of their troops. Tales of their address, their cunning, or their generosity, were in the mouths of every body, and a noted thief was a kind of hero in high repute. He adds that the mob, in all countries, being easily moved, look in general with concern upon criminals going to the gallows; but an English mob looked upon such scenes with extraordinary interest: they delighted to see them go through their last trials with resolution, and applauded those who were insensible enough to die as they had lived, braving the justice both of God and men: such, he might have added, as the noted robber Macpherson, of whom the old ballad says:

“Sae rantingly, sae wantonly,
Sae dauntingly gaed he:
He played a spring, and danced it round
Beneath the gallows tree.”

Among these traditional thieves the most noted in England, or perhaps in any country, is Robin Hood, a name which popular affection has encircled with a peculiar halo. “He robbed the rich to give to the poor;” and his reward has been an immortality of fame, a tithe of which would be thought more than sufficient to recompense a benefactor of his species. Romance and poetry have been emulous to make him all their own; and the forest of Sherwood, in which he roamed with his merry men, armed with their long bows, and clad in Lincoln green, has become the resort of pilgrims, and a classic spot sacred to his memory. The few virtues he had, which would have ensured him no praise if he had been an honest man, have been blazoned forth by popular renown during seven successive centuries, and will never be forgotten while the English tongue endures. His charity to the poor, and his gallantry and respect for women, have made him the pre-eminent thief of all the world.

Among English thieves of a later date, who has not heard of Claude Duval, Dick Turpin, Jonathan Wild, and Jack Sheppard, those knights of the road and of the town, whose peculiar chivalry formed at once the dread and the delight of England during the eighteenth century? Turpin's fame is unknown to no portion of the male population of England after they have attained the age of ten. His wondrous ride from London to York has endeared him to the imagination of millions; his cruelty in placing an old woman upon a fire, to force her to tell him where she had hidden her money, is regarded as a good joke; and his proud bearing upon the scaffold is looked upon as a virtuous action. The Abbé le Blanc, writing in 1737, says he was continually entertained with stories of Turpin—how, when he robbed gentlemen, he would generously leave them enough to continue their journey, and exact a pledge from them never to inform against him, and how scrupulous such gentlemen were in keeping their word. He was one day told a story with which the relator was in the highest degree delighted. Turpin, or some other noted robber, stopped a man whom he knew to be very rich, with the usual salutation—"Your money or your life!" but not finding more than five or six guineas about him, he took the liberty of entreating him, in the most affable manner, never to come out so ill provided; adding that, if he fell in with him, and he had no more than such a paltry sum, he would give him a good licking. Another story, told by one of Turpin's admirers, was of a robbery he had committed upon a Mr. C. near Cambridge. He took from this gentleman his watch, his snuff-box, and all his money but two shillings, and, before he left him, required his word of honour that he would not cause him to be pursued or brought before a justice. The promise being given, they both parted very courteously. They afterwards met at Newmarket, and renewed their acquaintance. Mr. C. kept his word religiously; he not only refrained from giving Turpin into custody, but made a boast that he had fairly won some of his money back again in an honest way. Turpin offered to bet with him on some favourite horse, and Mr. C. accepted the wager with as good a grace as he could have

done from the best gentleman in England. Turpin lost his bet and paid it immediately, and was so smitten with the generous behaviour of Mr. C., that he told him how deeply he regretted that the trifling affair which had happened between them did not permit them to drink together. The narrator of this anecdote was quite proud that England was the birthplace of such a highwayman.⁴⁶

Not less familiar to the people of England is the career of Jack Sheppard, as brutal a ruffian as ever disgraced his country, but who has claims upon the popular admiration which are very generally acknowledged. He did not, like Robin Hood, plunder the rich to relieve the poor, nor rob with an uncouth sort of courtesy, like Turpin; but he escaped from Newgate with the fetters on his limbs. This achievement, more than once repeated, has encircled his felon brow with the wreath of immortality, and made him quite a pattern thief among the populace. He was no more than twenty-three years of age at the time of his execution, and he died much pitied by the crowd. His adventures were the sole topics of conversation for months; the print-shops were filled with his effigies, and a fine painting of him was made by Sir Richard Thornhill. The following complimentary verses to the artist appeared in the *British Journal* of November 28th, 1724:

“Thornhill! ’tis thine to gild with fame
Th’ obscure, and raise the humble name;
To make the form elude the grave,
And Sheppard from oblivion save!

Apelles Alexander drew—
Cæsar is to Aurelius due;
Cromwell in Lilly’s works doth shine,
And Sheppard, Thornhill, lives in thine!”

This was a very equivocal sort of compliment, and might have meant, that if Apelles were worthy to paint a monarch, Thornhill was worthy to paint a thief. But the artist did not view it in that light, nor did the public; for they considered the verses to be very neat, pointed, and flattering. So high was Jack's fame, that he was thought a very fit subject for the stage; and a pantomime entertainment, called "*Harlequin Jack Sheppard*," was devised by one Thurmond, and brought out with considerable success at Drury Lane Theatre. All the scenes were painted from nature, including the public-house that the robber frequented in Clare Market, and the condemned cell from which he had made his escape in Newgate.⁴⁷

The Rev. Mr. Vilette, the editor of the *Annals of Newgate*, published in 1754, relates a curious sermon, which he says a friend of his heard delivered by a street-preacher about the time of Jack's execution. The orator, after animadverting on the great care men took of their bodies, and the little care they bestowed upon their souls, continued as follows, by way of exemplifying the position:—"We have a remarkable instance of this in a notorious malefactor, well known by the name of Jack Sheppard. What amazing difficulties has he overcome! what astonishing things has he performed! and all for the sake of a stinking, miserable carcass, hardly worth the hanging! How dexterously did he pick the chain of his padlock with a crooked nail! how manfully he burst his fetters asunder, climb up the chimney, wrench out an iron bar, break his way through a stone wall, make the strong door of a dark entry fly before him, till he got upon the leads of the prison, then, fixing a blanket to the wall with a spike, he stole out of the chapel! How intrepidly did he descend to the top of the turner's house! how cautiously pass down the stair, and make his escape to the street-door!

"Oh, that ye were all like Jack Sheppard! Mistake me not, my brethren—I don't mean in a carnal, but in a spiritual sense; for I propose to spiritualise these things. What a shame it would be if we

should not think it worth our while to take as much pains, and employ as many deep thoughts to save our souls as he has done to preserve his body!

“Let me exhort ye, then, to open the locks of your hearts with the nail of repentance! Burst asunder the fetters of your beloved lusts, mount the chimney of hope, take from thence the bar of good resolution, break through the stone wall of despair, and all the strongholds in the dark entry of the valley of the shadow of death! Raise yourselves to the leads of divine meditation, fix the blanket of faith with the spike of the Church, let yourselves down to the turner’s house of resignation, and descend the stairs of humility! So shall you come to the door of deliverance from the prison of iniquity, and escape the clutches of that old executioner the devil!”

Jonathan Wild, whose name has been immortalised by Fielding, was no favourite with the people. He had none of the virtues which, combined with crimes, make up the character of the great thief. He was a pitiful fellow, who informed against his comrades, and was afraid of death. This meanness was not to be forgiven by the crowd; and they pelted him with dirt and stones on his way to Tyburn, and expressed their contempt by every possible means. How different was their conduct to Turpin and Jack Sheppard, who died in their neatest attire, with nosegays in their button-holes, and with the courage that a crowd expects. It was anticipated that the body of Turpin would have been delivered up to the surgeons for dissection; and the people seeing some men very busily employed in removing it, suddenly set upon them, rescued the body, bore it about the town in triumph, and then buried it in a very deep grave, filled with quicklime, to hasten the progress of decomposition. They would not suffer the corpse of their hero—of the man who had ridden from London to York in four-and-twenty hours—to be mangled by the rude hands of unmannerly surgeons.

The death of Claude Duval would appear to have been no less triumphant. Claude was a gentlemanly thief. According to Butler, in the famous ode to his memory, he

“Taught the wild Arabs of the road
To rob in a more gentle mode;
Take prizes more obligingly than those
Who never had been bred *filous*;
And how to hang in a more graceful fashion
Than e’er was known before to the dull English nation.”

In fact, he was the pink of politeness, and his gallantry to the fair sex was proverbial. When he was caught at last, pent in “stone walls and chains and iron grates,” their grief was in proportion to his rare merits and his great fame. Butler says, that to his dungeon

“Came ladies from all parts,
To offer up close prisoners their hearts.
Which he received as tribute due—
* * * *
Never did bold knight to relieve
Distressed dames, such dreadful feats achieve,
As feeble damsels for his sake
Would have been proud to undertake,
And, bravely ambitious to redeem
The world’s loss and their own,
Strove who should have the honour to lay down,
And change a life with him.”

Among the noted thieves of France, there is none to compare with the famous Aimerigot Têtenoire, who flourished in the reign of Charles VI. This fellow was at the head of four or five hundred men, and possessed two very strong castles in Limousin and Auvergne. There was a good deal of the feudal baron about him, although he possessed no revenues but such as the road afforded him. At his death he left a singular will. "I give and bequeath," said the robber, "one thousand five hundred francs to St. George's Chapel, for such repairs as it may need; to my sweet girl, who so loyally loved me, I give two thousand five hundred; and the surplus I give to my companions. I hope they will all live as brothers, and divide it amicably among them. If they cannot agree, and the devil of contention gets among them, it is no fault of mine; and I advise them to get a good strong sharp axe, and break open my strong box. Let them scramble for what it contains, and the devil seize the hindmost." The people of Auvergne still recount with admiration the daring feats of this brigand.

Of later years, the French thieves have been such unmitigated scoundrels as to have left but little room for popular admiration. The famous Cartouche, whose name has become synonymous with ruffian in their language, had none of the generosity, courtesy, and devoted bravery which are so requisite to make a robber-hero. He was born at Paris, towards the end of the seventeenth century, and broken alive on the wheel in November 1727. He was, however, sufficiently popular to have been pitied at his death, and afterwards to have formed the subject of a much-admired drama, which bore his name, and was played with great success in all the theatres of France during the years 1734, 5, and 6. In our own day the French have been more fortunate in a robber; Vidocq bids fair to rival the fame of Turpin and Jack Sheppard. Already he has become the hero of many an apocryphal tale—already his compatriots boast of his manifold achievements, and express their doubts whether any other country in Europe could produce a thief so clever, so accomplished, so gentlemanly, as Vidocq.

Germany has its Schinderhannes, Hungary its Schubry, and Italy and Spain a whole host of brigands, whose names and exploits are familiar as household words in the mouths of the children and populace of those countries.

The Italian banditti are renowned over the world; and many of them are not only very religious (after a fashion) but very charitable. Charity from such a source is so unexpected, that the people doat upon them for it. One of them, when he fell into the hands of the police, exclaimed, as they led him away, “Ho fatto più carità!”—“I have given away more in charity than any three convents in these provinces.” And the fellow spoke truth.

In Lombardy, the people cherish the memory of two notorious robbers, who flourished about two centuries ago under the Spanish government. Their story, according to Macfarlane, is contained in a little book well known to all the children of the province, and read by them with much more gusto than their Bibles.

Schinderhannes, the robber of the Rhine, is a great favourite on the banks of the river which he so long kept in awe. Many amusing stories are related by the peasantry⁴⁸ of the scurvy tricks he played off upon rich Jews, or too-presuming officers of justice—of his princely generosity, and undaunted courage. In short, they are proud of him, and would no more consent to have the memory of his achievements dissociated from their river than they would have the rock of Ehrenbreitstein blown to atoms by gunpowder.

There is another robber-hero, of whose character and exploits the people of Germany speak admiringly. Mausch Nadel was captain of a considerable band that infested the Rhine, Switzerland, Alsatia, and Lorraine, during the years 1824, 5, and 6. Like Jack Sheppard, he endeared himself to the populace by his most hazardous escape from prison. Being confined at Bremen, in a dungeon on the third story of the prison of that town, he contrived to let himself down without exciting the vigilance of the sentinels, and to swim across the Weser, though heavily laden with irons.

When about half-way over, he was espied by a sentinel, who fired at him, and shot him in the calf of the leg: but the undaunted robber struck out manfully, reached the shore, and was out of sight before the officers of justice could get ready their boats to follow him. He was captured again in 1826, tried at Mayence, and sentenced to death. He was a tall, strong, handsome man, and his fate, villain as he was, excited much sympathy all over Germany. The ladies especially were loud in their regret that nothing could be done to save a hero so good-looking, and of adventures so romantic, from the knife of the headsman.

Mr. Charles Macfarlane, in speaking of Italian banditti, remarks, that the abuses of the Catholic religion, with its confessions and absolutions, have tended to promote crime of this description. But he adds more truly, that priests and monks have not done half the mischief which has been perpetrated by ballad-mongers and story-tellers. If he had said playwrights also, the list would have been complete. In fact, the theatre, which can only expect to prosper, in a pecuniary sense, by pandering to the tastes of the people, continually recurs to the annals of thieves and banditti for its most favourite heroes. These theatrical robbers, with their picturesque attire, wild haunts, jolly, reckless, devil-may-care manners, take a wonderful hold upon the imagination, and whatever their advocates may say to the contrary, exercise a very pernicious influence upon public morals. In the Memoirs of the Duke of Guise upon the Revolution of Naples in 1647 and 1648, it is stated, that the manners, dress, and mode of life of the Neapolitan banditti were rendered so captivating upon the stage, that the authorities found it absolutely necessary to forbid the representation of dramas in which they figured, and even to prohibit their costume at the masquerades. So numerous were the banditti at this time, that the duke found no difficulty in raising an army of them, to aid him in his endeavours to seize on the throne of Naples. He thus describes them:⁴⁹ “They were three thousand five hundred men, of whom the oldest came short of five-and-forty years, and the youngest was above twenty. They were all tall and

well made, with long black hair, for the most part curled; coats of black Spanish leather, with sleeves of velvet, or cloth of gold; cloth breeches with gold lace, most of them scarlet; girdles of velvet, laced with gold, with two pistols on each side; a cutlass hanging at a belt, suitably trimmed, three fingers broad and two feet long; a hawking-bag at their girdle, and a powder-flask hung about their neck with a great silk riband. Some of them carried firelocks, and others blunderbusses; they had all good shoes, with silk stockings, and every one a cap of cloth of gold, or cloth of silver, of different colours, on his head, which was very delightful to the eye.”

The Beggar's Opera, in our own country, is another instance of the admiration that thieves excite upon the stage. Of the extraordinary success of this piece, when first produced, the following account is given in the notes to *The Dunciad*, and quoted by Johnson in his *Lives of the Poets*: “This piece was received with greater applause than was ever known. Besides being acted in London sixty-three days without interruption, and renewed the next season with equal applause, it spread into all the great towns of England; was played in many places to the thirtieth and fortieth time; at Bath and Bristol, &c. fifty. It made its progress into Wales, Scotland, and Ireland, where it was performed twenty-four days successively. The ladies carried about with them the favourite songs of it in fans, and houses were furnished with it in screens. The fame of it was not confined to the author only. The person who acted Polly, till then obscure, became all at once the favourite of the town;⁵⁰ her pictures were engraved and sold in great numbers; her life written, books of letters and verses to her published, and pamphlets made even of her sayings and jests. Furthermore, it drove out of England, for that season, the Italian Opera, which had carried all before it for ten years.” Dr. Johnson, in his life of the author, says, that Herring, afterwards Archbishop of Canterbury, censured the opera, as giving encouragement, not only to vice, but to crimes, by making the highwayman the hero, and dismissing him at last unpunished; and adds, that it was even said, that after the exhibition the gangs of

robbers were evidently multiplied. The Doctor doubts the assertion, giving as his reason that highwaymen and housebreakers seldom frequent the playhouse, and that it was not possible for any one to imagine that he might rob with safety, because he saw Macheath reprieved upon the stage. But if Johnson had wished to be convinced, he might very easily have discovered that highwaymen and housebreakers did frequent the theatre, and that nothing was more probable than that a laughable representation of successful villany should induce the young and the already vicious to imitate it. Besides, there is the weighty authority of Sir John Fielding, the chief magistrate of Bow Street, who asserted positively, and proved his assertion by the records of his office, that the number of thieves was greatly increased at the time when that opera was so popular.

We have another instance of the same result much nearer our own times. Schiller's *Räuber*, that wonderful play, written by a green youth, perverted the taste and imagination of all the young men in Germany. An accomplished critic of our own country (Hazlitt), speaking of this play, says it was the first he ever read, and such was the effect it produced on him, that "it stunned him, like a blow." After the lapse of five-and-twenty years, he could not forget it; it was still, to use his own words, "an old dweller in the chambers of his brain," and he had not even then recovered enough from it to describe how it was. The high-minded, metaphysical thief, its hero, was so warmly admired, that several raw students, longing to imitate a character they thought so noble, actually abandoned their homes and their colleges, and betook themselves to the forests and the wilds to levy contributions upon travellers. They thought they would, like Moor, plunder the rich, and deliver eloquent soliloquies to the setting sun or the rising moon; relieve the poor when they met them, and drink flasks of Rhenish with their free companions in rugged mountain passes, or in tents in the thicknesses of the forests. But a little experience wonderfully cooled their courage; they found that real, everyday robbers were very unlike the conventional banditti of the stage, and that three months in prison, with

bread and water for their fare, and damp straw to lie upon, was very well to read about by their own firesides, but not very agreeable to undergo in their own proper persons.

Lord Byron, with his soliloquising, high-souled thieves, has, in a slight degree, perverted the taste of the juvenile rhymers of his country. As yet, however, they have shewn more good sense than their fellows of Germany, and have not taken to the woods or the highways. Much as they admire Conrad the Corsair, they will not go to sea, and hoist the black flag for him. By words only, and not by deeds, they testify their admiration, and deluge the periodicals and music-shops of the land with verses describing pirates' and bandits' brides, and robber adventures of every kind.

But it is the playwright who does most harm; and Byron has fewer sins of this nature to answer for than Gay or Schiller. With the aid of scenery, fine dresses and music, and the very false notions they convey, they vitiate the public taste, not knowing,

“Vulgaires rimeurs!

Quelle force ont les arts pour demolir les mœurs.”

In the penny theatres that abound in the poor and populous districts of London, and which are chiefly frequented by striplings of idle and dissolute habits, tales of thieves and murderers are more admired, and draw more crowded audiences, than any other species of representation. There the footpad, the burglar, and the highwayman are portrayed in their natural colours, and give pleasant lessons in crime to their delighted listeners. There the deepest tragedy and the broadest farce are represented in the career of the murderer and the thief, and are applauded in proportion to their depth and their breadth. There, whenever a crime of unusual atrocity is committed, it is brought out afresh, with all its disgusting incidents

copied from the life, for the amusement of those who will one day become its imitators.

With the mere reader the case is widely different; and most people have a partiality for knowing the adventures of noted rogues. Even in fiction they are delightful: witness the eventful story of Gil Blas de Santillane, and of that great rascal Don Guzman d'Alfarache. Here there is no fear of imitation. Poets, too, without doing mischief, may sing of such heroes when they please, wakening our sympathies for the sad fate of Jemmy Dawson, or Gilderoy, or Macpherson the Dauntless; or celebrating in undying verse the wrongs and the revenge of the great thief of Scotland, Rob Roy. If, by the music of their sweet rhymes, they can convince the world that such heroes are but mistaken philosophers, born a few ages too late, and having both a theoretical and practical love for

“The good old rule, the simple plan,
That they should take who have the power,
That they should keep who can;”

the world may perhaps become wiser, and consent to some better distribution of its good things, by means of which thieves may become reconciled to the age, and the age to them. The probability, however, seems to be, that the charmers will charm in vain, charm they ever so wisely.

FIGHT BETWEEN DU GUESCLIN AND TROUSSEL.

DUELS AND ORDEALS.

There was an ancient sage philosopher,
Who swore the world, as he could prove,
Was mad of fighting.—*Hudibras*.

MOST writers, in accounting for the origin of duelling, derive it from the warlike habits of those barbarous nations who overran Europe in the early centuries of the Christian era, and who knew no mode so effectual for settling their differences as the point of the sword. In fact, duelling, taken in its primitive and broadest sense, means nothing more than combating, and is the universal resort of all wild animals, including man, to gain or defend their possessions, or avenge their insults. Two dogs who tear each other for a bone, or two bantams fighting on a dunghill for the love of some beautiful hen, or two fools on Wimbledon Common, shooting at each other to satisfy the laws of offended honour, stand on the same footing in this respect, and are each and all mere duellists. As civilisation advanced, the best-informed men naturally grew ashamed of such a mode of adjusting disputes, and the promulgation of some sort of laws for obtaining redress for injuries was the consequence. Still there were many cases in which the allegations of an accuser could not be rebutted by any positive proof on the part of the accused; and in all these, which must have been exceedingly numerous in the early stages of European society, the combat was resorted to. From its decision there was no appeal. God was supposed to nerve the arm of the combatant whose cause was just, and to grant him the victory over his opponent. As Montesquieu well remarks,⁵¹ this belief was not unnatural among a people just emerging from barbarism. Their manners

being wholly warlike, the man deficient in courage, the prime virtue of his fellows, was not unreasonably suspected of other vices besides cowardice, which is generally found to be co-existent with treachery. He, therefore, who shewed himself most valiant in the encounter was absolved by public opinion from any crime with which he might be charged. As a necessary consequence, society would have been reduced to its original elements, if the men of thought, as distinguished from the men of action, had not devised some means for taming the unruly passions of their fellows. With this view, governments commenced by restricting within the narrowest possible limits the cases in which it was lawful to prove or deny guilt by the single combat. By the law of Gondebaldus king of the Burgundians, passed in the year 501, the proof by combat was allowed in all legal proceedings in lieu of swearing. In the time of Charlemagne, the Burgundian practice had spread over the empire of the Franks, and not only the suitors for justice, but the witnesses, and even the judges, were obliged to defend their cause, their evidence, or their decision at the point of the sword. Louis the Debonnaire, his successor, endeavoured to remedy the growing evil by permitting the duel only in appeals of felony, in civil cases, or issue joined in a writ of right, and in cases of the court of chivalry, or attacks upon a man's knighthood. None were exempt from these trials but women, the sick and the maimed, and persons under fifteen or above sixty years of age. Ecclesiastics were allowed to produce champions in their stead. This practice in the course of time extended to all trials of civil and criminal cases, which had to be decided by battle.

The clergy, whose dominion was an intellectual one, never approved of a system of jurisprudence which tended so much to bring all things under the rule of the strongest arm. From the first they set their faces against duelling, and endeavoured, as far as the prejudices of their age would allow them, to curb the warlike spirit, so alien from the principles of religion. In the Council of Valentia, and afterwards in the Council of Trent, they excommunicated all persons engaged in duelling; and not only them, but

even the assistants and spectators, declaring the custom to be hellish and detestable, and introduced by the devil for the destruction both of body and soul. They added also, that princes who connived at duels should be deprived of all temporal power, jurisdiction, and dominion over the places where they had permitted them to be fought. It will be seen hereafter that this clause only encouraged the practice which it was intended to prevent.

But it was the blasphemous error of these early ages to expect that the Almighty, whenever he was called upon, would work a miracle in favour of a person unjustly accused. The priesthood, in condemning the duel, did not condemn the principle on which it was founded. They still encouraged the popular belief of divine interference in all the disputes or differences that might arise among nations or individuals. It was the very same principle that regulated the ordeals, which with all their influence they supported against the duel. By the former, the power of deciding the guilt or innocence was vested wholly in their hands; while by the latter they enjoyed no power or privilege at all. It is not to be wondered at that, for this reason, if for no other, they should have endeavoured to settle all differences by the peaceful mode. While that prevailed, they were, as they wished to be, the first party in the state; but while the strong arm of individual prowess was allowed to be the judge in all doubtful cases, their power and influence became secondary to those of the nobility.

Thus it was not the mere hatred of bloodshed which induced them to launch the thunderbolts of excommunication against the combatants: it was a desire to retain the power, which, to do them justice, they were in those times the persons best qualified to wield. The germs of knowledge and civilisation lay within the bounds of their order; for they were the representatives of the intellectual, as the nobility were of the physical power of man. To centralise this power in the Church, and make it the judge of the last resort in all appeals, both in civil and criminal cases, they instituted five modes of trial, the management of which lay wholly in their hands. These were, the oath upon the evangelists; the ordeal of the cross

and the fire ordeal, for persons in the higher ranks; the water ordeal, for the humbler classes; and, lastly, the *corsned*, or bread and cheese ordeal, for members of their own body.

The oath upon the evangelists was taken in the following manner. The accused who was received to this proof, says Paul Hay, Count du Chastelet, in his *Memoirs of Bertrand du Guesclin*, swore upon a copy of the New Testament, and on the relics of the holy martyrs, or on their tombs, that he was innocent of the crime imputed to him. He was also obliged to find twelve persons of acknowledged probity who should take oath at the same time that they believed him innocent. This mode of trial led to very great abuses, especially in cases of disputed inheritance, where the hardest swearer was certain of the victory. This abuse was one of the principal causes which led to the preference given to the trial by battle. It is not at all surprising that a feudal baron, or captain of the early ages, should have preferred the chances of a fair fight with his opponent to a mode by which firm perjury would always be successful.

The trial by, or judgment of, the cross, which Charlemagne begged his sons to have recourse to, in case of disputes arising between them, was performed thus:—When a person accused of any crime had declared his innocence upon oath, and appealed to the cross for its judgment in his favour, he was brought into the church, before the altar. The priests previously prepared two sticks exactly like one another, upon one of which was carved a figure of the cross. They were both wrapped up with great care and many ceremonies, in a quantity of fine wool, and laid upon the altar, or on the relics of the saints. A solemn prayer was then offered up to God, that he would be pleased to discover, by the judgment of his holy cross, whether the accused person were innocent or guilty. A priest then approached the altar, and took up one of the sticks, and the assistants unswathed it reverently. If it was marked with the cross, the accused person was innocent; if unmarked, he was guilty. It would be unjust to assert, that the judgments thus delivered were, in all cases, erroneous; and

it would be absurd to believe that they were left altogether to chance. Many true judgments were doubtless given, and, in all probability, most conscientiously; for we cannot but believe that the priests endeavoured beforehand to convince themselves by secret inquiry and a strict examination of the circumstances, whether the appellant were innocent or guilty, and that they took up the crossed or uncrossed stick accordingly. Although, to all other observers, the sticks, as enfolded in the wool, might appear exactly similar, those who enwrapped them could, without any difficulty, distinguish the one from the other.

By the fire-ordeal the power of deciding was just as unequivocally left in their hands. It was generally believed that fire would not burn the innocent, and the clergy, of course, took care that the innocent, or such as it was their pleasure or interest to declare so, should be so warned before undergoing the ordeal, as to preserve themselves without any difficulty from the fire. One mode of ordeal was to place red-hot ploughshares on the ground at certain distances, and then, blindfolding the accused person, make him walk barefooted over them. If he stepped regularly in the vacant spaces, avoiding the fire, he was adjudged innocent; if he burned himself, he was declared guilty. As none but the clergy interfered with the arrangement of the ploughshares, they could always calculate beforehand the result of the ordeal. To find a person guilty, they had only to place them at irregular distances, and the accused was sure to tread upon one of them. When Emma, the wife of King Ethelred, and mother of Edward the Confessor, was accused of a guilty familiarity with Alwyn Bishop of Winchester, she cleared her character in this manner. The reputation, not only of their order, but of a queen, being at stake, a verdict of guilty was not to be apprehended from any ploughshares which priests had the heating of. This ordeal was called the *Judicium Dei*, and sometimes the *Vulgaris Purgatio*, and might also be tried by several other methods. One was to hold in the hand, unhurt, a piece of red-hot iron, of the weight of one, two, or three pounds. When we read not only that men with hard hands, but

women of softer and more delicate skin, could do this with impunity, we must be convinced that the hands were previously rubbed with some preservative, or that the apparently hot iron was merely cold iron painted red. Another mode was to plunge the naked arm into a caldron of boiling water. The priests then enveloped it in several folds of linen and flannel, and kept the patient confined within the church, and under their exclusive care, for three days. If, at the end of that time, the arm appeared without a scar, the innocence of the accused person was firmly established.⁵²

As regards the water-ordeal, the same trouble was not taken. It was a trial only for the poor and humble, and, whether they sank or swam, was thought of very little consequence. Like the witches of more modern times, the accused were thrown into a pond or river; if they sank, and were drowned, their surviving friends had the consolation of knowing that they were innocent; if they swam, they were guilty. In either case society was rid of them.

But of all the ordeals, that which the clergy reserved for themselves was the one least likely to cause any member of their corps to be declared guilty. The most culpable monster in existence came off clear when tried by this method. It was called the *Corsned*, and was thus performed. A piece of barley bread and a piece of cheese were laid upon the altar, and the accused priest, in his full canonicals, and surrounded by all the pompous adjuncts of Roman ceremony, pronounced certain conjurations, and prayed with great fervency for several minutes. The burden of the prayer was, that if he were guilty of the crime laid to his charge, God would send his angel Gabriel to stop his throat, that he might not be able to swallow the bread and cheese. There is no instance upon record of a priest having been choked in this manner.⁵³

When, under Pope Gregory VII., it was debated whether the Gregorian chant should be introduced into Castile, instead of the Musarabic, given by St. Isidore of Seville to the churches of that kingdom, very much ill feeling was excited. The churches refused to receive the novelty, and it was

proposed that the affair should be decided by a battle between two champions, one chosen from each side. The clergy would not consent to a mode of settlement which they considered impious, but had no objection to try the merits of each chant by the fire-ordeal. A great fire was accordingly made, and a book of the Gregorian and one of the Musarabic chant were thrown into it, that the flames might decide which was most agreeable to God by refusing to burn it. Cardinal Baronius, who says he was an eye-witness of the miracle, relates, that the book of the Gregorian chant was no sooner laid upon the fire, than it leaped out uninjured, visibly, and with a great noise. Every one present thought that the saints had decided in favour of Pope Gregory. After a slight interval, the fire was extinguished; but, wonderful to relate! the other book of St. Isidore was found covered with ashes, but not injured in the slightest degree. The flames had not even warmed it. Upon this it was resolved, that both were alike agreeable to God, and that they should be used by turns in all the churches of Seville.⁵⁴

If the ordeals had been confined to questions like this, the laity would have had little or no objection to them; but when they were introduced as decisive in all the disputes that might arise between man and man, the opposition of all those whose prime virtue was personal bravery, was necessarily excited. In fact, the nobility, from a very early period, began to look with jealous eyes upon them. They were not slow to perceive their true purport, which was no other than to make the Church the last court of appeal in all cases, both civil and criminal: and not only did the nobility prefer the ancient mode of single combat from this cause, in itself a sufficient one, but they clung to it because an acquittal gained by those displays of courage and address which the battle afforded, was more creditable in the eyes of their compeers, than one which it required but little or none of either to accomplish. To these causes may be added another, which was perhaps more potent than either in raising the credit of the judicial combat at the expense of the ordeal. The noble institution of chivalry was beginning to take root, and, notwithstanding the clamours of

the clergy, war was made the sole business of life, and the only elegant pursuit of the aristocracy. The fine spirit of honour was introduced, any attack upon which was only to be avenged in the lists, within sight of applauding crowds, whose verdict of approbation was far more gratifying than the cold and formal acquittal of the ordeal. Lothaire, the son of Louis I., abolished that by fire and the trial of the cross within his dominions; but in England they were allowed so late as the time of Henry III., in the early part of whose reign they were prohibited by an order of council. In the mean time, the Crusades had brought the institution of chivalry to the full height of perfection. The chivalric spirit soon achieved the downfall of the ordeal system, and established the judicial combat on a basis too firm to be shaken. It is true that with the fall of chivalry, as an institution, fell the tournament and the encounter in the lists; but the duel, their offspring, has survived to this day, defying the efforts of sages and philosophers to eradicate it. Among all the errors bequeathed to us by a barbarous age, it has proved the most pertinacious. It has put variance between men's reason and their honour; put the man of sense on a level with the fool, and made thousands who condemn it submit to it or practise it.

Those who are curious to see the manner in which these combats were regulated, may consult the learned Montesquieu, where they will find a copious summary of the code of ancient duelling.⁵⁵ Truly does he remark, in speaking of the clearness and excellence of the arrangements, that, as there were many wise matters which were conducted in a very foolish manner, so there were many foolish matters conducted very wisely. No greater exemplification of it could be given than the wise and religious rules of the absurd and blasphemous trial by battle.

In the ages that intervened between the Crusades and the new era that was opened out by the invention of gunpowder and printing, a more rational system of legislation took root. The inhabitants of cities, engaged in the pursuits of trade and industry, were content to acquiesce in the decisions of their judges and magistrates whenever any differences arose

among them. Unlike the class above them, their habits and manners did not lead them to seek the battle-field on every slight occasion. A dispute as to the price of a sack of corn, a bale of broad-cloth, or a cow, could be more satisfactorily adjusted before the mayor or bailiff of their district. Even the martial knights and nobles, quarrelsome as they were, began to see that the trial by battle would lose its dignity and splendour if too frequently resorted to. Governments also shared this opinion, and on several occasions restricted the cases in which it was legal to proceed to this extremity. In France, before the time of Louis IX., duels were permitted only in cases of *lèse majesté*, *rape*, *incendiarism*, *assassination*, and *burglary*. Louis IX., by taking off all restriction, made them legal in civil cases. This was not found to work well, and, in 1303, Philip the Fair judged it necessary to confine them, in criminal matters, to state offences, rape, and incendiarism; and in civil cases, to questions of disputed inheritance. Knighthood was allowed to be the best judge of its own honour, and might defend or avenge it as often as occasion arose.

Among the earliest duels upon record, is a very singular one that took place in the reign of Louis II. (A. D. 878). Ingelgerius count of Gastinois was one morning discovered by his countess dead in bed at her side. Gontran, a relation of the count, accused the countess of having murdered her husband, to whom, he asserted, she had long been unfaithful, and challenged her to produce a champion to do battle in her behalf, that he might establish her guilt by killing him.⁵⁶ All the friends and relatives of the countess believed in her innocence; but Gontran was so stout and bold and renowned a warrior that no one dared to meet him, for which, as Brantôme quaintly says, “mauvais et poltrons parens estaient.” The unhappy countess began to despair, when a champion suddenly appeared in the person of Ingelgerius count of Anjou, a boy of sixteen years of age, who had been held by the countess on the baptismal font, and received her husband’s name. He tenderly loved his godmother, and offered to do battle in her cause against any and every opponent. The king endeavoured to persuade

the generous boy from his enterprise, urging the great strength, tried skill, and invincible courage of the challenger; but he persisted in his resolution, to the great sorrow of all the court, who said it was a cruel thing to permit so brave and beautiful a child to rush to such butchery and death.

DUEL BETWEEN INGELGERIUS AND GONTRAN.

When the lists were prepared, the countess duly acknowledged her champion, and the combatants commenced the onset. Gontran rode so fiercely at his antagonist, and hit him on the shield with such impetuosity, that he lost his own balance and rolled to the ground. The young count, as Gontran fell, passed his lance through his body, and then dismounting, cut off his head, which, Brantôme says, “he presented to the king, who received it most graciously, and was very joyful, as much so as if any one had made him a present of a city.” The innocence of the countess was then proclaimed with great rejoicings; and she kissed her godson, and wept over his neck with joy, in the presence of all the assembly.

When the Earl of Essex was accused, by Robert de Montfort, before King Henry II., in 1162, of having traitorously suffered the royal standard of England to fall from his hands in a skirmish with the Welsh at Coleshill, five years previously, the latter offered to prove the truth of the charge by

single combat. The Earl of Essex accepted the challenge, and the lists were prepared near Reading. An immense concourse of persons assembled to witness the battle. Essex at first fought stoutly, but, losing his temper and self-command, he gave an advantage to his opponent which soon decided the struggle. He was unhorsed, and so severely wounded, that all present thought he was dead. At the solicitation of his relatives, the monks of the Abbey of Reading were allowed to remove the body for interment, and Montfort was declared the victor. Essex, however, was not dead, but stunned only, and, under the care of the monks, recovered in a few weeks from his bodily injuries. The wounds of his mind were not so easily healed. Though a loyal and brave subject, the whole realm believed him a traitor and a coward because he had been vanquished. He could not brook to return to the world deprived of the good opinion of his fellows; he therefore made himself a monk, and passed the remainder of his days within the walls of the abbey.

Du Chastelet relates a singular duel that was proposed in Spain.⁵⁷ A Christian gentleman of Seville sent a challenge to a Moorish cavalier, offering to prove against him, with whatever weapons he might choose, that the religion of Jesus Christ was holy and divine, and that of Mahomet impious and damnable. The Spanish prelates did not choose that Christianity should be compromised within their jurisdiction by the result of any such combat; the Moorish cavalier might, perchance, have proved to be the stronger, and they commanded the knight, under pain of excommunication, to withdraw the challenge.

The same author relates that, under Otho I., a question arose among jurisconsults, viz. whether grandchildren, who had lost their father, should share equally with their uncles in the property of their grandfather, at the death of the latter. The difficulty of this question was found so insurmountable, that none of the lawyers of that day could resolve it. It was at last decreed that it should be decided by single combat. Two champions were accordingly chosen; one for, and the other against, the claims of the

little ones. After a long struggle, the champion of the uncles was unhorsed and slain; and it was therefore decided that the right of the grandchildren was established, and that they should enjoy the same portion of their grandfather's possessions that their father would have done had he been alive.

Upon pretexts just as strange, and often more frivolous than these, duels continued to be fought in most of the countries of Europe during the whole of the fourteenth and fifteenth centuries. A memorable instance of the slightness of the pretext on which a man could be forced to fight a duel to the death, occurs in the Memoirs of the brave Constable, Du Guesclin. The advantage he had obtained, in a skirmish before Rennes, against William Brembre, an English captain, so preyed on the spirits of William Troussel, the chosen friend and companion of the latter, that nothing would satisfy him but a mortal combat with the Constable. The Duke of Lancaster, to whom Troussel applied for permission to fight the great Frenchman, forbade the battle, as not warranted by the circumstances. Troussel nevertheless burned with a fierce desire to cross his weapon with Du Guesclin, and sought every occasion to pick a quarrel with him. Having so good a will for it, of course he found a way. A relative of his had been taken prisoner by the Constable, in whose hands he remained till he was able to pay his ransom. Troussel resolved to make a quarrel out of this, and despatched a messenger to Du Guesclin, demanding the release of his prisoner, and offering a bond, at a distant date, for the payment of the ransom. Du Guesclin, who had received intimation of the hostile purposes of the Englishman, sent back word that he would not accept his bond, neither would he release his prisoner until the full amount of his ransom was paid. As soon as this answer was received, Troussel sent a challenge to the Constable, demanding reparation for the injury he had done his honour, by refusing his bond, and offering a mortal combat, to be fought three strokes with the lance, three with the sword, and three with the dagger. Du Guesclin, although ill in bed with the ague, accepted the

challenge, and gave notice to the Marshal d'Andreghem, the king's lieutenant-general in Lower Normandy, that he might fix the day and the place of combat. The marshal made all necessary arrangements, upon condition that he who was beaten should pay a hundred florins of gold to feast the nobles and gentlemen who were witnesses of the encounter.

The Duke of Lancaster was very angry with his captain, and told him that it would be a shame to his knighthood and his nation if he forced on a combat with the brave Du Guesclin at a time when he was enfeebled by disease and stretched on the couch of suffering. Upon these representations, Troussel, ashamed of himself, sent notice to Du Guesclin that he was willing to postpone the duel until such time as he should be perfectly recovered. Du Guesclin replied, that he could not think of postponing the combat after all the nobility had received notice of it; that he had sufficient strength left not only to meet, but to conquer such an opponent as he was; and that if he did not make his appearance in the lists at the time appointed, he would publish him every where as a man unworthy to be called a knight, or to wear an honourable sword by his side. Troussel carried this haughty message to the Duke of Lancaster, who immediately gave permission for the battle.

On the day appointed, the two combatants appeared in the lists, in the presence of several thousand spectators. Du Guesclin was attended by the flower of the French nobility, including the Marshal de Beaumanoir, Olivier de Mauny, Bertrand de Saint Pern, and the Viscount de la Bellière; while the Englishman appeared with no more than the customary retinue of two seconds, two squires, two coutilliers or daggersmen, and two trumpeters. The first onset was unfavourable to the Constable. He received so heavy a blow on his shield-arm, that he fell forward to the left upon his horse's neck; and being weakened by his fever, was nearly thrown to the ground. All his friends thought he could never recover himself, and began to deplore his ill fortune; but Du Guesclin collected his energies for a decisive effort, and at the second charge aimed a blow at the shoulder of his

enemy, which felled him to the earth, mortally wounded. He then sprang from his horse, sword in hand, with the intention of cutting off the head of his fallen foe, when the Marshal d'Andreghem threw a golden wand into the arena as a signal that hostilities should cease. Du Guesclin was proclaimed the victor amid the joyous acclamations of the crowd, and retiring, left the field to the meaner combatants, who were afterwards to make sport for the people. Four English and as many French squires fought for some time with pointless lances, when the French gaining the advantage, the sports were declared at an end.

In the time of Charles VI., about the beginning of the fifteenth century, a famous duel was ordered by the parliament of Paris. The Sieur de Carrouges being absent in the Holy Land, his lady was violated by the Sieur Legris. Carrouges, on his return, challenged Legris to mortal combat for the twofold crime of violation and slander, inasmuch as he had denied his guilt by asserting that the lady was a willing party. The lady's asseverations of innocence were held to be no evidence by the parliament, and the duel was commanded, with all the ceremonies. "On the day appointed," says Brantôme,⁵⁸ "the lady came to witness the spectacle in her chariot; but the king made her descend, judging her unworthy, because she was criminal in his eyes till her innocence was proved, and caused her to stand upon a scaffold to await the mercy of God and this judgment by the battle. After a short struggle, the Sieur de Carrouges overthrew his enemy, and made him confess both the rape and the slander. He was then taken to the gallows and hanged in the presence of the multitude; while the innocence of the lady was proclaimed by the heralds, and recognised by her husband, the king, and all the spectators."

Numerous battles of a similar description constantly took place, until the unfortunate issue of one encounter of the kind led the French king, Henry II., to declare solemnly that he would never again permit any such encounter, whether it related to a civil or criminal case, or the honour of a gentleman.

This memorable combat was fought in the year 1547. François de Vivonne, lord of La Chataigneraie, and Guy de Chabot, lord of Jarnac, had been friends from their early youth, and were noted at the court of Francis I. for the gallantry of their bearing and the magnificence of their retinue. Chataigneraie, who knew that his friend's means were not very ample, asked him one day in confidence how it was that he contrived to be so well provided? Jarnac replied, that his father had married a young and beautiful woman, who, loving the son far better than the sire, supplied him with as much money as he desired. La Chataigneraie betrayed the base secret to the dauphin, the dauphin to the king, the king to his courtiers, and the courtiers to all their acquaintance. In a short time it reached the ears of the old Lord de Jarnac, who immediately sent for his son, and demanded to know in what manner the report had originated, and whether he had been vile enough not only to carry on such a connexion, but to boast of it? De Jarnac indignantly denied that he had ever said so, or given reason to the world to say so, and requested his father to accompany him to court and confront him with his accuser, that he might see the manner in which he would confound him. They went accordingly; and the younger De Jarnac, entering a room where the dauphin, La Chataigneraie, and several courtiers were present, exclaimed aloud, "That whoever had asserted that he maintained a criminal connexion with his mother-in-law was a liar and a coward!" Every eye was turned to the dauphin and La Chataigneraie, when the latter stood forward and asserted, that De Jarnac had himself avowed that such was the fact, and he would extort from his lips another confession of it. A case like this could not be met or rebutted by any legal proof, and the royal council ordered that it should be decided by single combat. The king, however, set his face against the duel,⁵⁹ and forbade them both, under pain of his high displeasure, to proceed any further in the matter. But Francis died in the following year, and the dauphin, now Henry II., who was himself compromised, resolved that the combat should take place.

The lists were prepared in the court-yard of the chateau of St. Germain-en-Laye, and the 10th of July, 1547, was appointed for the encounter. The cartels of the combatants, which are preserved in the *Mémoires de Castelnau*, were as follow:

“Cartel of François de Vivonne, lord of la Chataigneraie.

“SIRE,

“Having learned that Guy Chabot de Jarnac, being lately at Compiègne, asserted that whoever had said that he boasted of having criminal intercourse with his mother-in-law was wicked and a wretch, I, sire, with your good will and pleasure, do answer that he has wickedly lied, and will lie as many times as he denies having said that which I affirm he did say; for I repeat, that he told me several times, and boasted of it, that he had slept with his mother-in-law.

“FRANÇOIS DE VIVONNE.”

To this cartel De Jarnac replied:

“SIRE,

“With your good will and permission, I say, that François de Vivonne has lied in the imputation which he has cast upon me, and of which I spoke to you at Compiègne. I therefore entreat you, sire, most humbly, that you be pleased to grant us a fair field, that we may fight this battle to the death.

“GUY CHABOT.”

The preparations were conducted on a scale of the greatest magnificence, the king having intimated his intention of being present. La Chataigneraie made sure of the victory, and invited the king and a hundred and fifty of the principal personages of the court to sup with him in the evening, after

the battle, in a splendid tent which he had prepared at the extremity of the lists. De Jarnac was not so confident, though perhaps more desperate. At noon, on the day appointed, the combatants met, and each took the customary oath that he bore no charms or amulets about him, or made use of any magic, to aid him against his antagonist. They then attacked each other, sword in hand. La Chataigneraie was a strong robust man, and over confident; De Jarnac was nimble, supple, and prepared for the worst. The combat lasted for some time doubtful, until De Jarnac, overpowered by the heavy blows of his opponent, covered his head with his shield, and, stooping down, endeavoured to make amends by his agility for his deficiency of strength. In this crouching posture he aimed two blows at the left thigh of La Chataigneraie, who had left it uncovered, that the motion of his leg might not be impeded. Each blow was successful, and, amid the astonishment of all the spectators, and to the great regret of the king, La Chataigneraie rolled over upon the sand. He seized his dagger, and made a last effort to strike De Jarnac: but he was unable to support himself, and fell powerless into the arms of the assistants. The officers now interfered, and De Jarnac being declared the victor, fell down upon his knees, uncovered his head, and, clasping his hands together, exclaimed: “*O Domine, non sum dignus!*” La Chataigneraie was so mortified by the result of the encounter, that he resolutely refused to have his wounds dressed. He tore off the bandages which the surgeons applied, and expired two days afterwards. Ever since that time, any sly and unforeseen attack has been called by the French a *coup de Jarnac*. Henry was so grieved at the loss of his favourite, that he made the solemn oath already alluded to, that he would never again, so long as he lived, permit a duel. Some writers have asserted, and among others, Mezerai, that he issued a royal edict forbidding them. This has been doubted by others, and as there appears no registry of the edict in any of the courts, it seems most probable that it was never issued. This opinion is strengthened by the fact, that, two years afterwards, the council ordered another duel to be fought with similar

forms, but with less magnificence, on account of the inferior rank of the combatants. It is not anywhere stated that Henry interfered to prevent it, notwithstanding his solemn oath; but that, on the contrary, he encouraged it, and appointed the Marshal de la Marque to see that it was conducted according to the rules of chivalry. The disputants were Fendille and D'Aguerre, two gentlemen of the household, who, quarrelling in the king's chamber, had proceeded from words to blows. The council, being informed of the matter, decreed that it could only be decided in the lists. Marshal de la Marque, with the king's permission, appointed the city of Sedan as the place of combat. Fendille, who was a bad swordsman, was anxious to avoid an encounter with D'Aguerre, who was one of the most expert men of the age; but the council authoritatively commanded that he should fight, or be degraded from all his honours. D'Aguerre appeared in the field attended by François de Vendôme, Count de Chartres, while Fendille was accompanied by the Duke of Nevers. Fendille appears to have been not only an inexpert swordsman, but a thorough coward; one who, like Cowley, might have heaped curses on the man,

“(Death's factor sure), who brought
Dire swords into this peaceful world.”

On the very first encounter he was thrown from his horse, and, confessing on the ground all that his victor required of him, slunk away ignominiously from the arena.

One is tempted to look upon the death of Henry II. as a judgment upon him for his perjury in the matter of duelling. In a grand tournament instituted on the occasion of the marriage of his daughter, he broke several lances in encounters with some of the bravest knights of the time. Ambitious of still further renown, he would not rest satisfied until he had also engaged the young Count de Montgomeri. He received a wound in

the eye from the lance of his antagonist, and died from its effects shortly afterwards, in the forty-first year of his age.

In the succeeding reigns of Francis II., Charles IX., and Henry III., the practice of duelling increased to an alarming extent. Duels were not rare in the other countries of Europe at the same period; but in France they were so frequent, that historians, in speaking of that age, designate it as “l’époque de la fureur des duels.” The parliament of Paris endeavoured, as far as in its power lay, to discourage the practice. By a decree dated the 26th of June 1559, it declared all persons who should be present at duels, or aiding and abetting in them, to be rebels to the king, transgressors of the law, and disturbers of the public peace.

When Henry III. was assassinated at St. Cloud in 1589, a young gentleman, named L’Isle-Marivaut, who had been much beloved by him, took his death so much to heart, that he resolved not to survive him. Not thinking suicide an honourable death, and wishing, as he said, to die gloriously in revenging his king and master, he publicly expressed his readiness to fight any body to the death, who should assert that Henry’s assassination was not a great misfortune to the community. Another youth, of a fiery temper and tried courage, named Marolles, took him at his word, and the day and place of the combat were forthwith appointed. When the hour had come, and all were ready, Marolles turned to his second, and asked whether his opponent had a casque or helmet only, or whether he wore a *sallade*, or headpiece. Being answered a helmet only, he said gaily, “So much the better; for, sir my second, you shall repute me the wickedest man in all the world, if I do not thrust my lance right through the middle of his head and kill him.” Truth to say, he did so at the very first onset, and the unhappy L’Isle-Marivaut expired without a groan. Brantôme, who relates this story, adds, that the victor might have done as he pleased with the body, cut off the head, dragged it out of the camp, or exposed it upon an ass; but that being a wise and very courteous gentleman, he left it to the relatives of the deceased to be honourably buried, contenting himself with

the glory of his triumph, by which he gained no little renown and honour among the ladies of Paris.

HENRY IV.

On the accession of Henry IV. that monarch determined to set his face against duelling; but such was the influence of early education and the prejudices of society upon him, that he never could find it in his heart to punish a man for this offence. He thought it tended to foster a warlike spirit among his people. When the chivalrous Créqui demanded his permission to fight Don Philippe de Savoie, he is reported to have said, "Go, and if I were not a king, I would be your second." It is no wonder that when such was known to be the king's disposition, his edicts attracted but small attention. A calculation was made by M. de Lomenie, in the year 1607, that since the accession of Henry, in 1589, no less than four thousand French gentlemen had lost their lives in these conflicts; which, for the eighteen years, would have been at the rate of four or five in a week, or eighteen per month! Sully, who reports this fact in his Memoirs, does not throw the slightest doubt upon its exactness; and adds, that it was chiefly owing to the facility and ill-advised good-nature of his royal master that the bad example had so empoisoned the court, the city, and the whole country. This wise minister devoted much of his time and attention to the subject; for the rage, he says, was such as to cause him a thousand pangs, and the king also. There was hardly a man moving in what was called good society, who had not been engaged in a duel either as principal or second; and if there were such a man, his chief desire was to free himself from the imputation of non-duelling, by picking a quarrel with somebody. Sully

constantly wrote letters to the king, in which he prayed him to renew the edicts against this barbarous custom, to aggravate the punishment against offenders, and never, in any instance, to grant a pardon, even to a person who had wounded another in a duel, much less to any one who had taken away life. He also advised, that some sort of tribunal, or court of honour, should be established, to take cognisance of injurious and slanderous language, and of all such matters as usually led to duels; and that the justice to be administered by this court should be sufficiently prompt and severe to appease the complainant, and make the offender repent of his aggression.

GALLERY AT FONTAINEBLEAU.

Henry, being so warmly pressed by his friend and minister, called together an extraordinary council in the gallery of the palace of Fontainebleau, to take the matter into consideration. When all the members were assembled, his majesty requested that some person conversant with the subject would make a report to him on the origin, progress, and different forms of the duel. Sully complacently remarks, that none of the councillors gave the king any great reason to felicitate them on their erudition. In fact, they all remained silent. Sully held his peace with the rest; but he looked so knowing, that the king turned towards him, and said:—“Great master! by your face I conjecture that you know more of this matter than you would have us believe. I pray you, and indeed I command, that you tell us what you think and what you know.” The coy minister

refused, as he says, out of mere politeness to his more ignorant colleagues; but, being again pressed by the king, he entered into a history of duelling both in ancient and modern times. He has not preserved this history in his Memoirs; and, as none of the ministers or councillors present thought proper to do so, the world is deprived of a discourse which was, no doubt, a learned and remarkable one. The result was, that a royal edict was issued, which Sully lost no time in transmitting to the most distant provinces, with a distinct notification to all parties concerned that the king was in earnest, and would exert the full rigour of the law in punishment of the offenders. Sully himself does not inform us what were the provisions of the new law; but Father Matthias has been more explicit, and from him we learn, that the marshals of France were created judges of a court of chivalry, for the hearing of all causes wherein the honour of a noble or gentleman was concerned, and that such as resorted to duelling should be punished by death and confiscation of property, and that the seconds and assistants should lose their rank, dignity, or offices, and be banished from the court of their sovereign.⁶⁰

But so strong a hold had the education and prejudice of his age upon the mind of the king, that though his reason condemned, his sympathies approved the duel. Notwithstanding this threatened severity, the number of duels did not diminish, and the wise Sully had still to lament the prevalence of an evil which menaced society with utter disorganisation. In the succeeding reign the practice prevailed, if possible, to a still greater extent, until the Cardinal de Richelieu, better able to grapple with it than Sully had been, made some severe examples in the very highest classes. Lord Herbert, the English ambassador at the court of Louis XIII., repeats, in his letters, an observation that had been previously made in the reign of Henry IV., that it was rare to find a Frenchman moving in good society who had not killed his man in a duel. The Abbé Millot says of this period, that the duel madness made the most terrible ravages. Men had actually a frenzy for combating. Caprice and vanity, as well as the excitement of

passion, imposed the necessity of fighting. Friends were obliged to enter into the quarrels of their friends, or be themselves called out for their refusal, and revenge became hereditary in many families. It was reckoned that in twenty years eight thousand letters of pardon had been issued to persons who had killed others in single combat.⁶¹

Other writers confirm this statement. Amelot de Houssaye, in his Memoirs, says, upon this subject, that duels were so common in the first years of the reign of Louis XIII., that the ordinary conversation of persons when they met in the morning was, "*Do you know who fought yesterday?*" and after dinner, "*Do you know who fought this morning?*" The most infamous duellist at that period was De Bouteville. It was not at all necessary to quarrel with this assassin, to be forced to fight a duel with him. When he heard that any one was very brave, he would go to him, and say, "*People tell me that you are brave; you and I must fight together!*" Every morning the most notorious bravos and duellists used to assemble at his house, to take a breakfast of bread and wine, and practise fencing. M. de Valençay, who was afterwards elevated to the rank of a cardinal, stood very high in the estimation of De Bouteville and his gang. Hardly a day passed but what he was engaged in some duel or other, either as principal or second; and he once challenged De Bouteville himself, his best friend, because De Bouteville had fought a duel without inviting him to become his second. This quarrel was only appeased on the promise of De Bouteville that, in his next encounter, he would not fail to avail himself of his services. For that purpose he went out the same day, and picked a quarrel with the Marquis des Portes. M. de Valençay, according to agreement, had the pleasure of serving as his second, and of running through the body M. de Cavois, the second of the Marquis des Portes, a man who had never done him any injury, and whom he afterwards acknowledged he had never seen before.

Cardinal Richelieu devoted much attention to this lamentable state of public morals, and seems to have concurred with his great predecessor

Sully, that nothing but the most rigorous severity could put a stop to the evil. The subject indeed was painfully forced upon him by his enemies. The Marquis de Themines, to whom Richelieu, then Bishop of Luçon, had given offence by some representations he had made to Mary of Medicis, determined, since he could not challenge an ecclesiastic, to challenge his brother. An opportunity was soon found. Themines, accosting the Marquis de Richelieu, complained, in an insulting tone, that the Bishop of Luçon had broken his faith. The Marquis resented both the manner and matter of his speech, and readily accepted a challenge. They met in the Rue d'Angoulême, and the unfortunate Richelieu was stabbed to the heart, and instantly expired. From that moment the bishop became the steady foe of the practice of duelling. Reason and the impulse of brotherly love alike combined to make him detest it, and when his power in France was firmly established, he set vigorously about repressing it. In his *Testament Politique*, he has collected his thoughts upon the subject, in the chapter entitled "Des moyens d'arrêter les Duels." In spite of the edicts that he published, the members of the nobility persisted in fighting upon the most trivial and absurd pretences. At last Richelieu made a terrible example. The infamous De Bouteville challenged and fought the Marquis de Beuvron; and although the duel itself was not fatal to either, its consequences were fatal to both. High as they were, Richelieu resolved that the law should reach them both, and they were both tried, found guilty, and beheaded. Thus did society get rid of one of the most bloodthirsty scoundrels that ever polluted it.

SULLY.

In 1632 two noblemen fought a duel in which they were both killed. The officers of justice had notice of the breach of the law, and arrived at the scene of combat before the friends of the parties had time to remove the bodies. In conformity with the cardinal's severe code upon the subject, the bodies were ignominiously stripped and hanged upon a gallows with their heads downwards, for several hours, within sight of all the people.⁶² This severity sobered the frenzy of the nation for a time; but it was soon forgotten. Men's minds were too deeply imbued with a false notion of honour to be brought to a right way of thinking: by such examples, however striking, Richelieu was unable to persuade them to walk in the right path, though he could punish them for choosing the wrong one. He had with all his acuteness, miscalculated the spirit of duelling. It was not death that a duellist feared; it was shame, and the contempt of his fellows. As Addison remarked more than eighty years afterwards,

“Death was not sufficient to deter men who made it their glory to despise it; but if every one who fought a duel were to stand in the pillory, it would quickly diminish the number of those imaginary men of honour, and put an end to so absurd a practice.” Richelieu never thought of this.

Sully says, that in his time the Germans were also much addicted to duelling. There were three places where it was legal to fight; Witzburg in Franconia, and Uspach and Halle in Swabia. Thither of course, vast numbers repaired, and murdered each other under sanction of the law. At an earlier period in Germany, it was held highly disgraceful to refuse to fight. Any one who surrendered to his adversary for a simple wound that did not disable him, was reputed infamous, and could neither cut his beard, bear arms, mount on horseback, or hold any office in the state. He who fell in a duel was buried with great pomp and splendour.

In the year 1652, just after Louis XIV. had attained his majority, a desperate duel was fought between the Dukes de Beaufort and De Nemours, each attended by four gentlemen. Although brothers-in-law, they had long been enemies, and their constant dissensions had introduced much disorganisation among the troops which they severally commanded. Each had long sought an opportunity for combat, which at last arose on a misunderstanding relative to the places they were to occupy at the council-board. They fought with pistols, and, at the first discharge, the Duke de Nemours was shot through the body, and almost instantly expired. Upon this the Marquis de Villars, who seconded Nemours, challenged Héricourt, the second of the Duke de Beaufort, a man whom he had never before seen; and the challenge being accepted, they fought even more

desperately than their principals. This combat, being with swords, lasted longer than the first, and was more exciting to the six remaining gentlemen who stayed to witness it. The result was fatal to Héricourt, who fell pierced to the heart by the sword of De Villars. Any thing more savage than this can hardly be imagined. Voltaire says such duels were frequent, and the compiler of the *Dictionnaire d'Anecdotes* informs us that the number of seconds was not fixed. As many as ten, or twelve, or twenty, were not unfrequent, and they often fought together after their principals were disabled. The highest mark of friendship one man could manifest towards another, was to choose him for his second; and many gentlemen were so desirous of serving in this capacity, that they endeavoured to raise every slight misunderstanding into a quarrel, that they might have the pleasure of being engaged in it. The Count de Bussy-Rabutin relates an instance of this in his Memoirs. He says, that as he was one evening coming out of the theatre, a gentleman named Bruc, whom he had not before known, stopped him very politely, and, drawing him aside, asked him if it was true that the Count de Thianges had called him (Bruc) a drunkard? Bussy replied that he really did not know, for he saw the count very seldom. "Oh, he is your uncle!" replied Bruc; "and, as I cannot have satisfaction from him, because he lives so far off in the country, I apply to you." "I see what you are at," replied Bussy, "and, since you wish to put me in my uncle's place, I answer, that whoever asserted that he called you a drunkard, told a lie!" "My brother said so," replied Bruc, "and he is a child." "Horsewhip him, then, for his falsehood," returned De Bussy. "I will not have my brother called, a liar," returned Bruc, determined to quarrel with him; "so draw, and defend yourself!" They both drew

their swords in the public street, but were separated by the spectators. They agreed, however, to fight on a future occasion, and with all the regular forms of the duello. A few days afterwards, a gentleman, whom De Bussy had never before seen, and whom he did not know even by name, called upon him and asked if he might have the privilege of serving as his second. He added, that he neither knew him nor Bruc, except by reputation, but having made up his mind to be second of one of them, he had decided upon accompanying De Bussy as the braver man of the two. De Bussy thanked him very sincerely for his politeness, but begged to be excused, as he had already engaged four seconds to accompany him, and he was afraid that if he took any more the affair would become a battle instead of a duel.

When such quarrels as these were looked upon as mere matters of course, the state of society must have been indeed awful. Louis XIV. very early saw the evil, and as early determined to remedy it. It was not, however, till the year 1679, when he instituted the “Chambre Ardente,” for the trial of the slow poisoners and pretenders to sorcery, that he published any edict against duelling. In that year his famous edict was promulgated, in which he reiterated and confirmed the severe enactments of his predecessors Henry IV. and Louis XIII., and expressed his determination never to pardon any offender. By this celebrated ordinance a supreme court of honour was established, composed of the marshals of France. They were bound, on taking the office, to give to every one who brought a well-founded complaint before them, such reparation as would satisfy the justice of the case. Should any gentleman against whom complaint was made refuse to obey the mandate of the court of honour, he might be punished by

fine and imprisonment; and when that was not possible, by reason of his absenting himself from the kingdom, his estates might be confiscated till his return.

Every man who sent a challenge, be the cause of offence what it might, was deprived of all redress from the court of honour—suspended three years from the exercise of any office in the state—was further imprisoned for two years, and sentenced to pay a fine of half his yearly income.

He who accepted a challenge was subject to the same punishment. Any servant or other person, who knowingly became the bearer of a challenge, was, if found guilty, sentenced to stand in the pillory and be publicly whipped for the first offence; and for the second, sent for three years to the galleys.

Any person who actually fought, was to be held guilty of murder, even though death did not ensue, and was to be punished accordingly. Persons in the higher ranks of life were to be beheaded, and those of the middle class hanged upon a gallows, and their bodies refused Christian burial.

At the same time that Louis published this severe edict, he exacted a promise from his principal nobility that they would never engage in a duel on any pretence whatever. He never swerved from his resolution to pursue all duellists with the utmost rigour, and many were executed in various parts of the country. A slight abatement of the evil was the consequence, and in the course of a few years one duel was not fought where twelve had been fought previously. A medal was struck to commemorate the circumstance, by the express command of the king. So much had he this object at heart, that, in his will, he particularly recommended to his successor the care of his

edict against duelling, and warned him against any ill-judged lenity to those who disobeyed it.

A singular law formerly existed in Malta with regard to duelling. By this law it was permitted, but only upon condition that the parties should fight in one particular street. If they presumed to settle their quarrel elsewhere, they were held guilty of murder, and punished accordingly. What was also very singular, they were bound, under heavy penalties, to put up their swords when requested to do so by a priest, a knight, or a woman. It does not appear, however, that the ladies or the knights exercised this mild and beneficent privilege to any great extent; the former were too often themselves the cause of duels, and the latter sympathised too much in the wounded honour of the combatants to attempt to separate them. The priests alone were the great peacemakers. Brydone says, that a cross was always painted on the wall opposite to the spot where a knight had been killed, and that in the "street of duels" he counted about twenty of them.⁶³

In England the private duel was also practised to a scandalous extent, towards the end of the sixteenth and beginning of the seventeenth centuries. The judicial combat now began to be more rare, but several instances of it are mentioned in history. One was instituted in the reign of Elizabeth, and another so late as the time of Charles I. Sir Henry Spelman gives an account of that which took place in Elizabeth's reign, which is curious, perhaps the more so when we consider that it was perfectly legal, and that similar combats remained so till the year 1819. A proceeding having been instituted in the Court of Common Pleas for the recovery of certain manorial rights in the county of Kent, the defendant offered to prove

by single combat his right to retain possession. The plaintiff accepted the challenge, and the Court having no power to stay the proceedings, agreed to the champions who were to fight in lieu of the principals. The queen commanded the parties to compromise; but it being represented to her majesty that they were justified by law in the course they were pursuing, she allowed them to proceed. On the day appointed, the justices of the Common Pleas, and all the counsel engaged in the cause, appeared as umpires of the combat, at a place in Tothill-fields, where the lists had been prepared. The champions were ready for the encounter, and the plaintiff and defendant were publicly called to come forward and acknowledge them. The defendant answered to his name, and recognised his champion with the due formalities, but the plaintiff did not appear. Without his presence and authority the combat could not take place; and his absence being considered an abandonment of his claim, he was declared to be non-suited, and barred for ever from renewing his suit before any other tribunal whatever.

LORD BACON.

The queen appears to have disapproved personally of this mode of settling a disputed claim, but her judges and legal advisers made no attempt to alter the barbarous law. The practice of private duelling excited more indignation, from its being of every-day occurrence. In the time of James I. the English were so infected with the French

madness, that Bacon, when he was attorney-general, lent the aid of his powerful eloquence to effect a reformation of the evil. Informations were exhibited in the Star Chamber against two persons, named Priest and Wright, for being engaged, as principal and second, in a duel, on which occasion he delivered a charge that was so highly approved of by the Lords of the Council, that they ordered it to be printed and circulated over the country, as a thing “very meet and worthy to be remembered and made known unto the world.” He began by considering the nature and greatness of the mischief of duelling. “It troubleth peace—it disfurnisheth war—it bringeth calamity upon private men, peril upon the state, and contempt upon the law. Touching the cause of it,” he observed, “that the first motive of it, no doubt, is a false and erroneous imagination of honour and credit; but then, the seed of this mischief being such, it is nourished by vain discourses and green and unripe conceits. Hereunto may be added, that men have almost lost the true notion and understanding of fortitude and valour. For fortitude distinguisheth of the grounds of quarrel whether they be just; and not only so, but whether they be worthy, and setteth a better price upon men’s lives than to bestow them idly. Nay, it is weakness and disesteem of a man’s self to put a man’s life upon such liedger performances. A man’s life is not to be trifled with; it is to be offered up and sacrificed to honourable services, public merits, good causes, and noble adventures. It is in expense of blood as it is in expense of money. It is no liberality to make a profusion of money upon every vain occasion, neither is it fortitude to make effusion of blood, except the cause of it be worth.”⁶⁴

The most remarkable event connected with duelling in this reign was that between Lord Sanquir, a Scotch nobleman, and one Turner, a fencing-master. In a trial of skill between them, his lordship's eye was accidentally thrust out by the point of Turner's sword. Turner expressed great regret at the circumstance, and Lord Sanquir bore his loss with as much philosophy as he was master of, and forgave his antagonist. Three years afterwards, Lord Sanquir was at Paris, where he was a constant visitor at the court of Henry IV. One day, in the course of conversation, the affable monarch inquired how he had lost his eye. Sanquir, who prided himself on being the most expert swordsman of the age, blushed as he replied that it was inflicted by the sword of a fencing-master. Henry, forgetting his assumed character of an anti-duellist, carelessly, and as a mere matter of course, inquired whether the man lived? Nothing more was said; but the query sank deep into the proud heart of the Scotch baron, who returned shortly afterwards to England, burning for revenge. His first intent was to challenge the fencing-master to single combat; but, on further consideration, he deemed it inconsistent with his dignity to meet him as an equal in fair and open fight. He therefore hired two bravos, who set upon the fencing-master, and murdered him in his own house at Whitefriars. The assassins were taken and executed, and a reward of one thousand pounds offered for the apprehension of their employer. Lord Sanquir concealed himself for several days, and then surrendered to take his trial, in the hope (happily false) that Justice would belie her name, and be lenient to a murderer because he was a nobleman, who on a false point of honour had thought fit to take revenge into his own hands. The most powerful intercessions were employed in his favour, but James, to his credit, was deaf to

them all. Bacon, in his character of attorney-general, prosecuted the prisoner to conviction; and he died the felon's death on the 29th of June, 1612, on a gibbet erected in front of the gate of Westminster Hall.

With regard to the public duel, or trial by battle, demanded under the sanction of the law, to terminate a quarrel which the ordinary course of justice could with difficulty decide, Bacon was equally opposed to it, and thought that in no case should it be granted. He suggested that there should be declared a constant and settled resolution in the state to abolish it altogether; that care should be taken that the evil be no more cockered, nor the humour of it fed, but that all persons found guilty should be rigorously punished by the Star Chamber, and those of eminent quality banished from the court.

In the succeeding reign, when Donald Mackay, the first Lord Reay, accused David Ramsay of treason, in being concerned with the Marquis of Hamilton in a design upon the crown of Scotland, he was challenged by the latter to make good his assertion by single combat.⁶⁵ It had been at first the intention of the government to try the case by the common law, but Ramsay thought he would stand a better chance of escape by recurring to the old and almost exploded custom, but which was still the right of every man in appeals of treason. Lord Reay readily accepted the challenge, and both were confined in the Tower until they found security that they would appear on a certain day appointed by the court to determine the question. The management of the affair was delegated to the Marischal Court of Westminster, and the Earl of Lindsay was created Lord Constable of England for the purpose. Shortly before the day appointed, Ramsay confessed in substance all that Lord Reay had

laid to his charge, upon which Charles I. put a stop to the proceedings.

But in England, about this period, sterner disputes arose among men than those mere individual matters which generate duels. The men of the Commonwealth encouraged no practice of the kind, and the subdued aristocracy carried their habits and prejudices elsewhere, and fought their duels at foreign courts. Cromwell's parliament, however—although the evil at that time was not so crying—published an order in 1654 for the prevention of duels, and the punishment of all concerned in them. Charles II., on his restoration, also issued a proclamation upon the subject. In his reign an infamous duel was fought—infamous not only from its own circumstances, but from the lenity that was shewn to the principal offenders.

The worthless Duke of Buckingham, having debauched the Countess of Shrewsbury, was challenged by her husband to mortal combat in January 1668. Charles II. endeavoured to prevent the duel, not from any regard to public morality, but from fear for the life of his favourite. He gave commands to the Duke of Albemarle to confine Buckingham to his house, or take some other measures to prevent him from fighting. Albemarle neglected the order, thinking that the king himself might prevent the combat by some surer means. The meeting took place at Barn Elms; the injured Shrewsbury being attended by Sir John Talbot, his relative, and Lord Bernard Howard, son of the Earl of Arundel. Buckingham was accompanied by two of his dependents, Captain Holmes and Sir John Jenkins. According to the barbarous custom of the age, not only the principals, but the seconds engaged each other. Jenkins was pierced to the heart, and left dead upon the field, and Sir John Talbot

severely wounded in both arms. Buckingham himself escaping with slight wounds, ran his unfortunate antagonist through the body, and then left the field with the wretched woman, the cause of all the mischief, who, in the dress of a page, awaited the issue of the conflict in a neighbouring wood, holding her paramour's horse to avoid suspicion. Great influence was exerted to save the guilty parties from punishment, and the master, as base as the favourite, made little difficulty in granting a free pardon to all concerned. In a royal proclamation issued shortly afterwards, Charles II. formally pardoned the murderers, but declared his intention never to extend in future any mercy to such offenders. It would be hard, after this, to say who was the most infamous, the king, the favourite, or the courtesan.

In the reign of Queen Anne, repeated complaints were made of the prevalence of duelling. Addison, Swift, Steele, and other writers employed their powerful pens in reprobation of it. Steele especially, in the *Tatler* and *Guardian*, exposed its impiety and absurdity, and endeavoured both by argument and by ridicule to bring his countrymen to a right way of thinking.⁶⁶ His comedy of *The Conscious Lovers* contains an admirable exposure of the abuse of the word *honour*, which led men into an error so lamentable. Swift, writing upon the subject, remarked that he could see no harm in rogues and fools shooting each other. Addison and Steele took higher ground; and the latter, in the *Guardian*, summed up nearly all that could be said upon the subject in the following impressive words:—"A Christian and a gentleman are made inconsistent appellations of the same person. You are not to expect eternal life if you do not forgive injuries, and your mortal life is rendered uncomfortable if

you are not ready to commit a murder in resentment of an affront; for good sense, as well as religion, is so utterly banished the world, that men glory in their very passions, and pursue trifles with the utmost vengeance, so little do they know that to forgive is the most arduous pitch human nature can arrive at. A coward has often fought, a coward has often conquered; but a coward never forgave.” Steele also published a pamphlet, in which he gave a detailed account of the edict of Louis XIV., and the measures taken by that monarch to cure his subjects of their murderous folly.

On the 8th of May, 1711, Sir Cholmely Deering, M.P. for the county of Kent, was slain in a duel by Mr. Richard Thornhill, also a member of the House of Commons. Three days afterwards, Sir Peter King brought the subject under the notice of the legislature; and after dwelling at considerable length on the alarming increase of the practice, obtained leave to bring in a bill for the prevention and punishment of duelling. It was read a first time that day, and ordered for a second reading in the ensuing week.

About the same time, the attention of the Upper House of Parliament was also drawn to the subject in the most painful manner. Two of its most noted members would have fought had it not been that Queen Anne received notice of their intention, and exacted a pledge that they would desist; while a few months afterwards two other of its members lost their lives in one of the most remarkable duels upon record. The first affair, which happily terminated without a meeting, was between the Duke of Marlborough and the Earl Pawlet; the latter and fatal encounter was between the Duke of Hamilton and Lord Mohun.

The first arose out of a debate in the Lords upon the conduct of the Duke of Ormond in refusing to hazard a general engagement with the enemy, in which Earl Pawlet remarked that nobody could doubt the courage of the Duke of Ormond. "He was not like a certain general, who led troops to the slaughter, to cause great numbers of officers to be knocked on the head in a battle, or against stone walls, in order to fill his pockets by disposing of their commissions." Every one felt that the remark was aimed at the Duke of Marlborough, but he remained silent, though evidently suffering in mind. Soon after the House broke up, the Earl Pawlet received a visit from Lord Mohun, who told him that the Duke of Marlborough was anxious to come to an explanation with him relative to some expressions he had made use of in that day's debate, and therefore prayed him to "go and take a little air in the country." Earl Pawlet did not affect to misunderstand the hint, but asked him in plain terms whether he brought a challenge from the duke. Lord Mohun said his message needed no explanation, and that he [Lord Mohun] would accompany the Duke of Marlborough. He then took his leave, and Earl Pawlet returned home and told his lady that he was going out to fight a duel with the Duke of Marlborough. His lady, alarmed for her lord's safety, gave notice of his intention to the Earl of Dartmouth, who immediately, in the queen's name, sent to the Duke of Marlborough, and commanded him not to stir abroad. He also caused Earl Pawlet's house to be guarded by two sentinels; and having taken these precautions, informed the queen of the whole affair. Her Majesty sent at once for the duke, expressed her abhorrence of the custom of duelling, and required his word of honour that he would proceed no

further. The duke pledged his word accordingly, and the affair terminated.

The lamentable duel between the Duke of Hamilton and Lord Mohun took place in November 1712, and sprang from the following circumstances. A lawsuit had been pending for eleven years between these two noblemen, and they looked upon each other in consequence with a certain degree of coldness. They met together on the 13th of November in the chambers of Mr. Orlebar, a master in Chancery, when, in the course of conversation, the Duke of Hamilton reflected upon the conduct of one of the witnesses in the cause, saying that he was a person who had neither truth nor justice in him. Lord Mohun, somewhat nettled at this remark applied to a witness favourable to his side, made answer hastily, that Mr. Whitworth, the person alluded to, had quite as much truth and justice in him as the Duke of Hamilton. The duke made no reply, and no one present imagined that he took offence at what was said; and when he went out of the room he made a low and courteous salute to the Lord Mohun. In the evening, General Macartney called twice upon the duke with a challenge from Lord Mohun, and failing in seeing him, sought him a third time at a tavern, where he found him, and delivered his message. The duke accepted the challenge, and the day after the morrow, which was Sunday, the 15th of November, at seven in the morning, was appointed for the meeting.

At that hour they assembled in Hyde Park, the duke being attended by his relative Colonel Hamilton, and the Lord Mohun by General Macartney. They jumped over a ditch into a place called the Nursery, and prepared for the combat. The Duke of Hamilton, turning to General Macartney, said, "*Sir, you are the cause of this,*

let the event be what it will.” Lord Mohun did not wish that the seconds should engage, but the duke insisted that “*Macartney should have a share in the dance.*” All being ready, the two principals took up their positions, and fought with swords so desperately, that after a short time they both fell down mortally wounded. The Lord Mohun expired upon the spot, and the Duke of Hamilton in the arms of his servants as they were carrying him to his coach.

This unhappy termination caused the greatest excitement not only in the metropolis, but all over the country. The Tories, grieved at the loss of the Duke of Hamilton, charged the fatal combat on the Whig party, whose leader, the Duke of Marlborough, had so recently set the example of political duels. They called Lord Mohun the bully of the Whig faction (he had already killed three men in duels, and been twice tried for murder), and asserted openly that the quarrel was concocted between him and General Macartney to rob the country of the services of the Duke of Hamilton by murdering him. It was also asserted that the wound of which the duke died was not inflicted by Lord Mohun, but by Macartney; and every means was used to propagate this belief. Colonel Hamilton, against whom and Macartney the coroner’s jury had returned a verdict of wilful murder, surrendered a few days afterwards, and was examined before a privy council sitting at the house of Lord Dartmouth. He then deposed, that seeing Lord Mohun fall, and the duke upon him, he ran to the duke’s assistance; and that he might with the more ease help him, he flung down both their swords, and as he was raising the duke up, *he saw Macartney make a push at him.* Upon this deposition, a royal proclamation was immediately issued, offering a reward of 500*l.* for

the apprehension of Macartney, to which the Duchess of Hamilton afterwards added a reward of 300*l*.

Upon the further examination of Colonel Hamilton, it was found that reliance could not be placed on all his statements, and that he contradicted himself in several important particulars. He was arraigned at the old Bailey for the murder of Lord Mohun, the whole political circles of London being in a fever of excitement for the result. All the Tory party prayed for his acquittal, and a Tory mob surrounded the doors and all the avenues leading to the court of justice for many hours before the trial began. The examination of witnesses lasted seven hours. The criminal still persisted in accusing General Macartney of the murder of the Duke of Hamilton, but in other respects, say the newspapers of the day, prevaricated foully. He was found guilty of manslaughter. This favourable verdict was received with universal applause, “not only from the court and all the gentlemen present, but the common people shewed a mighty satisfaction, which they testified by loud and repeated huzzas.”⁶⁷

As the popular delirium subsided, and men began to reason coolly upon the subject, they disbelieved the assertions of Colonel Hamilton that Macartney had stabbed the duke, although it was universally admitted that he had been much too busy and presuming. Hamilton was shunned by all his former companions, and his life rendered so irksome to him, that he sold out of the Guards and retired to private life, in which he died heart-broken four years afterwards.

General Macartney surrendered about the same time, and was tried for murder in the Court of King’s Bench. He was, however, found guilty of manslaughter only.

At the opening of the session of Parliament of 1713, the queen made pointed allusion in her speech to the frequency of duelling, and recommended to the legislature to devise some speedy and effectual remedy for it. A bill to that effect was brought forward, but thrown out on the second reading, to the very great regret of all the sensible portion of the community.

A famous duel was fought in 1765 between Lord Byron and Mr. Chaworth. The dispute arose at a club-dinner, and was relative to which of the two had the largest quantity of game on his estates. Infuriated by wine and passion, they retired instantly into an adjoining room, and fought with swords across a table, by the feeble glimmer of a tallow candle. Mr. Chaworth, who was the more expert swordsman of the two, received a mortal wound, and shortly afterwards expired. Lord Byron was brought to trial for the murder before the House of Lords; and it appearing clearly that the duel was not premeditated, but fought at once, and in the heat of passion, he was found guilty of manslaughter only, and ordered to be discharged upon payment of his fees. This was a very bad example for the country, and duelling of course fell into no disrepute after such a verdict.

In France more severity was exercised. In the year 1769, the Parliament of Grenoble took cognisance of the delinquency of the Sieur Duchelas, one of its members, who challenged and killed in a duel a captain of the Flemish legion. The servant of Duchelas officiated as second, and was arraigned with his master for the murder of the captain. They were both found guilty. Duchelas was broken alive on the wheel, and the servant condemned to the galleys for life.

A barbarous and fiercely-contested duel was fought in November 1778, between two foreign adventurers, at Bath, named Count Rice and the Vicomte du Barri. Some dispute arose relative to a gambling transaction, in the course of which Du Barri contradicted an assertion of the other, by saying "That is not true!" Count Rice immediately asked him if he knew the very disagreeable meaning of the words he had employed. Du Barri said he was perfectly well aware of their meaning, and that Rice might interpret them just as he pleased. A challenge was immediately given and accepted. Seconds were sent for, who, arriving with but little delay, the whole party, though it was not long after midnight, proceeded to a place called Claverton Down, where they remained with a surgeon until daylight. They then prepared for the encounter, each being armed with two pistols and a sword. The ground having been marked out by the seconds, Du Barri fired first, and wounded his opponent in the thigh. Count Rice then levelled his pistol, and shot Du Barri mortally in the breast. So angry were the combatants, that they refused to desist; both stepped back a few paces, and then rushing forward, discharged their second pistols at each other. Neither shot took effect, and both throwing away their pistols, prepared to finish the sanguinary struggle by the sword. They took their places, and were advancing towards each other, when the Vicomte du Barri suddenly staggered, grew pale, and, falling on the ground, exclaimed, "*Je vous demande ma vie.*" His opponent had but just time to answer, that he granted it, when the unfortunate Du Barri turned upon the grass, and expired with a heavy groan. The survivor of this savage conflict was then removed to his lodgings, where he lay for some weeks in a dangerous state. The coroner's jury, in the mean while, sat upon the body of Du

Barri, and disgraced themselves by returning a verdict of manslaughter only. Count Rice, upon his recovery, was indicted for the murder notwithstanding this verdict. On his trial he entered into a long defence of his conduct, pleading the fairness of the duel, and its unpremeditated nature; and, at the same time, expressing his deep regret for the unfortunate death of Du Barri, with whom for many years he had been bound in ties of the strictest friendship. These considerations appear to have weighed with the jury, and this fierce duellist was again found guilty of manslaughter only, and escaped with a merely nominal punishment.

A duel, less remarkable from its circumstances, but more so from the rank of the parties, took place in 1789. The combatants on this occasion were the Duke of York and Colonel Lenox, the nephew and heir of the Duke of Richmond. The cause of offence was given by the Duke of York, who had said in presence of several officers of the Guards, that words had been used to Colonel Lenox at Daubigny's to which no gentleman ought to have submitted. Colonel Lenox went up to the duke on parade, and asked him publicly whether he had made such an assertion. The Duke of York, without answering his question, coldly ordered him to his post. When parade was over, he took an opportunity of saying publicly in the orderly-room before Colonel Lenox, that he desired no protection from his rank as a prince and his station as commanding officer; adding that, when he was off duty he wore a plain brown coat like a private gentleman, and was ready as such to give satisfaction. Colonel Lenox desired nothing better than satisfaction; that is to say, to run the chance of shooting the duke through the body, or being himself shot. He accordingly challenged his Royal Highness, and they met on Wimbledon

Common. Colonel Lenox fired first, and the ball whizzed past the head of his opponent, so near to it as to graze his projecting curl. The duke refused to return the fire, and the seconds interfering, the affair terminated.

Colonel Lenox was very shortly afterwards engaged in another duel arising out of this. A Mr. Swift wrote a pamphlet in reference to the dispute between him and the Duke of York, at some expressions in which he took so much offence, as to imagine that nothing but a shot at the writer could atone for them. They met on the Uxbridge Road, but no damage was done to either party.

The Irish were for a long time renowned for their love of duelling. The slightest offence which it is possible to imagine that one man could offer to another was sufficient to provoke a challenge. Sir Jonah Barrington relates, in his *Memoirs*, that, previous to the Union, during the time of a disputed election in Dublin, it was no unusual thing for three-and-twenty duels to be fought in a day. Even in times of less excitement, they were so common as to be deemed unworthy of note by the regular chroniclers of events, except in cases where one or both of the combatants were killed.

In those days, in Ireland, it was not only the man of the military, but of every profession, who had to work his way to eminence with the sword or the pistol. Each political party had its regular corps of bullies, or fire-eaters, as they were called, who qualified themselves for being the pests of society by spending all their spare time in firing at targets. They boasted that they could hit an opponent in any part of his body they pleased, and made up their minds before the encounter began whether they should kill him, disable, or disfigure

him for life—lay him on a bed of suffering for a twelvemonth, or merely graze a limb.

The evil had reached an alarming height, when, in the year 1808, an opportunity was offered to King George III. of shewing in a striking manner his detestation of the practice, and of setting an example to the Irish that such murders were not to be committed with impunity. A dispute arose, in the month of June 1807, between Major Campbell and Captain Boyd, officers of the 21st regiment, stationed in Ireland, about the proper manner of giving the word of command on parade. Hot words ensued on this slight occasion, and the result was a challenge from Campbell to Boyd. They retired into the mess-room shortly afterwards, and each stationed himself at a corner, the distance obliquely being but seven paces. Here, without friends or seconds being present, they fired at each other, and Captain Boyd fell mortally wounded between the fourth and fifth ribs. A surgeon, who came in shortly, found him sitting in a chair, vomiting and suffering great agony. He was led into another room, Major Campbell following, in great distress and perturbation of mind. Boyd survived but eighteen hours, and just before his death, said, in reply to a question from his opponent, that the duel was not fair, and added, “You hurried me, Campbell—you’re a bad man.”—“Good God!” replied Campbell, “will you mention before these gentlemen, was not every thing fair? Did you not say that you were ready?” Boyd answered faintly, “Oh, no! you know I wanted you to wait and have friends.” On being again asked whether all was fair, the dying man faintly murmured, “Yes:” but in a minute after, he said, “You’re a bad man!” Campbell was now in great agitation, and ringing his hands convulsively, he exclaimed, “Oh, Boyd! you are the

happiest man of the two! Do you forgive me?" Boyd replied, "I forgive you—I feel for you, as I know you do for me." He shortly afterwards expired, and Major Campbell made his escape from Ireland, and lived for some months with his family under an assumed name, in the neighbourhood of Chelsea. He was, however, apprehended, and brought to trial at Armagh, in August 1808. He said while in prison, that, if found guilty of murder, he should suffer as an example to duellists in Ireland; but he endeavoured to buoy himself up with the hope that the jury would only convict him of manslaughter. It was proved in evidence upon the trial, that the duel was not fought immediately after the offence was given, but that Major Campbell went home and drank tea with his family before he sought Boyd for the fatal encounter. The jury returned a verdict of wilful murder against him, but recommended him to mercy on the ground that the duel had been a fair one. He was condemned to die on the Monday following, but was afterwards respited for a few days longer. In the mean time the greatest exertions were made in his behalf. His unfortunate wife went upon her knees before the Prince of Wales, to move him to use his influence with the king in favour of her unhappy husband. Every thing a fond wife and a courageous woman could do she tried, to gain the royal clemency; but George III. was inflexible, in consequence of the representations of the Irish viceroy that an example was necessary. The law was therefore allowed to take its course, and the victim of a false spirit of honour died the death of a felon.

The most inveterate duellists of the present day are the students in the Universities of Germany. They fight on the most frivolous pretences, and settle with swords and pistols the schoolboy disputes

which in other countries are arranged by the more harmless medium of the fisticuffs. It was at one time the custom among these savage youths to prefer the sword-combat, for the facility it gave them of cutting off the noses of their opponents. To disfigure them in this manner was an object of ambition, and the German duellists reckoned the number of these disgusting trophies which they had borne away, with as much satisfaction as a successful general the provinces he had reduced or the cities he had taken.

But it would be wearisome to enter into the minute detail of all the duels of modern times. If an examination were made into the general causes which produced them, it would be found that in every case they had been either of the most trivial or the most unworthy nature. Parliamentary duels were at one time very common, and amongst the names of those who have soiled a great reputation by conforming to the practice, may be mentioned those of Warren Hastings, Sir Philip Francis, Wilkes, Pitt, Fox, Grattan, Curran, Tierney, and Canning. So difficult is it even for the superior mind to free itself from the trammels with which foolish opinion has enswathed it—not one of these celebrated persons who did not in his secret soul condemn the folly to which he lent himself. The bonds of reason, though iron-strong, are easily burst through; but those of folly, though lithe and frail as the rushes by a stream, defy the stoutest heart to snap them asunder. Colonel Thomas, an officer in the Guards, who was killed in a duel, added the following clause to his will the night before he died:—“In the first place, I commit my soul to Almighty God, in hope of his mercy and pardon for the irreligious step I now (in compliance with the unwarrantable customs of this wicked world) put myself under the necessity of taking.” How many

have been in the same state of mind as this wise, foolish man! He knew his error, and abhorred it, but could not resist it for fear of the opinion of the prejudiced and unthinking. No other could have blamed him for refusing to fight a duel.

The list of duels that have sprung from the most degrading causes might be stretched out to an almost indefinite extent. Sterne's father fought a duel about a goose; and the great Raleigh about a tavern-bill.⁶⁸ Scores of duels (many of them fatal) have been fought from disputes at cards, or a place at a theatre; while hundreds of challenges, given and accepted over-night, in a fit of drunkenness, have been fought out the next morning to the death of one or both of the antagonists.

Two of the most notorious duels of modern times had their origin in causes no more worthy than the quarrel of a dog and the favour of a prostitute: that between Macnamara and Montgomery arising from the former; and that between Best and Lord Camelford from the latter. The dog of Montgomery attacked a dog belonging to Macnamara, and each master interfering in behalf of his own animal, high words ensued. The result was the giving and accepting a challenge to mortal combat. The parties met on the following day, when Montgomery was shot dead, and his antagonist severely wounded. The affair created a great sensation at the time, and Heaviside, the surgeon who attended at the fatal field to render his assistance if necessary, was arrested as an accessory to the murder, and committed to Newgate.

In the duel between Best and Lord Camelford, two pistols were used which were considered to be the best in England. One of them was thought slightly superior to the other, and it was agreed that the

belligerents should toss up a piece of money to decide the choice of weapons. Best gained it, and at the first discharge, Lord Camelford fell mortally wounded. But little sympathy was expressed for his fate; he was a confirmed duellist, had been engaged in many meetings of the kind, and the blood of more than one fellow-creature lay at his door. As he had sowed, so did he reap; and the violent man met an appropriate death.

It now only remains to notice the means that have been taken to stay the prevalence of this madness of false honour in the various countries of the civilised world. The efforts of the governments of France and England have already been mentioned, and their want of success is but too well known. The same efforts have been attended with the same results elsewhere. In despotic countries, where the will of the monarch has been strongly expressed and vigorously supported, a diminution of the evil has for a time resulted, but only to be increased again, when death relaxed the iron grasp, and a successor appeared of less decided opinions on the subject. This was the case in Prussia, under the great Frederick, of whose aversion to duelling a popular anecdote is recorded. It is stated of him that he permitted duelling in his army, but only upon the condition that the combatants should fight in presence of a whole battalion of infantry, drawn up on purpose to see fair play. The latter received strict orders, when one of the belligerents fell, to shoot the other immediately. It is added, that the known determination of the king effectually put a stop to the practice.

The Emperor Joseph II. of Austria was as firm as Frederick, although the measures he adopted were not so singular. The following letter explains his views on the subject:

“TO GENERAL * * * * *

“MY GENERAL,

“You will immediately arrest the Count of K. and Captain W. The count is young, passionate, and influenced by wrong notions of birth and a false spirit of honour. Captain W. is an old soldier, who will adjust every dispute with the sword and pistol, and who has received the challenge of the young count with unbecoming warmth.

“I will suffer no duelling in my army. I despise the principles of those who attempt to justify the practice, and who would run each other through the body in cold blood.

“When I have officers who bravely expose themselves to every danger in facing the enemy—who at all times exhibit courage, valour, and resolution in attack and defence, I esteem them highly. The coolness with which they meet death on such occasions is serviceable to their country, and at the same time redounds to their own honour; but should there be men amongst them who are ready to sacrifice every thing to their vengeance and hatred, I despise them. I consider such a man as no better than a Roman gladiator.

“Order a court-martial to try the two officers. Investigate the subject of their dispute with that impartiality which I demand from every judge; and he that is guilty, let him be a sacrifice to his fate and the laws.

“Such a barbarous custom, which suits the age of the Tamerlanes and Bajazets, and which has often had such melancholy effects on single families, I will have suppressed and

punished, even if it should deprive me of one half of my officers. There are still men who know how to unite the character of a hero with that of a good subject; and he only can be so who respects the laws.

*“August, 1771. JOSEPH .”*⁶⁹

In the United States of America the code varies considerably. In one or two of the still wild and simple states of the far West, where no duel has yet been fought, there is no specific law upon the subject beyond that in the Decalogue, which says, “Thou shalt do no murder;” but duelling every where follows the steps of modern civilisation; and by the time the backwoodsman is transformed into the citizen, he has imbibed the false notions of honour which are prevalent in Europe and around him, and is ready, like his progenitors, to settle his differences with the pistol. In the majority of the States the punishment for challenging, fighting, or acting as second, is solitary imprisonment and hard labour for any period less than a year, and disqualification for serving any public office for twenty years. In Vermont the punishment is total disqualification for office, deprivation of the rights of citizenship, and a fine; in fatal cases, the same punishment as that of murderers. In Rhode Island, the combatant, though death does not ensue, is liable to be carted to the gallows, with a rope about his neck, and to sit in this trim for an hour exposed to the peltings of the mob. He may be further imprisoned for a year, at the option of the magistrate. In Connecticut the punishment is total disqualification for office or employ, and a fine varying from one hundred to a thousand dollars. The laws of Illinois require certain officers of the state to make oath, previous to

their instalment, that they have never been, nor ever will be, concerned in a duel.⁷⁰

Amongst the edicts against duelling, promulgated at various times in Europe, may be mentioned that of Augustus King of Poland, in 1712, which decreed the punishment of death against principals and seconds, and minor punishments against the bearers of a challenge. An edict was also published at Munich, in 1773, according to which both principals and seconds, even in duels where no one was either killed or wounded, should be hanged, and their bodies buried at the foot of the gallows.

The king of Naples issued an ordinance against duelling in 1838, in which the punishment of death is decreed against all concerned in a fatal duel. The bodies of those killed, and of those who may be executed in consequence, are to be buried in unconsecrated ground, and without any religious ceremony; nor is any monument to be erected on the spot. The punishment for duels in which either, or both, are wounded, and for those in which no damage whatever is done, varies according to the case, and consists of fine, imprisonment, loss of rank and honours, and incapacity for filling any public situation. Bearers of challenges may also be punished with fine and imprisonment.

It might be imagined that enactments so severe all over the civilised world would finally eradicate a custom, the prevalence of which every wise and good man must deplore. But the frowns of the law never yet have taught, and never will teach, men to desist from this practice, as long as it is felt that the lawgiver sympathises with it in his heart. The stern judge upon the bench may say to the unfortunate wight who has been called a liar by some unmannerly

opponent, "If you challenge him, you meditate murder, and are guilty of murder!" but the same judge, divested of his robes of state, and mixing in the world with other men, would say, "If you do not challenge him, if you do not run the risk of making yourself a murderer, you will be looked upon as a mean-spirited wretch, unfit to associate with your fellows, and deserving nothing but their scorn and their contempt!" It is society, and not the duellist, who is to blame. Female influence too, which is so powerful in leading men either to good or to evil, takes in this case the evil part. Mere animal bravery has, unfortunately, such charms in the female eye, that a successful duellist is but too often regarded as a sort of hero; and the man who refuses to fight, though of truer courage, is thought a poltroon, who may be trampled on. Mr. Graves, a member of the American legislature, who, early in 1838, killed a Mr. Cilley in a duel, truly and eloquently said, on the floor of the House of Representatives, when lamenting the unfortunate issue of that encounter, that society was more to blame than he was. "Public opinion," said the repentant orator, "is practically the paramount law of the land. Every other law, both human and divine, ceases to be observed; yea, withers and perishes in contact with it. It was this paramount law of this nation and of this House that forced me, under the penalty of dishonour, to subject myself to the code, which impelled me unwillingly into this tragical affair. Upon the heads of this nation, and at the doors of this House, rests the blood with which my unfortunate hands have been stained!"

As long as society is in this mood; as long as it thinks that the man who refuses to resent an insult, deserved that insult, and should be scouted accordingly; so long, it is to be feared, will duelling exist,

however severe the laws may be. Men must have redress for injuries inflicted; and when those injuries are of such a nature that no tribunal will take cognisance of them, the injured will take the law into their own hands, and right themselves in the opinion of their fellows, at the hazard of their lives. Much as the sage may affect to despise the opinion of the world, there are few who would not rather expose their lives a hundred times than be condemned to live on, in society, but not of it—a by-word of reproach to all who know their history, and a mark for scorn to point his finger at.

The only practicable means for diminishing the force of a custom which is the disgrace of civilisation, seems to be the establishment of a court of honour, which should take cognisance of all those delicate and almost intangible offences which yet wound so deeply. The court established by Louis XIV. might be taken as a model. No man now fights a duel when a fit apology has been offered; and it should be the duty of this court to weigh dispassionately the complaint of every man injured in his honour, either by word or deed, and to force the offender to make a public apology. If he refused the apology, he would be the breaker of a second law; an offender against a high court, as well as against the man he had injured, and might be punished with fine and imprisonment, the latter to last until he saw the error of his conduct, and made the concession which the court demanded.

If, after the establishment of this tribunal, men should be found of a nature so bloodthirsty as not to be satisfied with its peaceful decisions, and should resort to the old and barbarous mode of an appeal to the pistol, some means might be found of dealing with them. To hang them as murderers would be of no avail; for to such

men death would have few terrors. Shame alone would bring them to reason. Transportation, the tread-wheel, or a public whipping, would perhaps be sufficient.

Shakspeare upon the leaf, written by the poet of all time himself; the chair preserved at Antwerp, in which Rubens sat when he painted the immortal Descent from the Cross; or the telescope, preserved in the Museum of Florence, which aided Galileo in his sublime discoveries. Who would not look with veneration upon the undoubted arrow of William Tell—the swords of Wallace or of Hampden—or the Bible whose leaves were turned by some stern old father of the faith?

Thus the principle of reliquism is hallowed and enshrined by love. But from this germ of purity how numerous the progeny of errors and superstitions! Men, in their admiration of the great, and of all that appertained to them, have forgotten that goodness is a component part of true greatness, and have made fools of themselves for the jawbone of a saint, the toe-nail of an apostle, the handkerchief a king blew his nose in, or the rope that hanged a criminal. Desiring to rescue some slight token from the graves of their predecessors, they have confounded the famous and the infamous, the renowned and the notorious. Great saints, great sinners; great philosophers, great quacks; great conquerors, great murderers; great ministers, great thieves; each and all have had their admirers, ready to ransack earth, from the equator to either pole, to find a relic of them.

The reliquism of modern times dates its origin from the centuries immediately preceding the Crusades. The first pilgrims to the Holy Land brought back to Europe thousands of apocryphal relics, in the purchase of which they had expended all their store. The greatest favourite was the wood of the true cross, which, like the oil of the widow, never diminished. It is generally asserted, in the traditions of the Romish Church, that the Empress Helen, the mother of Constantine the Great, first discovered the veritable “*true cross*” in her pilgrimage to Jerusalem. The Emperor Theodosius made a present of the greater part of it to St. Ambrose, Bishop of Milan, by whom it was studded with precious stones, and deposited in the principal church of that city. It was carried away by the Huns, by whom it was burnt, after they had extracted the valuable jewels it contained.

Fragments, purporting to have been cut from it, were, in the eleventh and twelfth centuries, to be found in almost every church in Europe, and would, if collected together in one place, have been almost sufficient to have built a cathedral. Happy was the sinner who could get a sight of one of them; happier he who possessed one! To obtain them the greatest dangers were cheerfully braved. They were thought to preserve from all evils, and to cure the most inveterate diseases. Annual pilgrimages were made to the shrines that contained them, and considerable revenues collected from the devotees.

Next in renown were those precious relics, the tears of the Saviour. By whom and in what manner they were preserved, the pilgrims did not inquire. Their genuineness was vouched by the Christians of the Holy Land, and that was sufficient. Tears of the Virgin Mary, and tears of St. Peter, were also to be had, carefully enclosed in little caskets, which the pious might wear in their bosoms. After the tears the next most precious relics were drops of the blood of Jesus and the martyrs, and the milk of the Virgin Mary. Hair and toe-nails were also in great repute, and were sold at extravagant prices. Thousands of pilgrims annually visited Palestine in the eleventh and twelfth centuries, to purchase pretended relics for the home market. The majority of them had no other means of subsistence than the profits thus obtained. Many a nail, cut from the filthy foot of some unscrupulous ecclesiastic, was sold at a diamond's price, within six months after its severance from its parent toe, upon the supposition that it had once belonged to a saint or an apostle. Peter's toes were uncommonly prolific, for there were nails enough in Europe, at the time of the Council of Clermont, to have filled a sack, all of which were devoutly believed to have grown on the sacred feet of that great apostle. Some of them are still shewn in the cathedral of Aix-la-Chapelle. The pious come from a distance of a hundred German miles to feast their eyes upon them.

At Port Royal, in Paris, is kept with great care a thorn, which the priests of that seminary assert to be one of the identical thorns that bound the holy

head of the Son of God. How it came there, and by whom it was preserved, has never been explained. This is the famous thorn, celebrated in the long dissensions of the Jansenists and the Molenists, and which worked the miraculous cure upon Mademoiselle Perrier: by merely kissing it she was cured of a disease of the eyes of long standing.⁷¹

What traveller is unacquainted with the Santa Scala, or Holy Stairs, at Rome? They were brought from Jerusalem along with the true cross, by the Empress Helen, and were taken from the house which, according to popular tradition, was inhabited by Pontius Pilate. They are said to be the steps which Jesus ascended and descended when brought into the presence of the Roman governor. They are held in the greatest veneration at Rome: it is sacrilegious to walk upon them. The knees of the faithful must alone touch them in ascending or descending, and that only after the pilgrims have reverentially kissed them.

Europe still swarms with these religious relics. There is hardly a Roman Catholic church in Spain, Portugal, Italy, France, or Belgium, without one or more of them. Even the poorly endowed churches of the villages boast the possession of miraculous thigh-bones of the innumerable saints of the Romish calendar. Aix-la-Chapelle is proud of the veritable *châsse*, or thigh-bone of Charlemagne, which cures lameness. Halle has a thigh-bone of the Virgin Mary; Spain has seven or eight, all said to be undoubted relics. Brussels at one time preserved, and perhaps does now, the teeth of St. Gudule. The faithful, who suffered from the toothache, had only to pray, look at them, and be cured. Some of these holy bones have been buried in different parts of the Continent. After a certain lapse of time, water is said to ooze from them, which soon forms a spring, and cures all the diseases of the faithful.

It is curious to remark the avidity manifested in all ages, and in all countries, to obtain possession of some relic of any persons who have been much spoken of, even for their crimes. When William Longbeard, leader of the populace of London in the reign of Richard I., was hanged at

Smithfield, the utmost eagerness was shewn to obtain a hair from his head, or a shred from his garments. Women came from Essex, Kent, Suffolk, Sussex, and all the surrounding counties, to collect the mould at the foot of his gallows. A hair of his beard was believed to preserve from evil spirits, and a piece of his clothes from aches and pains.

In more modern days, a similar avidity was shewn to obtain a relic of the luckless Masaniello, the fisherman of Naples. After he had been raised by mob favour to a height of power more despotic than monarch ever wielded, he was shot by the same populace in the streets, as if he had been a mad dog. His headless trunk was dragged through the mire for several hours, and cast at night-fall into the city ditch. On the morrow the tide of popular feeling turned once more in his favour. His corpse was sought, arrayed in royal robes, and buried magnificently by torch-light in the cathedral, ten thousand armed men, and as many mourners, attending at the ceremony. The fisherman's dress which he had worn was rent into shreds by the crowd, to be preserved as relics; the door of his hut was pulled off its hinges by a mob of women, and eagerly cut up into small pieces, to be made into images, caskets, and other mementos. The scanty furniture of his poor abode became of more value than the adornments of a palace; the ground he had walked upon was considered sacred, and, being collected in small phials, was sold at its weight in gold, and worn in the bosom as an amulet.

Almost as extraordinary was the frenzy manifested by the populace of Paris on the execution of the atrocious Marchioness de Brinvilliers. There were grounds for the popular wonder in the case of Masaniello, who was unstained with personal crimes. But the career of Madame de Brinvilliers was of a nature to excite no other feelings than disgust and abhorrence. She was convicted of poisoning several persons, and sentenced to be burned in the Place de Grève, and to have her ashes scattered to the winds. On the day of her execution, the populace, struck by her gracefulness and beauty, inveighed against the severity of her sentence. Their pity soon increased to admiration, and, ere evening, she was considered a saint. Her ashes were

industriously collected; even the charred wood, which had aided to consume her, was eagerly purchased by the populace. Her ashes were thought to preserve from witchcraft.

In England many persons have a singular love for the relics of thieves and murderers, or other great criminals. The ropes with which they have been hanged are very often bought by collectors at a guinea per foot. Great sums were paid for the rope which hanged Dr. Dodd, and for those more recently which did justice upon Mr. Fauntleroy for forgery, and on Thurtell for the murder of Mr. Weare. The murder of Maria Marten, by Corder, in the year 1828, excited the greatest interest all over the country. People came from Wales and Scotland, and even from Ireland, to visit the barn where the body of the murdered woman was buried. Every one of them was anxious to carry away some memorial of his visit. Pieces of the barn-door, tiles from the roof, and, above all, the clothes of the poor victim, were eagerly sought after. A lock of her hair was sold for two guineas, and the purchaser thought himself fortunate in getting it so cheaply.

So great was the concourse of people to visit the house in Camberwell Lane, where Greenacre murdered Hannah Brown, in 1837, that it was found necessary to station a strong detachment of police on the spot. The crowd was so eager to obtain a relic of the house of this atrocious criminal, that the police were obliged to employ force to prevent the tables and chairs, and even the doors, from being carried away.

In earlier times, a singular superstition was attached to the hand of a criminal who had suffered execution. It was thought that by merely rubbing the dead hand on the body, the patient afflicted with the king's evil would be instantly cured. The executioner at Newgate formerly derived no inconsiderable revenue from this foolish practice. The possession of the hand was thought to be of still greater efficacy in the cure of diseases and the prevention of misfortunes. In the time of Charles II., as much as ten guineas was thought a small price for one of these disgusting relics.

When the maniac, Thom, or Courtenay, was shot, in the spring of 1838, the relic-hunters were immediately in motion to obtain a memento of so extraordinary an individual. His long black beard and hair, which were cut off by the surgeons, fell into the hands of his disciples, by whom they were treasured with the utmost reverence. A lock of his hair commanded a great price, not only amongst his followers, but among the more wealthy inhabitants of Canterbury and its neighbourhood. The tree against which he fell when he was shot, was stripped of all its bark by the curious; while a letter, with his signature to it, was paid for in gold coins; and his favourite horse became as celebrated as its master. Parties of ladies and gentlemen went to Boughton from a distance of a hundred and fifty miles, to visit the scene of that fatal affray, and stroke on the back the horse of the “mad knight of Malta.” If a strict watch had not been kept over his grave for months, the body would have been disinterred, and the bones carried away as memorials.

Among the Chinese no relics are more valued than the *boots* which have been worn by an upright magistrate. In Davis’s interesting description of the empire of China, we are informed, that whenever a judge of unusual integrity resigns his situation, the people all congregate to do him honour. If he leaves the city where he has presided, the crowd accompany him from his residence to the gates, where his boots are drawn off with great ceremony, to be preserved in the hall of justice. Their place is immediately supplied by a new pair, which, in their turn, are drawn off to make room for others before he has worn them five minutes, it being considered sufficient to consecrate them that he should have merely drawn them on.

Among the most favourite relics of modern times, in Europe, are Shakspeare’s mulberry-tree, Napoleon’s willow, and the table at Waterloo on which the emperor wrote his despatches. Snuff-boxes of Shakspeare’s mulberry-tree are comparatively rare, though there are doubtless more of them in the market than were ever made of the wood planted by the great bard. Many a piece of alien wood passes under this name. The same may be

said of Napoleon's table at Waterloo. The original has long since been destroyed, and a round dozen of counterfeits along with it. Many preserve the simple stick of wood; others have them cut into brooches and every variety of ornament; but by far the greater number prefer them as snuff-boxes. In France they are made into *bonbonnières*, and are much esteemed by the many thousands whose cheeks still glow and whose eyes still sparkle at the name of Napoleon.

Bullets from the field of Waterloo, and buttons from the coats of the soldiers who fell in the fight, are still favourite relics in Europe. But the same ingenuity which found new tables after the old one was destroyed, has cast new bullets for the curious. Many a one who thinks himself the possessor of a bullet which aided in giving peace to the world on that memorable day, is the owner of a dump, first extracted from the ore a dozen years afterwards. Let all lovers of genuine relics look well to their money before they part with it to the ciceroni that swarm in the village of Waterloo!

Few travellers stopped at the lonely isle of St. Helena without cutting a twig from the willow that drooped over the grave of Napoleon, prior to the removal of the body by the government of Louis Philippe. Many of them have since been planted in different parts of Europe, and have grown into trees as large as their parent. Relic-hunters, who are unable to procure a twig of the original, are content with one from these. Several of them are growing in the neighbourhood of London.

But in relics, as in every thing else, there is the use and the abuse. The undoubted relics of great men, or great events, will always possess attractions for the thinking and refined. There are few who would not join with Cowley in the extravagant wish introduced in his lines "written while sitting in a chair made of the remains of the ship in which Sir Francis Drake sailed round the world:"

And I myself, who now love quiet too,
Almost as much, as any chair can do,
Would yet a journey take
 An old wheel of that chariot to see,
Which Phaeton so rashly brake.

9. Guibert de Nogent relates a curious instance of the imitateness of these juvenile Crusaders. He says that, during

the siege of Antioch, the Christian and Saracen boys used to issue forth every evening from the town and camp in great numbers, under the command of captains chosen from among themselves. Armed with sticks instead of swords, and stones instead of arrows, they ranged themselves in battle order, and, shouting each the war-cry of their country, fought with the utmost desperation. Some of them lost their eyes, and many became cripples for life from the injuries they received on these occasions.

10. The sacking of Vitry reflects indelible disgrace upon Louis VII. His predecessors had been long engaged in resistance to the outrageous powers assumed by the Popes, and Louis continued the same policy. The ecclesiastical chapter of Bourges, having elected an archbishop without his consent, he proclaimed the election to be invalid, and took severe and prompt measures against the refractory clergy. Thibault count de Champagne took up arms in defence of the Papal authority, and entrenched himself in the town of Vitry. Louis immediately took the field to chastise the rebel, and he besieged the town with so much vigour that the count was forced to surrender. Upwards of thirteen hundred of the inhabitants, fully one half of whom were women and children, took refuge in the church; and, when the gates of the city were opened, and all resistance had ceased, Louis inhumanly gave orders to set fire to the sacred edifice, and a thousand persons perished in the flames.

11. Philip, Archdeacon of the cathedral of Liege, wrote a detailed account of all the miracles performed by St. Bernard during

thirty-four days of his mission. They averaged about ten per day. The disciples of St. Bernard complained bitterly that the people flocked around their master in such numbers, that they could not see half the miracles he performed. But they willingly trusted the eyes of others, as far as faith in the miracles went, and seemed to vie with each other whose credulity should be greatest.

17. Richard left a high reputation in Palestine. So much terror did his name occasion, that the women of Syria used it to frighten their children for ages afterwards. Every disobedient child became still when told that King Richard was coming. Even men shared the panic that his name created; and a hundred years afterwards, whenever a horse shied at any object in the way, his

rider would exclaim, “What! dost thou think King Richard is in the bush?”

18. The following is a list of some of the works of art thus destroyed, from Nicetas, a contemporary Greek author: 1st. A colossal Juno, from the forum of Constantine, the head of which was so large that four horses could scarcely draw it from the place where it stood to the palace. 2^d. The statue of Paris, presenting the apple to Venus. 3^d. An immense bronze pyramid, crowned by a female figure, which turned with the wind. 4th. The colossal statue of Bellerophon, in bronze, which was broken down and cast into the furnace. Under the inner nail of the horse’s hind foot on the left side, was found a seal wrapped in a woollen cloth. 5th. A figure of Hercules, by Lysimachus, of such vast dimensions that the thumb was equal in circumference to the waist of a man. 6th. The Ass and his Driver, cast by order of Augustus after the battle of Actium, in commemoration of his having discovered the position of Anthony through the means of an ass-driver. 7th. The Wolf suckling the Twins of Rome. 8th. The gladiator in combat with a lion. 9th. The Hippopotamus. 10th. The Sphinxes. 11th. An Eagle fighting with a Serpent. 12th. A beautiful statue of Helen. 13th. A group, with a monster somewhat resembling a bull, engaged in deadly conflict with a serpent; and many other works of art, too numerous to mention.

25. M. Michaud, in his *History of the Crusades*, M. Guinguené, in his *Literary History of Italy*, and some other critics, have objected to Tasso’s poem, that he has attributed to the Crusaders a belief in magic, which did not exist at that time. If these critics had referred to the edicts of Charlemagne, they would have seen that Tasso was right, and that a disposition too eager to spy out imperfections in a great work was leading themselves into error.

37. A very graphic account of the execution of this unfortunate gentleman is to be found in the excellent romance of M. Alfred de Vigny, entitled *Cinq Mars*; but if the reader wishes for a full and accurate detail of all the circumstances of one of the most extraordinary trials upon record, he is referred to a work published anonymously, at Amsterdam, in 1693, entitled *Histoire des Diables de Loudun, ou de la Possession des Religieuses Ursulines, et de la Condemnation et du Supplice d'Urbain Grandier*.

[Return](#)

38. The punishment for the contumacious was expressed by the words *onere, frigore, et fame*. By the first was meant, that the culprit should be extended on his back on the ground, and weights placed over his body, gradually increased, until he expired. Sometimes the punishment was not extended to this length, and the victim being allowed to recover, underwent the second portion, the *frigore*, which consisted in his standing naked in the open air, for a certain space, in the sight of all the people. The third, or *fame*, was more dreadful, the statute saying, "That he was to be preserved with the coarsest bread that could be got, and water out of the next sink, or puddle, to the place of execution; and that day he had water he should have no bread, and that day he had bread he should have no water;" and in this torment he was to linger as long as nature would hold out.

[Return](#)

39. This is denied by Voltaire in his *Age of Louis XIV.*; but he does not state for what reason. His words are, "Il est faux qu'elle eut essayé ses poisons dans les hôpitaux, comme le disait le peuple,

et comme il est écrit dans les *Causes Célèbres*, ouvrage d'un avocat sans cause et fait pour le peuple.”

[Return](#)

40. Slow poisoning is a crime which has unhappily been revived in England within the last few years, and which has been carried to an extent sufficient to cast a stain upon the national character. The poisoners have been principally women of the lowest class, and their victims have been their husbands or their children. The motive for the crime has in most instances been the basest that can be imagined,—the desire to obtain from burial-clubs to which they subscribed, the premium, or burial-money. A recent enactment, restricting the sale of arsenic and other poisons, will, it is to be hoped, check, if it do not extirpate this abominable crime.—1851.

44. The woman whose ghost was said to manifest itself in Cock Lane was buried in the crypt or cloister of St. John, Clerkenwell. The vault is composed of two aisles, that on the south being much narrower than the other,—it was here she was deposited.

About seven years since, I was sketching a picturesque trefoil-headed door leading into this part of the vault; and the place being at that time in great confusion with coffins, remains of

bodies, some of which were dried like mummies, &c., I could find no better seat than one of the coffins. The sexton's boy, who held my light, informed me this was the coffin of *Scratching Fanny*, which recalled the Cock Lane story to my mind. I got off the lid of the coffin, and saw the face of a handsome woman, with an aquiline nose; this feature remaining perfect, an uncommon case, for the cartilage mostly gives way. The remains had become adipocere, and were perfectly preserved. She was said to have been poisoned by deleterious punch, but this was legally disproved; and, if I remember rightly, she was otherwise declared to have died of small-pox; of this disease there was not the least sign; but as some mineral poisons tend to render bodies adipocere, here was some evidence in support of the former allegation. I made particular inquiries at the time of Mr. Bird, churchwarden, a respectable and judicious man; and he gave me good assurance that this coffin had always been looked upon as the one containing the Cock Lane woman. Since that time the vault has been set in order, and the above-mentioned coffin, with others, put away.

The niche near the window in the drawing of the Ghost Room is the place where the bed-head was, and where the scratching, knocks, &c. were heard. This is the tradition of the house. Mrs. King, who holds the premises, informs me that her family has had the house about eighty years.—J. W. ARCHER.

46. The Abbé, in the second volume, in the letter No. 79, addressed to Monsieur de Buffon, gives the following curious

particulars of the robbers of 1737, which are not without interest at this day, if it were only to shew the vast improvement which has taken place since that period. “It is usual in travelling to put ten or a dozen guineas in a separate pocket, as a tribute to the first that comes to demand them the right of passport, which custom has established here in favour of the robbers, who are almost the only highway surveyors in England, has made this necessary; and accordingly the English call these fellows the ‘Gentlemen of the Road,’ the government letting them exercise their jurisdiction upon travellers without giving them any great molestation. To say the truth, they content themselves with only taking the money of those who obey without disputing; but notwithstanding their boasted humanity, the lives of those who endeavour to get away are not always safe. They are very strict and severe in levying their impost; and if a man has not wherewithal to pay them, he may run the chance of getting himself knocked on the head for his poverty.

“About fifteen years ago, these robbers, with the view of maintaining their rights, fixed up papers at the doors of rich people about London, expressly forbidding all persons, of whatsoever quality or condition, from going out of town without ten guineas and a watch about them, on pain of death. In bad times, when there is little or nothing to be got on the roads, these fellows assemble in gangs, to raise contributions even in London itself, and the watchmen seldom trouble themselves to interfere with them in their vocation.”

Return

47. Since the publication of the first edition of this volume, Jack Sheppard's adventures have been revived. A novel upon the real or fabulous history of the burglar has afforded, by its extraordinary popularity, a further exemplification of the allegations in the text. The *Sixth Report of the Inspector of Prisons for the Northern Districts of England* contains a mass of information upon the pernicious effect of such romances, and of the dramas founded upon them. The Inspector examined several boys attending the prison school in the New Bailey at Manchester, from whose evidence the following passages bearing upon the subject are extracted:

“J. L. (aged 14). The first time I was ever at the theatre was to see *Jack Sheppard*. There were two or three boys near to the house who were going, and they asked me. I took sixpence from the money I used to lay up weekly for clothes. The next time I went, which was the week after, I borrowed the money from a boy; I returned it to him the Saturday after. I then went many times. I took the money from my mother out of her pocket as she was sitting down, and I beside her. There was more than sixpence in her pocket. I got a great love for the theatre, and stole from people often to get there. *I thought this Jack Sheppard was a clever fellow* for making his escape and robbing his master. *If I could get out of gaol, I think I should be as clever as him:* but, after all his exploits, he got done at last. I have had the book out of a library at Dole Field. I had paid two-pence a book for three volumes. I also got *Richard*

Turpin, in two volumes, and paid the same. I have seen *Oliver Twist*, and think the Artful Dodger is very like some of the boys here. I am here for picking a pocket of 25*l.*

“H. C. (aged 15). When we came to Manchester, I went to the play, and saw *Jack Sheppard* the first night it came out. There were pictures of him about the streets on boards and on the walls; one of them was his picking a pocket in the church. I liked *Jack Sheppard* much. I had not been in prison there. I was employed in a warehouse at 6*s.* 6*d.* a-week, and was allowed 6*d.* out of it for myself, and with that I went regularly to the play. I saw *Jack Sheppard* afterwards four times in one week. I got the money out of my money-bag by stealth, and without my master’s knowledge. I once borrowed 10*s.* in my mother’s name from Mrs. —, a shopkeeper, with whom she used to deal; I went to the play with it.

“J. M’D. (aged 15). I have heard of *Jack Sheppard*: a lad whom I know told me of it, who had seen it, and said it was *rare fun* to see him break out of prison.

“J. L. (aged 11). Has been to the play twice, and seen *Jack Sheppard*. Went with his brother the first time, and by himself the second. I took the money to go a second time out of mother’s house, off the chimney-piece, where she had left a sixpence. It was the first night *Jack Sheppard* was played. There was great talk about it, and there were nice pictures about it all over the walls. I thought him a very clever fellow; but Blueskin made the most fun. I first went to the markets, and begun by stealing apples. I also knew a

lad, —, who has been transported, and went with him two or three times. The most I ever got was 10s. out of a till.”

The Inspector's *Report on Juvenile Delinquency at Liverpool* contains much matter of the same kind; but sufficient has been already quoted to shew the injurious effects of the deification of great thieves by thoughtless novelists.

52. Very similar to this is the fire-ordeal of the modern Hindoos, which is thus described in Forbes's *Oriental Memoirs*, vol. i. c. xi.:—“When a man, accused of a capital crime, chooses to undergo the ordeal trial, he is closely confined for several days; his right hand and arm are covered with thick wax-cloth, tied up and sealed, in the presence of proper officers, to prevent deceit. In the English districts the covering was always sealed with the Company's arms, and the prisoner placed under an European guard. At the time fixed for the ordeal, a caldron of oil is placed over a fire; when it boils, a piece of money is dropped into the vessel; the prisoner's arm is unsealed and washed in the

presence of his judges and accusers. During this part of the ceremony the attendant Brahmins supplicate the Deity. On receiving their benediction, the accused plunges his hand into the boiling fluid, and takes out the coin. The arm is afterwards again sealed up until the time appointed for a re-examination. The seal is then broken; if no blemish appears, the prisoner is declared innocent; if the contrary, he suffers the punishment due to his crime.”... On this trial the accused thus addresses the element before plunging his hand into the boiling oil:—“Thou, O fire! pervadest all things. O cause of purity! who givest evidence of virtue and of sin, declare the truth in this my hand!” If no juggling were practised, the decisions by this ordeal would be all the same way; but as some are by this means declared guilty, and others innocent, it is clear that the Brahmins, like the Christian priests of the middle ages, practise some deception in saving those whom they wish to be thought guiltless.

[Return](#)

53. An ordeal very like this is still practised in India. Consecrated rice is the article chosen, instead of bread and cheese. Instances are not rare in which, through the force of imagination, guilty persons are not able to swallow a single grain. Conscious of their crime, and fearful of the punishment of Heaven, they feel a suffocating sensation in their throat when they attempt it, and they fall on their knees, and confess all that is laid to their charge. The same thing, no doubt, would have happened with the bread and cheese of the Roman Church, if it had been applied to any others but ecclesiastics. The latter had too much wisdom to be caught in a trap of their own setting.

59. Although Francis shewed himself in this case an enemy to duelling, yet in his own case he had not the same objection. Every reader of history must remember his answer to the challenge of the Emperor Charles V. The Emperor wrote that he had failed in his word, and that he would sustain their quarrel single-handed against him. Francis replied, that he lied—*qu'il en avait menti par la gorge*, and that he was ready to meet him in single combat whenever and wherever he pleased.

68. Raleigh at one period of his life appeared to be an inveterate duellist, and it was said of him that he had been engaged in more encounters of the kind than any man of note among his contemporaries. More than one fellow-creature he had deprived of life; but he lived long enough to be convinced of the sinfulness of his conduct, and made a solemn vow never to fight another duel. The following anecdote of his forbearance is well known, but it will bear repetition:

A dispute arose in a coffee-house between him and a young man on some trivial point, and the latter, losing his temper, impertinently spat in the face of the veteran. Sir Walter, instead of running him through the body, as many would have done, or challenging him to mortal combat, coolly took out his handkerchief, wiped his face, and said, "Young man, if I could as easily wipe from my conscience the stain of killing you, as I can this spittle from my face, you should not live another minute." The young man immediately begged his pardon.

revival of enthusiasm, [38](#);

battle of Antioch, and defeat of the Turks, [38](#);

dissensions, [40](#);

fate of Peter Barthelemy, [41](#);

Marah taken by storm, 42;
shrine of the nativity at Bethlehem, (*engraving*), 43;
first sight of Jerusalem (*engraving*), 44;
the city besieged and taken, 45;
Peter the Hermit's fame revives, 46;
Jerusalem under its Christian kings, 48;
Godfrey of Bouillon succeeded by Baldwin; continual
conflicts with the Saracens; Edessa taken by them, 50.
Second Crusade:—Society in Europe at its
commencement, 52;
St. Bernard's preaching; Louis VII. joins the
Crusaders, 53-55;
receives the cross at Vezelai (*engraving*), 54;
is joined by Conrad emperor of Germany and a
large army, 56;
their reception by Manuel Comnenus, 57;
losses of the German army, 58;
progress to Nice, and thence to Jerusalem, 60;
jealousies of the leaders; siege of Damascus, 61;
further dissensions; the siege abandoned, 62.
Third Crusade:—Progress of chivalry, 62;
successes of Saladin, 63;
Barbarossa defeats the Saracens, 64;
Crusade joined by Henry II. and Philip Augustus,
64;
they meet at Gisors (*engraving*), 65;
the Crusade unpopular, 66;
delayed by war between France and England,
death of Henry II.; Richard and Philip proceed
to Palestine, 67;

Richard attacks the Sicilians, 68;
arrives at Acre, 69;
siege and surrender of the city, 71;
dissensions, Philip returns to France, Saladin
defeated at Azotus, 72;
Crusaders reach Bethlehem (*engraving*), retreat
agreed on, 73;
Jaffa attacked by Saladin and rescued by Richard,
peace concluded, Richard's imprisonment and
ransom, 74.

Fourth Crusade, undertaken by the Germans; its failure,
75.

Fifth Crusade:—Foulque, Bishop of Neuilly, enlists the
chivalry of France; assisted by the Venetians; siege of
Zara, 76;
Crusaders expel Alexius III. from Constantinople,
77;
Alexius IV. deposed, 78;
Murzuphlis defeated by the Crusaders and
Venetians, 79;
Baldwin count of Flanders, elected emperor;
Pilgrimages to Jerusalem; children undertaking
the Crusade are betrayed to slavery, 80.

Sixth Crusade, prompted by the Pope, 81;
undertaken by the King of Hungary; pursued in
Egypt; Damietta taken, 82;
Cardinal Pelagius and John of Brienne, 83;
dissensions and reverses; Damietta abandoned,
84.

Seventh Crusade:—Undertaken by Frederick II. of
Germany, 84;
intrigues against him; he is excommunicated, 85;

crowns himself King of Jerusalem, 86;
supported by the Templars and Hospitallers
(*engraving*), 86;
returns to Germany, 87.

Eighth Crusade, commenced in France, 87:
battle of Gaza; Richard earl of Cornwall; truce
agreed on; the Korasmins take Jerusalem, 88;
they subdue the Templars, but are extirpated by
the Syrian sultans, 90.

Ninth Crusade, began by Louis IX., 90;
joined by William Longsword (*engraving*), 91;
the Crusade unpopular in England, 91-97;
Damietta taken, 93;
battle of Massoura; Louis taken prisoner by the
Saracens; his ransom and return, 94;

and the Online Distributed Proofreading Team at
<http://www.pgdp.net>

Updated editions will replace the previous one--the old editions
will be renamed.

Creating the works from public domain print editions means that no
one owns a United States copyright in these works, so the Foundation
(and you!) can copy and distribute it in the United States without
permission and without paying copyright royalties. Special rules,
set forth in the General Terms of Use part of this license, apply to
copying and distributing Project Gutenberg-tm electronic works to
protect the PROJECT GUTENBERG-tm concept and trademark. Project
Gutenberg is a registered trademark, and may not be used if you
charge for the eBooks, unless you receive specific permission. If you

do not charge anything for copies of this eBook, complying with the rules is very easy. You may use this eBook for nearly any purpose such as creation of derivative works, reports, performances and research. They may be modified and printed and given away--you may do practically ANYTHING with public domain eBooks. Redistribution is subject to the trademark license, especially commercial redistribution.

*** START: FULL LICENSE ***

THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg-tm mission of promoting the free distribution of electronic works, by using or distributing this work (or any other work associated in any way with the phrase "Project Gutenberg"), you agree to comply with all the terms of the Full Project Gutenberg-tm License (available with this file or online at <http://gutenberg.org/license>).

Section 1. General Terms of Use and Redistributing Project Gutenberg-tm electronic works

1.A. By reading or using any part of this Project Gutenberg-tm electronic work, you indicate that you have read, understand, agree to and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg-tm electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg-tm electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. "Project Gutenberg" is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg-tm electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg-tm electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg-tm electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation ("the Foundation" or PGLAF), owns a compilation copyright in the collection of Project Gutenberg-tm electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is in the public domain in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg-tm mission of promoting free access to electronic works by freely sharing Project Gutenberg-tm works in compliance with the terms of this agreement for keeping the Project Gutenberg-tm name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project

Gutenberg-tm License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg-tm work. The Foundation makes no representations concerning the copyright status of any work in any country outside the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg-tm License must appear prominently whenever any copy of a Project Gutenberg-tm work (any work on which the phrase "Project Gutenberg" appears, or with which the phrase "Project Gutenberg" is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org

1.E.2. If an individual Project Gutenberg-tm electronic work is derived from the public domain (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase "Project Gutenberg" associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg-tm trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg-tm electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg-tm License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg-tm License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg-tm.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg-tm License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg-tm work in a format other than "Plain Vanilla ASCII" or other format used in the official version posted on the official Project Gutenberg-tm web site (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a

copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original "Plain Vanilla ASCII" or other form. Any alternate format must include the full Project Gutenberg-tm License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg-tm works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg-tm electronic works provided that

- You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg-tm works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg-tm trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, "Information about donations to the Project Gutenberg Literary Archive Foundation."
- You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg-tm License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg-tm works.
- You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- You comply with all other terms of this agreement for free distribution of Project Gutenberg-tm works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg-tm electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from both the Project Gutenberg Literary Archive Foundation and Michael Hart, the owner of the Project Gutenberg-tm trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread public domain works in creating the Project Gutenberg-tm collection. Despite these efforts, Project Gutenberg-tm electronic works, and the medium on which they may be stored, may contain "Defects," such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the "Right of Replacement or Refund" described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg-tm trademark, and any other party distributing a Project Gutenberg-tm electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH F3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS' WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg-tm electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg-tm electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg-tm work, (b) alteration, modification, or additions or deletions to any Project Gutenberg-tm work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need, is critical to reaching Project Gutenberg-tm's goals and ensuring that the Project Gutenberg-tm collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg-tm and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation web page at <http://www.pglaf.org>.

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Its 501(c)(3) letter is posted at <http://pglaf.org/fundraising>. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's principal office is located at 4557 Melan Dr. S. Fairbanks, AK, 99712., but its volunteers and employees are scattered throughout numerous locations. Its business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887, email business@pglaf.org. Email contact links and up to date contact information can be found at the Foundation's web site and official page at <http://pglaf.org>

For additional contact information:
Dr. Gregory B. Newby
Chief Executive and Director
gbnewby@pglaf.org

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide spread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit <http://pglaf.org>

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: <http://pglaf.org/donate>

Section 5. General Information About Project Gutenberg-tm electronic works.

Professor Michael S. Hart is the originator of the Project Gutenberg-tm concept of a library of electronic works that could be freely shared with anyone. For thirty years, he produced and distributed Project Gutenberg-tm eBooks with only a loose network of volunteer support.

Project Gutenberg-tm eBooks are often created from several printed editions, all of which are confirmed as Public Domain in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility:

<http://www.gutenberg.org>

This Web site includes information about Project Gutenberg-tm, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.

Should Law be just to unjust LAWS
And all his proud Directors,
The Law must hang up LAWS because
The vilest of Projectors
Let this write you to behold
Their decent Execution
Who basely for the sake of Gold
Have brought us to confusion
A Sermon, you shall also hear
From jerry's Lamentations
To comfort sufferers that appear
Upon this sad occasion.

The Psychology of Arithmetic

Edward L. Thorndike

The background of the lower half of the page is a vibrant blue, overlaid with a complex, abstract pattern of bright pink geometric shapes. This pattern includes various elements such as vertical and horizontal lines of different lengths, solid triangles pointing in various directions, and several squares and rectangles, some of which are hollow. The shapes are scattered across the blue field, creating a dynamic and modern visual texture.

PREFACE

Within recent years there have been three lines of advance in psychology which are of notable significance for teaching. The first is the new point of view concerning the general process of learning. We now understand that learning is essentially the formation of connections or bonds between situations and responses, that the satisfyingness of the result is the chief force that forms them, and that habit rules in the realm of thought as truly and as fully as in the realm of action.

The second is the great increase in knowledge of the amount, rate, and conditions of improvement in those organized groups or hierarchies of habits which we call abilities, such as ability to add or ability to read. Practice and improvement are no longer vague generalities, but concern changes which are definable and measurable by standard tests and scales.

The third is the better understanding of the so-called "higher processes" of analysis, abstraction, the formation of general notions, and reasoning. The older view of a mental chemistry whereby sensations were compounded into percepts, percepts were duplicated by images, percepts and images were amalgamated into abstractions and concepts, and these were manipulated by reasoning, has given way to the understanding of the laws of response to elements or aspects of situations and to many situations or elements thereof in combination. James' view of reasoning as "selection of essentials" and "thinking things together" in a revised and clarified form has important applications in the teaching of all the school subjects.

This book presents the applications of this newer dynamic psychology to the teaching of arithmetic. Its contents are substantially what have been included in a course of lectures on the psychology of the elementary school subjects given by the author for some years to students of elementary education at Teachers College. Many of these former students, now in supervisory charge of elementary schools, have urged that these lectures be made available to teachers in general. So they are now published in spite of

the author's desire to clarify and reinforce certain matters by further researches.

A word of explanation is necessary concerning the exercises and problems cited to illustrate various matters, especially erroneous pedagogy. These are all genuine, having their source in actual textbooks, courses of study, state examinations, and the like. To avoid any possibility of invidious comparisons they are not quotations, but equivalent problems such as represent accurately the spirit and intent of the originals.

I take pleasure in acknowledging the courtesy of Mr. S. A. Curtis, Ginn and Company, D. C. Heath and Company, The Macmillan Company, The Oxford University Press, Rand, McNally and Company, Dr. C. W. Stone, The Teachers College Bureau of Publications, and The World Book Company, in permitting various quotations.

GENERAL INTRODUCTION

THE PSYCHOLOGY OF THE ELEMENTARY SCHOOL SUBJECTS

The psychology of the elementary school subjects is concerned with the connections whereby a child is able to respond to the sight of printed words by thoughts of their meanings, to the thought of "six and eight" by thinking "fourteen," to certain sorts of stories, poems, songs, and pictures by appreciation thereof, to certain situations by acts of skill, to certain others by acts of courtesy and justice, and so on and on through the series of situations and responses which are provided by the systematic training of the school subjects and the less systematic training of school life during their study. The aims of elementary education, when fully defined, will be found to be the production of changes in human nature represented by an almost countless list of connections or bonds whereby the pupil thinks or feels or acts in certain ways in response to the situations the school has organized and is influenced to think and feel and act similarly to similar situations when life outside of school confronts him with them.

We are not at present able to define the work of the elementary school in detail as the formation of such and such bonds between certain detached situations and certain specified responses. As elsewhere in human learning, we are at present forced to think somewhat vaguely in terms of mental functions, like "ability to read the vernacular," "ability to spell common words," "ability to add, subtract, multiply, and divide with integers," "knowledge of the history of the United States," "honesty in examinations," and "appreciation of good music," defined by some general results obtained rather than by the elementary bonds which constitute them.

The psychology of the school subjects begins where our common sense knowledge of these functions leaves off and tries to define the knowledge, interest, power, skill, or ideal in question more adequately, to measure improvement in it, to analyze it into its constituent bonds, to decide what bonds need to be formed and in what order as means to the most

economical attainment of the desired improvement, to survey the original tendencies and the tendencies already acquired before entrance to school which help or hinder progress in the elementary school subjects, to examine the motives that are or may be used to make the desired connections satisfying, to examine any other special conditions of improvement, and to note any facts concerning individual differences that are of special importance to the conduct of elementary school work.

Put in terms of problems, the task of the psychology of the elementary school subjects is, in each case:—

(1) *What is the function?* For example, just what is "ability to read"? Just what does "the understanding of decimal notation" mean? Just what are "the moral effects to be sought from the teaching of literature"?

(2) *How are degrees of ability or attainment, and degrees of progress or improvement in the function or a part of the function measured?* For example, how can we determine how well a pupil should write, or how hard words we expect him to spell, or what good taste we expect him to show? How can we define to ourselves what knowledge of the meaning of a fraction we shall try to secure in grade 4?

(3) *What can be done toward reducing the function to terms of particular situation-response connections, whose formation can be more surely and easily controlled?* For example, how far does ability to spell involve the formation one by one of bonds between the thought of almost every word in the language and the thought of that word's letters in their correct order; and how far does, say, the bond leading from the situation of the sound of *ceive* in *receive* and *deceive* to their correct spelling insure the correct spelling of that part of *perceive*? Does "ability to add" involve special bonds leading from "27 and 4" to "31," from "27 and 5" to "32," and "27 and 6" to "33"; or will the bonds leading from "7 and 4" to "11," "7 and 5" to "12" and "7 and 6" to "13" (each plus a simple inference) serve as well? What are the situations and responses that represent in actual behavior the quality that we call school patriotism?

(4) *In almost every case a certain desired change of knowledge or skill or power can be attained by any one of several sets of bonds. Which of them is the best? What are the advantages of each?* For example, learning to add

may include the bonds "0 and 0 are 0," "0 and 1 are 1," "0 and 2 are 2," "1 and 0 are 1," "2 and 0 are 2," etc.; or these may be all left unformed, the pupil being taught the habits of entering 0 as the sum of a column that is composed of zeros and otherwise neglecting 0 in addition. Are the rules of usage worth teaching as a means toward correct speech, or is the time better spent in detailed practice in correct speech itself?

(5) *A bond to be formed may be formed in any one of many degrees of strength. Which of these is, at any given stage of learning the subject, the most desirable, all things considered?* For example, shall the dates of all the early settlements of North America be learned so that the exact year will be remembered for ten years, or so that the exact date will be remembered for ten minutes and the date with an error plus or minus of ten years will be remembered for a year or two? Shall the tables of inches, feet, and yards, and pints, quarts, and gallons be learned at their first appearance so as to be remembered for a year, or shall they be learned only well enough to be usable in the work of that week, which in turn fixes them to last for a month or so? Should a pupil in the first year of study of French have such perfect connections between the sounds of French words and their meanings that he can understand simple sentences containing them spoken at an ordinary rate of speaking? Or is slow speech permissible, and even imperative, on the part of the teacher, with gradual increase of rate?

(6) *In almost every case, any set of bonds may produce the desired change when presented in any one of several orders. Which is the best order? What are the advantages of each?* Certain systems for teaching handwriting perfect the elementary movements one at a time and then teach their combination in words and sentences. Others begin and continue with the complex movement-series that actual words require. What do the latter lose and gain? The bonds constituting knowledge of the metric system are now formed late in the pupil's course. Would it be better if they were formed early as a means of facilitating knowledge of decimal fractions?

(7) *What are the original tendencies and pre-school acquisitions upon which the connection-forming of the elementary school may be based or which it has to counteract?* For example, if a pupil knows the meaning of a heard word, he may read it understandingly from getting its sound, as by phonic reconstruction. What words does the average beginner so know?

What are the individual differences in this respect? What do the instincts of gregariousness, attention-getting, approval, and helpfulness recommend concerning group-work *versus* individual-work, and concerning the size of a group that is most desirable? The original tendency of the eyes is certainly not to move along a line from left to right of a page, then back in one sweep and along the next line. What is their original tendency when confronted with the printed page, and what must we do with it in teaching reading?

(8) *What armament of satisfiers and annoyers, of positive and negative interests and motives, stands ready for use in the formation of the intrinsically uninteresting connections between black marks and meanings, numerical exercises and their answers, words and their spelling, and the like?* School practice has tried, more or less at random, incentives and deterrents from quasi-physical pain to the most sentimental fondling, from sheer cajolery to philosophical argument, from appeals to assumed savage and primitive traits to appeals to the interest in automobiles, flying-machines, and wireless telegraphy. Can not psychology give some rules for guidance, or at least limit experimentation to its more hopeful fields?

(9) *The general conditions of efficient learning are described in manuals of educational psychology. How do these apply in the case of each task of the elementary school?* For example, the arrangement of school drills in addition and in short division in the form of practice experiments has been found very effective in producing interest in the work and in improvement at it. In what other arithmetical functions may we expect the same?

(10) *Beside the general principles concerning the nature and causation of individual differences, there must obviously be, in existence or obtainable as a possible result of proper investigation, a great fund of knowledge of special differences relevant to the learning of reading, spelling, geography, arithmetic, and the like. What are the facts as far as known? What are the means of learning more of them?* Curtis finds that a child may be specially strong in addition and yet be specially weak in subtraction in comparison with others of his age and grade. It even seems that such subtle and intricate tendencies are inherited. How far is such specialization the rule? Is it, for example, the case that a child may have a special gift for spelling certain sorts of words, for drawing faces rather than flowers, for learning ancient history rather than modern?

Such are our problems: this volume discusses them in the case of arithmetic. The student who wishes to relate the discussion to the general pedagogy of arithmetic may profitably read, in connection with this volume: *The Teaching of Elementary Mathematics*, by D. E. Smith ['01], *The Teaching of Primary Arithmetic*, by H. Suzzallo ['11], *How to Teach Arithmetic*, by J. C. Brown and L. D. Coffman ['14], *The Teaching of Arithmetic*, by Paul Klapper ['16], and *The New Methods in Arithmetic*, by the author ['21].

**THE PSYCHOLOGY OF
ARITHMETIC**

**THE PSYCHOLOGY OF
ARITHMETIC**

CHAPTER I

THE NATURE OF ARITHMETICAL ABILITIES

According to common sense, the task of the elementary school is to teach:—(1) the meanings of numbers, (2) the nature of our system of decimal notation, (3) the meanings of addition, subtraction, multiplication, and division, and (4) the nature and relations of certain common measures; to secure (5) the ability to add, subtract, multiply, and divide with integers, common and decimal fractions, and denominate numbers, (6) the ability to apply the knowledge and power represented by (1) to (5) in solving problems, and (7) certain specific abilities to solve problems concerning percentage, interest, and other common occurrences in business life.

This statement of the functions to be developed and improved is sound and useful so far as it goes, but it does not go far enough to make the task entirely clear. If teachers had nothing but the statement above as a guide to what changes they were to make in their pupils, they would often leave out important features of arithmetical training, and put in forms of training that a wise educational plan would not tolerate. It is also the case that different leaders in arithmetical teaching, though they might all subscribe to the general statement of the previous paragraph, certainly do not in practice have identical notions of what arithmetic should be for the elementary school pupil.

The ordinary view of the nature of arithmetical learning is obscure or inadequate in four respects. It does not define what 'knowledge of the meanings of numbers' is; it does not take account of the very large amount of teaching of *language* which is done and should be done as a part of the teaching of arithmetic; it does not distinguish between the ability to meet certain quantitative problems as life offers them and the ability to meet the problems provided by textbooks and courses of study; it leaves 'the ability to apply arithmetical knowledge and power' as a rather mystical general

faculty to be improved by some educational magic. The four necessary amendments may be discussed briefly.

KNOWLEDGE OF THE MEANINGS OF NUMBERS

Knowledge of the meanings of the numbers from one to ten may mean knowledge that 'one' means a single thing of the sort named, that two means one more than one, that three means one more than two, and so on. This we may call the *series* meaning. To know the meaning of 'six' in this sense is to know that it is one more than five and one less than seven—that it is between five and seven in the number series. Or we may mean by knowledge of the meanings of numbers, knowledge that two fits a collection of two units, that three fits a collection of three units, and so on, each number being a name for a certain sized collection of discrete things, such as apples, pennies, boys, balls, fingers, and the other customary objects of enumeration in the primary school. This we may call the *collection* meaning. To know the meaning of six in this sense is to be able to name correctly any collection of six separate, easily distinguishable individual objects. In the third place, knowledge of the numbers from one to ten may mean knowledge that two is twice whatever is called one, that three is three times whatever is one, and so on. This is, of course, the *ratio* meaning. To know the meaning of six in this sense is to know that if _____ is one, a line half a foot long is six, that if [] is one, [_____] is about six, while if [] is one, [_____] is about six, and the like. In the fourth place, the meaning of a number may be a smaller or larger fraction of its *implications*—its numerical relations, facts about it. To know six in this sense is to know that it is more than five or four, less than seven or eight, twice three, three times two, the sum of five and one, or of four and two, or of three and three, two less than eight—that with four it makes ten, that it is half of twelve, and the like. This we may call the '*nucleus of facts*' or *relational* meaning of a number.

Ordinary school practice has commonly accepted the second meaning as that which it is the task of the school to teach beginners, but each of the other meanings has been alleged to be the essential one—the series idea by Phillips ['97], the ratio idea by McLellan and Dewey ['95] and Speer ['97], and the relational idea by Grube and his followers.

This diversity of views concerning what the function is that is to be improved in the case of learning the meanings of the numbers one to ten is not a trifling matter of definition, but produces very great differences in school practice. Consider, for example, the predominant value assigned to counting by Phillips in the passage quoted below, and the samples of the sort of work at which children were kept employed for months by too ardent followers of Speer and Grube.

THE SERIES IDEA OVEREMPHASIZED

"This is essentially the counting period, and any words that can be arranged into a series furnish all that is necessary. Counting is fundamental, and counting that is spontaneous, free from sensible observation, and from the strain of reason. A study of these original methods shows that multiplication was developed out of counting, and not from addition as nearly all textbooks treat it. Multiplication is counting. When children count by 4's, etc., they accent the same as counting gymnastics or music. When a child now counts on its fingers it simply reproduces a stage in the growth of the civilization of all nations.

I would emphasize again that during the counting period there is a somewhat spontaneous development of the number series-idea which Preyer has discussed in his *Arithmogenezis*; that an immense momentum is given by a systematic series of names; and that these names are generally first learned and applied to objects later. A lady teacher told me that the Superintendent did not wish the teachers to allow the children to count on their fingers, but she failed to see why counting with horse-chestnuts was any better. Her children could hardly avoid using their fingers in counting other objects yet they followed the series to 100 without hesitation or reference to their fingers. This spontaneous counting period, or naming and following the series, should precede its application to objects." [D.E. Phillips, '97, p. 238.]

THE RATIO IDEA OVEREMPHASIZED

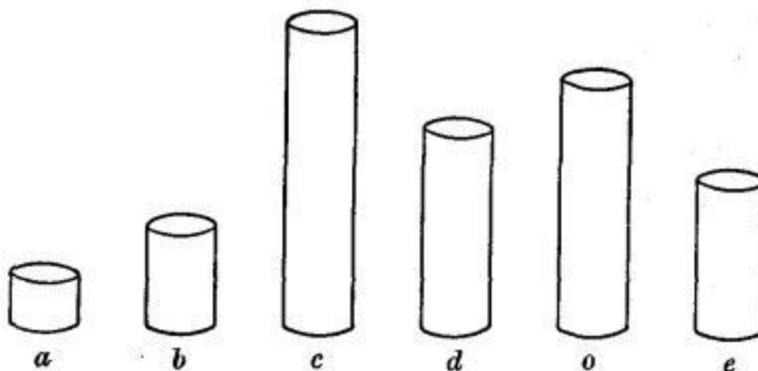

FIG. 1.

"Ratios.—1. Select solids having the relation, or ratio, of a, b, c, d, o, e .

2. Name the solids, a, b, c, d, o, e .

The means of expressing must be as freely supplied as the means of discovery. The pupil is not expected to invent terms.

3. Tell all you can about the relation of these units.

4. Unite units and tell what the sum equals.

5. Make statements like this: o less e equals b .

6. c can be separated into how many d 's? into how many b 's?

7. c can be separated into how many b 's? What is the name of the largest unit that can be found in both c and d an exact number of times?

8. Each of the other units equals what part of c ?

9. If b is 1, what is each of the other units?

10. If a is 1, what is each of the other units?

11. If b is 1, how many 1's are there in each of the other units?

12. If d is 1, how many 1's and parts of 1 in each of the other units?

13. 2 is the relation of what units?

14. 3 is the relation of what units?

15. $\frac{1}{2}$ is the relation of what units?

16. $\frac{2}{3}$ is the relation of what units?

17. Which units have the relation $\frac{3}{2}$?

18. Which unit is 3 times as large as $\frac{1}{2}$ of b ?

19. c equals 6 times $\frac{1}{3}$ of what unit?

20. $\frac{1}{3}$ of what unit equals $\frac{1}{6}$ of c ?

21. What equals $\frac{1}{2}$ of c ? d equals how many sixths of c ?

22. o equals 5 times $\frac{1}{3}$ of what unit?

23. $\frac{1}{3}$ of what unit equals $\frac{1}{5}$ of o ?

24. $\frac{2}{3}$ of d equals what unit? b equals how many thirds of d ?

in the number series; it is the name for a certain sized collection of discrete objects; it is also the name for a continuous magnitude equal to four units—for four quarts of milk in a gallon pail as truly as for four separate quart-pails of milk; it is also, if we know it well, the thing got by adding one to three or subtracting six from ten or taking two two's or half of eight. To know the meaning of a number means to know somewhat about it in all of these respects. The difficulty has been the narrow vision of the extremists. A child must not be left interminably counting; in fact the one-more-ness of the number series can almost be had as a by-product. A child must not be restricted to exercises with collections objectified as in Fig. 2 or stated in words as so many apples, oranges, hats, pens, etc., when work with measurement of continuous quantities with varying units—inches, feet, yards, glassfuls, pints, quarts, seconds, minutes, hours, and the like—is so easy and so significant. On the other hand, the elaboration of artificial problems with fictitious units of measure just to have relative magnitudes as in the exercises on page 5 is a wasteful sacrifice. Similarly, special drills emphasizing the fact that eighteen is eleven and seven, twelve and six, three less than twenty-one, and the like, are simply idolatrous; these facts about eighteen, so far as they are needed, are better learned in the course of actual column-addition and -subtraction.

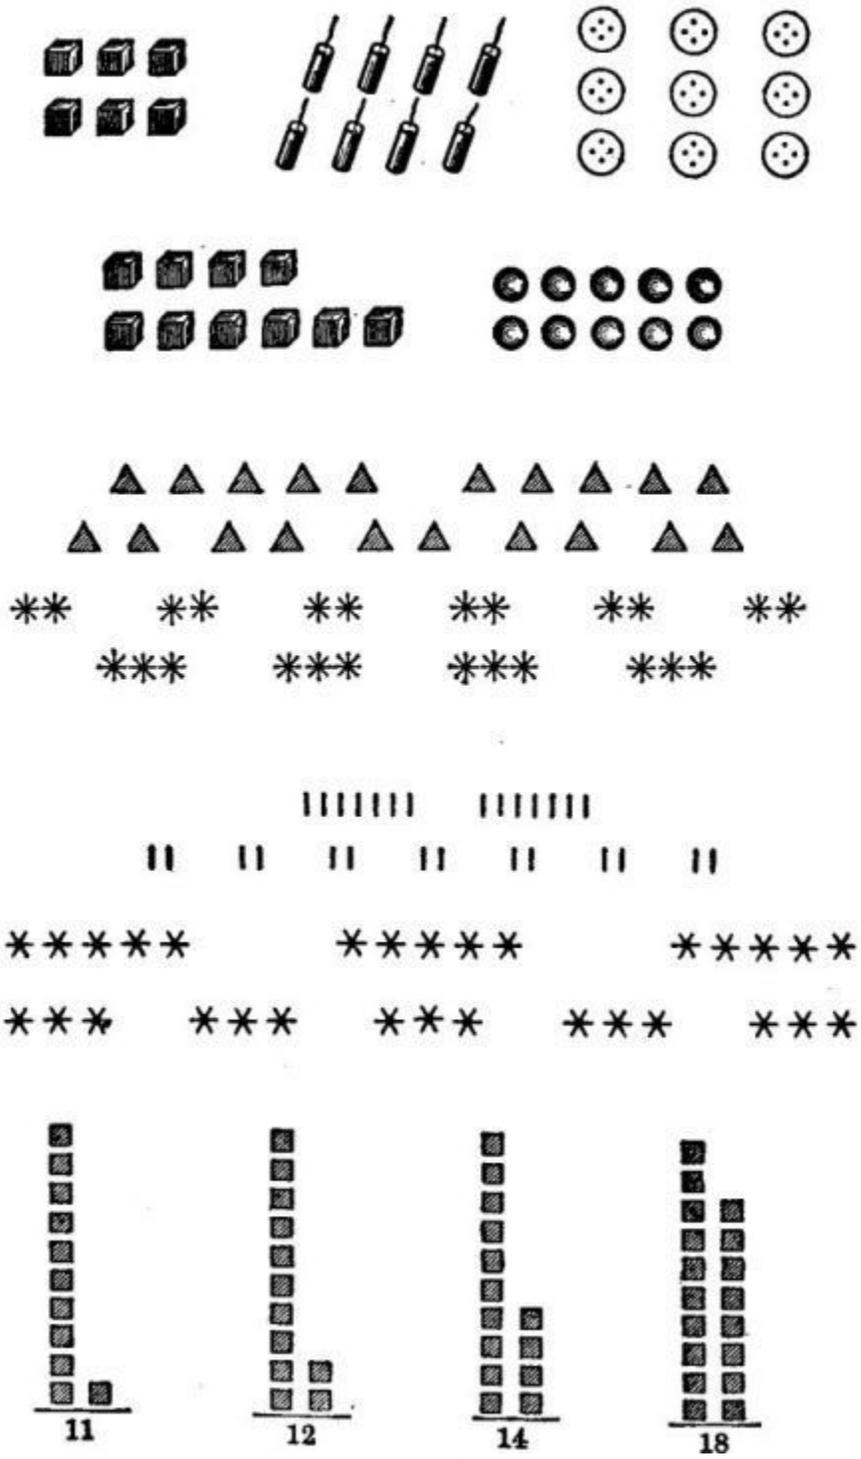

FIG. 2.

ARITHMETICAL LANGUAGE

The second improvement to be made in the ordinary notion of what the functions to be improved are in the case of arithmetic is to include among these functions the knowledge of certain words. The understanding of such words as *both*, *all*, *in all*, *together*, *less*, *difference*, *sum*, *whole*, *part*, *equal*, *buy*, *sell*, *have left*, *measure*, *is contained in*, and the like, is necessary in arithmetic as truly as is the understanding of numbers themselves. It must be provided for by the school; for pre-school and extra-school training does not furnish it, or furnishes it too late. It can be provided for much better in connection with the teaching of arithmetic than in connection with the teaching of English.

It has not been provided for. An examination of the first fifty pages of eight recent textbooks for beginners in arithmetic reveals very slight attention to this matter at the best and no attention at all in some cases. Three of the books do not even use the word *sum*, and one uses it only once in the fifty pages. In all the four hundred pages the word *difference* occurs only twenty times. When the words are used, no great ingenuity or care appears in the means of making sure that their meanings are understood.

The chief reason why it has not been provided for is precisely that the common notion of what the functions are that arithmetic is to develop has left out of account this function of intelligent response to quantitative terms, other than the names of the numbers and processes.

Knowledge of language over a much wider range is a necessary element in arithmetical ability in so far as the latter includes ability to solve verbally stated problems. As arithmetic is now taught, it does include that ability, and a large part of the time of wise teaching is given to improving the function 'knowing what a problem states and what it asks for.' Since, however, this understanding of verbally stated problems may not be an absolutely necessary element of arithmetic, it is best to defer its consideration until we have seen what the general function of problem-solving is.

PROBLEM-SOLVING

The third respect in which the function, 'ability in arithmetic,' needs clearer definition, is this 'problem-solving.' The aim of the elementary

school is to provide for correct and economical response to genuine problems, such as knowing the total due for certain real quantities at certain real prices, knowing the correct change to give or get, keeping household accounts, calculating wages due, computing areas, percentages, and discounts, estimating quantities needed of certain materials to make certain household or shop products, and the like. Life brings these problems usually either with a real situation (as when one buys and counts the cost and his change), or with a situation that one imagines or describes to himself (as when one figures out how much money he must save per week to be able to buy a forty-dollar bicycle before a certain date). Sometimes, however, the problem is described in words to the person who must solve it by another person (as when a life insurance agent says, 'You pay only 25 cents a week from now till—and you get \$250 then'; or when an employer says, 'Your wages would be 9 dollars a week, with luncheon furnished and bonuses of such and such amounts'). Sometimes also the problem is described in printed or written words to the person who must solve it (as in an advertisement or in the letter of a customer asking for an estimate on this or that). The problem may be in part real, in part imagined or described to oneself, and in part described to one orally or in printed or written words (as when the proposed articles for purchase lie before one, the amount of money one has in the bank is imagined, the shopkeeper offers 10 percent discount, and the printed price list is there to be read).

To fit pupils to solve these real, personally imagined, or self-described problems, and 'described-by-another' problems, schools have relied almost exclusively on training with problems of the last sort only. The following page taken almost at random from one of the best recent textbooks could be paralleled by thousands of others; and the oral problems put by teachers have, as a rule, no real situation supporting them.

1. At 70 cents per 100 pounds, what will be the amount of duty on an invoice of 3622 steel rails, each rail being 27 feet long and weighing 60 pounds to the yard?
2. A man had property valued at \$6500. What will be his taxes at the rate of \$10.80 per \$1000?
3. Multiply seventy thousand fourteen hundred-thousandths by one hundred nine millionths, and divide the product by five hundred forty-five.
4. What number multiplied by $43\frac{3}{4}$ will produce $265\frac{5}{8}$?
5. What decimal of a bushel is 3 quarts?
6. A man sells $\frac{5}{8}$ of an acre of land for \$93.75. What would be the value of his farm of $150\frac{3}{4}$ acres at the same rate?
7. A coal dealer buys 375 tons coal at \$4.25 per ton of 2240 pounds. He sells it at \$4.50 per ton of 2000 pounds. What is his profit?
8. Bought 60 yards of cloth at the rate of 2 yards for \$5, and 80 yards more at the rate of 4 yards for \$9. I immediately sold the whole of it at the rate of 5 yards for \$12. How much did I gain?
9. A man purchased 40 bushels of apples at \$1.50 per bushel. Twenty-five hundredths of them were damaged, and he sold them at 20 cents per peck. He sold the remainder at 50 cents per peck. How much did he gain or lose?
10. If oranges are $37\frac{1}{2}$ cents per dozen, how many boxes, each containing 480, can be bought for \$60?
11. A man can do a piece of work in $18\frac{3}{4}$ days. What part of it can he do in $6\frac{2}{3}$ days?
12. How old to-day is a boy that was born Oct. 29, 1896? [Walsh, '06, Part I, p. 165.]

As a result, teachers and textbook writers have come to think of the functions of solving arithmetical problems as identical with the function of solving the described problems which they give in school in books, examination papers, and the like. If they do not think explicitly that this is so, they still act in training and in testing pupils as if it were so.

It is not. Problems should be solved in school to the end that pupils may solve the problems which life offers. To know what change one should receive after a given real purchase, to keep one's accounts accurately, to adapt a recipe for six so as to make enough of the article for four persons, to estimate the amount of seed required for a plot of a given size from the statement of the amount required per acre, to make with surety the applications that the household, small stores, and ordinary trades require—such is the ability that the elementary school should develop. Other things being equal, the school should set problems in arithmetic which life then and later will set, should favor the situations which life itself offers and the responses which life itself demands.

Other things are not always equal. The same amount of time and effort will often be more productive toward the final end if directed during school to 'made-up' problems. The keeping of personal financial accounts as a school exercise is usually impracticable, partly because some of the children have no earnings or allowance—no accounts to keep, and partly because the task of supervising work when each child has a different problem is too great for the teacher. The use of real household and shop problems will be easy only when the school program includes the household arts and industrial education, and when these subjects themselves are taught so as to improve the functions used by real life. Very often the most efficient course is to make sure that arithmetical procedures are applied to the real and personally initiated problems which they fit, by having a certain number of such problems arise and be solved; then to make sure that the similarity between these real problems and certain described problems of the textbook or teacher's giving is appreciated; and then to give the needed drill work with described problems. In many cases the school practice is fairly well justified in assuming that solving described problems will prepare the pupil to solve the corresponding real problems actually much better than the same amount of time spent on the real problems themselves.

All this is true, yet the general principle remains that, other things being equal, the school should favor real situations, should present issues as life will present them.

Where other things make the use of verbally described problems of the ordinary type desirable, these should be chosen so as to give a maximum of preparation for the real applications of arithmetic in life. We should not, for example, carelessly use any problem that comes to mind in applying a certain principle, but should stop to consider just what the situations of life really require and show clearly the application of that principle. For example, contrast these two problems applying cancellation:—

A. A man sold 24 lambs at \$18 apiece on each of six days, and bought 8 pounds of metal with the proceeds. How much did he pay per ounce for the metal?

B. How tall must a rectangular tank 16" long by 8" wide be to hold as much as a rectangular tank 24" by 18" by 6"?

The first problem not only presents a situation that would rarely or never occur, but also takes a way to find the answer that would not, in that situation, be taken since the price set by another would determine the amount.

Much thought and ingenuity should in the future be expended in eliminating problems whose solution does not improve the real function to be improved by applied arithmetic, or improves it at too great cost, and in devising problems which prepare directly for life's demands and still can fit into a curriculum that can be administered by one teacher in charge of thirty or forty pupils, under the limitations of school life.

The following illustrations will to some extent show concretely what the ability to apply the knowledge and power represented by abstract or pure arithmetic—the so-called fundamentals—in solving problems should mean and what it should not mean.

Samples of Desirable Applications of Arithmetic in Problems where the Situation is Actually Present to Sense in Whole or in Part

Keeping the scores and deciding which side beat and by how much in appropriate classroom games, spelling matches, and the like.

Computing costs, making and inspecting change, taking inventories, and the like with a real or play store.

Mapping the school garden, dividing it into allotments, planning for the purchase of seeds, and the like.

Measuring one's own achievement and progress in tests of word-knowledge, spelling, addition, subtraction, speed of writing, and the like. Measuring the rate of improvement per hour of practice or per week of school life, and the like.

Estimating costs of food cooked in the school kitchen, articles made in the school shops, and the like.

Computing the cost of telegrams, postage, expressage, for a real message or package, from the published tariffs.

Computing costs from mail order catalogues and the like.

Samples of Desirable Applications of Arithmetic where the Situation is Not Present to Sense

The samples given here all concern the subtraction of fractions. Samples concerning any other arithmetical principle may be found in the appropriate pages of any text which contains problem-material selected with consideration of life's needs.

A

1. Dora is making jelly. The recipe calls for 24 cups of sugar and she has only $21\frac{1}{2}$. She has no time to go to the store so she has to borrow the sugar from a neighbor. How much must she get?

Subtract

$$\begin{array}{r} 24 \\ 21\frac{1}{2} \\ \hline 2\frac{1}{2} \end{array} \quad \begin{array}{l} \text{Think "}\frac{1}{2} \text{ and } \frac{1}{2} = 1.\text{" Write } \frac{1}{2}.\text{ } \\ \text{Think "2 and 2 = 4." Write the 2.} \end{array}$$

2. A box full of soap weighs $29\frac{1}{2}$ lb. The empty box weighs $3\frac{1}{2}$ lb. How much does the soap alone weigh?

3. On July 1, Mr. Lewis bought a 50-lb. bag of ice-cream salt. On July 15 there were just $11\frac{1}{2}$ lb. left. How much had he used in the two weeks?

4. Grace promised to pick 30 qt. blueberries for her mother. So far she has picked $18\frac{1}{2}$ qt. How many more quarts must she pick?

B

This table of numbers tells what Nell's baby sister Mary weighed every two months from the time she was born till she was a year old.

**Weight of Mary
Adams**

When born	$7\frac{3}{8}$ lb.
2 months old	$11\frac{1}{4}$ lb.
4 months old	$14\frac{1}{8}$ lb.
6 months old	$15\frac{3}{4}$ lb.
8 months old	$17\frac{5}{8}$ lb.
10 months old	$19\frac{1}{2}$ lb.
12 months old	$21\frac{3}{8}$ lb.

1. How much did the Adams baby gain in the first two months?
2. How much did the Adams baby gain in the second two months?
3. In the third two months?
4. In the fourth two months?
5. From the time it was 8 months old till it was 10 months old?
6. In the last two months?
7. From the time it was born till it was 6 months old?

C

1. Helen's exact average for December was $87\frac{1}{3}$. Kate's was $84\frac{1}{2}$. How much higher was Helen's than Kate's?

$$\begin{array}{r} 87\frac{1}{3} \\ 84\frac{1}{2} \\ \hline \end{array}$$

How do you think of $\frac{1}{2}$ and $\frac{1}{3}$?

How do you think of $1\frac{2}{6}$?

How do you change the 4?

2. Find the exact average for each girl in the following list. Write the answers clearly so that you can see them easily. You will use them in solving problems 3, 4, 5, 6, 7, and 8.

	Alice	Dora	Emma	Grace	Louise	Mary
Reading	91	87	83	81	79	77
Language	88	78	82	79	73	78
Arithmetic	89	85	79	75	84	87
Spelling	90	79	75	80	82	91
Geography	91	87	83	75	78	85
Writing	90	88	75	72	93	92

3. Which girl had the highest average?
4. How much higher was her average than the next highest?
5. How much difference was there between the highest and the lowest girl?
6. Was Emma's average higher or lower than Louise's? How much?
7. How much difference was there between Alice's average and Dora's?
8. How much difference was there between Mary's average and Nell's?
9. Write five other problems about these averages, and solve each of them.

Samples of Undesirable Applications of Arithmetic^[1]

Will has XXI marbles, XII jackstones, XXXVI pieces of string. How many things had he?

George's kite rose CDXXXV feet and Tom's went LXIII feet higher. How high did Tom's kite rise?

If from DCIV we take CCIV the result will be a number IV times as large as the number of dollars Mr. Dane paid for his horse. How much did he pay for his horse?

Hannah has $\frac{5}{8}$ of a dollar, Susie $\frac{7}{25}$, Nellie $\frac{3}{4}$, Norah $\frac{13}{16}$. How much money have they all together?

A man saves $3\frac{17}{80}$ dollars a week. How much does he save in a year?

A tree fell and was broken into 4 pieces, $13\frac{1}{6}$ feet, $10\frac{3}{7}$ feet, $8\frac{1}{2}$ feet, and $7\frac{16}{21}$ feet long. How tall was the tree?

Annie's father gave her 20 apples to divide among her friends. She gave each one $2\frac{2}{9}$ apples apiece. How many playmates had she?

John had $17\frac{2}{5}$ apples. He divided his whole apples into fifths. How many pieces had he in all?

A landlady has $3\frac{3}{7}$ pies to be divided among her 8 boarders. How much will each boarder receive?

There are twenty columns of spelling words in Mary's lesson and 16 words in each column. How many words are in her lesson?

There are 9 nuts in a pint. How many pints in a pile of 5,888,673 nuts?

The Adams school contains eight rooms; each room contains 48 pupils; if each pupil has eight cents, how much have they together?

A pile of wood in the form of a cube contains $15\frac{1}{2}$ cords. What are the dimensions to the nearest inch?

A man 6 ft. high weighs 175 lb. How tall is his wife who is of similar build, and weighs 125 lb.?

A stick of timber is in the shape of the frustum of a square pyramid, the lower base being 22 in. square and the upper 14 in. square. How many cubic feet in the log, if it is 22 ft. long?

Mr. Ames, being asked his age, replied: "If you cube one half of my age and add 41,472 to the result, the sum will be one half the cube of my age. How old am I?"

These samples, just given, of the kind of problem-solving that should not be emphasized in school training refer in some cases to books of forty years back, but the following represent the results of a collection made in 1910 from books then in excellent repute. It required only about an hour to collect them; and I am confident that a thousand such problems describing situations that the pupil will never encounter in real life, or putting questions that he will never be asked in real life, could easily be found in any ten textbooks of the decade from 1900 to 1910.

If there are 250 kernels of corn on one ear, how many are there on 24 ears of corn the same size?

Maud is four times as old as her sister, who is 4 years old. What is the sum of their ages?

If the first century began with the year 1, with what year does it end?

Every spider has 8 compound eyes. How many eyes have 21 spiders?

A nail 4 inches long is driven through a board so that it projects 1.695 inches on one side and 1.428 on the other. How thick is the board?

Find the perimeter of an envelope 5 in. by $3\frac{1}{4}$ in.

How many minutes in $\frac{5}{9}$ of $\frac{9}{4}$ of an hour?

Mrs. Knox is $\frac{3}{4}$ as old as Mr. Knox, who is 48 years old. Their son Edward is $\frac{4}{9}$ as old as his mother. How old is Edward?

Suppose a pie to be exactly round and $10\frac{1}{2}$ miles in diameter. If it were cut into 6 equal pieces, how long would the curved edge of each piece be?

$8\frac{1}{3}\%$ of a class of 36 boys were absent on a rainy day. $33\frac{1}{3}\%$ of those present went out of the room to the school yard. How many were left in the room?

Just after a ton of hay was weighed in market, a horse ate one pound of it. What was the ratio of what he ate to what was left?

If a fan having 15 rays opens out so that the outer rays form a straight line, how many degrees are there between any two adjacent rays?

One half of the distance between St. Louis and New Orleans is 280 miles more than $\frac{1}{10}$ of the distance; what is the distance between these places?

If the pressure of the atmosphere is 14.7 lb. per square inch what is the pressure on the top of a table $1\frac{1}{4}$ yd. long and $\frac{2}{3}$ yd. wide?

$\frac{13}{28}$ of the total acreage of barley in 1900 was 100,000 acres; what was the total acreage?

What is the least number of bananas that a mother can exactly divide between her 2 sons, or among her 4 daughters, or among all her children?

If Alice were two years older than four times her actual age she would be as old as her aunt, who is 38 years old. How old is Alice?

Three men walk around a circular island, the circumference of which is 360 miles. A walks 15 miles a day, B 18 miles a day, and C 24 miles a day. If they start together and walk in the same direction, how many days will elapse before they will be together again?

With only thirty or forty dollars a year to spend on a pupil's education, of which perhaps eight dollars are spent on improving his arithmetical abilities, the immediate guidance of his responses to real situations and personally initiated problems has to be supplemented largely by guidance of his responses to problems described in words, diagrams, pictures, and the like. Of these latter, words will be used most often. As a consequence the understanding of the words used in these descriptions becomes a part of the ability required in arithmetic. Such word knowledge is also required in so far as the problems to be solved in real life are at times described, as in advertisements, business letters, and the like.

This is recognized by everybody in the case of words like *remainder, profit, loss, gain, interest, cubic capacity, gross, net, and discount*, but holds equally of *let, suppose, balance, average, total, borrowed, retained*, and many such semi-technical words, and may hold also of hundreds of other words unless the textbook and teacher are careful to use only words and sentence structures which daily life and the class work in English have made well known to the pupils. To apply arithmetic to a problem a pupil must understand what the problem is; problem-solving depends on problem-reading. In actual school practice training in problem-reading will be less and less necessary as we get rid of problems to be solved simply for the sake of solving them, unnecessarily unreal problems, and clumsy descriptions, but it will remain to some extent as an important joint task for the 'arithmetical' and 'reading' of the elementary school.

ARITHMETICAL REASONING

The last respect in which the nature of arithmetical abilities requires definition concerns arithmetical reasoning. An adequate treatment of the reasoning that may be expected of pupils in the elementary school and of the most efficient ways to encourage and improve it cannot be given until we have studied the formation of habits. For reasoning is essentially the organization and control of habits of thought. Certain matters may, however, be decided here. The first concerns the use of computation and problems merely for discipline,—that is, the emphasis on training in reasoning regardless of whether the problem is otherwise worth reasoning about. It used to be thought that the mind was a set of faculties or abilities or powers which grew strong and competent by being exercised in a certain way, no matter on what they were exercised. Problems that could not occur in life, and were entirely devoid of any worthy interest, save the intellectual interest in solving them, were supposed to be nearly or quite as useful in training the mind to reason as the genuine problems of the home, shop, or trade. Anything that gave the mind a chance to reason would do; and pupils labored to find when the minute hand and hour hand would be together, or how many sheep a shepherd had if half of what he had plus ten was one third of twice what he had!

We now know that the training depends largely on the particular data used, so that efficient discipline in reasoning requires that the pupil reason about matters of real importance. There is no magic essence or faculty of reasoning that works in general and irrespective of the particular facts and relations reasoned about. So we should try to find problems which not only stimulate the pupil to reason, but also direct his reasoning in useful channels and reward it by results that are of real significance. We should replace the purely disciplinary problems by problems that are also valuable as special training for important particular situations of life. Reasoning sought for reasoning's sake alone is too wasteful an expenditure of time and is also likely to be inferior as reasoning.

The second matter concerns the relative merits of 'catch' problems, where the pupil has to go against some customary habit of thinking, and what we may call 'routine' problems, where the regular ways of thinking that have served him in the past will, except for some blunder, guide him rightly.

Consider, for example, these four problems:

1. "A man bought ten dozen eggs for \$2.50 and sold them for 30 cents a dozen. How many cents did he lose?"
2. "I went into Smith's store at 9 A.M. and remained until 10 A.M. I bought six yards of gingham at 40 cents a yard and three yards of muslin at 20 cents a yard and gave a \$5.00 bill. How long was I in the store?"
3. "What must you divide 48 by to get half of twice 6?"
4. "What must you add to 19 to get 30?"

The 'catch' problem is now in disrepute, the wise teacher feeling by a sort of intuition that to willfully require a pupil to reason to a result sharply contrary to that to which previous habits lead him is risky. The four illustrations just given show, however, that mere 'catchiness' or 'contra-previous-habit-ness' in a problem is not enough to condemn it. The fourth problem is a catch problem, but so useful a one that it has been adopted in many modern books as a routine drill! The first problem, on the contrary, all, save those who demand no higher criterion for a problem than that it make the pupil 'think,' would reject. It demands the reversal of fixed habits *to no valid purpose*; for in life the question in such case would never (or almost never) be 'How many cents did he lose?' but 'What was the result?' or simply 'What of it?' This problem weakens without excuse the child's confidence in the training he has had. Problems like (2) are given by teachers of excellent reputation, but probably do more harm than good. If a pupil should interrupt his teacher during the recitation in arithmetic by saying, "I got up at 7 o'clock to multiply 9 by $2\frac{3}{4}$ and got $24\frac{3}{4}$ for my answer; was that the right time to get up?" the teacher would not thank fortune for the stimulus to thought but would think the child a fool. Such catch questions may be fairly useful as an object lesson on the value of search for the essential element in a situation if a great variety of them are given one after another with routine problems intermixed and with warning of the general nature of the exercise at the beginning. Even so, it should be remembered that reasoning should be chiefly a force organizing habits, not opposing them; and also that there are enough bad habits to be opposed to give all necessary training. Fabricated puzzle situations wherein a peculiar hidden element of the situation makes the good habits called up by the situation misleading are useful therefore rather as a relief and amusing variation in arithmetical work than as stimuli to thought.

Problems like the third quoted above we might call puzzling rather than 'catch' problems. They have value as drills in analysis of a situation into its elements that will amuse the gifted children, and as tests of certain abilities. They also require that of many confusing habits, the right one be chosen, rather than that ordinary habits be set aside by some hidden element in the situation. Not enough is known about their effect to enable us to decide whether or not the elementary school should include special facility with them as one of the arithmetical functions that it specially trains.

The fourth 'catch' quoted above, which all would admit is a good problem, is good because it opposes a good habit for the sake of another good habit, forces the analysis of an element whose analysis life very much requires, and does it with no obvious waste. It is not safe to leave a child with the one habit of responding to 'add, 19, 30' by 49, for in life the 'have 19, must get to have 30' situation is very frequent and important.

On the whole, the ordinary problems which ordinary life proffers seem to be the sort that should be reasoned out, though the elementary school may include the less noxious forms of pure mental gymnastics for those pupils who like them.

SUMMARY

These discussions of the meanings of numbers, the linguistic demands of arithmetic, the distinction between scholastic and real applications of arithmetic, and the possible restrictions of training in reasoning,—may serve as illustrations of the significance of the question, "What are the functions that the elementary school tries to improve in its teaching of arithmetic?" Other matters might well be considered in this connection, but the main outline of the work of the elementary school is now fairly clear. The arithmetical functions or abilities which it seeks to improve are, we may say:—

- (1) Working knowledge of the meanings of numbers as names for certain sized collections, for certain relative magnitudes, the magnitude of unity being known, and for certain centers or nuclei of relations to other numbers.
- (2) Working knowledge of the system of decimal notation.
- (3) Working knowledge of the meanings of addition, subtraction, multiplication, and division.
- (4) Working knowledge of the nature and relations of certain common measures.
- (5) Working ability to add, subtract, multiply, and divide with integers, common and decimal fractions, and denominate numbers, all being real positive numbers.
- (6) Working knowledge of words, symbols, diagrams, and the like as required by life's simpler arithmetical demands or by economical preparation therefor.
- (7) The ability to apply all the above as required by life's simpler arithmetical demands or by economical preparation therefor, including (7 a) certain specific abilities to solve problems concerning areas of rectangles, volumes of rectangular solids, percents, interest, and certain other common occurrences in household, factory, and business life.

THE SOCIOLOGY OF ARITHMETIC

The phrase 'life's simpler arithmetical demands' is necessarily left vague. Just what use is being made of arithmetic in this country in 1920 by each person therein, we know only very roughly. What may be called a 'sociology' of arithmetic is very much needed to investigate this matter. For rare or difficult demands the elementary school should not prepare; there are too many other desirable abilities that it should improve.

A most interesting beginning at such an inventory of the actual uses of arithmetic has been made by Wilson [19] and Mitchell.^[2] Although their studies need to be much extended and checked by other methods of inquiry, two main facts seem fairly certain.

First, the great majority of people in the great majority of their doings use only very elementary arithmetical processes. In 1737 cases of addition reported by Wilson, seven eighths were of five numbers or less. Over half of the multipliers reported were one-figure numbers. Over 95 per cent of the fractions operated with were included in this list: $\frac{1}{2}$ $\frac{1}{4}$ $\frac{3}{4}$ $\frac{1}{3}$ $\frac{2}{3}$ $\frac{1}{8}$ $\frac{3}{8}$ $\frac{1}{5}$ $\frac{2}{5}$ $\frac{4}{5}$. Three fourths of all the cases reported were simple one-step computations with integers or United States money.

Second, they often use these very elementary processes, not because such are the quickest and most convenient, but because they have lost, or maybe never had, mastery of the more advanced processes which would do the work better. The 5 and 10 cent stores, the counter with "Anything on this counter for 25¢," and the arrangements for payments on the installment plan are familiar instances of human avoidance of arithmetic. Wilson found very slight use of decimals; and Mitchell found men computing with 49ths as common fractions when the use of decimals would have been more efficient. If given 120 seconds to do a test like that shown below, leading lawyers, physicians, manufacturers, and business men and their wives will, according to my experience, get only about half the work right. Many women, finding on their meat bill "7 $\frac{3}{8}$ lb. roast beef \$2.36," will spend time and money to telephone the butcher asking how much roast beef was per pound, because they have no sure power in dividing by a mixed number.

Test

Perform the operations indicated. Express all fractions in answers in lowest terms.

Add:

$$\frac{3}{4} + \frac{1}{6} + .25$$

4 yr. 6 mo.
1 yr. 2 mo.
6 yr. 9 mo.
3 yr. 6 mo.
4 yr. 5 mo.

Subtract:

$$8.6 - 6.05007 \quad \frac{7}{8} - \frac{2}{3} = \quad 5\frac{7}{16} - 2\frac{3}{16} =$$

Multiply:

$$7 \times 8 \times 4\frac{1}{2} =$$

29 ft.	6 in.
8	

Divide:

$$4\frac{1}{2} \div 7 =$$

It seems probable that the school training in arithmetic of the past has not given enough attention to perfecting the more elementary abilities. And we shall later find further evidence of this. On the other hand, the fact that people in general do not at present use a process may not mean that they ought not to use it.

Life's simpler arithmetical demands certainly do not include matters like the rules for finding cube root or true discount, which no sensible person uses. They should not include matters like computing the lateral surface or volume of pyramids and cones, or knowing the customs of plasterers and paper hangers, which are used only by highly specialized trades. They should not include matters like interest on call loans, usury, exact interest, and the rediscounting of notes, which concern only brokers, bank clerks, and rich men. They should not include the technique of customs which are vanishing from efficient practice, such as simple interest on amount for times longer than a year, days of grace, or extremes and means in proportions. They should not include any elaborate practice with very large numbers, or decimals beyond thousandths, or the addition and subtraction of fractions which not one person in a hundred has to add or subtract oftener than once a year.

When we have an adequate sociology of arithmetic, stating accurately just who should use each arithmetical ability and how often, we shall be able to define the task of the elementary school in this respect. For the present, we may proceed by common sense, guided by two limiting rules. The first is,—"It is no more desirable for the elementary school to teach all the facts of arithmetic than to teach all the words in the English language, or all the topography of the globe, or all the details of human physiology." The second is,—"It is not desirable to eliminate any element of arithmetical training until you have something better to put in its place."

CHAPTER II

THE MEASUREMENT OF ARITHMETICAL ABILITIES

One of the best ways to clear up notions of what the functions are which schools should develop and improve is to get measures of them. If any given knowledge or skill or power or ideal exists, it exists in some amount. A series of amounts of it, varying from less to more, defines the ability itself in a way that no general verbal description can do. Thus, a series of weights, 1 lb., 2 lb., 3 lb., 4 lb., etc., helps to tell us what we mean by weight. By finding a series of words like *only*, *smoke*, *another*, *pretty*, *answer*, *taylor*, *circus*, *telephone*, *saucy*, and *beginning*, which are spelled correctly by known and decreasing percentages of children of the same age, or of the same school grade, we know better what we mean by 'spelling-difficulty.' Indeed, until we can measure the efficiency and improvement of a function, we are likely to be vague and loose in our ideas of what the function is.

A SAMPLE MEASUREMENT OF AN ARITHMETICAL ABILITY: THE ABILITY TO ADD INTEGERS

Consider first, as a sample, the measurement of ability to add integers.

The following were the examples used in the measurements made by Stone ['08]:

	596	4695
	428	872
2375	94	7948
4052	75	6786
6354	304	567
260	645	858
5041	984	9447
1543	897	7499
_____	_____	_____

The scoring was as follows: Credit of 1 for each column added correctly. Stone combined measures of other abilities with this in a total score for amount done correctly in 12 minutes. Stone also scored the correctness of the additions in certain work in multiplication.

Courtis uses a sheet of twenty-four tasks or 'examples,' each consisting of the addition of nine three-place numbers as shown below. Eight minutes is allowed. He scores the amount done by the number of examples, and also scores the number of examples done correctly, but does not suggest any combination of these two into a general-efficiency score.

927
379
756
837
924
110
854
965
344

The author long ago proposed that pupils be measured also with series like *a* to *g* shown below, in which the difficulty increases step by step.

g.					13			
		13		9	14	12	9	
		9		13	12	9	14	24
	23	19	19	29	9	9	13	21
	28	26	26	14	8	8	29	23
	29	16	15	19	17	19	19	22
	—	—	—	—	—	—	—	—

Woody [16] has constructed his well-known tests on this principle, though he uses only one example at each step of difficulty instead of eight or ten as suggested above. His test, so far as addition of integers goes, is:—

SERIES A. ADDITION SCALE (in part)

By Clifford Woody

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
2	2	17	53	72	60		
3	4	2	45	26	37	3 + 1 =	2 + 5 + 1
—	3	—	—	—	—		=
—	—	—	—	—	—		=
(10)	(11)	(12)	(13)	(14)	(15)	(16)	(17)
21	32	43	23		100	9	199
33	59	1	25	25 + 42	33	24	194
35	17	2	16	=	45	12	295

In his original report, Woody gives no scheme for scoring an individual, wisely assuming that, with so few samples at each degree of difficulty, a pupil's score would be too unreliable for individual diagnosis. The test is reliable for a class; and for a class Woody used the degree of difficulty such that a stated fraction of the class can do the work correctly, if twenty minutes is allowed for the thirty-eight examples of the entire test.

The measurement of even so simple a matter as the efficiency of a pupil's responses to these tests in adding integers is really rather complex. There is first of all the problem of combining speed and accuracy into some single estimate. Stone gives no credit for a column unless it is correctly added. Curtis evades the difficulty by reporting both number done and number correct. The author's scheme, which gives specified weights to speed and accuracy at each step of the series, involves a rather intricate computation.

This difficulty of equating speed and accuracy in adding means precisely that we have inadequate notions of what the ability is that the elementary school should improve. Until, for example, we have decided whether, for a given group of pupils, fifteen Curtis attempts with ten right, is or is not a better achievement than ten Curtis

attempts with nine right, we have not decided just what the business of the teacher of addition is, in the case of that group of pupils.

There is also the difficulty of comparing results when short and long columns are used. Correctness with a short column, say of five figures, testifies to knowledge of the process and to the power to do four successive single additions without error. Correctness with a long column, say of ten digits, testifies to knowledge of the process and to the power to do nine successive single additions without error. Now if a pupil's precision was such that on the average he made one mistake in eight single additions, he would get about half of his five-digit columns right and almost none of his ten-digit columns right. (He would do this, that is, if he added in the customary way. If he were taught to check results by repeated addition, by adding in half-columns and the like, his percentages of accurate answers might be greatly increased in both cases and be made approximately equal.) Length of column in a test of addition under ordinary conditions thus automatically overweights precision in the single additions as compared with knowledge of the process, and ability at carrying.

Further, in the case of a column of whatever size, the result as ordinarily scored does not distinguish between one, two, three, or more (up to the limit) errors in the single additions. Yet, obviously, a pupil who, adding with ten-digit columns, has half of his answer-figures wrong, probably often makes two or more errors within a column, whereas a pupil who has only one column-answer in ten wrong, probably almost never makes more than one error within a column. A short-column test is then advisable as a means of interpreting the results of a long-column test.

Finally, the choice of a short-column or of a long-column test is indicative of the measurer's notion of the kind of efficiency the world properly demands of the school. Twenty years ago the author would have been readier to accept a long-column test than he now is. In the world at large, long-column addition is being more and more done by machine, though it persists still in great frequency in the bookkeeping of weekly and monthly accounts in local groceries, butcher shops, and the like.

The search for a measure of ability to add thus puts the problem of speed *versus* precision, and of short-column *versus* long-column additions clearly before us. The latter problem has hardly been realized at all by the ordinary definitions of ability to add.

It may be said further that the measurement of ability to add gives the scientific student a shock by the lack of precision found everywhere in schools. Of what value is it to a graduate of the elementary school to be able to add with examples like those of the Curtis test, getting only eight out of ten right? Nobody would pay a computer for that ability. The pupil could not keep his own accounts with it. The supposed disciplinary value of habits of precision runs the risk of turning negative in such a case. It appears, at least to the author, imperative that checking should be taught and required until a pupil can add single columns of ten digits with not over one wrong answer in twenty columns. Speed is useful, especially indirectly as an indication of control of the separate higher-decade additions, but the social demand for addition below a certain standard of precision is *nil*, and its disciplinary value is *nil* or negative. This will be made a matter of further study later.

MEASUREMENTS OF ABILITIES IN COMPUTATION

Measurements of these abilities may be of two sorts—(1) of the speed and accuracy shown in doing one same sort of task, as illustrated by the Curtis test for addition shown on page 28; and (2) of how hard a task can be done perfectly (or with some specified precision) within a certain assigned time or less, as illustrated by the author's rough test for addition shown on pages 28 and 29, and by the Woody tests, when extended to include alternative forms.

The Curtis tests, originated as an improvement on the Stone tests and since elaborated by the persistent devotion of their author, are a standard instrument of the first sort for measuring the so-called 'fundamental' arithmetical abilities with integers. They are shown on this and the following page.

Tests of the second sort are the Woody tests, which include operations with integers, common and decimal fractions, and denominate numbers, the Ballou test for common fractions [16], and the "Ladder" exercises of the Thorndike arithmetics. Some of these are shown on pages 36 to 41.

Curtis Test

Arithmetic. Test No. 1. Addition

Series B

You will be given eight minutes to find the answers to as many of these addition examples as possible. Write the answers on this paper directly underneath the examples. You are not expected to be able to do them all. You will be marked for both speed and accuracy, but it is more important to have your answers right than to try a great many examples.

927	297	136	486	384	176	277	837
379	925	340	765	477	783	445	882

An Addition Ladder [Thorndike, '17, III, 5]

Begin at the bottom of the ladder. See if you can climb to the top without making a mistake. Be sure to copy the numbers correctly.

- Step 6.** a. Add $1\frac{1}{3}$ yd., $\frac{7}{8}$ yd., $1\frac{1}{4}$ yd., $\frac{3}{4}$ yd., $\frac{7}{8}$ yd., and $1\frac{1}{2}$ yd.
 b. Add $62\frac{1}{2}\text{¢}$, $66\frac{2}{3}\text{¢}$, $56\frac{1}{4}\text{¢}$, 60¢ , and $62\frac{1}{2}\text{¢}$.
 c. Add $1\frac{5}{16}$, $1\frac{9}{32}$, $1\frac{3}{8}$, $1\frac{11}{32}$, and $1\frac{7}{16}$.
 d. Add $1\frac{1}{3}$ yd., $1\frac{1}{4}$ yd., $1\frac{1}{2}$ yd., 2 yd., $\frac{3}{4}$ yd., and $\frac{2}{3}$ yd.
- Step 5.** a. Add 4 ft. $6\frac{1}{2}$ in., $53\frac{1}{4}$ in., 5 ft. $\frac{1}{2}$ in., $56\frac{3}{4}$ in., and 5 ft.
 b. Add 7 lb., 6 lb. 11 oz., $7\frac{1}{2}$ lb., 6 lb. $4\frac{1}{2}$ oz., and $8\frac{1}{2}$ lb.
 c. Add 1 hr. 6 min. 20 sec., 58 min. 15 sec., 1 hr. 4 min., and 55 min.
 d. Add 7 dollars, 13 half dollars, 21 quarters, 17 dimes, and 19 nickels.
- Step 4.** a. Add $.05\frac{1}{2}$, $.06$, $.04\frac{3}{4}$, $.02\frac{3}{4}$, and $.05\frac{1}{4}$.
 b. Add $.33\frac{1}{3}$, $.12\frac{1}{2}$, $.18$, $.16\frac{2}{3}$, $.08\frac{1}{3}$ and $.15$.
 c. Add $.08\frac{1}{3}$, $.06\frac{1}{4}$, $.21$, $.03\frac{3}{4}$, and $.16\frac{2}{3}$.
 d. Add $.62$, $.64\frac{1}{2}$, $.66\frac{2}{3}$, $.10\frac{1}{4}$, and $.68$.
- Step 3.** a. Add $7\frac{1}{4}$, $6\frac{1}{2}$, $8\frac{3}{8}$, $5\frac{3}{4}$, $9\frac{5}{8}$ and $3\frac{7}{8}$.
 b. Add $4\frac{5}{8}$, 12, $7\frac{1}{2}$, $8\frac{3}{4}$, 6 and $5\frac{1}{4}$.
 c. Add $9\frac{3}{4}$, $5\frac{7}{8}$, $4\frac{1}{8}$, $6\frac{1}{2}$, 7, $3\frac{5}{8}$.
 d. Add 12, $8\frac{1}{2}$, $7\frac{1}{3}$, 5, $6\frac{2}{3}$, and $9\frac{1}{2}$.
- Step 2.** a. Add 12.04, .96, 4.7, 9.625, 3.25, and 20.
 b. Add .58, 6.03, .079, 4.206, 2.75, and 10.4.
 c. Add 52, 29.8, 41.07, 1.913, 2.6, and 110.
 d. Add 29.7, 315, 26.75, 19.004, 8.793, and 20.05.

- Step 1.** a. Add $10\frac{3}{5}$, $11\frac{1}{5}$, $10\frac{4}{5}$, 11, $11\frac{2}{5}$, $10\frac{3}{5}$, and 11.
 b. Add $7\frac{3}{8}$, $6\frac{5}{8}$, 8, $9\frac{1}{8}$, $7\frac{7}{8}$, $5\frac{3}{8}$, and $8\frac{1}{8}$.
 c. Add $21\frac{1}{2}$, $18\frac{3}{4}$, $31\frac{1}{2}$, $19\frac{1}{4}$, $17\frac{1}{4}$, 22, and $16\frac{1}{2}$.
 d. Add $14\frac{5}{12}$, $12\frac{7}{12}$, $9\frac{11}{12}$, $6\frac{1}{12}$, and 5.

A Subtraction Ladder [Thorndike, '17, III, 11]

Step 9.

- a. 2.16 mi. – $1\frac{3}{4}$ mi. b. 5.72 ft. – 5 ft. 3 in.
 c. 2 min. $10\frac{1}{2}$ sec. – 93.4 sec. d. 30.28 A. – $10\frac{1}{5}$ A.
 e. 10 gal. $2\frac{1}{2}$ qt. – 4.623 gal.

Step 8.	a	b	c	d	e

An Average Ladder [Thorndike, '17, III, 132]

Find the average of the quantities on each line. Begin with **Step 1**. Climb to the top without making a mistake. Be sure to copy the numbers correctly. Extend the division to two decimal places if necessary.

- Step 6.** *a.* $2\frac{2}{3}$, $1\frac{7}{8}$, $2\frac{3}{4}$, $4\frac{1}{4}$, $3\frac{5}{8}$, $3\frac{1}{2}$
b. $62\frac{1}{2}\text{¢}$, $66\frac{2}{3}\text{¢}$, 40¢ , $83\frac{1}{3}\text{¢}$, \$1.75, \$2.25
c. $3\frac{11}{16}$, $3\frac{9}{32}$, $3\frac{3}{8}$, $3\frac{17}{32}$, $3\frac{7}{16}$
d. .17, 19, $.16\frac{2}{3}$, $.15\frac{1}{2}$, $.23\frac{1}{4}$, .18

- Step 5.** *a.* 5 ft. $3\frac{1}{2}$ in., $61\frac{1}{4}$ in., $58\frac{3}{4}$ in., 4 ft. 11 in.
b. 6 lb. 9 oz., 6 lb. 11 oz., $7\frac{1}{4}$ lb., $7\frac{3}{8}$ lb.
c. 1 hr. 4 min. 40 sec., 58 min. 35 sec., $1\frac{1}{4}$ hr.
d. 2.8 miles, $3\frac{1}{2}$ miles, 2.72 miles

- Step 4.** *a.* $.03\frac{1}{2}$, .06, $.04\frac{3}{4}$, $.05\frac{1}{2}$, $.05\frac{1}{4}$
b. .043, .045, .049, .047, .046, .045
c. 2.20, $.87\frac{1}{2}$, 1.18, $.93\frac{3}{4}$, 1.2925, .80
d. $.14\frac{1}{2}$, $.12\frac{1}{2}$, $.33\frac{1}{3}$, $.16\frac{2}{3}$, .15, .17

- Step 3.** *a.* $5\frac{1}{4}$, $4\frac{1}{2}$, $8\frac{3}{8}$, $7\frac{3}{4}$, $6\frac{5}{8}$, $9\frac{3}{8}$
b. $9\frac{5}{8}$, 12, $8\frac{1}{2}$, $8\frac{3}{4}$, 6, $5\frac{1}{4}$, 9
c. $9\frac{3}{8}$, $5\frac{3}{4}$, $4\frac{1}{8}$, $7\frac{1}{2}$, 6
d. 11, $9\frac{1}{2}$, $10\frac{1}{3}$, 13, $16\frac{2}{3}$, $9\frac{1}{2}$

- Step 2.** *a.* 13.05, .97, 4.8, 10.625, 3.37
b. 1.48, 7.02, .93, 5.307, 4.1, 7, 10.4
c. 68, 71.4, 59.8, 112, 96.1, 79.8
d. 2.079, 3.908, 4.165, 2.74

- Step 1.** *a.* 4, $9\frac{1}{2}$, 6, 5, $7\frac{1}{2}$, 8, 10, 9
b. 6, 5, 3.9, 7.1, 8
c. 1086, 1141, 1059, 1302, 1284
d. \$100.82, \$206.49, \$317.25, \$244.73

As such tests are widened to cover the whole task of the elementary school in respect to arithmetic, and accepted by competent authorities as adequate measures of achievement in computing, they will give, as has been said, a working definition of the task. The reader will observe, for example, that work such as the following, though still found in many textbooks and classrooms, does not, in general, appear in the modern tests and scales.

Reduce the following improper fractions to mixed numbers:—

$$\frac{19}{13} \quad \frac{43}{21} \quad \frac{176}{25} \quad \frac{198}{14}$$

Reduce to integral or mixed numbers:—

$$\frac{61381}{37} \quad \frac{2134}{67} \quad \frac{413}{413} \quad \frac{697}{225}$$

Simplify:—

$\frac{3}{4}$ of $\frac{8}{9}$ of $\frac{3}{5}$ of $\frac{15}{22}$

Reduce to lowest terms:—

$\frac{357}{527}$ $\frac{264}{312}$ $\frac{492}{779}$ $\frac{418}{874}$ $\frac{854}{1769}$ $\frac{30}{735}$ $\frac{44}{242}$ $\frac{77}{847}$ $\frac{18}{243}$ $\frac{96}{224}$

Find differences:—

$\frac{6^2}{7}$ $\frac{8^5}{11}$ $\frac{8^4}{13}$ $\frac{5^1}{4}$ $\frac{7^1}{8}$
 $\frac{3^1}{14}$ $\frac{5^1}{7}$ $\frac{3^7}{13}$ $\frac{2^{11}}{14}$ $\frac{2^1}{7}$

Square:—

$\frac{2}{3}$ $\frac{4}{5}$ $\frac{5}{7}$ $\frac{6}{9}$ $\frac{10}{11}$ $\frac{12}{13}$ $\frac{2}{7}$ $\frac{15}{16}$ $\frac{19}{20}$ $\frac{17}{18}$ $\frac{25}{30}$ $\frac{41}{53}$

Multiply:—

$\frac{2}{11} \times 33$ $32 \times \frac{3}{14}$ $39 \times \frac{2}{13}$ $60 \times \frac{11}{28}$ $77 \times \frac{4}{11}$ $63 \times \frac{2}{27}$
 $54 \times \frac{8}{45}$ $65 \times \frac{3}{13}$ $344^{\frac{16}{21}}$ $432^{\frac{2}{7}}$

MEASUREMENTS OF ABILITY IN APPLIED ARITHMETIC: THE SOLUTION OF PROBLEMS

Stone ['08] measured achievement with the following problems, fifteen minutes being the time allowed.

"Solve as many of the following problems as you have time for; work them in order as numbered:

1. If you buy 2 tablets at 7 cents each and a book for 65 cents, how much change should you receive from a two-dollar bill?
2. John sold 4 Saturday Evening Posts at 5 cents each. He kept $\frac{1}{2}$ the money and with the other $\frac{1}{2}$ he bought Sunday papers at 2 cents each. How many did he buy?
3. If James had 4 times as much money as George, he would have \$16. How much money has George?
4. How many pencils can you buy for 50 cents at the rate of 2 for 5 cents?'
5. The uniforms for a baseball nine cost \$2.50 each. The shoes cost \$2 a pair. What was the total cost of uniforms and shoes for the nine?
6. In the schools of a certain city there are 2200 pupils; $\frac{1}{2}$ are in the primary grades, $\frac{1}{4}$ in the grammar grades, $\frac{1}{8}$ in the high school, and the rest in the night school. How many pupils are there in the night school?
7. If $3\frac{1}{2}$ tons of coal cost \$21, what will $5\frac{1}{2}$ tons cost?
8. A news dealer bought some magazines for \$1. He sold them for \$1.20, gaining 5 cents on each magazine. How many magazines were there?
9. A girl spent $\frac{1}{8}$ of her money for car fare, and three times as much for clothes. Half of what she had left was 80 cents. How much money did she have at first?
10. Two girls receive \$2.10 for making buttonholes. One makes 42, the other 28. How shall they divide the money?
11. Mr. Brown paid one third of the cost of a building; Mr. Johnson paid $\frac{1}{2}$ the cost. Mr. Johnson received \$500 more annual rent than Mr. Brown. How much did each receive?
12. A freight train left Albany for New York at 6 o'clock. An express left on the same track at 8 o'clock. It went at the rate of 40 miles an hour. At what time of day will it overtake the freight train if the freight train stops after it has gone 56 miles?"

The criteria he had in mind in selecting the problems were as follows:—

"The main purpose of the reasoning test is the determination of the ability of VI A children to reason in arithmetic. To this end, the problems, as selected and arranged, are meant to embody the following conditions:—

1. Situations equally concrete to all VI A children.
2. Graduated difficulties.
 - a. As to arithmetical thinking.

In the blank space below, work as many of the following examples as possible in the time allowed. Work them in order as numbered, entering each answer in the "answer" column before commencing a new example. Do not work on any other paper.

1. The children in a certain school gave a Christmas party. One of the presents was a box of candy. In filling the boxes, one grade used 16 pounds of candy, another 17 pounds, a third 12 pounds, and a fourth 13 pounds. What did the candy cost at 26¢. a pound?

2. A school in a certain city used 2516 pieces of chalk in 37 school days. Three new rooms were opened, each room holding 50 children, and the school was then found to use 84 sticks of chalk per day. How many more sticks of chalk were used per day than at first?

3. Several boys went on a bicycle trip of 1500 miles. The first week they rode 374 miles, the second week 264 miles, the third 423 miles, the fourth 401 miles. They finished the trip the next week. How many miles did they ride the last week?

4. Forty-five boys were hired to pick apples from 15 trees in an apple orchard. In 50 minutes each boy had picked 48 choice apples. If all the apples picked were packed away carefully in 8 boxes of equal size, how many apples were put in each box?

5. In a certain school 216 children gave a sleigh-ride party. They rented 7 sleighs at a cost of \$30.00 and paid \$24.00 for the refreshments. The party travelled 15 miles in 2½ hours and had a very pleasant time. What was each child's share of the expense?

6. A girl found, by careful counting, that there

ANSWER	

were 2400 letters on one page of her history, and only 2295 letters on a page of her reader. How many more letters had she read in one book than in the other if she had read 47 pages in each of the books?

7. Each of 59 rooms in the schools of a certain city contributed 25 presents to a Christmas entertainment for poor children. The stores of the city gave 1986 other articles for presents. What was the total number of presents given away at the entertainment?

8. Forty-eight children from a certain school paid 10¢ apiece to ride 7 miles on the cars to a woods. There in a few hours they gathered 2765 nuts. 605 of these were bad, but the rest were shared equally among the children. How many good nuts did each one get?

Total

These proposed measures of ability to apply arithmetic illustrate very nicely the differences of opinion concerning what applied arithmetic and arithmetical reasoning should be. The thinker who emphasizes the fact that in life out of school the situation demanding quantitative treatment is usually real rather than described, will condemn a test all of whose constituents are *described* problems. Unless we are excessively hopeful concerning the transfer of ideas of method and procedure from one mental function to another we shall protest against the artificiality of No. 3 of the Stone series, and of the entire Curtis Test 8 except No. 4. The Curtis speed-reasoning test (No. 6) is a striking example of the mixture of ability to understand quantitative relations with the ability to understand words. Consider these five, for example, in comparison with the revised versions attached.^[3]

1. The children of a school gave a sleigh-ride party. There were 9 sleighs, and each sleigh held 30 children. How many children were there in the party?

REVISION. *If one sleigh holds 30 children, 9 sleighs hold children.*

2. Two school-girls played a number-game. The score of the girl that lost was 57 points and she was beaten by 16 points. What was the score of the girl that won?

REVISION. *Mary and Nell played a game. Mary had a score of 57. Nell beat Mary by 16. Nell had a score of*

3. A girl counted the automobiles that passed a school. The total was 60 in two hours. If the girl saw 27 pass the first hour how many did she see the second?

REVISION. *In two hours a girl saw 60 automobiles. She saw 27 the first hour. She saw the second hour.*

4. On a playground there were five equal groups of children each playing a different game. If there were 75 children all together, how many were there in each group?

REVISION. *75 pounds of salt just filled five boxes. The boxes were exactly alike. There were pounds in a box.*

5. A teacher weighed all the children in a certain grade. One girl weighed 70 pounds. Her older sister was 49 pounds heavier. How many pounds did the sister weigh?

REVISION. *Mary weighs 70 lb. Jane weighs 49 pounds more than Mary. Jane weighs pounds.*

The distinction between a problem described as clearly and simply as possible and the same problem put awkwardly or in ill-known words or willfully obscured should be regarded; and as a rule measurements of ability to apply arithmetic should eschew all needless obscurity or purely linguistic difficulty. For example,

A boy bought a two-cent stamp. He gave the man in the store 10 cents. The right change was cents.

is better as a test than

If a boy, purchasing a two-cent stamp, gave a ten-cent stamp in payment, what change should he be expected to receive in return?

The distinction between the description of a *bona fide* problem that a human being might be called on to solve out of school and the description of imaginary possibilities or puzzles should also be considered. Nos. 3 and 9 of Stone are bad because to frame the problems one must first know the answers, so that in reality there could never be any point in solving them. It is probably safe to say that nobody in the world ever did or ever will or ever should find the number of apples in a box by the task of No. 4 of the Courtis Test 8.

This attaches no blame to Dr. Stone or to Mr. Courtis. Until very recently we were all so used to the artificial problems of the traditional sort that we did not expect anything better; and so blind to the language demands of described problems that we did not see their very great influence. Courtis himself has been active in reform and has pointed out ('13, p. 4 f.) the defects in his Tests 6 and 8.

"Tests Nos. 6 and 8, the so-called reasoning tests, have proved the least satisfactory of the series. The judgments of various teachers and superintendents as to the inequalities of the units in any one test, and of the differences between the different editions of the same test, have proved the need of investigating these questions. Tests of adults in many lines of commercial work have yielded in many cases lower scores than those of the average eighth grade children. At the same time the scores of certain individuals of marked ability have been high, and there appears to be a general relation between ability in these tests and accuracy in the abstract work. The most significant facts, however, have been the difficulties experienced by teachers in attempting to remedy the defects in reasoning. It is certain that the tests measure abilities of value but the abilities are probably not what they seem to be. In an attempt to measure the value of different units, for instance, as many problems as possible were constructed based upon a single situation. Twenty-one varieties were secured by varying the relative form of the question and the relative position of the different phrases. One of these proved nineteen times as hard as another as measured by the number of mistakes made by the children; yet the cause of the difference was merely the changes in the phrasing. This and other facts of the same kind seem to show that Tests 6 and 8 measure mainly the ability to read."

The scientific measurement of the abilities and achievements concerned with applied arithmetic or problem-solving is thus a matter for the future. In the case of described problems a beginning has been made in the series which form a part of the National Intelligence Tests ['20], one of which is shown on page 49 f. In the case of problems with real situations, nothing in systematic form is yet available.

Systematic tests and scales, besides defining the abilities we are to establish and improve, are of very great service in measuring the status and

improvement of individuals and of classes, and the effects of various methods of instruction and of study. They are thus helpful to pupils, teachers, supervisors, and scientific investigators; and are being more and more widely used every year. Information concerning the merits of the different tests, the procedure to follow in giving and scoring them, the age and grade standards to be used in interpreting results, and the like, is available in the manuals of Educational Measurement, such as Curtis, *Manual of Instructions for Giving and Scoring the Curtis Standard Tests in the Three R's* [14]; Starch, *Educational Measurements* [16]; Chapman and Rush, *Scientific Measurement of Classroom Products* [17]; Monroe, DeVoss, and Kelly, *Educational Tests and Measurements* [17]; Wilson and Hoke, *How to Measure* [20]; and McCall, *How to Measure in Education* [21].

National Intelligence Tests.
Scale A. Form 1, Edition 1

TEST 1

Find the answers as quickly as you can.
Write the answers on the dotted lines.
Use the side of the page to figure on.

Begin here

- 1 Five cents make 1 nickel. How many nickels make a dime? *Answer.....*
- 2 John paid 5 dollars for a watch and 3 dollars for a chain. How many dollars did he pay for the watch and chain? *Answer.....*
- 3 Nell is 13 years old. Mary is 9 years old. How much younger is Mary than Nell? *Answer.....*
- 4 One quart of ice cream is enough for 5 persons. How many quarts of ice cream are needed for 25 persons? *Answer.....*
- 5 John's grandmother is 86 years old. If she lives, in how many years will she be 100 years old? *Answer.....*

- 6 If a man gets \$2.50 a day, what will he be paid for six days' work? *Answer.....*
- 7 How many inches are there in a foot and a half? *Answer.....*
- 8 What is the cost of 12 cakes at 6 for 5 cents? *Answer.....*
- 9 The uniforms for a baseball team of nine boys cost \$2.50 each. The shoes cost \$2 a pair. What was the total cost of uniforms and shoes for the nine? *Answer.....*
- 10 A train that usually arrives at half-past ten was 17 minutes late. When did it arrive? *Answer.....*
- 11 At 10¢ a yard, what is the cost of a piece 10½ ft. long? *Answer.....*
- 12 A man earns \$6 a day half the time, \$4.50 a day one fourth of the time, and nothing on the remaining days for a total period of 40 days. What did he earn in all in the 40 days? *Answer.....*
- 13 What per cent of \$800 is 4% of \$1000? *Answer.....*
- 14 If 60 men need 1500 lb. flour per month, what is the requirement per man per day counting a month as 30 days? *Answer.....*
- 15 A car goes at the rate of a mile a minute. A truck goes 20 miles an hour. How many times as far will the car go as the truck in 10 seconds? *Answer.....*
- 16 The area of the base (inside measure) of a cylindrical tank is 90 square feet. How tall must it be to hold 100 cubic yards? *Answer.....*

CHAPTER III

THE CONSTITUTION OF ARITHMETICAL ABILITIES

THE ELEMENTARY FUNCTIONS OF ARITHMETICAL LEARNING

It would be a useful work for some one to try to analyze arithmetical learning into the unitary abilities which compose it, showing just what, in detail, the mind has to do in order to be prepared to pass a thorough test on the whole of arithmetic. These unitary abilities would make a very long list. Examination of a well-planned textbook will show that such an ability as multiplication is treated as a composite of the following: knowledge of the multiplications up to 9×9 ; ability to multiply two (or more)-place numbers by 2, 3, and 4 when 'carrying' is not required and no zeros occur in the multiplicand; ability to multiply by 2, 3, ... 9, with carrying; the ability to handle zeros in the multiplicand; the ability to multiply with two-place numbers not ending in zero; the ability to handle zero in the multiplier as last number; the ability to multiply with three (or more)-place numbers not including a zero; the ability to multiply with three- and four-place numbers with zero in second or third, or second and third, as well as in last place; the ability to save time by annexing zeros; and so on and on through a long list of further abilities required to multiply with United States money, decimal fractions, common fractions, mixed numbers, and denominate numbers.

The units or 'steps' thus recognized by careful teaching would make a long list, but it is probable that a still more careful study of arithmetical ability as a hierarchy of mental habits or connections would greatly increase the list. Consider, for example, ordinary column addition. The majority of teachers probably treat this as a simple application of the knowledge of the

additions to $9 + 9$, plus understanding of 'carrying.' On the contrary there are at least seven processes or minor functions involved in two-place column addition, each of which is psychologically distinct and requires distinct educational treatment.

These are:—

- A. Learning to keep one's place in the column as one adds.
- B. Learning to keep in mind the result of each addition until the next number is added to it.
- C. Learning to add a seen to a thought-of number.
- D. Learning to neglect an empty space in the columns.
- E. Learning to neglect 0s in the columns.
- F. Learning the application of the combinations to higher decades may for the less gifted pupils involve as much time and labor as learning all the original addition tables. And even for the most gifted child the formation of the connection '8 and $7 = 15$ ' probably never quite insures the presence of the connections ' 38 and $7 = 45$ ' and ' $18 + 7 = 25$.'
- G. Learning to write the figure signifying units rather than the total sum of a column. In particular, learning to write 0 in the cases where the sum of the column is 10, 20, etc. Learning to 'carry' also involves in itself at least two distinct processes, by whatever way it is taught.

We find evidence of such specialization of functions in the results with such tests as Woody's. For example, $2 + 5 + 1 = \dots$ surely involves abilities in part different from

$$\begin{array}{r} 2 \\ 4 \\ 3 \\ \hline \end{array}$$

because only 77 percent of children in grade 3 do the former correctly, whereas 95 percent of children in that grade do the latter correctly. In grade

2 the difference is even more marked. In the case of subtraction

$$\begin{array}{r} 4 \\ 4 \\ \hline \end{array}$$

involves abilities different from those involved in

$$\begin{array}{r} 9 \\ 3 \\ \hline \end{array},$$

being much less often solved correctly in grades 2 and 4.

$$\begin{array}{r} 6 \\ 0 \\ \hline \end{array}$$

is much harder than either of the above.

$$\begin{array}{r} 43 \\ 1 \\ 2 \\ 13 \\ \hline \end{array} \quad \text{is much harder than} \quad \begin{array}{r} 21 \\ 33 \\ 35 \\ \hline \end{array}$$

It may be said that these differences in difficulty are due to different amounts of practice. This is probably not true, but if it were, it would not change the argument; if the two abilities were identical, the practice of one would improve the other equally.

I shall not undertake here this task of listing and describing the elementary functions which constitute arithmetical learning, partly because what they are is not fully known, partly because in many cases a final ability may be constituted in several different ways whose descriptions become necessarily tedious, and partly because an adequate statement of what is known would far outrun the space limits of this chapter. Instead, I shall illustrate the results by some samples.

KNOWLEDGE OF THE MEANING OF A FRACTION

As a first sample, consider knowledge of the meaning of a fraction. Is the ability in question simply to understand that a fraction is a statement of the number of parts, each of a certain size, the upper number or numerator telling how many parts are taken and the lower number or denominator telling what fraction of unity each part is? And is the educational treatment required simply to describe and illustrate such a statement and have the pupils apply it to the recognition of fractions and the interpretation of each of them? And is the learning process (1) the formation of the notions of part, size of part, number of part, (2) relating the last two to the numbers in a fraction, and, as a necessary consequence, (3) applying these notions adequately whenever one encounters a fraction in operation?

Precisely this was the notion a few generations ago. The nature of fractions was taught as one principle, in one step, and the habits of dealing with fractions were supposed to be deduced from the general law of a fraction's nature. As a result the subject of fractions had to be long delayed, was studied at great cost of time and effort, and, even so, remained a mystery to all save gifted pupils. These gifted pupils probably of their own accord built up the ability piecemeal out of constituent insights and habits.

At all events, scientific teaching now does build up the total ability as a fusion or organization of lesser abilities. What these are will be seen best by examining the means taken to get them. (1) First comes the association of $\frac{1}{2}$ of a pie, $\frac{1}{2}$ of a cake, $\frac{1}{2}$ of an apple, and such like with their concrete meanings so that a pupil can properly name a clearly designated half of an obvious unit like an orange, pear, or piece of chalk. The same degree of understanding of $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{3}$, $\frac{1}{6}$, and $\frac{1}{5}$ is secured. The pupil is taught that 1 pie = 2 $\frac{1}{2}$ s, 3 $\frac{1}{3}$ s, 4 $\frac{1}{4}$ s, 5 $\frac{1}{5}$ s, 6 $\frac{1}{6}$ s, and 8 $\frac{1}{8}$ s; similarly for 1 cake, 1 apple, and the like.

So far he understands $\frac{1}{x}$ of y in the sense of certain simple parts of obviously unitary ys .

(2) Next comes the association with $\frac{1}{2}$ of an inch, $\frac{1}{2}$ of a foot, $\frac{1}{2}$ of a glassful and other cases where y is not so obviously a unitary object whose pieces still show their derivation from it. Similarly for $\frac{1}{4}$, $\frac{1}{3}$, etc.

(3) Next comes the association with $\frac{1}{2}$ of a collection of eight pieces of candy, $\frac{1}{3}$ of a dozen eggs, $\frac{1}{5}$ of a squad of ten soldiers, etc., until $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$, and $\frac{1}{8}$ are understood as names of certain parts of a collection of objects.

(4) Next comes the similar association when the nature of the collection is left undefined, the pupil responding to

$\frac{1}{2}$ of 6 is ..., $\frac{1}{4}$ of 8 is ..., 2 is $\frac{1}{5}$ of ...,

$\frac{1}{3}$ of 6 is ..., $\frac{1}{3}$ of 9 is ..., 2 is $\frac{1}{3}$ of ..., and the like.

Each of these abilities is justified in teaching by its intrinsic merits, irrespective of its later service in helping to constitute the general understanding of the meaning of a fraction. The habits thus formed in grades 3 or 4 are of constant service then and thereafter in and out of school.

(5) With these comes the use of $\frac{1}{5}$ of 10, 15, 20, etc., $\frac{1}{6}$ of 12, 18, 42, etc., as a useful variety of drill on the division tables, valuable in itself, and a means of making the notion of a unit fraction more general by adding $\frac{1}{7}$ and $\frac{1}{9}$ to the scheme.

(6) Next comes the connection of $\frac{3}{4}$, $\frac{2}{5}$, $\frac{3}{5}$, $\frac{4}{5}$, $\frac{2}{3}$, $\frac{1}{6}$, $\frac{5}{6}$, $\frac{3}{8}$, $\frac{5}{8}$, $\frac{7}{8}$, $\frac{3}{10}$, $\frac{7}{10}$, and $\frac{9}{10}$, each with its meaning as a certain part of some conveniently divisible unit, and, (7) and (8), connections between these fractions and their meanings as parts of certain magnitudes (7) and collections (8) of convenient size, and (9) connections between these fractions and their meanings when the nature of the magnitude or collection is unstated, as in $\frac{4}{5}$ of 15 = ..., $\frac{5}{8}$ of 32 = ...

(10) That the relation is general is shown by using it with numbers requiring written division and multiplication, such as $\frac{7}{8}$ of 1736 = ..., and with United States money.

Elements (6) to (10) again are useful even if the pupil never goes farther in arithmetic. One of the commonest uses of fractions is in calculating the

cost of fractions of yards of cloth, and fractions of pounds of meat, cheese, etc.

The next step (11) is to understand to some extent the principle that the value of any of these fractions is unaltered by multiplying or dividing the numerator and denominator by the same number. The drills in expressing fractions in lower and higher terms which accomplish this are paralleled by (12) and (13) simple exercises in adding and subtracting fractions to show that fractions are quantities that can be operated on like any quantities, and by (14) simple work with mixed numbers (addition and subtraction and reductions), and (15) improper fractions. All that is done with improper fractions is (*a*) to have the pupil use a few of them as he would any fractions and (*b*) to note their equivalent mixed numbers. In (12), (13), and (14) only fractions of the same denominators are added or subtracted, and in (12) (13), (14), and (15) only fractions with 2, 3, 4, 5, 6, 8, or 10 in the denominator are used. As hitherto, the work of (11) to (15) is useful in and of itself. (16) Definitions are given of the following type:—

Numbers like 2, 3, 4, 7, 11, 20, 36, 140, 921 are called whole numbers.

Numbers like $\frac{7}{8}$, $\frac{1}{5}$, $\frac{2}{3}$, $\frac{3}{4}$, $\frac{11}{8}$, $\frac{7}{6}$, $\frac{1}{3}$, $\frac{4}{3}$, $\frac{1}{8}$, $\frac{1}{6}$ are called fractions.

Numbers like $5\frac{1}{4}$, $7\frac{3}{8}$, $9\frac{1}{2}$, $16\frac{4}{5}$, $315\frac{7}{8}$, $1\frac{1}{3}$, $1\frac{2}{3}$ are called mixed numbers.

(17) The terms numerator and denominator are connected with the upper and lower numbers composing a fraction.

Building this somewhat elaborate series of minor abilities seems to be a very roundabout way of getting knowledge of the meaning of a fraction, and is, if we take no account of what is got along with this knowledge. Taking account of the intrinsically useful habits that are built up, one might retort that the pupil gets his knowledge of the meaning of a fraction at zero cost.

KNOWLEDGE OF THE SUBTRACTION AND DIVISION TABLES

Consider next the knowledge of the subtraction and division 'Tables.' The usual treatment presupposes that learning them consists of forming independently the bonds:—

$$\begin{array}{rcl}
 3 - 1 = 2 & & 4 \div 2 = 2 \\
 3 - 2 = 1 & & 6 \div 2 = 3 \\
 4 - 1 = 3 & & 6 \div 3 = 2 \\
 & & \cdot \\
 & & \cdot \\
 & & \cdot \\
 18 - 9 = 9 & & 81 \div 9 = 9
 \end{array}$$

In fact, however, these 126 bonds are not formed independently. Except perhaps in the case of the dullest twentieth of pupils, they are somewhat facilitated by the already learned additions and multiplications. And by proper arrangement of the learning they may be enormously facilitated thereby. Indeed, we may replace the independent memorizing of these facts by a set of instructive exercises wherein the pupil derives the subtractions from the corresponding additions by simple acts of reasoning or selective thinking. As soon as the additions giving sums of 9 or less are learned, let the pupil attack an exercise like the following:—

Write the missing numbers:—

A	B	C	D
3 and ... are 5.	5 and ... are 8.	4 and ... are 5.	4 and ... are 8.
3 and ... are 9.	3 and ... are 6.	5 and ... are 6.	1 and ... are 7.
4 and ... are 7.	4 and ... are 9.	6 and ... are 9.	6 and ... are 7.
5 and ... are 7.	2 and ... = 6.	1 and ... are 8.	8 and ... are 9.
6 and ... are 8.	5 and ... = 9.	3 and ... are 7.	3 + ... are 4.
4 and ... are 6.	2 and ... = 7.	1 + ... are 3.	7 + ... are 8.

2 and ... are 5.	3 and ... = 8.	1 + ... are 5.	4 + ... are 9.
2 and ... = 8.	1 and ... = 4.	4 + ... are 8.	2 + ... are 3.
3 and ... = 6.	2 and ... = 4.	7 + ... are 9.	1 + ... are 9.
6 and ... = 9.	3 and ... = 8.	2 + ... = 4.	3 + ... = 6.
4 and ... = 6.	6 and ... = 7.	3 + ... = 8.	5 + ... = 9.
4 and ... = 7.	2 and ... = 5.	4 + ... = 5.	1 + ... = 3.

The task for reasoning is only to try, one after another, numbers that seem promising and to select the right one when found. With a little stimulus and direction children can thus derive the subtractions up to those with 9 as the larger number. Let them then be taught to do the same with the printed forms:—

Subtract

9	7	8	5	8	6	
3	5	6	2	2	4	etc.
—	—	—	—	—	—	

and $9 - 7 = \dots$, $9 - 5 = \dots$, $7 - 5 = \dots$, etc.

In the case of the divisions, suppose that the pupil has learned his first table and gained surety in such exercises as:—

4 5s =	$6 \times 5 = \dots$	9 nickels = cents.
8 5s =	$4 \times 5 = \dots$	6 " = "
3 5s =	$2 \times 5 = \dots$	5 " = "
7 5s =	$9 \times 5 = \dots$	7 " = "

If one ball costs 5 cents,
two balls cost cents,
three balls cost cents, etc.

He may then be set at once to work at the answers to exercises like the following:—

Write the answers and the missing numbers:—

A	B	C	D
.... 5s = 15	40 = 5s × 5 = 25	20 cents = nickels.
.... 5s = 20	20 = 5s × 5 = 50	30 cents = nickels.
.... 5s = 40	15 = 5s × 5 = 35	15 cents = nickels.
.... 5s = 25	45 = 5s × 5 = 10	40 cents = nickels.
.... 5s = 30	50 = 5s × 5 = 40	
.... 5s = 35	25 = 5s × 5 = 45	

E

For 5 cents you can buy 1 small loaf of bread.
 For 10 cents you can buy 2 small loaves of bread.
 For 25 cents you can buy small loaves of bread.
 For 45 cents you can buy small loaves of bread.
 For 35 cents you can buy small loaves of bread.

F

5 cents pays 1 car fare.
 15 cents pays car fares.
 10 cents pays car fares.
 20 cents pays car fares.

G

How many 5 cent balls can you buy with 30 cents?
 How many 5 cent balls can you buy with 35 cents?
 How many 5 cent balls can you buy with 25 cents?
 How many 5 cent balls can you buy with 15 cents?

In the case of the meaning of a fraction, the ability, and so the learning, is much more elaborate than common practice has assumed; in the case of the subtraction and division tables the learning is much less so. In neither case is the learning either mere memorizing of facts or the mere understanding of a principle *in abstracto* followed by its application to concrete cases. It is (and this we shall find true of almost all efficient learning in arithmetic) the formation of connections and their use in such an order that each helps the others to the maximum degree, and so that each will do the maximum amount for arithmetical abilities other than the one specially concerned, and for the general competence of the learner.

LEARNING THE PROCESSES OF COMPUTATION

As another instructive topic in the constitution of arithmetical abilities, we may take the case of the reasoning involved in understanding the manipulations of figures in two (or more)-place addition and subtraction, multiplication and division involving a two (or more)-place number, and the manipulations of decimals in all four operations. The psychology of these is of special interest and importance. For there are two opposite explanations possible here, leading to two opposite theories of teaching.

The common explanation is that these methods of manipulation, if understood at all, are understood as deductions from the properties of our system of decimal notation. The other is that they are understood partly as inductions from the experience that they always give the right answer. The first explanation leads to the common preliminary deductive explanations of the textbooks. The other leads to explanations by verification; *e.g.*, of addition by counting, of subtraction by addition, of multiplication by addition, of division by multiplication. Samples of these two sorts of explanation are given below.

SHORT MULTIPLICATION WITHOUT CARRYING: DEDUCTIVE EXPLANATION

MULTIPLICATION is the process of taking one number as many times as there are units in another number.

The PRODUCT is the result of the multiplication.

The MULTIPLICAND is the number to be taken.

The MULTIPLIER is the number denoting how many times the multiplicand is to be taken.

The multiplier and multiplicand are the FACTORS.

Multiply 623 by 3

OPERATION

<i>Multiplicand</i>	623
<i>Multiplier</i>	<u>3</u>
<i>Product</i>	1869

EXPLANATION.—For convenience we write the multiplier under the multiplicand, and begin with units to multiply. 3 times 3 units are 9 units. We write the nine units in units' place in the product. 3 times 2 tens are 6 tens. We write the 6 tens in tens' place in the product. 3 times 6 hundreds are 18 hundreds, or 1 thousand and 8 hundreds. The 1 thousand we write in thousands' place and the 8

hundreds in hundreds' place in the product. Therefore, the product is 1 thousand 8 hundreds, 6 tens and 9 units, or 1869.

SHORT MULTIPLICATION WITHOUT CARRYING: INDUCTIVE EXPLANATION

1. The children of the third grade are to have a picnic. 32 are going. How many sandwiches will they need if each of the 32 children has four sandwiches?

Here is a quick way to find out:—

32 *Think "4 × 2," write 8 under the 2 in the ones column.*
4 *Think "4 × 3," write 12 under the 3 in the tens column.*

2. How many bananas will they need if each of the 32 children has two bananas? 32×2 or 2×32 will give the answer.

3. How many little cakes will they need if each child has three cakes? 32×3 or 3×32 will give the answer.

32 $3 \times 2 = \dots$ *Where do you write the 6?*
3 $3 \times 3 = \dots$ *Where do you write the 9?*

4. Prove that 128, 64, and 96 are right by adding four 32s, two 32s, and three 32s.

32
32 32
32 32 32
32 32 32

Multiplication

You **multiply** when you find the answers to questions like

How many are 9×3 ?
How many are 3×32 ?
How many are 8×5 ?
How many are 4×42 ?

1. Read these lines. Say the right numbers where the dots are:
If you **add** 3 to 32, you have 35 is the **sum**.
If you **subtract** 3 from 32, the result is 29 is the **difference** or **remainder**.
If you **multiply** 3 by 32 or 32 by 3, you have 96 is the **product**.

Find the products. Check your answers to the first line by adding.

SHORT DIVISION: DEDUCTIVE EXPLANATION

Divide 1825 by 4

Divisor 4 | 1825 Dividend
 456¼
 Quotient

EXPLANATION.—For convenience we write the divisor at the left of the dividend, and the quotient below it, and begin at the left to divide. 4 is not contained in 1 thousand any thousand times, therefore the quotient contains no unit of any order higher than hundreds. Consequently we find how many times 4 is contained in the hundreds of the dividend. 1 thousand and 8 hundreds are 18 hundreds. 4 is contained in 18 hundreds 4 hundred times and 2 hundreds remaining. We write the 4 hundreds in the quotient. The 2 hundreds we consider as united with the 2 tens, making 22 tens. 4 is contained in 22 tens 5 tens times, and 2 tens remaining. We write the 5 tens in the quotient, and the remaining 2 tens we consider as united with the 5 units, making 25 units. 4 is contained in 25 units 6 units times and 1 unit remaining. We write the 6 units in the quotient and indicate the division of the remainder, 1 unit, by the divisor 4.

Therefore the quotient of 1825 divided by 4 is 456¼, or 456 and 1 remainder.

SHORT DIVISION: INDUCTIVE EXPLANATION

Dividing Large Numbers

1. Tom, Dick, Will, and Fred put in 2 cents each to buy an eight-cent bag of marbles. There are 128 marbles in it. How many should each boy have, if they divide the marbles equally among the four boys?

$$4 \overline{) 128}$$

Think "12 = three 4s." Write the 3 over the 2 in the tens column.

Think "8 = two 4s." Write the 2 over the 8 in the ones column.

32 is right, because $4 \times 32 = 128$.

2. Mary, Nell, and Alice are going to buy a book as a present for their Sunday-school teacher. The present costs 69 cents. How much should each girl pay, if they divide the cost equally among the three girls?

$$3 \overline{)69}$$

Think "6 = 3s." Write the 2 over the 6 in the tens column.

Think "9 = 3s." Write the 3 over the 9 in the ones column.

23 is right, for $3 \times 23 = 69$.

3. Divide the cost of a 96-cent present equally among three girls. How much should each girl pay? girls. How much should each girl pay? $3 \overline{)96}$

4. Divide the cost of an 84-cent present equally among 4 girls. How much should each girl pay?

5. Learn this: (Read \div as "divided by.")

- | | |
|---------------------------------------|--|
| 12 + 4 = 16. | 16 is the sum. |
| 12 - 4 = 8. | 8 is the difference or remainder. |
| 12 \times 4 = 48. | 48 is the product. |
| 12 \div 4 = 3. | 3 is the quotient. |

6. Find the quotients. Check your answers by multiplying.

$$3 \overline{)99} \quad 2 \overline{)86} \quad 5 \overline{)155} \quad 6 \overline{)246} \quad 4 \overline{)168} \quad 3 \overline{)219}$$

[Uneven division is taught by the same general plan, extended.]

LONG DIVISION: DEDUCTIVE EXPLANATION

To Divide by Long Division

1. Let it be required to divide 34531 by 15.

Operation

	Divided		
Divisor	15) 34531 (2302 ¹ / ₁₅	Quotient
	30		
	<u>45</u>		
	45		
	<u>31</u>		
	30		
	<u>1</u>		
	1		
	Remainder		

For convenience we write the divisor at the left and the quotient at the right of the dividend, and begin to divide as in Short Division.

15 is contained in 3 ten-thousands 0 ten-thousands times; therefore, there will be 0 ten-thousands in the quotient. Take 34 thousands; 15 is contained in 34 thousands 2 thousands times; we write the 2 thousands in the quotient. 15×2 thousands = 30 thousands, which, subtracted from 34 thousands, leaves 4 thousands = 40 hundreds. Adding the 5 hundreds, we have 45 hundreds.

15 in 45 hundreds 3 hundreds times; we write the 3 hundreds in the quotient. 15×3 hundreds = 45 hundreds, which subtracted from 45 hundreds, leaves nothing. Adding the 3 tens, we have 3 tens.

15 in 3 tens 0 tens times; we write 0 tens in the quotient. Adding to the three tens, which equal 30 units, the 1 unit, we have 31 units.

15 in 31 units 2 units times; we write the 2 units in the quotient. 15×2 units = 30 units, which, subtracted from 31 units, leaves 1 unit as a remainder. Indicating the division of the 1 unit, we annex the fractional expression, $\frac{1}{15}$ unit, to the integral part of the quotient.

Therefore, 34531 divided by 15 is equal to $2302\frac{1}{15}$.

[B. Greenleaf, *Practical Arithmetic*, '73, p. 49.]

LONG DIVISION: INDUCTIVE EXPLANATION

Dividing by Large Numbers

1. Just before Christmas Frank's father sent 360 oranges to be divided among the children in Frank's class. There are 29 children. How many oranges should each child receive? How many oranges will be left over?

Here is the best way to find out:

$$\begin{array}{r} 12 \\ 29 \overline{)360} \\ \underline{29} \\ 70 \\ \underline{58} \\ 12 \end{array}$$

*and 12
remainder*

Think how many 29s there are in 36. 1 is right.

Write 1 over the 6 of 36. Multiply 29 by 1.

Write the 29 under the 36. Subtract 29 from 36.

Write the 0 of 360 after the 7.

Think how many 29s there are in 70. 2 is right.

Write 2 over the 0 of 360. Multiply 29 by 2.

Write the 58 under 70. Subtract 58 from 70.

There is 12 remainder.

Each child gets 12 oranges, and there are 12 left over. This is right, for 12 multiplied by 29 = 348, and $348 + 12 = 360$.

$$\begin{array}{r} 8. \\ 31 \overline{) 99,587} \end{array}$$

In No. 8, keep on dividing by 31 until you have used the 5, the 8, and the 7, and have four figures in the quotient.

$$\begin{array}{r} 9. \\ 22 \overline{) 253} \end{array}$$

$$\begin{array}{r} 10. \\ 22 \overline{) 2895} \end{array}$$

$$\begin{array}{r} 11. \\ 21 \overline{) 8891} \end{array}$$

$$\begin{array}{r} 12. \\ 22 \overline{) 290} \end{array}$$

$$\begin{array}{r} 13. \\ 32 \overline{) 16,368} \end{array}$$

Check your results for 9, 10, 11, 12, and 13.

1. The boys and girls of the Welfare Club plan to earn money to buy a victrola. There are 23 boys and girls. They can get a good second-hand victrola for \$5.75. How much must each earn if they divide the cost equally?

Here is the best way to find out:

$$\begin{array}{r} \$.25 \\ 23 \overline{) \$5.75} \\ \underline{46} \\ 115 \\ \underline{115} \end{array}$$

Think how many 23s there are in 57. 2 is right.

Write 2 over the 7 of 57. Multiply 23 by 2.

Write 46 under 57 and subtract. Write the 5 of 575 after the 11.

Think how many 23s there are in 115. 5 is right.

Write 5 over the 5 of 575. Multiply 23 by 5.

Write the 115 under the 115 that is there and subtract.

There is no remainder.

Put \$ and the decimal point where they belong.

Each child must earn 25 cents. This is right, for \$.25 multiplied by 23 = \$5.75.

2. Divide \$71.76 equally among 23 persons. How much is each person's share?

3. Check your result for No. 2 by multiplying the quotient by the divisor.

Find the quotients. Check each quotient by multiplying it by the divisor.

$$\begin{array}{r} 4. \\ 23 \overline{) \$99.13} \end{array}$$

$$\begin{array}{r} 5. \\ 25 \overline{) \$18.50} \end{array}$$

$$\begin{array}{r} 6. \\ 21 \overline{) \$129.15} \end{array}$$

$$\begin{array}{r} 7. \\ 13 \overline{) \$29.25} \end{array}$$

$$\begin{array}{r} 8. \\ 32 \overline{) \$73.92} \end{array}$$

1 bushel = 32 qt.

9. How many bushels are there in 288 qt.? 10. In 192 qt.? 11. In 416 qt.?

Crucial experiments are lacking, but there are several lines of well-attested evidence. First of all, there can be no doubt that the great majority of pupils learn these manipulations at the start from the placing of units under units, tens under tens, etc., in addition, to the placing of the decimal point in division with decimals, by imitation and blind following of specific instructions, and that a very large proportion of the pupils do not to the end, that is to the fifth school-year, understand them as necessary deductions from decimal notation. It also seems probable that this proportion would not be much reduced no matter how ingeniously and carefully the deductions were explained by textbooks and teachers. Evidence of this fact will appear abundantly to any one who will observe schoolroom life. It also appears in the fact that after the properties of the decimal notation have been thus used again and again; *e.g.*, for deducing 'carrying' in addition, 'borrowing' in subtraction, 'carrying' in multiplication, the value of the digits in the partial product, the value of each remainder in short division, the value of the quotient figures in division, the addition, subtraction, multiplication, and division of United States money, and the placing of the decimal point in multiplication, no competent teacher dares to rely upon the pupil, even though he now has four or more years' experience with decimal notation, to deduce the placing of the decimal point in division with decimals. It may be an illusion, but one seems to sense in the better textbooks a recognition of the futility of the attempt to secure deductive derivations of those manipulations. I refer to the brevity of the explanations and their insertion in such a form that they will influence the pupils' thinking as little as possible. At any rate the fact is sure that most pupils do not learn the manipulations by deductive reasoning, or understand them as necessary consequences of abstract principles.

It is a common opinion that the only alternative is knowing them by rote. This, of course, is one common alternative, but the other explanation suggests that understanding the manipulations by inductive reasoning from their results is another and an important alternative. The manipulations of 'long' multiplication, for instance, learned by imitation or mechanical drill, are found to give for $25 \times A$ a result about twice as large as for $13 \times A$, for 38 or $39 \times A$ a result about three times as large; for $115 \times A$ a result about ten times as large as for $11 \times A$. With even the very dull pupils the procedure is verified at least to the extent that it gives a result which the

scientific expert in the case—the teacher—calls right. With even the very bright pupils, who can appreciate the relation of the procedure to decimal notation, this relation may be used not as the sole deduction of the procedure beforehand, but as one partial means of verifying it afterward. Or there may be the condition of half-appreciation of the relation in which the pupil uses knowledge of the decimal notation to convince himself that the procedure *does*, but not that it *must* give the right answer, the answer being 'right' because the teacher, the answer-list, and collateral evidence assure him of it.

I have taken the manipulation of the partial products as an illustration because it is one of the least favored cases for the explanation I am presenting. If we take the first case where a manipulation may be deduced from decimal notation, known merely by rote, or verified inductively, namely, the addition of two-place numbers, it seems sure that the mental processes just described are almost the universal rule.

Surely in our schools at present children add the 3 of 23 to the 3 of 53 and the 2 of 23 to the 5 of 53 at the start, in nine cases out of ten because they see the teacher do so and are told to do so. They are protected from adding $3 + 3 + 2 + 5$ not by any deduction of any sort but because they do not know how to add 8 and 5, because they have been taught the habit of adding figures that stand one above the other, or with a + between them; and because they are shown or told what they are to do. They are protected from adding $3 + 5$ and $2 + 3$, again, by no deductive reasoning but for the second and third reasons just given. In nine cases out of ten they do not even think of the possibility of adding in any other way than the '3 + 3, 2 + 5' way, much less do they select that way on account of the facts that $53 = 50 + 3$ and $23 = 20 + 3$, that $50 + 20 = 70$, that $3 + 3 = 6$, and that $(a + b) + (c + d) = (a + c) + (b + d)$!

Just as surely all but the very dullest twentieth or so of children come in the end to something more than rote knowledge,—to *understand*, to *know* that the procedure in question is right.

Whether they know *why* 76 is right depends upon what is meant by *why*. If it means that 76 is the result which competent people agree upon, they do. If it means that 76 is the result which would come from accurate

counting they perhaps know why as well as they would have, had they been given full explanations of the relation of the procedure in two-place addition to decimal notation. If *why* means because $53 = 50 + 3$, $23 = 20 + 3$, $50 + 20 = 70$, and $(a + b) + (c + d) = (a + c) + (b + d)$, they do not. Nor, I am tempted to add, would most of them by any sort of teaching whatever.

I conclude, therefore, that school children may and do reason about and understand the manipulations of numbers in this inductive, verifying way without being able to, or at least without, under present conditions, finding it profitable to derive them deductively. I believe, in fact, that pure arithmetic *as it is learned and known* is largely an *inductive science*. At one extreme is a minority to whom it is a series of deductions from principles; at the other extreme is a minority to whom it is a series of blind habits; between the two is the great majority, representing every gradation but centering about the type of the inductive thinker.

CHAPTER IV

THE CONSTITUTION OF ARITHMETICAL ABILITIES (CONTINUED): THE SELECTION OF THE BONDS TO BE FORMED

When the analysis of the mental functions involved in arithmetical learning is made thorough it turns into the question, 'What are the elementary bonds or connections that constitute these functions?' and when the problem of teaching arithmetic is regarded, as it should be in the light of present psychology, as a problem in the development of a hierarchy of intellectual habits, it becomes in large measure a problem of the choice of the bonds to be formed and of the discovery of the best order in which to form them and the best means of forming each in that order.

THE IMPORTANCE OF HABIT-FORMATION

The importance of habit-formation or connection-making has been grossly underestimated by the majority of teachers and writers of textbooks. For, in the first place, mastery by deductive reasoning of such matters as 'carrying' in addition, 'borrowing' in subtraction, the value of the digits in the partial products in multiplication, the manipulation of the figures in division, the placing of the decimal point after multiplication or division with decimals, or the manipulation of the figures in the multiplication and division of fractions, is impossible or extremely unlikely in the case of children of the ages and experience in question. They do not as a rule deduce the method of manipulation from their knowledge of decimal notation. Rather they learn about decimal notation by carrying, borrowing, writing the last figure of each partial product under the multiplier which gives that product, etc. They learn the method of manipulating numbers by

seeing them employed, and by more or less blindly acquiring them as associative habits.

In the second place, we, who have already formed and long used the right habits and are thereby protected against the casual misleadings of unfortunate mental connections, can hardly realize the force of mere association. When a child writes sixteen as 61, or finds 428 as the sum of

15
19
16
18

or gives 642 as an answer to 27×36 , or says that 4 divided by $\frac{1}{4} = 1$, we are tempted to consider him mentally perverse, forgetting or perhaps never having understood that he goes wrong for exactly the same general reason that we go right; namely, the general law of habit-formation. If we study the cases of 61 for 16, we shall find them occurring in the work of pupils who after having been drilled in writing 26, 36, 46, 62, 63, and so on, in which the order of the six in writing is the same as it is in speech, return to writing the 'teen numbers. If our language said onety-one for eleven and onety-six for sixteen, we should probably never find such errors except as 'lapses' or as the results of misperception or lack of memory. They would then be more frequent *before* the 20s, 30s, etc., were learned.

If pupils are given much drill on written single column addition involving the higher decades (each time writing the two-figure sum), they are forming a habit of writing 28 after the sum of 8, 6, 9, and 5 is reached; and it should not surprise us if the pupil still occasionally writes the two-figure sum for the first column though a second column is to be added also. On the contrary, unless some counter force influences him, he is absolutely sure to make this mistake.

The last mistake quoted ($4 \div \frac{1}{4} = 1$) is interesting because here we have possibly one of the cases where deduction from psychology alone can give constructive aid to teaching. Multiplication and division by fractions have been notorious for their difficulty. The former is now alleviated by using *of* instead of \times until the new habit is fixed. The latter is still approached with

elaborate caution and with various means of showing why one must 'invert and multiply' or 'multiply by the reciprocal.'

But in the author's opinion it seems clear that the difficulty in multiplying and dividing by a fraction was not that children felt any logical objections to canceling or inverting. I fancy that the majority of them would cheerfully invert any fraction three times over or cancel numbers at random in a column if they were shown how to do so. But if you are a youngster inexperienced in numerical abstractions and if you have had *divide* connected with 'make smaller' three thousand times and never once connected with 'make bigger,' you are sure to be somewhat impelled to make the number smaller the three thousand and first time you are asked to divide it. Some of my readers will probably confess that even now they feel a slight irritation or doubt in saying or writing that $\frac{16}{1} \div \frac{1}{8} = 128$.

The habits that have been confirmed by every multiplication and division by integers are, in this particular of '*the ratio of result to number operated upon,*' directly opposed to the formation of the habits required with fractions. And that is, I believe, the main cause of the difficulty. Its treatment then becomes easy, as will be shown later.

These illustrations could be added to almost indefinitely, especially in the case of the responses made to the so-called 'catch' problems. The fact is that the learner rarely can, and almost never does, survey and analyze an arithmetical situation and justify what he is going to do by articulate deductions from principles. He usually feels the situation more or less vaguely and responds to it as he has responded to it or some situation like it in the past. Arithmetic is to him not a logical doctrine which he applies to various special instances, but a set of rather specialized habits of behavior toward certain sorts of quantities and relations. And in so far as he does come to know the doctrine it is chiefly by doing the will of the master. This is true even with the clearest expositions, the wisest use of objective aids, and full encouragement of originality on the pupil's part.

Lest the last few paragraphs be misunderstood, I hasten to add that the psychologists of to-day do not wish to make the learning of arithmetic a mere matter of acquiring thousands of disconnected habits, nor to decrease by one jot the pupil's genuine comprehension of its general truths. They

wish him to reason not less than he has in the past, but more. They find, however, that you do not secure reasoning in a pupil by demanding it, and that his learning of a general truth without the proper development of organized habits back of it is likely to be, not a rational learning of that general truth, but only a mechanical memorizing of a verbal statement of it. They have come to know that reasoning is not a magic force working in independence of ordinary habits of thought, but an organization and coöperation of those very habits on a higher level.

The older pedagogy of arithmetic stated a general law or truth or principle, ordered the pupil to learn it, and gave him tasks to do which he could not do profitably unless he understood the principle. It left him to build up himself the particular habits needed to give him understanding and mastery of the principle. The newer pedagogy is careful to help him build up these connections or bonds ahead of and along with the general truth or principle, so that he can understand it better. The older pedagogy commanded the pupil to reason and let him suffer the penalty of small profit from the work if he did not. The newer provides instructive experiences with numbers which will stimulate the pupil to reason so far as he has the capacity, but will still be profitable to him in concrete knowledge and skill, even if he lacks the ability to develop the experiences into a general understanding of the principles of numbers. The newer pedagogy secures more reasoning in reality by not pretending to secure so much.

The newer pedagogy of arithmetic, then, scrutinizes every element of knowledge, every connection made in the mind of the learner, so as to choose those which provide the most instructive experiences, those which will grow together into an orderly, rational system of thinking about numbers and quantitative facts. It is not enough for a problem to be a test of understanding of a principle; it must also be helpful in and of itself. It is not enough for an example to be a case of some rule; it must help review and consolidate habits already acquired or lead up to and facilitate habits to be acquired. Every detail of the pupil's work must do the maximum service in arithmetical learning.

DESIRABLE BONDS NOW OFTEN NEGLECTED

As hitherto, I shall not try to list completely the elementary bonds that the course of study in arithmetic should provide for. The best means of preparing the student of this topic for sound criticism and helpful invention is to let him examine representative cases of bonds now often neglected which should be formed and representative cases of useless, or even harmful, bonds now often formed at considerable waste of time and effort.

(1) *Numbers as measures of continuous quantities.*—The numbers one, two, three, 1, 2, 3, etc., should be connected soon after the beginning of arithmetic each with the appropriate amount of some continuous quantity like length or volume or weight, as well as with the appropriate sized collection of apples, counters, blocks, and the like. Lines should be labeled 1 foot, 2 feet, 3 feet, etc.; one inch, two inches, three inches, etc.; weights should be lifted and called one pound, two pounds, etc.; things should be measured in glassfuls, handfuls, pints, and quarts. Otherwise the pupil is likely to limit the meaning of, say, *four* to four sensibly discrete things and to have difficulty in multiplication and division. Measuring, or counting by insensibly marked off repetitions of a unit, binds each number name to its meaning as — *times whatever 1 is*, more surely than mere counting of the units in a collection can, and should reënforce the latter.

(2) *Additions in the higher decades.*—In the case of all save the very gifted children, the additions with higher decades—that is, the bonds, $16 + 7 = 23$, $26 + 7 = 33$, $36 + 7 = 43$, $14 + 8 = 22$, $24 + 8 = 32$, and the like—need to be specifically practiced until the tendency becomes generalized. 'Counting' by 2s beginning with 1, and with 2, counting by 3s beginning with 1, with 2, and with 3, counting by 4s beginning with 1, with 2, with 3, and with 4, and so on, make easy beginnings in the formation of the decade connections. Practice with isolated bonds should soon be added to get freer use of the bonds. The work of column addition should be checked for accuracy so that a pupil will continually get beneficial practice rather than 'practice in error.'

(3) *The uneven divisions.*—The quotients with remainders for the divisions of every number to 19 by 2, every number to 29 by 3, every number to 39 by 4, and so on should be taught as well as the even divisions. A table like the following will be found a convenient means of making these connections:—

$$\begin{aligned}
10 &= \dots 2s \\
10 &= \dots 3s \text{ and } \dots \text{ rem.} \\
10 &= \dots 4s \text{ and } \dots \text{ rem.} \\
10 &= \dots 5s \\
11 &= \dots 2s \text{ and } \dots \text{ rem.} \\
11 &= \dots 3s \text{ and } \dots \text{ rem.} \\
&\cdot \\
&\cdot \\
&\cdot \\
89 &= \dots 9s \text{ and } \dots \text{ rem.}
\end{aligned}$$

These bonds must be formed before short division can be efficient, are useful as a partial help toward selection of the proper quotient figures in long division, and are the chief instruments for one of the important problem series in applied arithmetic,—“How many x s can I buy for y cents at z cents per x and how much will I have left?” That these bonds are at present sadly neglected is shown by Kirby [’13], who found that pupils in the last half of grade 3 and the first half of grade 4 could do only about four such examples per minute (in a ten-minute test), and even at that rate made far from perfect records, though they had been taught the regular division tables. Sixty minutes of practice resulted in a gain of nearly 75 percent in number done per minute, with an increase in accuracy as well.

(4) *The equation form.*—The equation form with an unknown quantity to be determined, or a missing number to be found, should be connected with its meaning and with the problem attitude long before a pupil begins algebra, and in the minds of pupils who never will study algebra.

Children who have just barely learned to add and subtract learn easily to do such work as the following:—

Write the missing numbers:—

$$\begin{aligned}
4 + 8 &= \dots \\
5 + \dots &= 14 \\
\dots + 3 &= 11 \\
\dots &= 5 + 2 \\
16 &= 7 + \dots \\
12 &= \dots + 5
\end{aligned}$$

The equation form is the simplest uniform way yet devised to state a quantitative issue. It is capable of indefinite extension if certain easily understood conventions about parentheses and fraction signs are learned. It should be

employed widely in accounting and the treatment of commercial problems, and would be except for outworn conventions. It is a leading contribution of algebra to business and industrial life. Arithmetic can make it nearly as well. It saves more time in the case of drills on reducing fractions to higher and lower terms alone than is required to learn its meaning and use. To rewrite a quantitative problem as an equation and then make the easy selection of the necessary technique to solve the equation is one of the most universally useful intellectual devices known to man. The words 'equals,' 'equal,' 'is,' 'are,' 'makes,' 'make,' 'gives,' 'give,' and their rarer equivalents should therefore early give way on many occasions to the '=' which so far surpasses them in ultimate convenience and simplicity.

(5) *Addition and subtraction facts in the case of fractions.*—In the case of adding and subtracting fractions, certain specific bonds—between the situation of halves and thirds to be added and the responses of thinking of the numbers as equal to so many sixths, between the situation thirds and fourths to be added and thinking of them as so many twelfths, between fourths and eighths to be added and thinking of them as eighths, and the like—should be formed separately. The general rule of thinking of fractions as their equivalents with some convenient denominator should come as an organization and extension of such special habits, not as an edict from the textbook or teacher.

(6) *Fractional equivalents.*—Efficiency requires that in the end the much used reductions should be firmly connected with the situations where they are needed. They may as well, therefore, be so connected from the beginning, with the gain of making the general process far easier for the dull pupils to master. We shall see later that, for all save the very gifted pupils, the economical way to get an understanding of arithmetical principles is not, usually, to learn a rule and then apply it, but to perform instructive operations and, in the course of performing them, to get insight into the principles.

(7) *Protective habits in multiplying and dividing with fractions.*—In multiplying and dividing with fractions special bonds should be formed to counteract the now harmful influence of the 'multiply = get a larger number' and 'divide = get a smaller number' bonds which all work with integers has been reënforcing.

For example, at the beginning of the systematic work with multiplication by a fraction, let the following be printed clearly at the top of every relevant page of the textbook and displayed on the blackboard:—

When you multiply a number by anything more than 1 the result is larger than the number.

When you multiply a number by 1 the result is the same as the number.

When you multiply a number by anything less than 1 the result is smaller than the number.

Let the pupils establish the new habit by many such exercises as:—

$18 \times 4 = \dots$	$9 \times 2 = \dots$
$4 \times 4 = \dots$	$6 \times 2 = \dots$
$2 \times 4 = \dots$	$3 \times 2 = \dots$
$1 \times 4 = \dots$	$1 \times 2 = \dots$
$\frac{1}{2} \times 4 = \dots$	$\frac{1}{3} \times 2 = \dots$
$\frac{1}{4} \times 4 = \dots$	$\frac{1}{6} \times 2 = \dots$
$\frac{1}{8} \times 4 = \dots$	$\frac{1}{9} \times 2 = \dots$

In the case of division by a fraction the old harmful habit should be counteracted and refined by similar rules and exercises as follows:—

When you divide a number by anything more than 1 the result is smaller than the number.

When you divide a number by 1 the result is the same as the number.

When you divide a number by anything less than 1 the result is larger than the number.

State the missing numbers:—

$8 = \dots 4s$	$12 = \dots 6s$	$9 = \dots 9s$	
$8 = \dots 2s$	$12 = \dots 4s$	$9 = \dots 3s$	
$8 = \dots 1s$	$12 = \dots 3s$	$9 = \dots 1s$	
$8 = \dots \frac{1}{2}s$	$12 = \dots 2s$	$9 = \dots \frac{1}{3}s$	
$8 = \dots \frac{1}{4}s$	$12 = \dots 1s$	$9 = \dots \frac{1}{9}s$	
$8 = \dots \frac{1}{8}s$	$12 = \dots \frac{1}{2}s$		
	$12 = \dots \frac{1}{3}s$		
	$12 = \dots \frac{1}{4}s$		
$16 \div 16$	$9 \div 9$	$10 \div 10$	$12 \div 6$
$=$	$=$	$=$	$=$
$16 \div 8$	$9 \div 3$	$10 \div 5$	$12 \div 4$
$=$	$=$	$=$	$=$
$16 \div 4$	$9 \div 1$	$10 \div 1$	$12 \div 3$
$=$	$=$	$=$	$=$

$16 \div 2$	$9 \div \frac{1}{3}$	$10 \div \frac{1}{5}$	$12 \div 2$
=	=	=	=
$16 \div 1$	$9 \div \frac{1}{9}$	$10 \div \frac{1}{10}$	$12 \div 1$
=	=	=	=
$16 \div \frac{1}{2}$			$12 \div \frac{1}{2}$
=			=
$16 \div \frac{1}{4}$			$12 \div \frac{1}{3}$
=			=
$16 \div \frac{1}{8}$			$12 \div \frac{1}{4}$
=			=
			$12 \div \frac{1}{6}$
			=

(8) *'% of means hundredths times.'*—In the case of percentage a series of bonds like the following should be formed:—

5	percent	of	=	.05 times
20	" "	"	=	.20 "
6	" "	"	=	.06 "
25	%	"	=	.25 ×
12	%	"	=	.12 ×
3	%	"	=	.03 ×

Four five-minute drills on such connections between 'x percent of' and 'its decimal equivalent times' are worth an hour's study of verbal definitions of the meaning of percent as per hundred or the like. The only use of the study of such definitions is to facilitate the later formation of the bonds, and, with all save the brighter pupils, the bonds are more needed for an understanding of the definitions than the definitions are needed for the formation of the bonds.

(9) *Habits of verifying results.*—Bonds should early be formed between certain manipulations of numbers and certain means of checking, or verifying the correctness of, the manipulation in question. The additions to $9 + 9$ and the subtractions to $18 - 9$ should be verified by objective addition and subtraction and counting until the pupil has sure command; the multiplications to 9×9 should be verified by objective multiplication and counting of the result (in piles of tens and a pile of ones) eight or ten times,^[4] and by addition eight or ten times;^[4] the divisions to $81 \div 9$ should be verified by multiplication and occasionally objectively until the pupil has sure command; column addition should be checked

by adding the columns separately and adding the sums so obtained, and by making two shorter tasks of the given task and adding the two sums; 'short' multiplication should be verified eight or ten times by addition; 'long' multiplication should be checked by reversing multiplier and multiplicand and in other ways; 'short' and 'long' division should be verified by multiplication.

These habits of testing an obtained result are of threefold value. They enable the pupil to find his own errors, and to maintain a standard of accuracy by himself. They give him a sense of the relations of the processes and the reasons why the right ways of adding, subtracting, multiplying, and dividing are right, such as only the very bright pupils can get from verbal explanations. They put his acquisition of a certain power, say multiplication, to a real and intelligible use, in checking the results of his practice of a new power, and so instill a respect for arithmetical power and skill in general. The time spent in such verification produces these results at little cost; for the practice in adding to verify multiplications, in multiplying to verify divisions, and the like is nearly as good for general drill and review of the addition and multiplication themselves as practice devised for that special purpose.

Early work in adding, subtracting, and reducing fractions should be verified by objective aids in the shape of lines and areas divided in suitable fractional parts. Early work with decimal fractions should be verified by the use of the equivalent common fractions for .25, .75, .125, .375, and the like. Multiplication and division with fractions, both common and decimal, should in the early stages be verified by objective aids. The placing of the decimal point in multiplication and division with decimal fractions should be verified by such exercises as:—

$$1.23 \begin{array}{r}) \ 24.60 \\ \underline{246} \end{array}$$

It cannot be 200; for 200×1.23 is much more than 24.6.

It cannot be 2; for 2×1.23 is much less than 24.6.

The establishment of habits of verifying results and their use is very greatly needed. The percentage of wrong answers in arithmetical work in schools is now so high that the pupils are often being practiced in error. In many cases they can feel no genuine and effective confidence in the processes, since their own use of the processes brings wrong answers as often as right. In solving problems they often cannot decide whether they have done the right thing or the wrong, since even if they have done the right thing, they may have done it inaccurately. A wrong answer to a problem is therefore too often ambiguous and uninformative to them.^[5]

These illustrations of the last few pages are samples of the procedures recommended by a consideration of all the bonds that one might form and of the contribution that each would make toward the abilities that the study of arithmetic should develop and improve. It is by doing more or less at haphazard what psychology teaches us to do deliberately and systematically in this respect that many of the past advances in the teaching of arithmetic have been made.

WASTEFUL AND HARMFUL BONDS

A scrutiny of the bonds now formed in the teaching of arithmetic with questions concerning the exact service of each, results in a list of bonds of small value or even no value, so far as a psychologist can determine. I present here samples of such psychologically unjustifiable bonds with some of the reasons for their deficiencies.

(1) *Arbitrary units.*—In drills intended to improve the ability to see and use the meanings of numbers as names for ratios or relative magnitudes, it is unwise to employ entirely arbitrary units. The procedure in II (on page 84) is better than that in I. Inches, half-inches, feet, and centimeters are better as units of length than arbitrary As. Square inches, square centimeters, and square feet are better for areas. Ounces and pounds should be lifted rather than arbitrary weights. Pints, quarts, glassfuls, cupfuls, handfuls, and cubic inches are better for volume.

All the real merit in the drills on relative magnitude advocated by Speer, McLellan and Dewey, and others can be secured without spending time in relating magnitudes for the sake of relative magnitude alone. The use of units of measure in drills which will never be used in *bona fide* measuring is like the use of fractions like sevenths, elevenths, and thirteenths. A very little of it is perhaps desirable to test the appreciation of certain general principles, but for regular training it should give place to the use of units of practical significance.

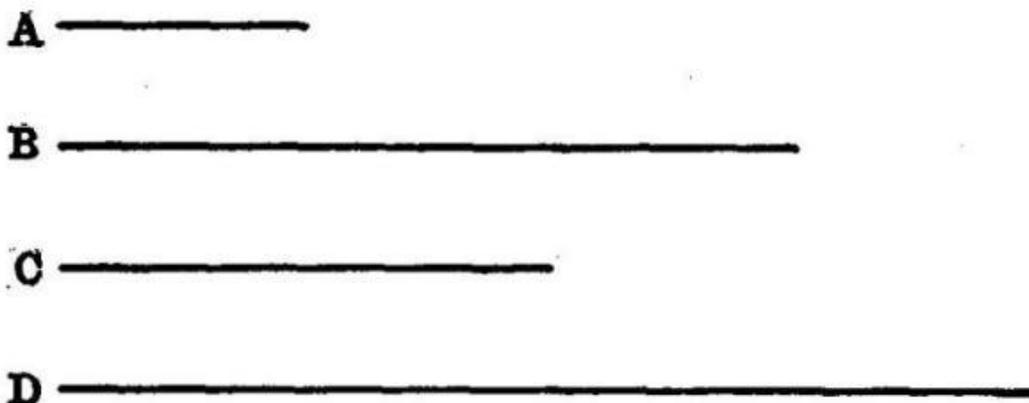

FIG. 3.

I. If A is 1 which line is 2? Which line is 4? Which line is 3? A and C together equal what line? A and B together equal what line? How much longer is B than A ? How much longer is B than C ? How much longer is D than A ?

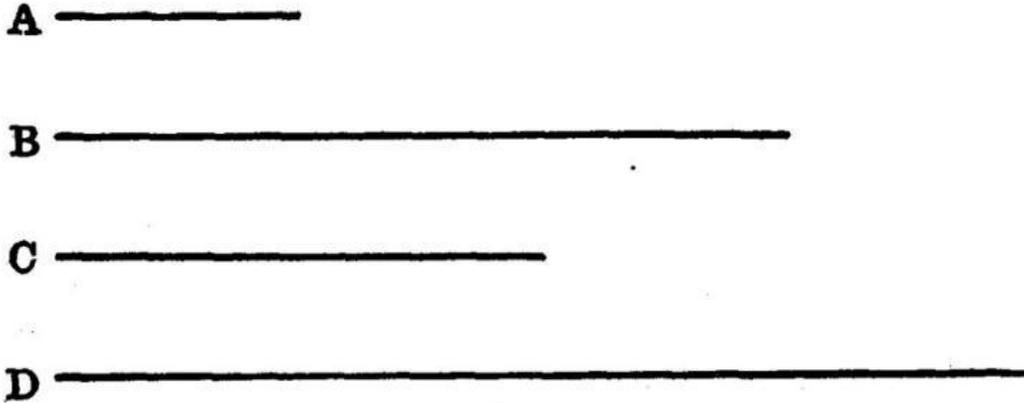

FIG. 4.

II. A is 1 inch long. Which line is 2 inches long? Which line is 4 inches long? Which line is 3 inches long? A and C together make ... inches? A and B together make ... inches? B is longer than A ? B is longer than C ? D is longer than A ?

(2) *Multiples of 11.*—The multiplications of 2 to 12 by 11 and 12 as single connections should be left for the pupil to acquire by himself as he needs them. These connections interfere with the process of learning two-place multiplication. The manipulations of numbers there required can be learned much more easily if 11 and 12 are used as multipliers in just the same way that 78 or 96 would be. Later the 12×2 , 12×3 , etc., may be taught. There is less reason for knowing the multiples of 11 than for knowing the multiples of 15, 16, or 25.

(3) *Abstract and concrete numbers.*—The elaborate emphasis of the supposed fact that we cannot multiply 726 by 8 dollars and the still more elaborate explanations of why nevertheless we find the cost of 726 articles at \$8 each by multiplying 726 by 8 and calling the answer dollars are wasteful. The same holds of the corresponding pedantry about division. These imaginary difficulties should not be raised at all. The pupil should not think of multiplying or dividing men or dollars, but simply of the necessary equation and of the sort of thing that the missing number represents. " $8 \times 726 = \dots$ Answer is dollars," or "8, 726, multiply. Answer is dollars," is all that he needs to think, and is in the best form for his thought. Concerning the distinction between abstract and concrete numbers, both

logic and common sense as well as psychology support the contention of McDougale ['14, p. 206f.], who writes:—

"The most elementary counting, even that stage when the counts were not carried in the mind, but merely in notches on a stick or by DeMorgan's stones in a pot, requires some thought; and the most advanced counting implies memory of things. The terms, therefore, abstract and concrete number, have long since ceased to be used by thinking people.

"Recently the writer visited an arithmetic class in a State Normal School and saw a group of practically adult students confused about this very question concerning abstract and concrete numbers, according to their previous training in the conventionalities of the textbook. Their teacher diverted the work of the hour and she and the class spent almost the whole period in reestablishing the requirements 'that the product must always be the same kind of unit as the multiplicand,' and 'addends must all be alike to be added.' This is not an exceptional case. Throughout the whole range of teaching arithmetic in the public schools pupils are obfuscated by the philosophical encumbrances which have been imposed upon the simplest processes of numerical work. The time is surely ripe, now that we are readjusting our ideas of the subject of arithmetic, to revise some of these wasteful and disheartening practices. Algebra historically grew out of arithmetic, yet it has not been laden with this distinction. No pupil in algebra lets x equal the horses; he lets x equal the *number* of horses, and proceeds to drop the idea of horses out of his consideration. He multiplies, divides, and extracts the root of the *number*, sometimes handling fractions in the process, and finally interprets the result according to the conditions of his problem. Of course, in the early number work there have been the sense-objects from which number has been perceived, but the mind retreats naturally from objectivity to the pure conception of number, and then to the number symbol. The following is taken from the appendix to Horn's thesis, where a seventh grade girl gets the population of the United States in 1820:—

7,862,166	whites
233,634	free negroes
<u>1,538,022</u>	slaves
9,633,822	

In this problem three different kinds of addends are combined, if we accept the usual distinction. Some may say that this is a mistake,—that the pupil transformed the 'whites,' 'free negroes,' and 'slaves' into a common unit, such as 'people' of 'population' and then added these common units. But this 'explanation' is entirely gratuitous, as one will find if he questions the pupil about the process. It will be

found that the child simply added the figures as numbers only and then interpreted the result, according to the statement of the problem, without so much mental gymnastics. The writer has questioned hundreds of students in Normal School work on this point, and he believes that the ordinary mind-movement is correctly set forth here, no matter how well one may maintain as an academic proposition that this is not logical. Many classes in the Eastern Kentucky State Normal have been given this problem to solve, and they invariably get the same result:—

'In a garden on the Summit are as many cabbage-heads as the total number of ladies and gentlemen in this class. How many cabbage-heads in the garden?'

And the blackboard solution looks like this each time:—

$$\begin{array}{r} 29 \quad \text{ladies} \\ 15 \quad \text{gentlemen} \\ \hline 44 \quad \text{cabbage-heads} \end{array}$$

So, also, one may say: I have 6 times as many sheep as you have cows. If you have 5 cows, how many sheep have I? Here we would multiply the number of cows, which is 5, by 6 and call the result 30, which must be linked with the idea of sheep because the conditions imposed by the problem demand it. The mind naturally in this work separates the pure number from its situation, as in algebra, handles it according to the laws governing arithmetical combinations, and labels the result as the statement of the problem demands. This is expressed in the following, which is tacitly accepted in algebra, and should be accepted equally in arithmetic:

'In all computations and operations in arithmetic, all numbers are essentially abstract and should be so treated. They are concrete only in the thought process that attends the operation and interprets the result.'

(4) *Least common multiple*.—The whole set of bonds involved in learning 'least common multiple' should be left out. In adding and subtracting fractions the pupil should *not* find the least common multiple of their denominators but should find any common multiple that he can find quickly and correctly. No intelligent person would ever waste time in searching for the least common multiple of sixths, thirds, and halves except for the unfortunate traditions of an oversystematized arithmetic, but would think of their equivalents in sixths or twelfths or twenty-fourths or *any other convenient common multiple*. The process of finding the least common multiple is of such exceedingly rare application in science or business or life generally that the textbooks have to resort to purely fantastic problems to give drill in its use.

(5) *Greatest common divisor*.—The whole set of bonds involved in learning 'greatest common divisor' should also be left out. In reducing fractions to lowest terms the pupil should divide by anything that he sees that he can divide by, favoring large divisors, and continue doing so until he gets the fraction in terms suitable for the purpose in hand. The reader probably never has had occasion to compute a greatest common divisor since he left school. If he has computed any, the chances are that he would have saved time by solving the problem in some other way!

The following problems are taken at random from those given by one of the best of the textbooks that make the attempt to apply the facts of Greatest Common Divisor and Least Common Multiple to problems.^[6] Most of these problems are fantastic. The others are trivial, or are better solved by trial and adaptation.

1. A certain school consists of 132 pupils in the high school, 154 in the grammar, and 198 in the primary grades. If each group is divided into sections of the same number containing as many pupils as possible, how many pupils will there be in each section?

2. A farmer has 240 bu. of wheat and 920 bu. of oats, which he desires to put into the least number of boxes of the same capacity, without mixing the two kinds of grain. Find how many bushels each box must hold.

3. Four bells toll at intervals of 3, 7, 12, and 14 seconds respectively, and begin to toll at the same instant. When will they next toll together?

4. A, B, C, and D start together, and travel the same way around an island which is 600 mi. in circuit. A goes 20 mi. per day, B 30, C 25, and D 40. How long must their journeying continue, in order that they may all come together again?

5. The periods of three planets which move uniformly in circular orbits round the sun, are respectively 200, 250, and 300 da. Supposing their positions relatively to each other and the sun to be given at any moment, determine how many da. must elapse before they again have exactly the same relative positions.

(6) *Rare and unimportant words*.—The bonds between rare or unimportant words and their meanings should not be formed for the mere sake of verbal variety in the problems of the textbook. A pupil should not be expected to solve a problem that he cannot read. He should not be expected in grades 2 and 3, or even in grade 4, to read words that he has rarely or never seen before. He should not be given elaborate drill in reading during the time devoted to the treatment of quantitative facts and relations.

All this is so obvious that it may seem needless to relate. It is not. With many textbooks it is now necessary to give definite drill in reading the words in the printed problems intended for grades 2, 3, and 4, or to replace them by oral statements, or to leave the pupils in confusion concerning what the problems are that they are to solve. Many good teachers make a regular reading-lesson out of

every page of problems before having them solved. There should be no such necessity.

To define *rare* and *unimportant* concretely, I will say that for pupils up to the middle of grade 3, such words as the following are rare and unimportant (though each of them occurs in the very first fifty pages of some well-known beginner's book in arithmetic).

(7) *Misleading facts and procedures.*—Bonds should not be formed between articles of commerce and grossly inaccurate prices therefor, between events and grossly improbable consequences, or causes or accompaniments thereof, nor between things, qualities, and events which have no important connections one with another in the real world. In general, things should not be put together in the pupil's mind that do not belong together.

If the reader doubts the need of this warning let him examine problems 1 to 5, all from reputable books that are in common use, or have been within a few years, and consider how addition, subtraction, and the habits belonging with each are confused by exercise 6.

1. If a duck flying $\frac{3}{5}$ as fast as a hawk flies 90 miles in an hour, how fast does the hawk fly?
2. At $\frac{5}{8}$ of a cent apiece how many eggs can I buy for \$60?
3. At \$.68 a pair how many pairs of overshoes can you buy for \$816?
4. At \$.13 a dozen how many dozen bananas can you buy for \$3.12?
5. How many pecks of beans can be put into a box that will hold just 21 bushels?
6. Write answers:

537 Beginning at the bottom say 11, 18, and 2 (writing it in its place)
 365 are 20. 5, 11, 14, and 6 (writing it) are 20, 5, 10. The number,
 ? omitted, is 62.

$$\begin{array}{r} 36 \\ \hline 1000 \end{array}$$

<i>a.</i>	581	<i>b.</i>	625	<i>c.</i>	752	<i>d.</i>	314	<i>e.</i>	?
	97		?		414		429		845
	364		90		130		?		223
	?		417		?		76		95
	<u>1758</u>		<u>2050</u>		<u>2460</u>		<u>1000</u>		<u>2367</u>

(8) *Trivialities and absurdities.*—Bonds should not be formed between insignificant or foolish questions and the labor of answering them, nor between the general arithmetical work of the school and such insignificant or foolish questions. The following are samples from recent textbooks of excellent standing:—

On one side of George's slate there are 32 words, and on the other side 26 words. If he erases 6 words from one side, and 8 from the other, how many words remain on his slate?

A certain school has 14 rooms, and an average of 40 children in a room. If every one in the school should make 500 straight marks on each side of his slate, how many would be made in all?

8 times the number of stripes in our flag is the number of years from 1800 until Roosevelt was elected President. In what year was he elected President?

From the Declaration of Independence to the World's Fair in Chicago was 9 times as many years as there are stripes in the flag. How many years was it?

(9) *Useless methods.*—Bonds should not be formed between a described situation and a method of treating the situation which would not be a useful one to follow in the case of the real situation. For example, "If I set 96 trees in rows, sixteen trees in a row, how many rows will I have?" forms the habit of treating by division a problem that in reality would be solved by counting the rows. So also "I wish to give 25 cents to each of a group of boys and find that it will require \$2.75. How many boys are in the group?" forms the habit of answering a question by division whose answer must already have been present to give the data of the problem.

(10) *Problems whose answers would, in real life, be already known.*—The custom of giving problems in textbooks which could not occur in reality because the answer has to be known to frame the problem is a natural result of the lazy author's tendency to work out a problem to fit a certain process and a certain answer. Such bogus problems are very, very common. In a random sampling of a

dozen pages of "General Review" problems in one of the most widely used of recent textbooks, I find that about 6 percent of the problems are of this sort. Among the problems extemporized by teachers these bogus problems are probably still more frequent. Such are:—

A clerk in an office addressed letters according to a given list. After she had addressed 2500, $\frac{4}{9}$ of the names on the list had not been used; how many names were in the entire list?

The Canadian power canal at Sault Ste. Marie furnished 20,000 horse power. The canal on the Michigan side furnished $2\frac{1}{2}$ times as much. How many horse power does the latter furnish?

It may be asserted that the ideal of giving as described problems only problems that might occur and demand the same sort of process for solution with a real situation, is too exacting. If a problem is comprehensible and serves to illustrate a principle or give useful drill, that is enough, teachers may say. For really scientific teaching it is not enough. Moreover, if problems are given merely as tests of knowledge of a principle or as means to make some fact or principle clear or emphatic, and are not expected to be of direct service in the quantitative work of life, it is better to let the fact be known. For example, "I am thinking of a number. Half of this number is twice six. What is the number?" is better than "A man left his wife a certain sum of money. Half of what he left her was twice as much as he left to his son, who receives \$6000. How much did he leave his wife?" The former is better because it makes no false pretenses.

(11) *Needless linguistic difficulties.*—It should be unnecessary to add that bonds should not be formed between the pupil's general attitude toward arithmetic and needless, useless difficulty in language or needless, useless, wrong reasoning. Our teaching is, however, still tainted by both of these unfortunate connections, which dispose the pupil to think of arithmetic as a mystery and folly.

Consider, for example, the profitless linguistic difficulty of problems 1-6, whose quantitative difficulties are simply those of:—

1. $5 + 8 + 3 + 7$
2. $64 \div 8$, and knowledge that 1 peck = 8 quarts
3. $12 \div 4$
4. $6 \div 2$
5. 3×2
6. 4×4

1. What amount should you obtain by putting together 5 cents, 8 cents, 3 cents, and 7 cents? Did you find this result by adding or multiplying?

2. How many times must you empty a peck measure to fill a basket holding 64 quarts of beans?

3. If a girl commits to memory 4 pages of history in one day, in how many days will she commit to memory 12 pages?

4. If Fred had 6 chickens how many times could he give away 2 chickens to his companions?

5. If a croquet-player drove a ball through 2 arches at each stroke, through how many arches will he drive it by 3 strokes?

6. If mamma cut the pie into 4 pieces and gave each person a piece, how many persons did she have for dinner if she used 4 whole pies for dessert?

Arithmetically this work belongs in the first or second years of learning. But children of grades 2 and 3, save a few, would be utterly at a loss to understand the language.

We are not yet free from the follies illustrated in the lessons of pages 96 to 99, which mystified our parents.

FIG. 5.

LESSON I

1. In this picture, how many girls are in the swing?
2. How many girls are pulling the swing?
3. If you count both girls together, how many are they?
One girl and *one* other girl are how many?
4. How many kittens do you see on the stump?
5. How many on the ground?
6. How many kittens are in the picture? One kitten and one other kitten are how many?
7. If you should ask me how many girls are in the swing, or how many kittens are on the stump, I could answer aloud, *One*; or I could write *One*; or thus, *I*.
8. If I write *One*, this is called the *word One*.
9. This, *I*, is named a **figure One**, because it means the same as the word *One*, and stands for *One*.
10. Write 1. What is this named? Why?
11. A figure 1 may stand for *one* girl, *one* kitten, or *one* anything.
12. When children first attend school, what do they begin to learn? *Ans.* Letters and words.
13. Could you read or write before you had learned either letters or words?
14. If we have all the *letters* together, they are named the Alphabet.
15. If we write or speak *words*, they are named Language.
16. You are commencing to study Arithmetic; and you can read and write in Arithmetic only as you learn the Alphabet and Language of Arithmetic. But little time will be required for this purpose.

FIG. 6.

LESSON II

1. If we speak or write words, what do we name them, when taken together?
2. What are you commencing to study? *Ans.* Arithmetic.
3. What Language must you now learn?
4. What do we name this, **1**? Why?
5. This figure, **1**, is part of the Language of Arithmetic.
6. If I should write something to stand for **Two**—two girls, two kittens, or two things of any kind—what do you think we would name it?
 7. A **figure Two** is written thus: **2**. Make a *figure two*.
 8. Why do we name this a *figure two*?
 9. This figure two (**2**) is part of the Language of Arithmetic.
 10. In this picture one boy is sitting, playing a flageolet. What is the other boy doing? If the boy standing should sit down by the other, how many boys would be sitting together? One boy and one other boy are how

many boys?

11. You see a flageolet and a violin. They are musical instruments. One musical instrument and one other musical instrument are how many?

12. I will write thus: 1 1 2. We say that 1 boy and 1 other boy, counted together, are 2 boys; or are equal to 2 boys. We will now write something to show that the first 1 and the other 1 are to be counted together.

13. We name a line drawn thus,—, a *horizontal line*. Draw such a line. Name it.

14. A line drawn thus, |, we name a *vertical line*. Draw such a line. Name it.

15. Now I will put two such lines together; thus, +. What kind of a line do we name the first (—)? And what do we name the last? (|)? Are these lines long or short? Where do they cross each other?

16. Each of you write thus: —, |, +.

17. This, +, is named *Plus*. *Plus* means *more*; and + also means *more*.

18. I will write.

One and One More Equal Two.

19. Now I will write part of this in the Language of Arithmetic. I write the first *One* thus, 1; then the other *One* thus, 1. Afterward I write, for the word *More*, thus, +, placing the + between 1 and 1, so that the whole stands thus: 1 + 1. As I write, I say, *One and One more*.

20. Each of you write 1 + 1. Read what you have written.

21. This +, when written between the 1s, shows that they are to be put together, or counted together, so as to make 2.

22. Because + shows what is to be done, it is called a *Sign*. If we take its name, *Plus*, and the word *Sign*, and put both words together, we have *Sign Plus*, or *Plus Sign*. In speaking of this we may call it *Sign Plus*, or *Plus Sign*, or *Plus*.

23. 1, 2, +, are part of the Language of Arithmetic.

Write the following in the Language of Arithmetic:

24. One and one more.
25. One and two more.
26. Two and one more.

(12) *Ambiguities and falsities.*—Consider the ambiguities and false reasoning of these problems.

1. If you can earn 4 cents a day, how much can you earn in 6 weeks? (Are Sundays counted? Should a child who earns 4 cents some day expect to repeat the feat daily?)

2. How many lines must you make to draw ten triangles and five squares? (I can do this with 8 lines, though the answer the book requires is 50.)

3. A runner ran twice around an $\frac{1}{8}$ mile track in two minutes. What distance did he run in $\frac{2}{3}$ of a minute? (I do not know, but I do know that, save by chance, he did not run exactly $\frac{2}{3}$ of $\frac{1}{8}$ mile.)

4. John earned \$4.35 in a week, and Henry earned \$1.93. They put their money together and bought a gun. What did it cost? (Maybe \$5, maybe \$10. Did they pay for the whole of it? Did they use all their earnings, or less, or more?)

5. Richard has 12 nickels in his purse. How much more than 50 cents would you give him for them? (Would a wise child give 60 cents to a boy who wanted to swap 12 nickels therefor, or would he suspect a trick and hold on to his own coins?)

6. If a horse trots 10 miles in one hour how far will he travel in 9 hours?

7. If a girl can pick 3 quarts of berries in 1 hour how many quarts can she pick in 3 hours?

(These last two, with a teacher insisting on the 90 and 9, might well deprive a matter-of-fact boy of respect for arithmetic for weeks thereafter.)

The economics and physics of the next four problems speak for themselves.

8. I lost \$15 by selling a horse for \$85. What was the value of the horse?

9. If floating ice has 7 times as much of it under the surface of the water as above it, what part is above water? If an iceberg is 50 ft. above water, what is the entire height of the iceberg? How high above water would an iceberg 300 ft. high have to be?

10. A man's salary is \$1000 a year and his expenses \$625. How many years will elapse before he is worth \$10,000 if he is worth \$2500 at the present time?

11. Sound travels 1120 ft. a second. How long after a cannon is fired in New York will the report be heard in Philadelphia, a distance of 90 miles?

GUIDING PRINCIPLES

The reader may be wearied of these special details concerning bonds now neglected that should be formed and useless or harmful bonds formed for no valid reason. Any one of them by itself is perhaps a minor matter, but when we have cured all our faults in this respect and found all the possibilities for wiser selection

of bonds, we shall have enormously improved the teaching of arithmetic. The ideal is such choice of bonds (and, as will be shown later, such arrangement of them) as will most improve the functions in question at the least cost of time and effort. The guiding principles may be kept in mind in the form of seven simple but golden rules:—

1. Consider the situation the pupil faces.
 2. Consider the response you wish to connect with it.
 3. Form the bond; do not expect it to come by a miracle.
 4. Other things being equal, form no bond that will have to be broken.
 5. Other things being equal, do not form two or three bonds when one will serve.
 6. Other things being equal, form bonds in the way that they are required later to act.
 7. Favor, therefore, the situations which life itself will offer, and the responses which life itself will demand.
-

CHAPTER V

THE PSYCHOLOGY OF DRILL IN ARITHMETIC: THE STRENGTH OF BONDS

An inventory of the bonds to be formed in learning arithmetic should be accompanied by a statement of how strong each bond is to be made and kept year by year. Since, however, the inventory itself has been presented here only in samples, the detailed statement of desired strength for each bond cannot be made. Only certain general facts will be noted here.

THE NEED OF STRONGER ELEMENTARY BONDS

The constituent bonds involved in the fundamental operations with numbers need to be much stronger than they now are. Inaccuracy in these operations means weakness of the constituent bonds. Inaccuracy exists, and to a degree that deprives the subject of much of its possible disciplinary value, makes the pupil's achievements of slight value for use in business or industry, and prevents the pupil from verifying his work with new processes by some previously acquired process.

The inaccuracy that exists may be seen in the measurements made by the many investigators who have used arithmetical tasks as tests of fatigue, practice, individual differences and the like, and in the special studies of arithmetical achievements for their own sake made by Curtis and others.

Burgerstein ['91], using such examples as

$$\begin{array}{r}
 28704516938276546397 \\
 + 35869427359163827263 \\
 \hline
 \end{array}$$

and similar long numbers to be multiplied by 2 or by 3 or by 4 or by 5 or by 6, found 851 errors in 28,267 answer-figures, or 3 per hundred answer-figures, or $\frac{3}{5}$ of an error per example. The children were $9\frac{1}{2}$ to 15 years old. Laser ['94], using the same sort of addition and multiplication, found somewhat over 3 errors per hundred answer-figures in the case of boys and girls averaging $11\frac{1}{2}$ years, during the period of their most accurate work. Holmes ['95], using addition of the sort just described, found 346 errors in 23,713 answer-figures or about $1\frac{1}{2}$ per hundred. The children were from all grades from the third to the eighth. In Laser's work, 21, 19, 13, and 10 answer-figures were obtained per minute. Friedrich ['97] with similar examples, giving the very long time of 20 minutes for obtaining about 200 answer-figures, found from 1 to 2 per hundred wrong. King ['07] had children in grade 5 do sums, each consisting of 5 two-place numbers. In the most accurate work-period, they made 1 error per 20 columns. In multiplying a four-place by a four-place number they had less than one total answer right out of three. In New York City Courtis found ['11-'12] with his Test 7 that in 12 minutes the average achievement of fourth-grade children is 8.8 units attempted with 4.2 right. In grade 5 the facts are 10.9 attempts with 5.8 right; in grade 6, 12.5 attempts with 7.0 right; in grade 7, 15 attempts with 8.5 right; in grade 8, 15.7 attempts with 10.1 right. These results are near enough to those obtained from the country at large to serve as a text here.

The following were set as official standards, in an excellent school system, Courtis Series B being used:—

	GRADE.	SPEED ATTEMPTS.	PERCENT OF CORRECT ANSWERS.
Addition	8	12	80
	7	11	80
	6	10	70
	5	9	70
	4	8	70
Subtraction	8	12	90
	7	11	90
	6	10	90
	5	9	80
	4	7	80
Multiplication	8	11	80
	7	10	80
	6	9	80
	5	7	70
	4	6	60
Division	8	11	90
	7	10	90
	6	8	80
	5	6	70
	4	4	60

Kirby ['13, pp. 16 ff. and 55 ff.] found that, in adding columns like those printed below, children in grade 4 got on the average less than 80 percent of correct answers. Their average speed was about 2 columns per minute. In doing division of the sort printed below children of grades 3 *B* and 4 *A* got less than 95 percent of correct answers, the average speed being 4 divisions per minute. In both cases the slower computers were no more accurate than the faster ones. Practice improved the speed very rapidly, but the accuracy remained substantially unchanged. Brown ['11 and '12] found a similar low status of ability and notable improvement from a moderate amount of special practice.

3 5 6 2 3 8 9 7 4 9

7	9	6	5	5	6	4	5	8	2
3	4	7	8	7	3	7	9	3	7
8	8	4	8	2	6	8	2	9	8
2	2	4	7	6	9	8	5	6	2
6	9	5	7	8	5	2	3	2	4
9	6	4	2	7	2	9	4	4	5
3	3	7	9	9	9	2	8	9	7
6	8	9	6	4	7	7	9	2	4
8	4	6	9	9	2	6	9	8	9
—	—	—	—	—	—	—	—	—	—

- 20 = 5s
- 56 = 9s and r.
- 30 = 7s and r.
- 89 = 9s and r.
- 20 = 8s and r.
- 56 = 6s and r.
- 31 = 4s and r.
- 86 = 9s and r.

It is clear that numerical work as inaccurate as this has little or no commercial or industrial value. If clerks got only six answers out of ten right as in the Courtis tests, one would need to have at least four clerks make each computation and would even then have to check many of their discrepancies by the work of still other clerks, if he wanted his accounts to show less than one error per hundred accounting units of the Courtis size.

It is also clear that the "habits of ... absolute accuracy, and satisfaction in truth as a result" which arithmetic is supposed to further must be largely mythical in pupils who get right answers only from three to nine times out of ten!

EARLY MASTERY

The bonds in question clearly must be made far stronger than they now are. They should in fact be strong enough to abolish errors in computation, except for those due to temporary lapses. It is much better for a child to know half of the multiplication tables, and to know that he does not know the rest, than to half-know them all; and this holds good of all the elementary bonds required for computation. Any bond should be made to work perfectly, though slowly, very soon after its formation is begun. Speed can easily be added by proper practice.

The chief reasons why this is not done now seem to be the following: (1) Certain important bonds (like the additions with higher decades) are not given enough attention when they are first used. (2) The special training necessary when a bond is used in a different connection (as when the multiplications to 9×9 are used in examples like

$$\begin{array}{r} 729 \\ \underline{\quad 8} \end{array}$$

where the pupil has also to choose the right number to multiply, keep in mind what is carried, use it properly, and write the right figure in the right place, and carry a figure, or remember that he carries none) is neglected. (3) The pupil is not taught to check his work. (4) He is not made responsible for substantially accurate results. Furthermore, the requirement of (4) without the training of (1), (2), and (3) will involve either a fruitless failure on the part of many pupils, or an utterly unjust requirement of time. The common error of supposing that the task of computation with integers consists merely in learning the additions to $9 + 9$, the subtractions to $18 - 9$, the multiplications to 8×9 , and the divisions to $81 \div 9$, and in applying this knowledge in connection with the principles of decimal notation, has had a large share in permitting the gross inaccuracy of arithmetical work. The bonds involved in 'knowing the tables' do not make up one fourth of the bonds involved in real adding, subtracting, multiplying, and dividing (with integers alone).

It should be noted that if the training mentioned in (1) and (2) is well cared for, the checking of results as recommended in (3) becomes enormously more valuable than it is under present conditions, though even now it is one of our soundest practices. If a child knows the additions to higher decades so that he can add a seen one-place number to a thought-of two-place number in three seconds or less with a correct answer 199 times out of 200, there is only an infinitesimal chance that a ten-figure column twice added (once up, once down) a few minutes apart with identical answers will be wrong. Suppose that, in long multiplication, a pupil can multiply to 9×9 while keeping his place and keeping track of what he is 'carrying' and of where to write the figure he writes, and can add what he carries without losing track of what he is to add it to, where he is to write the unit figure, what he is to multiply next and by what, and what he will then have to carry, in each case to a surety of 99 percent of correct responses. Then two identical answers got by multiplying one three-place number by another a few minutes apart, and with reversal of the numbers, will not be wrong more than twice in his entire school career. Checks approach proofs when the constituent bonds are strong.

If, on the contrary, the fundamental bonds are so weak that they do not work accurately, checking becomes much less trustworthy and also very much more laborious. In fact, it is possible to show that below a certain point of strength of the fundamental bonds, the time required for checking is so great that part of it might better be spent in improving the fundamental bonds.

For example, suppose that a pupil has to find the sum of five numbers like \$2.49, \$5.25, \$6.50, \$7.89, and \$3.75. Counting each act of holding in mind the number to be carried and each writing of a column's result as equivalent in difficulty to one addition, such a sum equals nineteen single additions. On this basis and with certain additional estimates^[7] we can compute the practical consequences for a pupil's use of addition in life according to the mastery of it that he has gained in school.

I have so computed the amount of checking a pupil will have to do to reach two agreeing numbers (out of two, or three, or four, or five, or whatever the number before he gets two that are alike), according to his mastery of the elementary processes. The facts appear in Table 1.

It is obvious that a pupil whose mastery of the elements is that denoted by getting them right 96 times out of 100 will require so much time for checking that, even if he were never to use this ability for anything save a few thousand sums in addition, he would do well to improve this ability before he tried to do the sums. An ability of 199 out of 200, or 995 out of 1000, seems likely to save much more time than would be taken to acquire it, and a reasonable defense could be made for requiring 996 or 997 out of 1000.

A precision of from 995 to 997 out of 1000 being required, and ordinary sagacity being used in the teaching, speed will substantially take care of itself. Counting on the fingers or in words will not give that precision. Slow recourse to memory of serial addition tables will not give that precision. Nothing save sure memory of the facts operating under the conditions of actual examples will give it. And such memories will operate with sufficient speed.

TABLE 1

THE EFFECT OF MASTERY OF THE ELEMENTARY FACTS OF ADDITION UPON THE LABOR REQUIRED TO SECURE TWO AGREEING ANSWERS WHEN ADDING FIVE THREE-FIGURE NUMBERS

MASTERY OF THE ELEMENTARY ADDITIONS TIMES RIGHT IN 1000	APPROXIMATE NUMBER OF WRONG ANSWERS IN SUMS OF 5 THREE-PLACE NUMBERS PER 1000	APPROXIMATE NUMBER OF AGREEING ANSWERS, AFTER ONE CHECKING, PER 1000	APPROXIMATE NUMBER OF AGREEING ANSWERS, AFTER A CHECKING OF THE FIRST DISCREPANCIES	APPROXIMATE NUMBER OF CHECKINGS REQUIRED (OVER AND ABOVE THE FIRST GENERAL CHECKING OF THE 100 SUMS) TO SECURE TWO
--	--	---	--	---

				AGREEING RESULTS
960	700	90	216	4500
980	380	384	676	1200
990	190	656	906	470
995	95	819	975	210
996	76	854	984	165
997	54	895	992	115
998	38	925	996	80
999	19	962	999	40

There is one intelligent objection to the special practice necessary to establish arithmetical connections so fully as to give the accuracy which both utilitarian and disciplinary aims require. It may be said that the pupils in grades 3, 4, and 5 cannot appreciate the need and that consequently the work will be dull, barren, and alien, without close personal appropriation by the pupil's nature. It is true that no vehement life-purpose is directly involved by the problem of perfecting one's power to add 7 to 28 in grade 2, or by the problem of multiplying 253 by 8 accurately in grade 3 or by precise subtraction in long division in grade 4. It is also true, however, that the most humanly interesting of problems—one that the pupil attacks most whole-heartedly—will not be solved correctly unless the pupil has the necessary associative mechanisms in order; and the surer he is of them, the freer he is to think out the problem as such. Further, computation is not dull if the pupil can compute. He does not himself object to its barrenness of vital meaning, so long as the barrenness of failure is prevented. We must not forget that pupils like to learn. In teaching excessively dull individuals, who has not often observed the great interest which they display in anything that they are enabled to master? There is pathos in their joy in learning to recognize parts of speech, perform algebraic simplifications, or translate Latin sentences, and in other accomplishments equally meaningless to all their interests save the universal human interest in success and recognition. Still further, it is not very hard to show to pupils the imperative need of accuracy in scoring games, in the shop, in the store, and in the office. Finally, the argument that accurate work of this sort is alien to the pupil in these grades is still stronger against *inaccurate* work of the same sort. If we are to teach computation with two- and three- and four-place numbers at all, it should be taught as a reliable instrument, not as a combination of vague memories and faith. The author is ready to cut computation with numbers above 10 out of the curriculum of grades 1-6 as soon as more valuable educational instruments are offered in its place, but he is convinced that nothing in child-nature makes a large variety of inaccurate computing more interesting or educative or germane to felt needs, than a smaller variety of accurate computing!

THE STRENGTH OF BONDS FOR TEMPORARY SERVICE

The second general fact is that certain bonds are of service for only a limited time and so need to be formed only to a limited and slight degree of strength. The data of problems set to illustrate a principle or improve some habit of computation are, of course, the clearest cases. The pupil needs to remember that John bought 3 loaves of bread and that they were 5-cent loaves and that he gave 25 cents to the baker only long enough to use the data to decide what change John should receive. The connections between the total described situation and the answer obtained, supposing some considerable computation to intervene, is a bond that we let expire almost as soon as it is born.

It is sometimes assumed that the bond between a certain group of features which make a problem a 'Buy a things at b per thing, find total cost' problem or a 'Buy a things at b per thing, what change from c ' problem or a 'What gain on buying for a and selling for b ' problem or a 'How many things at a each can I buy for b cents' problem—it is assumed that the bond between these essential defining features and the operation or operations required for solution is as temporary as the bonds with the name of the buyer or the price of the thing. It is assumed that all problems are and should be solved by some pure act of reasoning without help or hindrance from bonds with the particular verbal structure and vocabulary of the problems. Whether or not they *should* be, they *are not*. Every time that a pupil solves a 'bought-sold' problem by subtraction he strengthens the tendency to respond to any problem whatsoever that contains the words 'bought for' and 'sold for' by subtraction; and he will by no means surely stop and survey every such problem in all its elements to make sure that no other feature makes inapplicable the tendency to subtract which the 'bought sold' evokes.

To prevent pupils from responding to the form of statement rather than the essential facts, we should then not teach them to forget the form of statement, but rather give them all the common forms of statement to which the response in question is an appropriate response, and only such. If a certain form of statement does in life always signify a certain arithmetical procedure, the bond between it and that procedure may properly be made very strong.

Another case of the formation of bonds to only a slight degree of strength concerns the use of so-called 'crutches' such as writing +, -, and × in copying problems like those below:—

Add	Subtract	Multiply
23	79	32
61	24	3
—	—	—

or altering the figures when 'borrowing' in subtraction, and the like. Since it is undesirable that the pupil should regard the 'crutch' response as essential to the total procedure, or become so used to having it that he will be disturbed by its absence later, it is supposed that the bond between the situation and the crutch should not be fully formed. There is a better way out of the difficulty, in case crutches are used at all. This is to associate the crutch with a special 'set,' and its non-use with the general set which is to be the permanent one. For example, children may be taught from the start never to write the crutch sign or crutch figure unless the work is accompanied by "Write ... to help you to...."

<p>Write - to help you to remember that you must subtract in this row.</p>	<p>Find the differences:—</p> <table style="width: 100%; text-align: center;"> <tr> <td>39</td> <td>67</td> <td>78</td> <td>56</td> <td>45</td> </tr> <tr> <td><u>23</u></td> <td><u>44</u></td> <td><u>36</u></td> <td><u>26</u></td> <td><u>24</u></td> </tr> </table>	39	67	78	56	45	<u>23</u>	<u>44</u>	<u>36</u>	<u>26</u>	<u>24</u>
39	67	78	56	45							
<u>23</u>	<u>44</u>	<u>36</u>	<u>26</u>	<u>24</u>							
<p>Remember that you must subtract in this row.</p>	<p>Find the differences:—</p> <table style="width: 100%; text-align: center;"> <tr> <td>85</td> <td>27</td> <td>96</td> <td>38</td> <td>78</td> </tr> <tr> <td><u>63</u></td> <td><u>14</u></td> <td><u>51</u></td> <td><u>45</u></td> <td><u>32</u></td> </tr> </table>	85	27	96	38	78	<u>63</u>	<u>14</u>	<u>51</u>	<u>45</u>	<u>32</u>
85	27	96	38	78							
<u>63</u>	<u>14</u>	<u>51</u>	<u>45</u>	<u>32</u>							

The bond evoking the use of the crutch may then be formed thoroughly enough so that there is no hesitation, insecurity, or error, without interfering to any harmful extent with the more general bond from the situation to work without the crutch.

THE STRENGTH OF BONDS WITH TECHNICAL FACTS AND TERMS

Another instructive case concerns the bonds between certain words and their meanings, and between certain situations of commerce, industry, or agriculture and useful facts about these situations. Illustrations of the former are the bonds between *cube root*, *hectare*, *brokerage*, *commission*, *indorsement*, *vertex*, *adjacent*, *nonagon*, *sector*, *draft*, *bill of exchange*, and their meanings. Illustrations of the latter are the bonds from "Money being lent 'with interest' at no specified rate, what rate is charged?" to "The legal rate of the state," from "\$X per M as a rate for lumber" to "Means \$X per thousand board feet, a board foot being 1 ft. by 1 ft. by 1 in."

It is argued by many that such bonds are valuable for a short time; namely, while arithmetical procedures in connection with which they serve are learned, but that their value is only to serve as a means for learning these procedures and that thereafter they may be forgotten. "They are formed only as accessory means to certain more purely arithmetical knowledge or discipline; after this is acquired they may be forgotten. Everybody does in fact forget them, relearning them later if life requires." So runs the argument.

In some cases learning such words and facts only to use them in solving a certain sort of problems and then forget them may be profitable. The practice is, however, exceedingly risky. It is true that everybody does in fact forget many such meanings and facts, but this commonly means either that they should not have been learned at all at the time that they were learned, or that they should have been learned more permanently, or that details should have been learned with the expectation that they themselves would be forgotten but that a general fact or attitude would remain. For example, duodecagon should not be learned at all in the elementary school; indorsement should either not be learned at all there, or be learned for permanence of a year or more; the details of the metric system should be so taught as to leave for several years at least knowledge of the facts that there is a system so named that is important, whose tables go by tens, hundreds, or thousands, and a tendency (not necessarily strong) to connect

meter, kilogram, and liter with measurement by the metric system and with approximate estimates of their several magnitudes.

If an arithmetical procedure seems to require accessory bonds which are to be forgotten, once the procedure is mastered, we should be suspicious of the value of the procedure itself. If pupils forget what compound interest is, we may be sure that they will usually also have forgotten how to compute it. Surely there is waste if they have learned what it is only to learn how to compute it only to forget how to compute it!

THE STRENGTH OF BONDS CONCERNING THE REASONS FOR ARITHMETICAL PROCESSES

The next case of the formation of bonds to slight strength is the problematic one of forming the bonds involved in understanding the reasons for certain processes only to forget them after the process has become a habit. Should a pupil, that is, learn why he inverts and multiplies, only to forget it as soon as he can be trusted to divide by a fraction? Should he learn why he puts the units figure of each partial product in multiplication under the figure that he multiplies by, only to forget the reason as soon as he has command of the process? Should he learn why he gets the number of square inches in a rectangle by multiplying the length by the width, both being expressed in linear inches, and forget why as soon as he is competent to make computations of the areas of rectangles?

On general psychological grounds we should be suspicious of forming bonds only to let them die of starvation later, and tend to expect that elaborate explanations learned only to be forgotten either should not be learned at all, or should be learned at such a time and in such a way that they would not be forgotten. Especially we should expect that the general principles of arithmetic, the whys and wherefores of its fundamental ways of manipulating numbers, ought to be the last bonds of all to be forgotten. Details of *how* you arranged numbers to multiply might vanish, but the general reasons for the placing would be expected to persist and enable one to invent the detailed manipulations that had been forgotten.

This suspicion is, I think, justified by facts. The doctrine that the customary deductive explanations of why we invert and multiply, or place the partial products as we do before adding, may be allowed to be forgotten once the actual habits are in working order, has a suspicious source. It arose to meet the criticism that so much time and effort were required to keep these deductive explanations in memory. The fact was that the pupil learned to compute correctly *irrespective of* the deductive explanations. They were only an added burden. His inductive learning that the procedure gave the right answer really taught him. So he wisely shuffled off the extra burden of facts about the consequences of the nature of a fraction or the place values of our decimal notation. The bonds weakened because they were not used. They were not used because they were not useful in the shape and at the time that they were formed, or because the pupil was unable to understand the explanations so as to form them at all.

The criticism was valid and should have been met in part by replacing the deductive explanations by inductive verifications, and in part by using the deductive reasoning as a check after the process itself is mastered. The very same discussions of place-value which are futile as proof that you must do a certain thing before you have done it, often become instructive as an explanation of why the thing that you have learned to do and are familiar with and have verified by other tests works as well as it does. The general deductive theory of arithmetic should not be learned only to be forgotten. Much of it should, by most pupils, not be learned at all. What is learned should be learned much later than now, as a synthesis and rationale of habits, not as their creator. What is learned of such deductive theory should rank among the most rather than least permanent of a pupil's stock of arithmetical knowledge and power. There are bonds which are formed only to be lost, and bonds formed only to be lost *in their first form*, being used in a new organization as material for bonds of a higher order; but the bonds involved in deductive explanations of why certain processes are right are not such: they are not to be formed just to be forgotten, nor as mere propædeutics to routine manipulations.

PROPÆDEUTIC BONDS

The formation of bonds to a limited strength because they are to be lost in their first form, being worked over in different ways in other bonds to which they are propædeutic or contributing is the most important case of low strength, or rather low permanence, in bonds.

The bond between four 5s in a column to be added and the response of thinking '10, 15, 20' is worth forming, but it is displaced later by the multiplication bond or direct connection of 'four 5s to be added' with '20.' Counting by 2s from 2, 3s from 3, 4s from 4, 5s from 5, etc., forms serial bonds which as series might well be left to disappear. Their separate steps are kept as permanent bonds for use in column addition, but their serial nature is changed from 2 (and 2) 4, (and 2) 6, (and 2) 8, etc., to two 2s = 4, three 2s = 6, four 2s = 8, etc.; after playing their part in producing the bonds whereby any multiple of 2 by 2 to 9, can be got, the original serial bonds are, as series, needed no longer. The verbal response of saying 'and' in adding, after helping to establish the bonds whereby the general set of the mind toward adding coöperates with the numbers seen or thought of to produce their sum, should disappear; or remain so slurred in inner speech as to offer no bar to speed.

The rule for such bonds is, of course, to form them strongly enough so that they work quickly and accurately for the time being and facilitate the bonds that are to replace them, but not to overlearn them. There is a difference between learning something to be held for a short time, and the same amount of energy spent in learning for long retention. The former sort of learning is, of course, appropriate with many of these propædeutic bonds.

The bonds mentioned as illustrations are not *purely* propædeutic, nor formed *only* to be transmuted into something else. Even the saying of 'and' in addition has some genuine, intrinsic value in distinguishing the process of addition, and may perhaps be usefully reviewed for a brief space during the first steps in adding common fractions. Some such propædeutic bonds may be worth while apart from their value in preparing for other bonds. Consider, for example, exercises like those shown below which are propædeutic to long division, giving the pupil some basis in experience for his selection of the quotient figures. These multiplications are intrinsically worth doing, especially the 12s and 25s. Whatever the pupil remembers of them will be to his advantage.

1. Count by 11s to 132, beginning 11, 22, 33.
2. Count by 12s to 144, beginning 12, 24, 36.
3. Count by 25s to 300, beginning 25, 50, 75.
4. State the missing numbers:—

A.	B.	C.	D.
3 11s =	5 11s =	8 ft. = in.	2 dozen =
4 12s =	3 12s =	10 ft. = in.	4 dozen =
5 12s =	6 12s =	7 ft. = in.	10 dozen =
6 11s =	12 11s =	4 ft. = in.	5 dozen =
9 11s =	2 12s =	6 ft. = in.	7 dozen =
7 12s =	9 12s =	9 ft. = in.	12 dozen =
8 12s =	7 11s =	11 ft. = in.	9 dozen =
11 11s =	12 12s =	5 ft. = in.	6 dozen =

5. Count by 25s to \$2.50, saying, "25 cents, 50 cents, 75 cents, one dollar," and so on.
6. Count by 15s to \$1.50.
7. Find the products. Do not use pencil. Think what they are.

A.	B.	C.	D.	E.
2×25	3×15	2×12	4×11	6×25
3×25	10×15	2×15	4×15	6×15
5×25	4×15	2×25	4×12	6×12
10×25	2×15	2×11	4×25	6×11
4×25	7×15	3×25	5×11	7×12
6×25	9×15	3×15	5×12	7×15
8×25	5×15	3×11	5×15	7×25
7×25	8×15	3×12	5×25	7×11
9×25	6×15	8×12	9×12	8×25

State the missing numbers:—

- | | | |
|---------------------|---------------------|---------------------|
| A. $36 = \dots 12s$ | B. $44 = \dots 11s$ | C. $50 = \dots 25s$ |
| $60 = \dots 12s$ | $88 = \dots 11s$ | $125 = \dots 25s$ |

24 = 12s	77 = 11s	75 = 25s
48 = 12s	55 = 11s	200 = 25s
144 = 12s	99 = 11s	250 = 25s
108 = 12s	110 = 11s	175 = 25s
72 = 12s	33 = 11s	225 = 25s
96 = 12s	66 = 11s	150 = 25s
84 = 12s	22 = 11s	100 = 25s

Find the quotients and remainders. If you need to use paper and pencil to find them, you may. But find as many as you can without pencil and paper. Do Row A first. Then do Row B. Then Row C, etc.

Row A.	11 $\overline{)45}$	12 $\overline{)45}$	25 $\overline{)45}$	15 $\overline{)45}$	21 $\overline{)45}$	22 $\overline{)45}$
Row B.	25 $\overline{)55}$	11 $\overline{)55}$	12 $\overline{)55}$	15 $\overline{)55}$	22 $\overline{)55}$	30 $\overline{)55}$
Row C.	12 $\overline{)60}$	25 $\overline{)60}$	15 $\overline{)60}$	11 $\overline{)60}$	30 $\overline{)60}$	21 $\overline{)60}$
Row D.	12 $\overline{)75}$	11 $\overline{)75}$	15 $\overline{)75}$	25 $\overline{)75}$	30 $\overline{)75}$	35 $\overline{)75}$
Row E.	11 $\overline{)100}$	12 $\overline{)100}$	25 $\overline{)100}$	15 $\overline{)100}$	30 $\overline{)100}$	22 $\overline{)100}$
Row F.	11 $\overline{)96}$	12 $\overline{)96}$	25 $\overline{)96}$	15 $\overline{)96}$	30 $\overline{)96}$	22 $\overline{)96}$
Row G.	25 $\overline{)105}$	11 $\overline{)105}$	15 $\overline{)105}$	12 $\overline{)105}$	22 $\overline{)105}$	35 $\overline{)105}$
Row H.	12 $\overline{)64}$	15 $\overline{)64}$	25 $\overline{)64}$	11 $\overline{)64}$	22 $\overline{)64}$	21 $\overline{)64}$
Row I.	11 $\overline{)80}$	12 $\overline{)80}$	15 $\overline{)80}$	25 $\overline{)80}$	35 $\overline{)80}$	21 $\overline{)80}$
Row J.	25 $\overline{)200}$	30 $\overline{)200}$	75 $\overline{)200}$	63 $\overline{)200}$	65 $\overline{)200}$	66 $\overline{)200}$

Do this section again. Do all the first column first. Then do the second column, then the third, and so on.

Consider, from the same point of view, exercises like $(3 \times 4) + 2$, $(7 \times 6) + 5$, $(9 \times 4) + 6$, given as a preparation for written multiplication. The work of

48	68	47
<u> 3</u>	<u> 7</u>	<u> 9</u>

and the like is facilitated if the pupil has easy control of the process of getting a product, and keeping it in mind while he adds a one-place number to it. The practice with $(3 \times 4) + 2$ and the like is also good practice intrinsically. So some teachers provide systematic preparatory drills of this type just before or along with the beginning of short multiplication.

In some cases the bonds are purely propædeutic or are formed *only* for later reconstruction. They then differ little from 'crutches.' The typical crutch forms a habit which has actually to be broken, whereas the purely propædeutic bond forms a habit which is left to rust out from disuse.

For example, as an introduction to long division, a pupil may be given exercises using one-figure divisors in the long form, as:—

$\begin{array}{r} 773 \\ 7 \overline{)5416} \\ \underline{49} \\ 51 \\ \underline{49} \\ 26 \\ \underline{21} \\ 5 \end{array}$	and 5 remainder
---	-----------------

The important recommendation concerning these purely propædeutic bonds, and bonds formed only for later reconstruction, is to be very critical of them, and not indulge in them when, by the exercise of enough ingenuity, some bond worthy of a permanent place in the individual's equipment can be devised which will do the work as well. Arithmetical teaching has done very well in this respect, tending to err by leaving out really valuable preparatory drills rather than by inserting uneconomical ones. It is in the teaching of reading that we find the formation of propædeutic bonds of dubious value (with letters, phonograms, diacritical marks, and the like) often carried to demonstrably wasteful extremes.

CHAPTER VI

THE PSYCHOLOGY OF DRILL IN ARITHMETIC: THE AMOUNT OF PRACTICE AND THE ORGANIZATION OF ABILITIES

THE AMOUNT OF PRACTICE

It will be instructive if the reader will perform the following experiment as an introduction to the discussion of this chapter, before reading any of the discussion.

Suppose that a pupil does all the work, oral and written, computation and problem-solving, presented for grades 1 to 6 inclusive (that is, in the first two books of a three-book series) in the average textbook now used in the elementary school. How many times will he have exercised each of the various bonds involved in the four operations with integers shown below? That is, how many times will he have thought, "1 and 1 are 2," "1 and 2 are 3," etc.? Every case of the action of each bond is to be counted.

THE FUNDAMENTAL BONDS

1 + 1		2 - 1	1 × 1	2 ÷ 1
1 + 2		2 - 2	2 × 1	2 ÷ 2
1 + 3			3 × 1	
1 + 4			4 × 1	
1 + 5		3 - 1	5 × 1	3 ÷ 1
1 + 6		3 - 2	6 × 1	3 ÷ 2
1 + 7		3 - 3	7 × 1	3 ÷ 3
1 + 8			8 × 1	
1 + 9			9 × 1	
		4 - 1		4 ÷ 1
		4 - 2		4 ÷ 2
11 (or 21 or 31, etc.) + 1		4 - 3	1 × 2	4 ÷ 3
11 " + 2		4 - 4	2 × 2	4 ÷ 4
11 " + 3			3 × 2	
11 " + 4			4 × 2	
11 " + 5	5 - 1		5 × 2	5 ÷ 1
11 " + 6	5 - 2		6 × 2	5 ÷ 2
11 " + 7	5 - 3		7 × 2	5 ÷ 3
11 " + 8	5 - 4		8 × 2	5 ÷ 4
11 " + 9	5 - 5		9 × 2	5 ÷ 5
		6 - 1	1 × 3	6 ÷ 1
2 + 1		6 - 2	2 × 3	6 ÷ 2
2 + 2		6 - 3	3 × 3	6 ÷ 3
2 + 3		6 - 4	4 × 3	6 ÷ 4
2 + 4		6 - 5	5 × 3	6 ÷ 5
2 + 5		6 - 6	6 × 3	6 ÷ 6
2 + 6			7 × 3	
2 + 7			8 × 3	
2 + 8		7 - 1	9 × 3	7 ÷ 1
2 + 9		7 - 2		7 ÷ 2
		7 - 3		7 ÷ 3
		7 - 4	1 × 4	7 ÷ 4
12 (or 22 or 32, etc.) + 1		7 - 5	2 × 4	7 ÷ 5
12 " + 2		7 - 6	and so on	7 ÷ 6
		7 - 7	to 9 × 9	7 ÷ 7
and so on to		and so on		and so on to
9 + 9		to 18 - 9		82 ÷ 9 83 ÷ 9, etc.
19 (or 29 or 39, etc.) + 9				

If estimating for the entire series is too long a task, it will be sufficient to use eight or ten from each, say:—

3 + 2	13, 23, etc. + 2	7 + 2	17, 27, etc. + 2
" 3	" 3	" 3	" 3
" 4	" 4	" 4	" 4
" 5	" 5	" 5	" 5
" 6	" 6	" 6	" 6
" 7	" 7	" 7	" 7
" 8	" 8	" 8	" 8
" 9	" 9	" 9	" 9
3 - 3	7 - 7	9 × 7	63 ÷ 9
4 "	8 "	7 × 9	64 "

5 "	9 "	8×6	65 "
6 "	10 "	6×8	66 "
7 "	11 "		67 "
8 "	12 "		68 "
9 "	13 "		69 "
10 "	14 "		70 "
11 "	15 "		71 "
12 "	16 "		

TABLE 2

ESTIMATES OF THE AMOUNT OF PRACTICE PROVIDED IN BOOKS I AND II OF THE AVERAGE THREE-BOOK TEXT IN ARITHMETIC; BY 50 EXPERIENCED TEACHERS

ARITHMETICAL FACT	LOWEST ESTIMATE	MEDIAN ESTIMATE	HIGHEST ESTIMATE	RANGE REQUIRED TO INCLUDE HALF OF THE ESTIMATES
3 or 13 or 23, etc. + 2	25	1500	1,000,000	800-5000
" " 3	24	1450	80,000	475-5000
" " 4	23	1150	50,000	750-5000
" " 5	22	1400	44,000	700-5000
" " 6	21	1350	41,000	700-4500
" " 7	21	1500	37,000	600-4000
" " 8	20	1400	33,000	550-4100
" " 9	20	1150	28,000	650-4500
7 or 17 or 27, etc. + 2	20	1250	2,000,000	600-5000
" " 3	19	1100	1,000,000	650-4900
" " 4	18	1000	80,000	650-4900
" " 5	17	1300	80,000	650-4400
" " 6	16	1100	29,000	650-4500
" " 7	15	1100	25,000	500-4500

XXX	15	450	12,000	100-1000
XXO	25	400	15,000	150-1000
XOO	15	400	5,000	100-1000
XOX	10	400	10,000	100- 975

Having made his estimates the reader should compare them first with similar estimates made by experienced teachers (shown on page 124 f.), and then with the results of actual counts for representative textbooks in arithmetic (shown on pages 126 to 132).

It will be observed in Table 2 that even experienced teachers vary enormously in their estimates of the amount of practice given by an average textbook in arithmetic, and that most of them are in serious error by overestimating the amount of practice. In general it is the fact that we use textbooks in arithmetic with very vague and erroneous ideas of what is in them, and think they give much more practice than they do.

The authors of the textbooks as a rule also probably had only very vague and erroneous ideas of what was in them. If they had known, they would almost certainly have revised their books. Surely no author would intentionally provide nearly four times as much practice on $2 + 2$ as on $8 + 8$, or eight times as much practice on 2×2 as on 9×8 , or eleven times as much practice on $2 - 2$ as on $17 - 8$, or over forty times as much practice on $2 \div 2$ as on $75 \div 8$ and $75 \div 9$, both together. Surely no author would have provided intentionally only twenty to thirty occurrences each of $16 - 7$, $16 - 8$, $16 - 9$, $17 - 8$, $17 - 9$, and $18 - 9$ for the entire course through grade 6; or have left the practice on $60 \div 7$, $60 \div 8$, $60 \div 9$, $61 \div 7$, $61 \div 8$, $61 \div 9$, and the like to occur only about once a year!

TABLE 3

AMOUNT OF PRACTICE: ADDITION BONDS IN A RECENT TEXTBOOK (A) OF EXCELLENT REPUTE. BOOKS I AND II, ALL SAVE FOUR SECTIONS OF SUPPLEMENTARY MATERIAL, TO BE USED AT THE TEACHER'S DISCRETION

The Table reads: $2 + 2$ was used 226 times, $12 + 2$ was used 74 times, $22 + 2$, $32 + 2$, $42 + 2$, and so on were used 50 times.

Tables 3 to 8 show that even gifted authors make instruments for instruction in arithmetic which contain much less practice on certain elementary facts than teachers suppose; and which contain relatively much more practice on the more easily learned facts than on those which are harder to learn.

How much practice should be given in arithmetic? How should it be divided among the different bonds to be formed? Below a certain amount there is waste because, as has been shown in Chapter VI, the pupil will need more time to detect and correct his errors than would have been required to give him mastery. Above a certain amount there is waste because of unproductive overlearning. If 668 is just enough for 2×2 , 82 is not enough for 9×8 . If 82 is just enough for 9×8 , 668 is too much for 2×2 .

It is possible to find the answers to these questions for the pupil of median ability (or any stated ability) by suitable experiments. The amount of practice will, of course, vary according to the ability of the pupil. It will also vary according to the interest aroused in him and the satisfaction he feels in progress and mastery. It will also vary according to the amount of practice of other related bonds; $7 + 7 = 14$ and $60 \div 7 = 8$ and 4 remainder will help the formation of $7 + 8 = 15$ and $61 \div 7 = 8$ and 5 remainder. It will also, of course, vary with the general difficulty of the bond, $17 - 8 = 9$ being under ordinary conditions of teaching harder to form than $7 - 2 = 5$.

Until suitable experiments are at hand we may estimate for the fundamental bonds as follows, assuming that by the end of grade 6 a strength of 199 correct out of 200 is to be had, and that the teaching is by an intelligent person working in accord with psychological principles as to both ability and interest.

For one of the easier bonds, most facilitated by other bonds (such as $2 \times 5 = 10$, or $10 - 2 = 8$, or the double bond $7 = \text{two } 3\text{s and } 1 \text{ remainder}$) in the case of the median or average pupil, twelve practices in the week of first learning, supported by twenty-five practices during the two months following, and maintained by thirty practices well spread over the later periods should be enough. For the more gifted pupils lesser amounts down to six, twelve, and fifteen may suffice. For the less gifted pupils more may be required up to thirty, fifty, and a hundred. It is to be doubted, however, whether pupils requiring nearly two hundred repetitions of each of these easy bonds should be taught arithmetic beyond a few matters of practical necessity.

For bonds of ordinary difficulty, with average facilitation from other bonds (such as $11 - 3$, 4×7 , or $48 \div 8 = 6$) in the case of the median or average pupil, we may estimate twenty practices in the week of first learning, supported by thirty, and maintained by fifty practices well spread over the later periods. Gifted pupils may gain and keep mastery with twelve, fifteen, and twenty practices respectively. Pupils dull at arithmetic may need up to twenty, sixty, and two hundred. Here, again, it is to be doubted whether a pupil for whom arithmetical facts, well taught and made interesting, are so hard to acquire as this, should learn many of them.

For bonds of greater difficulty, less facilitated by other bonds (such as $17 - 9$, 8×7 , or $12\frac{1}{2}\%$ of $= \frac{1}{8}$ of), the practice may be from ten to a hundred percent more than the above.

UNDERLEARNING AND OVERLEARNING

If we accept the above provisional estimates as reasonable, we may consider the harm done by giving less and by giving more than these reasonable amounts. Giving less is indefensible. The pupil's time is wasted in excessive checking to find his errors. He is in danger of being practiced in error. His attention is diverted from the learning of new facts and processes by the necessity of thinking out these supposedly mastered facts. All new bonds are harder to learn than they should be because the bonds which should facilitate them are not strong enough to do so. Giving more does harm to some extent by using up time that could be spent better for other purposes, and (though not necessarily) by detracting from the pupil's interest in arithmetic. In certain cases, however, such excess practice and overlearning are actually desirable. Three cases are of special importance.

The first is the case of a bond operating under a changed mental set or adjustment. A pupil may know 7×8 adequately as a thing by itself, but need more practice to operate it in

where he has to remember that 3 is to be added to the 56 when he obtains it, and that only the 9 is to be written down, the 5 to be held in mind for later use. The practice required to operate the bond efficiently in this new set is desirable, even though it is excess from a narrower point of view, and causes the straightforward 'seven eights are fifty-six' to be overlearned. So also a pupil's work with 24, 34, 44, etc., + 9 may react to give what would be excess practice from the point of view of 4 + 9 alone; his work in estimating approximate quotient figures in long division may give excess practice on the division tables. There are many such cases. Even adding the 5 and 7 in $\frac{5}{12} + \frac{7}{12}$ is not quite the same task as adding 5 and 7 undisturbed by the fact that they are twelfths. We know far too little about the amount of practice needed to adapt arithmetical bonds to efficient operation in these more complicated conditions to estimate even approximately the allowances to be made. But some allowance, and often a rather large allowance, must be made.

The second is the case where the computation in general should be made very easy and sure for the pupil except for some one new element that is being learned. For example, in teaching the meaning and uses of 'Averages' and of uneven division, we may deliberately use 2, 3, and 4 as divisors rather than 7 and 9, so as to let all the pupil's energy be spent in learning the new facts, and so that the fraction in the quotient may be something easily understood, real, and significant. In teaching the addition of mixed numbers, we may use, in the early steps,

$11\frac{1}{2}$	$79\frac{1}{2}$
$13\frac{1}{2}$	$98\frac{1}{2}$
24	67
———	———

so as to save attention for the new process itself. In cancellation, we may give excess practice to divisions by 2, 3, 4, and 5 in order to make the transfer to the new habits of considering two numbers together from the point of view of their divisibility by some number. In introducing trade discount, we may give excess practice on '5% of' and '10% of' deliberately, so that the meaning of discount may not be obscured by difficulties in the computation itself. Excess practice on, and overlearning of, certain bonds is thus very often justifiable.

The third case concerns bonds whose importance for practical uses in life or as notable facilitators of other bonds is so great that they may profitably be brought to a greater strength than 199 correct out of 200 at a speed of 2 sec. or less, or be brought to that degree of strength very early. Examples of bonds of such special practical use are the subtractions from 10, $\frac{1}{2} + \frac{1}{2}$, $\frac{1}{2} + \frac{1}{4}$, $\frac{1}{2}$ of 60, $\frac{1}{4}$ of 60, and the fractional parts of 12 and of \$1.00. Examples of notable facilitating bonds are ten 10s = 100, ten 100s = 1000, additions like $2 + 2$, $3 + 3$, and $4 + 4$, and all the multiplication tables to 9×9 .

In consideration of these three modifying cases or principles, a volume could well be written concerning just how much practice to give to each bond, in each of the types of complex situations where it has to operate. There is evidently need for much experimentation to expose the facts, and for much sagacity and inventiveness in making sure of effective learning without wasteful overlearning.

The facts of primary importance are:—

- (1) The textbook or other instrument of instruction which is a teacher's general guide may give far too little practice on certain bonds.
- (2) It may divide the practice given in ways that are apparently unjustifiable.
- (3) The teacher needs therefore to know how much practice it does give, where to supplement it, and what to omit.
- (4) The omissions, on grounds of apparent excess practice, should be made only after careful consideration of the third principle described above.
- (5) The amount of practice should always be considered in the light of its interest and appeal to the pupil's tendency to work with full power and zeal. Mere repetition of bonds when the learner does not care whether he is improving is rarely justifiable on any grounds.
- (6) Practice that is actually in excess is not a very grave defect if it is enjoyed and improves the pupil's attitude toward arithmetic. Not much time is lost; a hundred practices for each of a thousand bonds after

mastery to 199 in 200 at 2 seconds will use up less than 60 hours, or 15 hours per year in grades 3 to 6.

- (7) By the proper division of practice among bonds, the arrangement of learning so that each bond helps the others, the adroit shifting of practice of a bond to each new type of situation requiring it to operate under changed conditions, and the elimination of excess practice where nothing substantial is gained, notable improvements over the past hit-and-miss customs may be expected.
- (8) Unless the material for practice is adequate, well balanced and sufficiently motivated, the teacher must keep close account of the learning of pupils. Otherwise disastrous underlearning of many bonds is almost sure to occur and retard the pupil's development.

THE ORGANIZATION OF ABILITIES

There is danger that the need of brevity and simplicity which has made us speak so often of a bond or an ability, and of the amount of practice it requires, may mislead the reader into thinking that these bonds and abilities are to be formed each by itself alone and kept so. They should rarely be formed so and never kept so. This we have indicated from time to time by references to the importance of forming a bond in the way in which it is to be used, to the action of bonds in changed situations, to facilitation of one bond by others, to the coöperation of abilities, and to their integration into a total arithmetical ability.

As a matter of fact, only a small part of drill work in arithmetic should be the formation of isolated bonds. Even the very young pupil learning 5 and 3 are 8 should learn it with '5 and 5 = 10,' '5 and 2 = 7,' at the back of his mind, so to speak. Even so early, $5 + 3 = 8$ should be part of an organized, coöperating system of bonds. Later $50 + 30 = 80$ should become allied to it. Each bond should be considered, not simply as a separate tool to be put in a compartment until needed, but also as an improvement of one total tool or machine, arithmetical ability.

There are differences of course. Knowledge of square root can be regarded somewhat as a separate tool to be sharpened, polished, and used by

itself, whereas knowledge of the multiplication tables cannot. Yet even square root is probably best made more closely a part of the total ability, being taught as a special case of dividing where divisor is to be the same as quotient, the process being one of estimating and correcting.

In general we do not wish the pupil to be a repository of separated abilities, each of which may operate only if you ask him the sort of questions which the teacher used to ask him, or otherwise indicate to him which particular arithmetical tool he is to use. Rather he is to be an effective organization of abilities, coöperating in useful ways to meet the quantitative problems life offers. He should not as a rule have to think in such fashion as: "Is this interest or discount? Is it simple interest or compound interest? What did I do in compound interest? How do I multiply by 2 percent?" The situation that calls up interest should also call up the kind of interest that is appropriate, and the technique of operating with percents should be so welded together with interest in his mind that the right coöperation will occur almost without supervision by him.

As each new ability is acquired, then, we seek to have it take its place as an improvement of a thinking being, as a coöperative member of a total organization, as a soldier fighting together with others, as an element in an educated personality. Such an organization of bonds will not form itself any more than any one bond will create itself. If the elements of arithmetical ability are to act together as a total organized unified force they must be made to act together in the course of learning. What we wish to have work together we must put together and give practice in teamwork.

We can do much to secure such coöperative action when and where and as it is needed by a very simple expedient; namely, to give practice with computation and problems such as life provides, instead of making up drills and problems merely to apply each fact or principle by itself. Though a pupil has solved scores of problems reading, "A triangle has a base of a feet and an altitude of b feet, what is its area?" he may still be practically helpless in finding the area of a triangular plot of ground; still more helpless in using the formula for a triangle which is one of two into which a trapezoid is divided. Though a pupil has learned to solve problems in trade discount, simple interest, compound interest, and bank discount one at a time, stated in a few set forms, he may be practically helpless before the actual series of problems confronting him in starting in business, and may take money out of the

savings bank when he ought to borrow on a time loan, or delay payment on his bills when by paying cash he could save money as well as improve his standing with the wholesaler.

Instead of making up problems to fit the abilities given by school instruction, we should preferably modify school instruction so that arithmetical abilities will be organized into an effective total ability to meet the problems that life will offer. Still more generally, *every bond formed should be formed with due consideration of every other bond that has been or will be formed; every ability should be practiced in the most effective possible relations with other abilities.*

CHAPTER VII

THE SEQUENCE OF TOPICS: THE ORDER OF FORMATION OF BONDS

The bonds to be formed having been chosen, the next step is to arrange for their most economical order of formation—to arrange to have each help the others as much as possible—to arrange for the maximum of facilitation and the minimum of inhibition.

The principle is obvious enough and would probably be admitted in theory by any intelligent teacher, but in practice we are still wedded to conventional usages which arose long before the psychology of arithmetic was studied. For example, we inherit the convention of studying addition of integers thoroughly, and then subtraction, and then multiplication, and then division, and many of us follow it though nobody has ever given a proof that this is the best order for arithmetical learning. We inherit also the opposite convention of studying in a so-called "spiral" plan, a little addition, subtraction, multiplication, and division, and then some more of each, and then some more, and many of us follow this custom, with an unreasoned faith that changing about from one process to another is *per se* helpful.

Such conventions are very strong, illustrating our common tendency to cherish most those customs which we cannot justify! The reductions of denominate numbers ascending and descending were, until recently, in most courses of study, kept until grade 4 or grade 5 was reached, although this material is of far greater value for drills on the multiplication and division tables than the customary problems about apples, eggs, oranges, tablets, and penholders. By some historical accident or for good reasons the general treatment of denominate numbers was put late; by our naïve notions of order and system we felt that any use of denominate numbers before this time was heretical; we thus became blind to the advantages of quarts and pints for the tables of 2s; yards and feet for the tables of 3s; gallons and quarts for the

tables of 4s; nickels and cents for the 5s; weeks and days for the 7s; pecks and quarts for the 8s; and square yards and square feet for the 9s. Problems like 5 yards = ___ feet or 15 feet = ___ yards have not only the advantages of brevity, clearness, practical use, real reference, and ready variation, but also the very great advantage that part of the data have to be *thought of* in a useful way instead of *read off* from the page. In life, when a person has twenty cents with which to buy tablets of a certain sort, he *thinks of* the price in making his purchase, asking it of the clerk only in case he does not know it, and in planning his purchases beforehand he *thinks of* prices as a rule. In spite of these and other advantages, not one textbook in ten up to 1900 made early use of these exercises with denominate numbers. So strong is mere use and wont.

Besides these conventional customs, there has been, in those responsible for arithmetical instruction, an admiration for an arrangement of topics that is easy for a person, after he knows the subject, to use in thinking of its constituent parts and their relations. Such arrangements are often called 'logical' arrangements of subject matter, though they are often far from logical in any useful sense. Now the easiest order in which to think of a hierarchy of habits after you have formed them all may be an extremely difficult order in which to form them. The criticism of other orders as 'scrappy,' or 'unsystematic,' valid enough if the course of study is thought of as an object of contemplation, may be foolish if the course of study is regarded as a working instrument for furthering arithmetical learning.

We must remember that all our systematizing and labeling is largely without meaning to the pupils. They cannot at any point appreciate the system as a progression from that point toward this and that, since they have no knowledge of the 'this or that.' They do not as a rule think of their work in grade 4 as an outcome of their work in grade 3 with extensions of a to a_1 , and additions of b_2 and b_3 to b and b_1 , and refinements of c and d by c_4 and d_5 . They could give only the vaguest account of what they did in grade 3, much less of why it should have been done then. They are not much disturbed by a lack of so-called 'system' and 'logical' progression for the same reason that they are not much helped by their presence. What they need and can use is a *dynamically* effective system or order, one that they can learn easily and retain long by, regardless of how it would look in a museum of arithmetical systems. Unless their actual arithmetical habits are usefully

related it does no good to see the so-called logical relations; and if their habits are usefully related, it does not very much matter whether or not they do see these; finally, they can be brought to see them best by first acquiring the right habits in a dynamically effective order.

DECREASING INTERFERENCE AND INCREASING FACILITATION

Psychology offers no single, easy, royal road to discovering this dynamically best order. It can only survey the bonds, think what each demands as prerequisite and offers as future help, recommend certain orders for trial, and measure the efficiency of each order as a means of attaining the ends desired. The ingenious thought and careful experimentation of many able workers will be required for many years to come.

Psychology can, however, even now, give solid constructive help in many instances, either by recommending orders that seem almost certainly better than those in vogue, or by proposing orders for trial which can be justified or rejected by crucial tests.

Consider, for example, the situation, 'a column of one-place numbers to be added, whose sum is over 9,' and the response 'writing down the sum.' This bond is commonly firmly fixed before addition with two-place numbers is undertaken. As a result the pupil has fixed a habit that he has to break when he learns two-place addition. If *oral* answers only are given with such single columns until two-place addition is well under way, the interference is avoided.

In many courses of study the order of systematic formation of the multiplication table bonds is : 1×1 , 2×1 , etc., 1×2 , 2×2 , etc., 1×3 , 2×3 , etc., 1×9 , 2×9 , etc. This is probably wrong in two respects. There is abundant reason to believe that the $\times 5$ s should be learned first, since they are easier to learn than the 1s or the 2s, and give the idea of multiplying more emphatically and clearly. There is also abundant reason to believe that the 1×5 , 1×2 , 1×3 , etc., should be put very late—after at least three or four tables are learned, since the question "What is 1 times 2?" (or 3 or 5) is unnecessary until we come to multiplication of two- and three-place numbers, seems a foolish question until then, and obscures the notion of

multiplication if put early. Also the facts are best learned once for all as the habits "1 times k is the same as k ," and " k times 1 is the same as k ."^[8]

In another connection it was recommended that the divisions to $81 \div 9$ be learned by selective thinking or reasoning from the multiplications. This determines the order of bonds so far as to place the formation of the division bonds soon after the learning of the multiplications. For other reasons it is well to make the proximity close.

One of the arbitrary systematizations of the order of formation of bonds restricts operations at first to the numbers 1 to 10, then to numbers under 100, then to numbers under 1000, then to numbers under 10,000. Apart from the avoidance of unreal and pedantic problems in applied arithmetic to which work with large numbers in low grades does somewhat predispose a teacher, there is little merit in this restriction of the order of formation of bonds. Its demerits are many. For example, when the pupil is learning to 'carry' in addition he can be given better practice by soon including tasks with sums above 100, and can get a valuable sense of the general use of the process by being given a few examples with three- and four-place numbers to be added. The same holds for subtraction. Indeed, there is something to be said in favor of using six- or seven-place numbers in subtraction, enforcing the 'borrowing' process by having it done again and again in the same example, and putting it under control by having the decision between 'borrowing' and 'not borrowing' made again and again in the same example. When the multiplication tables are learned the most important use for them is not in tedious reviews or trivial problems with answers under 100, but in regular 'short' multiplication of two- and three- and even four-place numbers. Just as the addition combinations function mainly in the higher-decade modifications of them, so the multiplication combinations function chiefly in the cases where the bond has to operate while the added tasks of keeping one's place, adding what has been carried, writing down the right figure in the right place, and holding the right number for later addition, are also taken care of. It seems best to introduce such short multiplication as soon as the $\times 5$ s, $\times 2$ s, $\times 3$ s, and $\times 4$ s are learned and to put the $\times 6$ s, $\times 7$ s, and the rest to work in such short multiplication as soon as each is learned.

Still surer is the need for four-, five-, and six-place numbers when two-place numbers are used in multiplying. When the process with a two-place

multiplier is learned, multiplications by three-place numbers should soon follow. They are not more difficult than later. On the contrary, if the pupil gets used to multiplying only as one does with two-place multipliers, he will suffer more by the resulting interference than he does from getting six- or seven-place answers whose meaning he cannot exactly realize. They teach the rationale and the manipulations of long multiplication with especial economy because the principles and the procedures are used two or three times over and the contrasts between the values which the partial products have in adding become three instead of one.

The entire matter of long multiplication with integers and United States money should be treated as a teaching unit and the bonds formed in close organization, even though numbers as large as 900,000 are occasionally involved. The reason is not that it is more logical, or less scrappy, but that each of the bonds in question thus gets much help from, and gives much help to, the others.

In sharp contrast to a topic like 'long multiplication' stands a topic like denominate numbers. It most certainly should not be treated as a large teaching unit, and all the bonds involved in adding, subtracting, multiplying, and dividing with all the ordinary sorts of measures should certainly not be formed in close sequence. The reductions ascending and descending for many of the measures should be taught as drills on the appropriate multiplication and division tables. The reduction of feet and inches to inches, yards and feet to yards, gallons and quarts to quarts, and the like are admirable exercises in connection with the $(a \times b) + c = \dots$ problems,—the 'Bought 3 lbs. of sugar at 7 cents and 5 cents worth of matches' problems. The reductions of inches to feet and inches and the like are admirable exercises in the $d = (\dots \times b) + c$ or 'making change' problem, which in its small-number forms is an excellent preparatory step for short division. They are also of great service in early work with fractions. The feet-mile, square-foot-square-inch, and other simple relations give a genuine and intelligible demand for multiplication with large numbers.

Knowledge of the metric system for linear and square measure would perhaps, as an introduction to decimal fractions, more than save the time spent to learn it. It would even perhaps be worth while to invent a measure (call it the *twoqua*) midway between the quart and gallon and teach carrying in addition and borrowing in subtraction by teaching first the addition and

subtraction of 'gallon, twoqua, quart, and pint' series! Many of the bonds which a system-made tradition huddled together uselessly in a chapter on denominate numbers should thus be formed as helpful preparations for and applications of other bonds all the way from the first to the eighth half-year of instruction in arithmetic.

The bonds involved in the ability to respond correctly to the series:—

$$5 = \dots 2s \text{ and } \dots \text{ remainder}$$

$$5 = \dots 3s \text{ and } \dots \text{ remainder}$$

$$88 = \dots 9s \text{ and } \dots \text{ remainder}$$

should be formed before, not during, the training in short division. They are admirable at that point as practice on the division tables; are of practical service in the making-change problems of the small purchase and the like; and simplify the otherwise intricate task of keeping one's place, choosing the quotient figure, multiplying by it, subtracting and holding in mind the new number to be divided, which is composed half of the remainder and half of a figure in the written dividend. This change of order is a good illustration of the nearly general rule that "*When the practice or review required to perfect or hold certain bonds can, by an inexpensive modification, be turned into a useful preparation for new bonds, that modification should be made.*"

The bonds involved in the four operations with United States money should be formed in grades 3 and 4 along with or very soon after the corresponding bonds with three-place and four-place integers. This statement would have seemed preposterous to the pedagogues of fifty years ago. "United States money," they would have said, "is an application of decimals. How can it be learned until the essentials of decimal fractions are known? How will the child understand when multiplying \$.75 by 3 that 3 times 5 cents is 1 dime and 5 cents, or that 3 times 70 cents is 2 dollars and 1 dime? Why perplex the young pupils with the difficulties of placing the decimal point? Why disturb the learning of the four operations with integers by adding at each step a second 'procedure with United States money'?"

The case illustrates very well the error of the older oversystematic treatment of the order of topics and the still more important error of confusing the logic of proof with the psychology of learning. To prove that $3 \times \$.75 = \2.25 to the satisfaction of certain arithmeticians, you may need to

know the theory of decimal fractions; but to do such multiplication all a child needs is to do just what he has been doing with integers and then "Put a \$ before the answer to show that it means dollars and cents, and put a decimal point in the answer to show which figures mean dollars and which figures mean cents." And this is general. The ability to operate with integers plus the two habits of prefixing \$ and separating dollars from cents in the result will enable him to operate with United States money.

Consequently good practice came to use United States money not as a consequence of decimal fractions, learned by their aid, but as an introduction to decimal fractions which aids the pupil to learn them. So it has gradually pushed work with United States money further and further back, though somewhat timidly.

We need not be timid. The pupil will have no difficulty in adding, subtracting, multiplying, and dividing with United States money—unless we create it by our explanations! If we simply form the two bonds described above and show by proper verification that the procedure always gives the right answer, the early teaching of the four operations with United States money will in fact actually show a learning profit! It will save more time in the work with integers than was spent in teaching it! For, in the first place, it will help to make work with four-place and five-place numbers more intelligible and vital. A pupil can understand \$16.75 or \$28.79 more easily than 1675 or 2879. The former may be the prices of a suit or sewing machine or bicycle. In the second place, it permits the use of a large stock of genuine problems about spending, saving, sharing, and the like with advertisements and catalogues and school enterprises. In the third place, it permits the use of common-sense checks. A boy may find one fourth of 3000 as 7050 or 75 and not be disturbed, but he will much more easily realize that one fourth of \$30.00 is not over \$70 or less than \$1. Even the decimal point of which we used to be so afraid may actually help the eye to keep its place in adding.

INTEREST

So far, the illustrations of improvements in the order of bonds so as to get less interference and more facilitation than the customary orders secure have sought chiefly to improve the mechanical organization of the bonds. Any gain in interest which the changes described effected would be largely due to

the greater achievement itself. Dewey and others have emphasized a very different principle of improving the order of formation of bonds—the principle of determination of the bonds to be formed by some vital, engaging problem which arouses interest enough to lighten the labor and which goes beyond or even against cut-and-dried plans for sequences in order to get effective problems. For example, the work of the first month in grade 2B might sacrifice facilitations of the mechanical sort in order to put arithmetic to use in deciding what dimensions a rabbit's cage should have to give him 12 square feet of floor space, how much bread he should have per meal to get 6 ounces a day, how long a ten-cent loaf would last, how many loaves should be bought per week, how much it costs to feed the rabbit, how much he has gained in weight since he was brought to the school, and so on.

Such sacrifices of the optimal order if interest were equal, in order to get greater interest or a healthier interest, are justifiable. Vital problems as nuclei around which to organize arithmetical learning are of prime importance. It is even safe probably to insist that some genuine problem-situation requiring a new process, such as addition with carrying, multiplication by two-place numbers, or division with decimals, be provided in every case as a part of the introduction to that process. The sacrifice should not be too great, however; the search for vital problems that fit an economical order of subject matter is as much needed as the amendment of that order to fit known interests; and the assurance that a problem helps the pupil to learn arithmetic is as important as the assurance that arithmetic is used to help the pupil solve his personal problems.

Much ingenuity and experimentation will be required to find the order that is satisfactory in both quality and quantity of interest or motive and helpfulness of the bonds one to another. The difficulty of organizing arithmetic around attractive problems is much increased by the fact of class instruction. For any one pupil vital, personal problems or projects could be found to provide for many arithmetical abilities; and any necessary knowledge and technique which these projects did not develop could be somehow fitted in along with them. But thirty children, half boys and half girls, varying by five years in age, coming from different homes, with different native capacities, will not, in September, 1920, unanimously feel a vital need to solve any one problem, and then conveniently feel another on, say, October 15! In the mechanical laws of learning children are much alike,

and the gain we may hope to make from reducing inhibitions and increasing facilitations is, for ordinary class-teaching, probably greater than that to be made from the discovery of attractive central problems. We should, however, get as much as possible of both.

GENERAL PRINCIPLES

The reader may by now feel rather helpless before the problem of the arrangement of arithmetical subject matter. "Sometimes you complete a topic, sometimes you take it piecemeal months or years apart, often you make queer twists and shifts to get a strategic advantage over the enemy," he may think, "but are there no guiding principles, no general rules?" There is only one that is absolutely general, to *take the order that works best for arithmetical learning*. There are particular rules, but there are so many and they are so limited by an 'other things being equal' clause, that probably a general eagerness to think out the *pros* and *cons* for any given proposal is better than a stiff attempt to adhere to these rules. I will state and illustrate some of them, and let the reader judge.

Other things being equal, one new sort of bonds should not be started until the previous set is fairly established, and two different sets should not be started at once. Thus, multiplication of two- and three-place numbers by 2, 3, 4, and 5 will first use numbers such that no carrying is required, and no zero difficulties are encountered, then introduce carrying, then introduce multiplicands like 206 and 320. If other things were equal, the carrying would be split into two steps—first drills with $(4 \times 6) + 2$, $(3 \times 7) + 3$, $(5 \times 4) + 1$, and the like, and second the actual use of these habits in the multiplication. The objection to this separation of the double habit is that the first part of it in isolation is too artificial—that it may be better to suffer the extra difficulty of forming the two together than to teach so rarely used habits as the $(a \times b) + c$ series. Experimental tests are needed to decide this point.

Other things being equal, bonds should be formed in such order that none will have to be broken later. For example, there is a strong argument for teaching long division first, or very early, with remainders, letting the case of zero remainder come in as one of many. If the pupils have been familiarized with the remainder notion by the drills recommended as preparation for short

division,^[9] the use of remainders in long division will offer little difficulty. The exclusive use of examples without remainders may form the habit of not being exact in computation, of trusting to 'coming out even' as a sole check, and even of writing down a number to fit the final number to be divided instead of obtaining it by honest multiplication.

For similar reasons additions with 2 and 3 as well as 1 to be 'carried' have much to recommend them in the very first stages of column addition with carrying. There is here the added advantage that a pupil will be more likely to remember to carry if he has to think *what* to carry. The present common practice of using small numbers for ease in the addition itself teaches many children to think of carrying as adding one.

Other things being equal, arrange to have variety. Thus it is probably, though not surely, wise to interrupt the monotony of learning the multiplication and division tables, by teaching the fundamentals of 'short' multiplication and perhaps of division after the 5s, 2s, 3s, and 4s are learned. This makes a break of several weeks. The facts for the 6s, 7s, 8s, and 9s can then be put to varied use as fast as learned. It is almost certainly wise to interrupt the first half-year's work with addition and subtraction, by teaching 2×2 , 2×3 , 3×2 , 2×4 , 4×2 , 2×5 , later by 2×10 , 3×10 , 4×10 , 5×10 , later by $\frac{1}{2} + \frac{1}{2}$, $1\frac{1}{2} + \frac{1}{2}$, $\frac{1}{2}$ of 2, $\frac{1}{2}$ of 4, $\frac{1}{2}$ of 6, and at some time by certain profitable exercises wherein a pupil tells all he knows about certain numbers which may be made nuclei of important facts (say, 5, 8, 10, 12, 15, and 20).

Other things being equal, use objective aids to verify an arithmetical process or inference after it is made, as well as to provoke it. It is well at times to let pupils do everything that they can with relations abstractly conceived, testing their results by objective counting, measuring, adding, and the like. For example, an early step in adding should be to show three things, put them under a book, show two more, put these under the book, and then ask how many there are under the book, letting the objective counting come later as the test of the correctness of the addition.

Other things being equal, reserve all explanations of why a process must be right until the pupils can use the process accurately, and have verified the fact that it is right. Except for the very gifted pupils, the ordinary preliminary deductive explanations of what must be done are probably useless as means of teaching the pupils what to do. They use up much time

and are of so little permanent effect that, as we have seen, the very arithmeticians who advocate making them, admit that after a pupil has mastered the process he may be allowed to forget the reasons for it. I am not sure that the deductive proofs of why we place the decimal point as we do in division by a decimal, or invert and multiply in dividing by a fraction, and the like, are worth teaching at all. If they are to be taught at all, the time to teach them is (except for the very gifted) after the pupil has mastered the process and has confidence in it. He then at least knows what process he is to prove is right, and that it is right, and has had some chance of seeing *why* it is right from his experience with it.

One more principle may be mentioned without illustration. *Arrange the order of bonds with due regard for the aims of the other studies of the curriculum and the practical needs of the pupil outside of school.* Arithmetic is not a book or a closed system of exercises. It is the quantitative work of the pupils in the elementary school. No narrower view of it is adequate.

CHAPTER VIII

THE DISTRIBUTION OF PRACTICE

THE PROBLEM

The same amount of practice may be distributed in various ways. Figures 7 to 10, for example, show 200 practices with division by a fraction distributed over three and a half years of 10 months in four different ways. In Fig. 7, practice is somewhat evenly distributed over the whole period. In Fig. 8 the practice is distributed at haphazard. In Fig. 9 there is a first main learning period, a review after about ten weeks, a review at the beginning of the seventh grade, another review at the beginning of the eighth grade, and some casual practice rather at random. In Fig. 10 there is a main learning period, with reviews diminishing in length and separated by wider and wider intervals, with occasional practice thereafter to keep the ability alive and healthy.

Plans I and II are obviously inferior to Plans III and IV; and Plan IV gives promise of being more effective than Plan III, since there seems danger that the pupil working by Plan III might in the ten weeks lose too much of what he had gained in the initial practice, and so again in the next ten weeks.

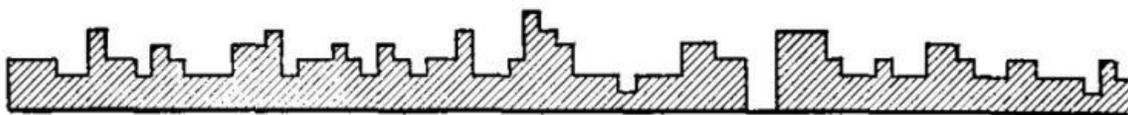

FIG. 7.—Plan I. 200 practices distributed somewhat evenly over $3\frac{1}{2}$ years of 10 months. In Figs. 7, 8, 9, and 10, each tenth of an inch along the base line represents one month. Each hundredth of a square inch represents four practices, a little square $\frac{1}{20}$ of an inch wide and $\frac{1}{20}$ inch high representing one practice.

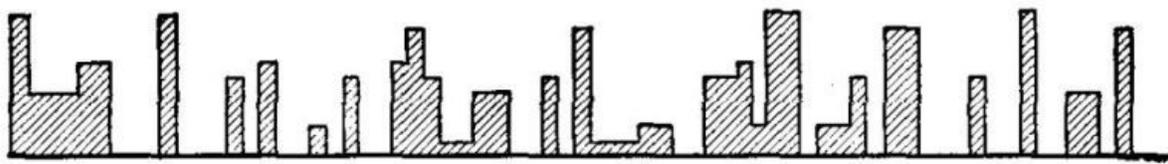

FIG. 8.—Plan II. 200 practices distributed haphazard over 3½ years of 10 months.

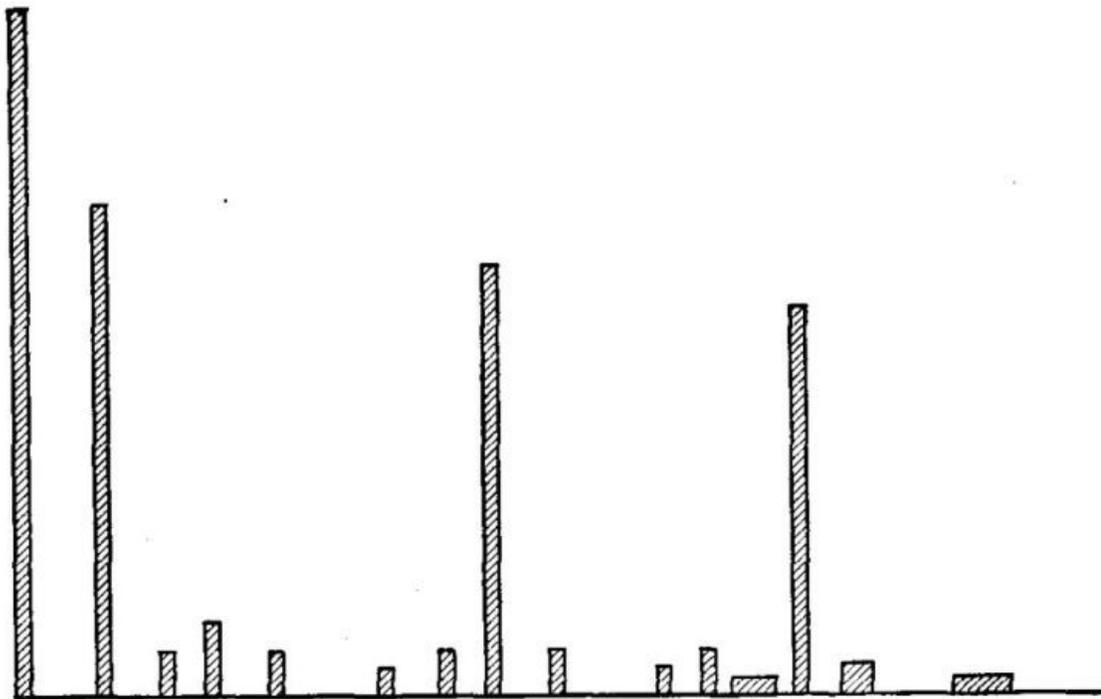

FIG. 9.—Plan III. A learning period, three reviews, and incidental practice.

It is not wise, however, to try now to make close decisions in the case of practice with division by a fraction; or to determine what the best distribution of practice is for that or any other ability to be improved. The facts of psychology are as yet not adequate for very close decisions, nor are the types of distribution of practice that are best adapted to different abilities even approximately worked out.

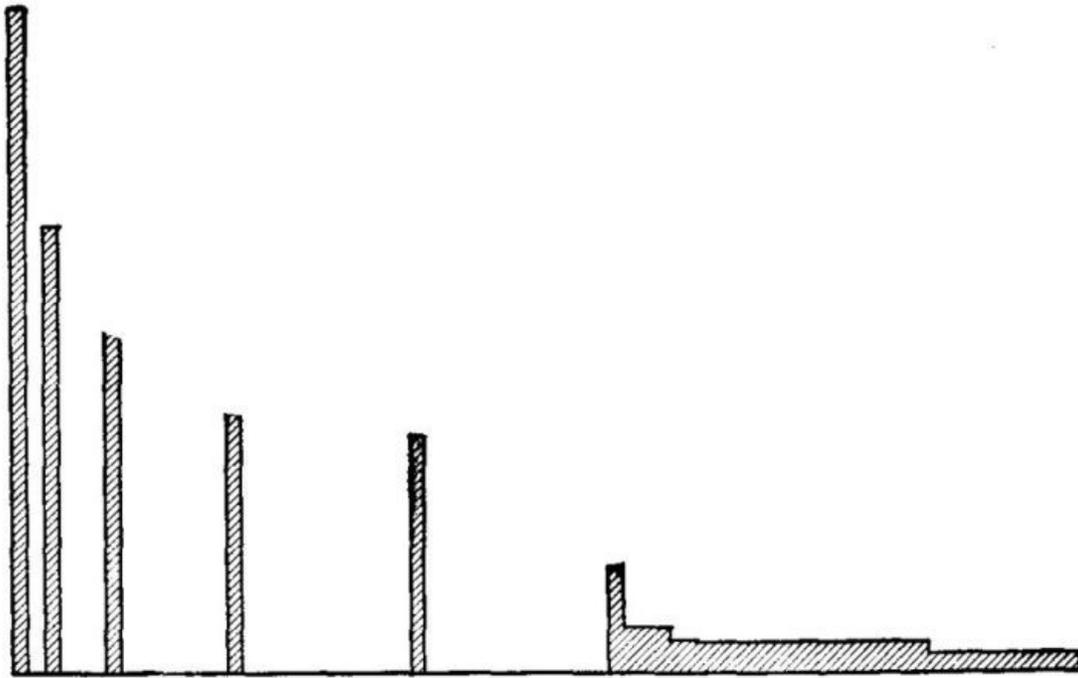

FIG. 10.—Plan IV. A learning period with reviews of decreasing length at increasing intervals.

SAMPLE DISTRIBUTIONS

Let us rather examine some actual cases of distribution of practice found in school work and consider, not the attainment of the best possible distribution, but simply the avoidance of gross blunders and the attainment of reasonable, defensible procedures in this regard.

Figures 11 to 18 show the distribution of examples in multiplication with multipliers of various sorts. *X* stands for any digit except zero. *O* stands for 0. *XXO* thus means a multiplier like 350 or 270 or 160; *XOX* means multipliers like 407, 905, or 206; *XX* means multipliers like 25, 17, 38. Each of these diagrams covers approximately 3½ years of school work, or from about the middle of grade 3 to the end of grade 6. They are made from counts of four textbooks (A, B, C, and D), the count being taken for each successive 8 pages.^[10] Each tenth of an inch along the base line equals 8 pages of the text in question. Each .01 sq. in. equals one example. The books, it will be observed, differ in the amount of practice given, as well as in the way in which it is distributed.

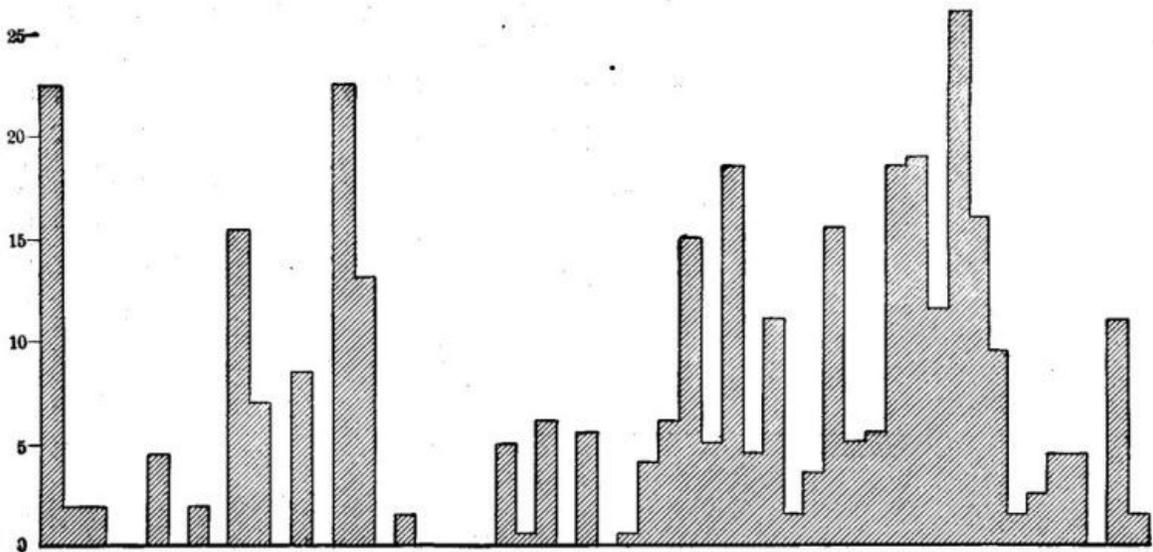

FIG. 11.—Distribution of practise with multipliers of the *XX* type in the first two books of the three-book text A.

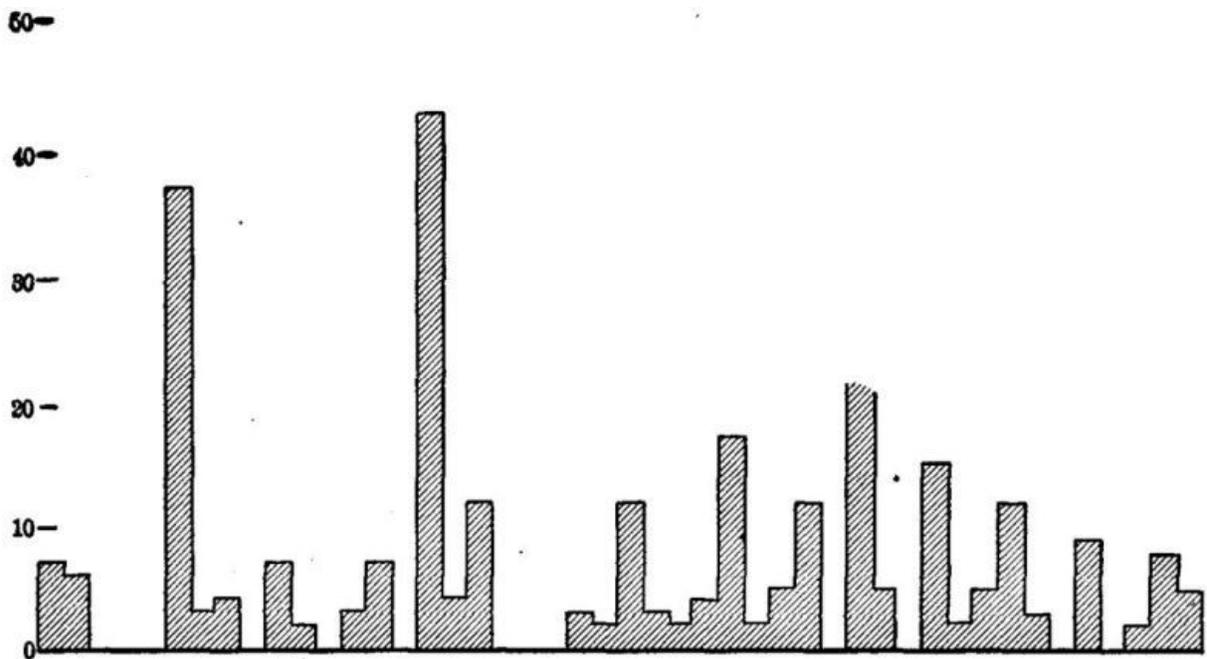

FIG. 12.—Same as Fig. 11, but for text B. Following this period come certain pages of computation to be used by the teacher at her discretion, containing 24 *XX* multiplications.

These distributions are worthy of careful study; we shall note only a few salient facts about them here. Of the distributions of multiplications with multipliers of the *XX* type, that of book D (Fig. 14) is perhaps the best. A

(Fig. 11) has too much of the practice too late; B (Fig. 12) gives too little practice in the first learning; C (Fig. 13) gives too much in the first learning and in grade 6. Among the distributions of multiplication with multipliers of the *XOX* type, that of book D (Fig. 18) is again probably the best. A, B, and C (Figs. 15, 16, and 17) have too much practice early and too long intervals between reviews. Book C (Fig. 17) by a careless oversight has one case of this very difficult process, without any explanation, weeks before the process is taught!

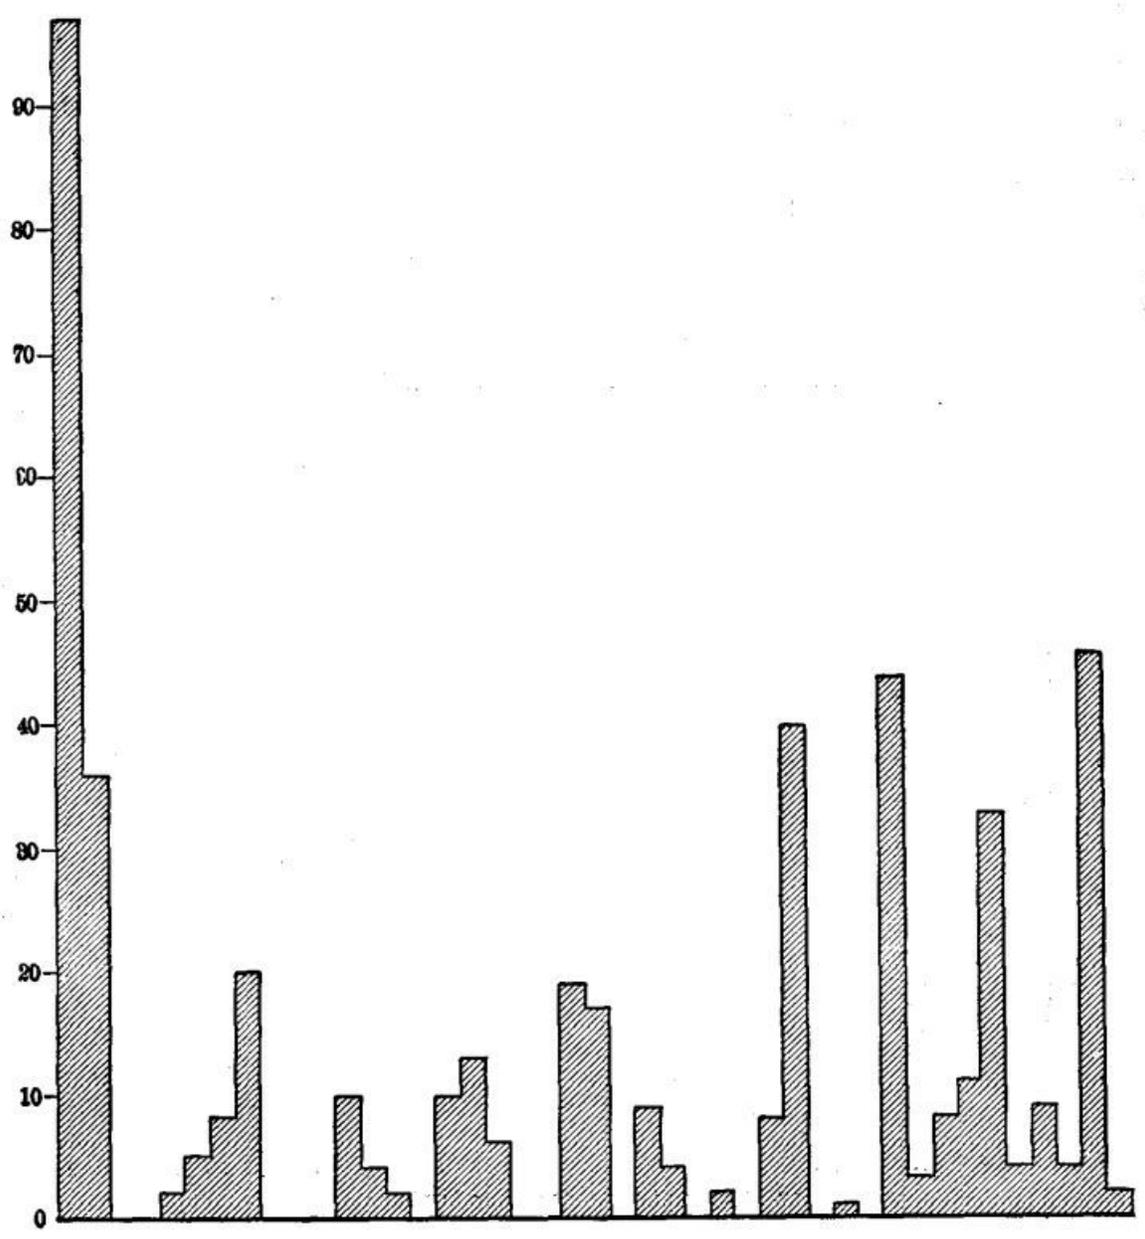

FIG. 13.—Same as Fig. 11, but for text C.

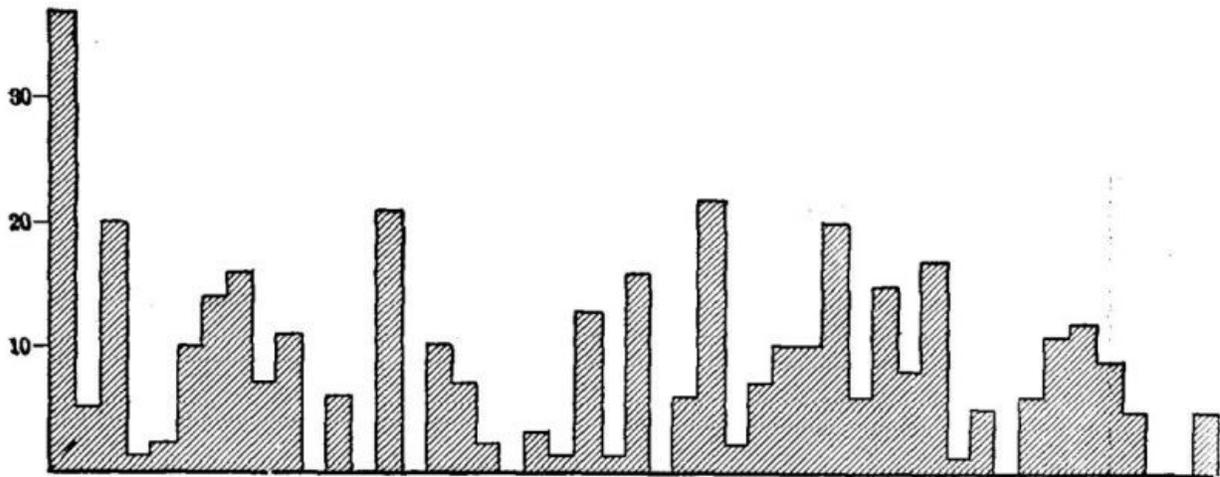

FIG. 14.—Same as Fig. 11, but for text D.

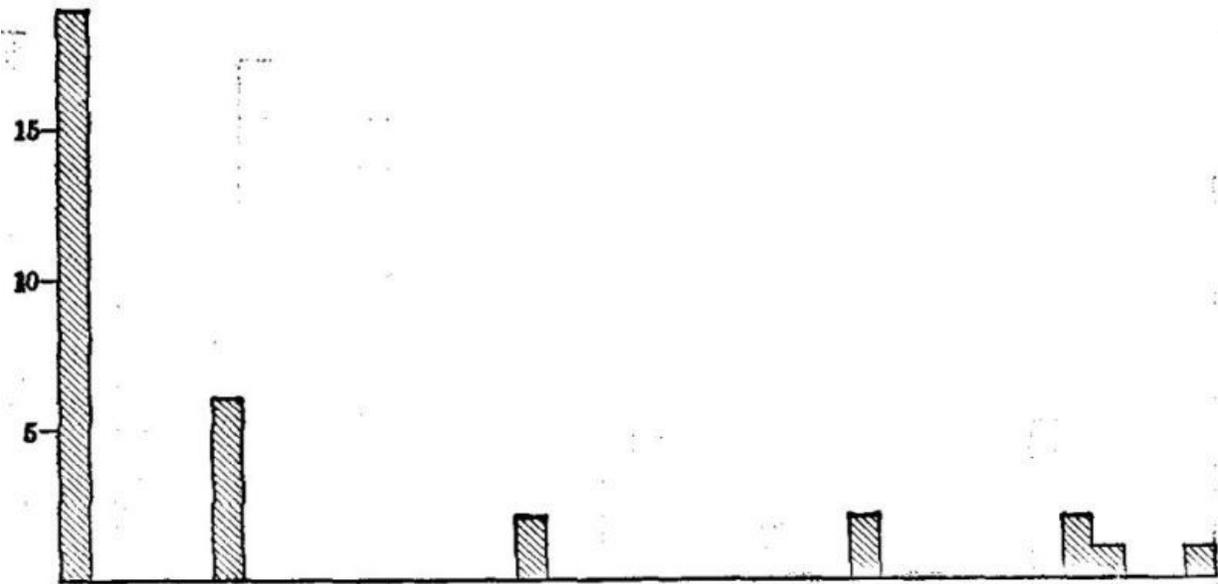

FIG. 15.—Distribution of practice with multipliers of the *XOX* type in the first two books of the three-book text A.

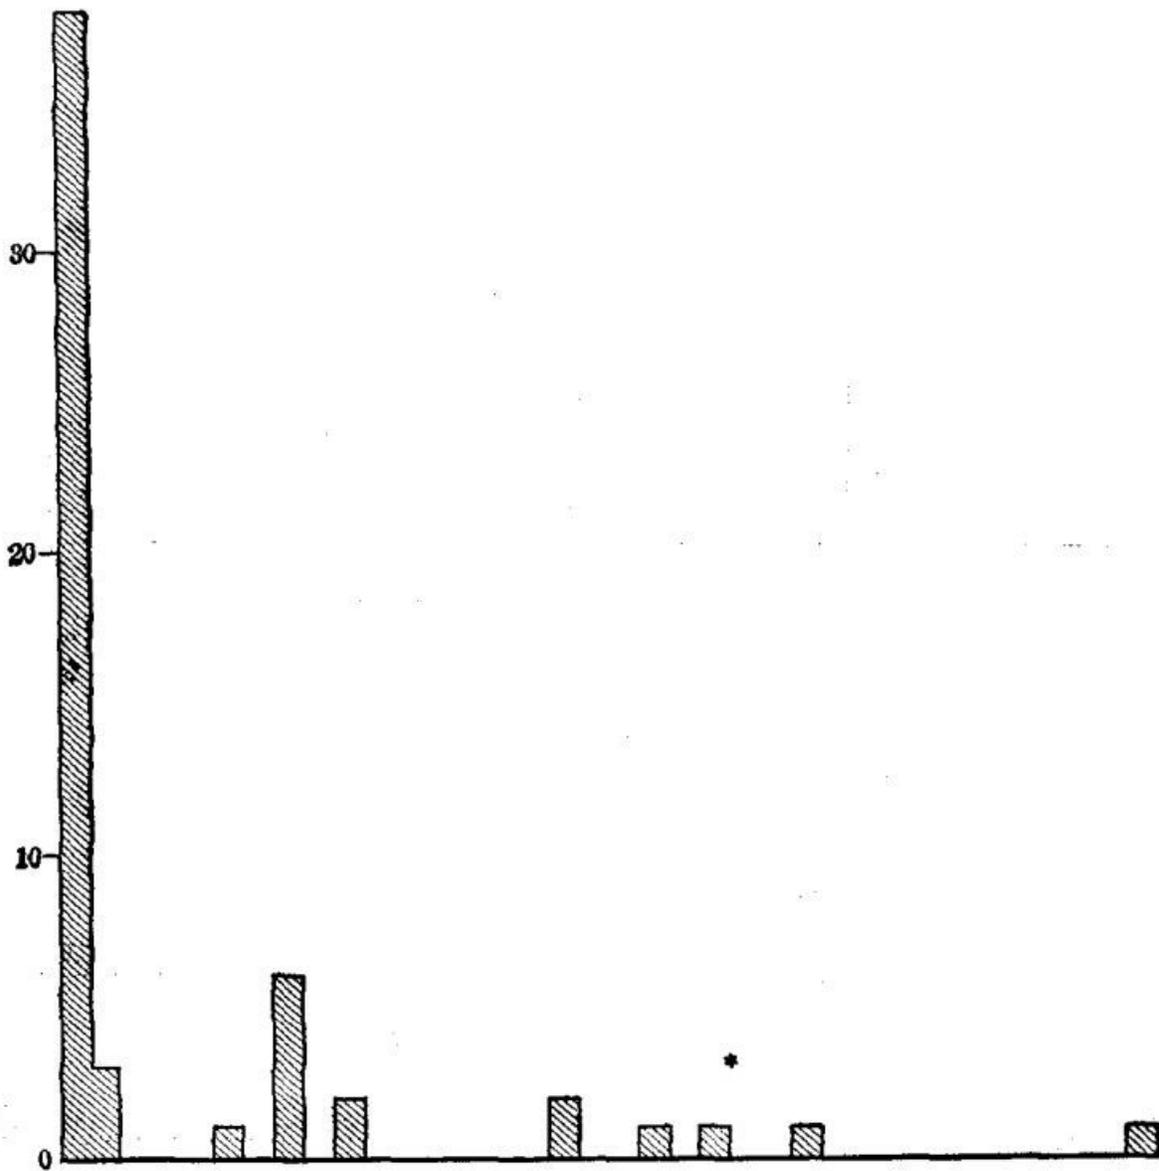

FIG. 16.—Same as Fig. 15, but for text B. Following this period come certain pages of computation to be used by the teacher at her discretion, containing 17 *XOX* multiplications.

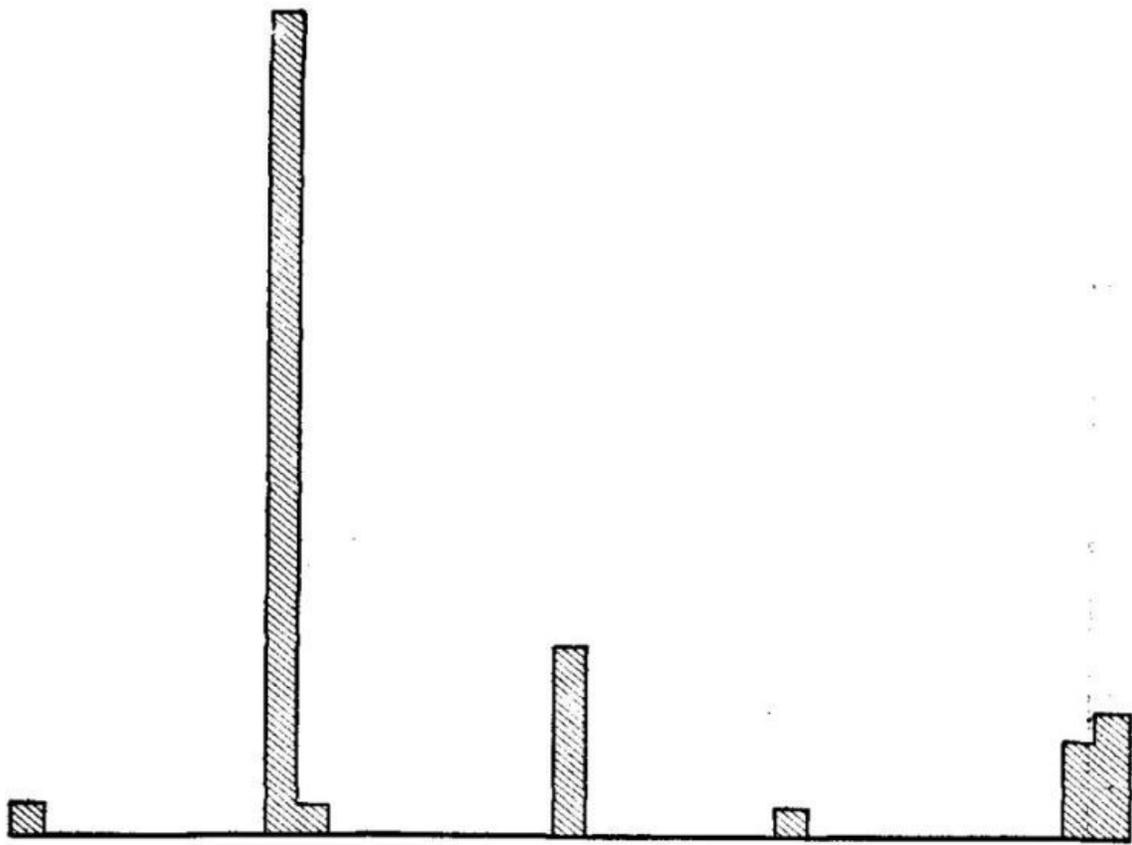

FIG. 17.—Same as Fig. 16, but for text C.

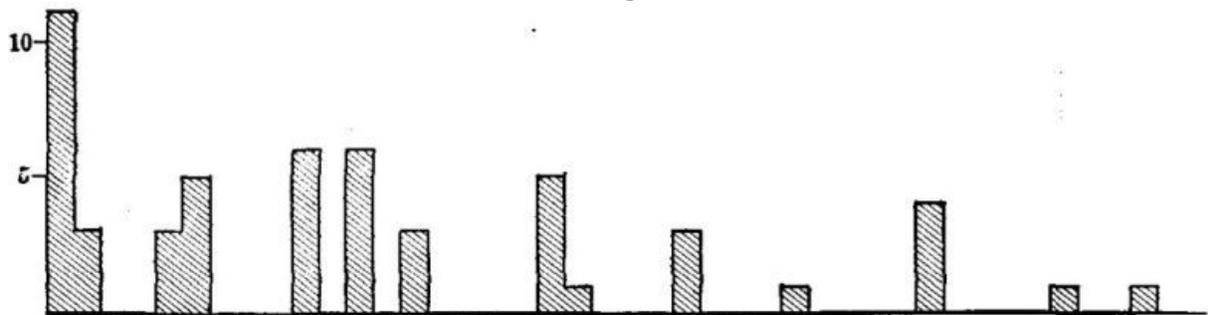

FIG. 18.—Same as Fig. 16, but for text D.

Figures 19, 20, 21, 22, and 23 all concern the first two books of the three-book text E.

Figure 19 shows the distribution of practice on 5×5 in the first two books of text E. The plan is the same as in Figs. 11 to 18, except that each tenth of an inch along the base line represents ten pages. Figure 20 shows the distribution of practice on 7×7 ; Fig. 21 shows it for 6×7 and 7×6

together. In Figs. 20 and 21 also, 0.1 inch along the base line equals ten pages.

Figures 22 and 23 show the distribution of practice on the divisions of 72, 73, 74, 75, 76, 77, 78, and 79 by either 8 or 9, and on the divisions of 81, 82 ... 89 by 9. Each tenth of an inch along the base line represents ten pages here also.

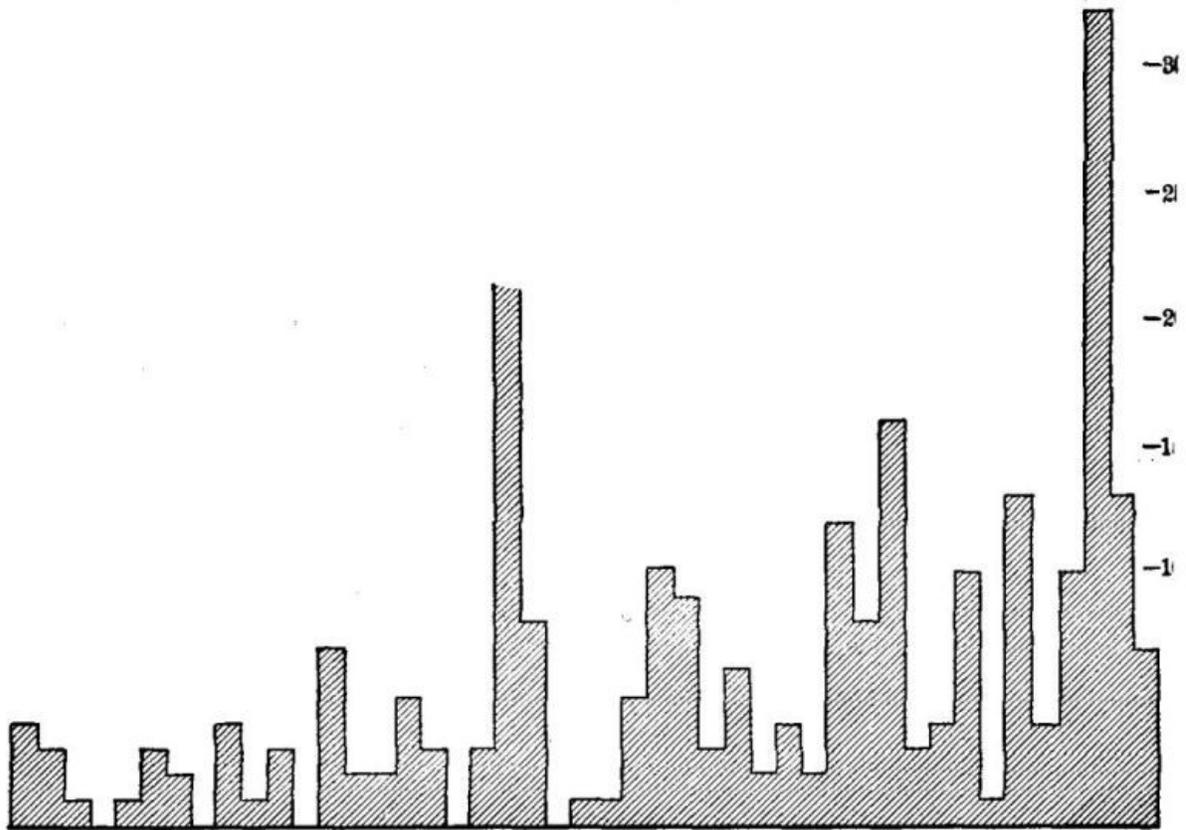

FIG. 19.—Distribution of practice with 5×5 in the first two books of the three-book text E.

Figures 19 to 23 show no consistent plan for distributing practice. With 5×5 (Fig. 19) the amount of practice increases from the first treatment in grade 3 to the end of grade 6, so that the distribution would be better if the pupil began at the end and went backward! With 7×7 (Fig. 20) the practice is distributed rather evenly and in small doses. With 6×7 and 7×6 (Fig. 21) much of it is in very large doses. With the divisions (Figs. 22 and 23) the practice is distributed more suitably, though in Fig. 23 there is too much of it given at one time in the middle of the period.

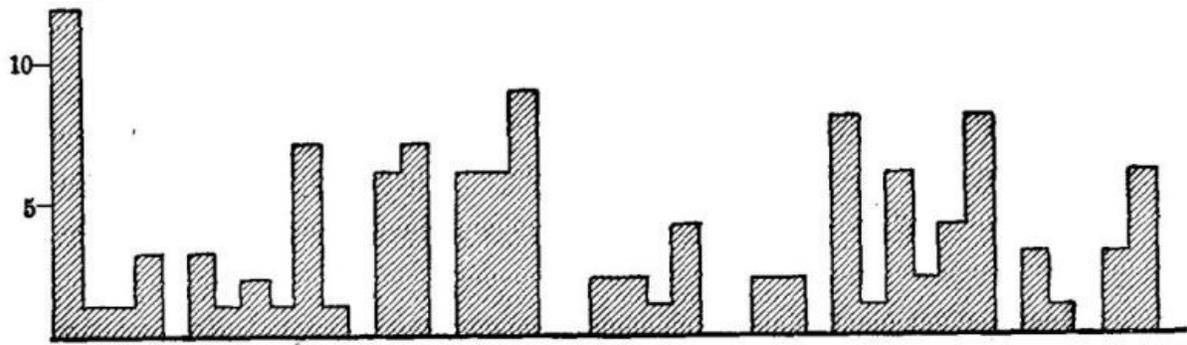

FIG. 20.—Distribution of practice with 7×7 in the first two books of text E.

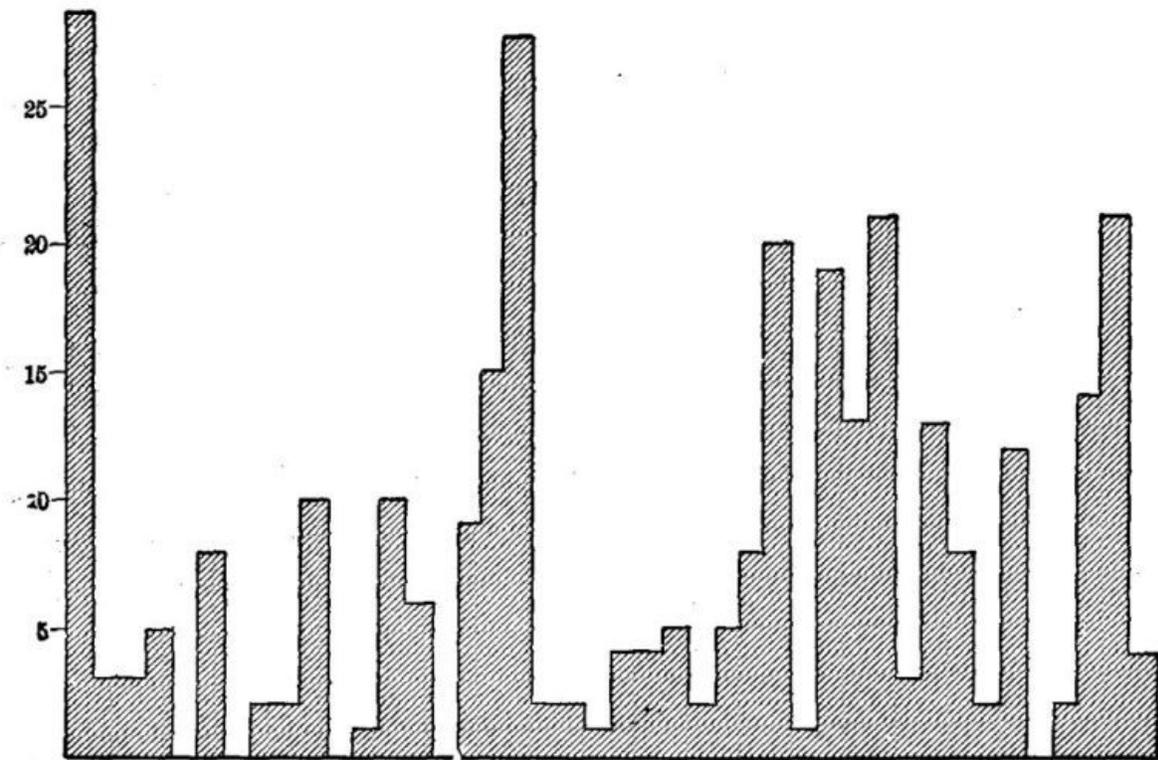

FIG. 21.—Distribution of practice with 6×7 or 7×6 in the first two books of text E.

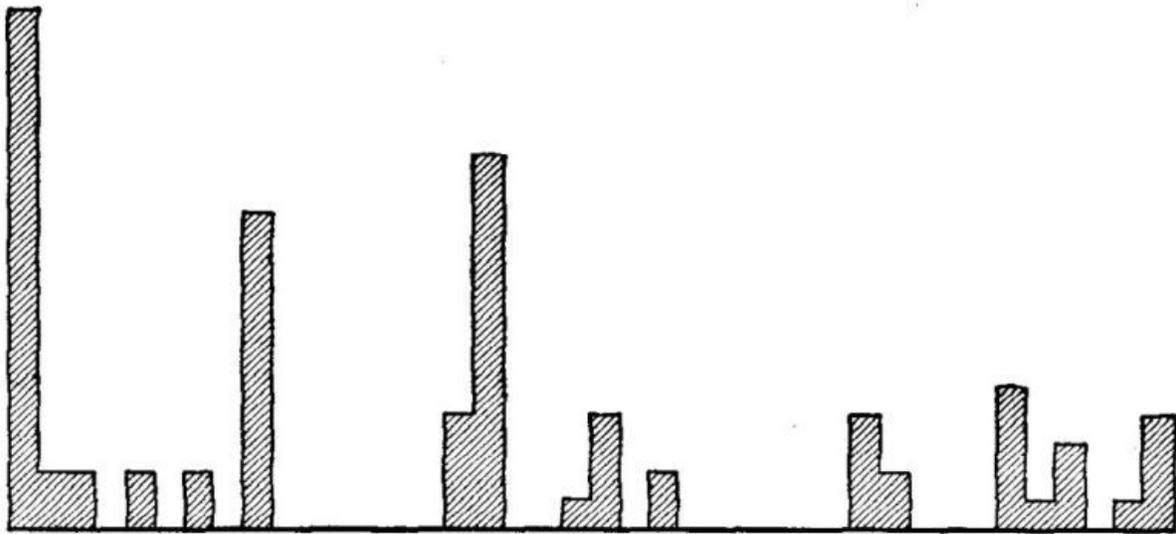

FIG. 22.—Distribution of practice with $72, 73 \dots 79 \div 8$ or 9 in the first two books of text E.

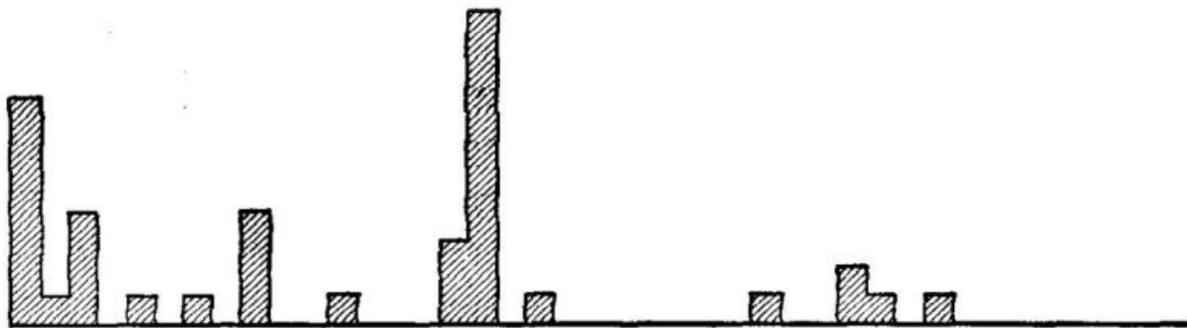

FIG. 23.—Distribution of practice with $81, 82 \dots 89 \div 9$ in the first two books of text E.

POSSIBLE IMPROVEMENTS

Even if we knew what the best distribution of practice was for each ability of the many to be inculcated by arithmetical instruction, we could perhaps not provide it for all of them. For, in the first place, the allotments for some of them might interfere with those for others. In the second place, there are many other considerations of importance in the ordering of topics besides giving the optimal distribution of practice to each ability. Such are considerations of interest, of welding separate abilities into an integrated total ability, and of the limitations due to the school schedule with its Saturdays, Sundays, holidays, and vacations.

Improvement can, however, be made over present practice in many respects. A scientific examination of the teaching of almost any class for a year, or of many of our standard instruments of instruction, will reveal opportunities for improving the distribution of practice with no sacrifice of interest, and with an actual gain in integrated functioning arithmetical power. In particular it will reveal cases where an ability is given practice and then, never being used again, left to die of inactivity. It will reveal cases where an ability is given practice and then left so long without practice that the first effect is nearly lost. There will be cases where practice is given and reviews are given, but all in such isolation from everything else in arithmetic that the ability, though existent, does not become a part of the pupil's general working equipment. There will be cases where more practice is given in the late than the earlier periods for no apparent extrinsic advantage; and cases where the practice is put where it is for no reason that is observable save that the teacher or author in question has decided to have some drill work at that time!

Each ability has its peculiar needs in this matter, and no set rules are at present of much value. It will be enough for the present if we are aroused to the problem of distribution, avoid obvious follies like those just noted, and exercise what ingenuity we have.

CHAPTER IX

THE PSYCHOLOGY OF THINKING: ABSTRACT IDEAS AND GENERAL NOTIONS IN ARITHMETIC^[11]

RESPONSES TO ELEMENTS AND CLASSES

The plate which you see, the egg before you at the breakfast table, and this page are concrete things, but whiteness, whether of plate, egg, or paper, is, we say, an abstract quality. To be able to think of whiteness irrespective of any concrete white object is to be able to have an abstract idea or notion of white; to be able to respond to whiteness, irrespective of whether it is a part of china, eggshell, paper or whatever object, is to be able to respond to the abstract element of whiteness.

Learning arithmetic involves the formation of very many such ideas, the acquisition of very many such powers of response to elements regardless of the gross total situations in which they appear. To appreciate the fiveness of five boys, five pencils, five inches, five rings of a bell; to understand the division into eight equal parts of 40 cents, 32 feet, 64 minutes, or 16 ones; to respond correctly to the fraction relation in $\frac{2}{3}$, $\frac{5}{6}$, $\frac{3}{4}$, $\frac{7}{12}$, $\frac{1}{8}$, or any other; to be sensitive to the common element of $9 = 3 \times 3$, $16 = 4 \times 4$, $625 = 25 \times 25$, $.04 = .2 \times .2$, $\frac{1}{4} = \frac{1}{2} \times \frac{1}{2}$,—these are obvious illustrations. All the numbers which the pupil learns to understand and manipulate are in fact abstractions; all the operations are abstractions; percent, discount, interest, height, length, area, volume, are abstractions; sum, difference, product, quotient, remainder, average, are facts that concern elements or aspects which may appear with countless different concrete surroundings or concomitants.

Towser is a particular dog; your house lot on Elm Street is a particular rectangle; Mr. and Mrs. I.S. Peterson and their daughter Louise are a particular family of three. In contrast to these particulars, we mean by a dog, a rectangle, and a family of three, *any* specimens of these classes of facts. The idea of a dog, of rectangles in general, of any family of three is a general notion, a concept or idea of a class or species. The ability to respond to any dog, or rectangle, or family of three, regardless of which particular one it may be, is the general notion in action.

Learning arithmetic involves the formation of very many such general notions, such powers of response to any member of a certain class. Thus a hundred different sized lots may all be responded to as rectangles; $\frac{9}{18}$, $\frac{12}{27}$, $\frac{15}{24}$, and $\frac{27}{36}$ may all be responded to as members of the class, 'both members divisible by 3.' The same fact may be responded to in different ways according to the class to which it is assigned. Thus 4 in $\frac{3}{4}$, $\frac{4}{5}$, 45, 54, and 405 is classed respectively as 'a certain sized part of unity,' 'a certain number of parts of the size shown by the 5,' 'a certain number of tens,' 'a certain number of ones,' and 'a certain number of hundreds.' Each abstract quality may become the basis of a class of facts. So fourness as a quality corresponds to the class 'things four in number or size'; the fractional quality or relation corresponds to the class 'fractions.' The bonds formed with classes of facts and with elements or features by which one whole class of facts is distinguished from another, are in fact, a chief concern of arithmetical learning.^[12]

FACILITATING THE ANALYSIS OF ELEMENTS

Abstractions and generalizations then depend upon analysis and upon bonds formed with more or less subtle elements rather than with gross total concrete situations. The process involved is most easily understood by considering the means employed to facilitate it.

The first of these is having the learner respond to the total situations containing the element in question with the attitude of piecemeal examination, and with attentiveness to one element after another, especially to so near an approximation to the element in question as he can already select for attentive examination. This attentiveness to one element after

another serves to emphasize whatever appropriate minor bonds from the element in question the learner already possesses. Thus, in teaching children to respond to the 'fiveness' of various collections, we show five boys or five girls or five pencils, and say, "See how many boys are standing up. Is Jack the only boy that is standing here? Are there more than two boys standing? Name the boys while I point at them and count them. (Jack) is one, and (Fred) is one more, and (Henry) is one more. Jack and Fred make (two) boys. Jack and Fred and Henry make (three) boys." (And so on with the attentive counting.) The mental set or attitude is directed toward favoring the partial and predominant activity of 'how-many-ness' as far as may be; and the useful bonds that the 'fiveness,' the 'one and one and one and one and one-ness,' already have, are emphasized as far as may be.

The second of the means used to facilitate analysis is having the learner respond to many situations each containing the element in question (call it A), but with varying concomitants (call these V. C.) his response being so directed as, so far as may be, to separate each total response into an element bound to the A and an element bound to the V. C.

Thus the child is led to associate the responses—'Five boys,' 'Five girls,' 'Five pencils,' 'Five inches,' 'Five feet,' 'Five books,' 'He walked five steps,' 'I hit my desk five times,' and the like—each with its appropriate situation. The 'Five' element of the response is thus bound over and over again to the 'fiveness' element of the situation, the mental set being 'How many?,' but is bound only once to any one of the concomitants. These concomitants are also such as have preferred minor bonds of their own (the sight of a row of boys *per se* tends strongly to call up the 'Boys' element of the response). The other elements of the responses (boys, girls, pencils, etc.) have each only a slight connection with the 'fiveness' element of the situations. These slight connections also in large part^[13] counteract each other, leaving the field clear for whatever uninhibited bond the 'fiveness' has.

The third means used to facilitate analysis is having the learner respond to situations which, pair by pair, present the element in a certain context and present that same context with *the opposite of the element in question*, or with something at least very unlike the element. Thus, a child who is being taught to respond to 'one fifth' is not only led to respond to 'one fifth of a cake,' 'one fifth of a pie,' 'one fifth of an apple,' 'one fifth of ten inches,' 'one

fifth of an army of twenty soldiers,' and the like; he is also led to respond to each of these *in contrast with* 'five cakes,' 'five pies,' 'five apples,' 'five times ten inches,' 'five armies of twenty soldiers.' Similarly the 'place values' of tenths, hundredths, and the rest are taught by contrast with the tens, hundreds, and thousands.

These means utilize the laws of connection-forming to disengage a response element from gross total responses and attach it to some situation element. The forces of use, disuse, satisfaction, and discomfort are so maneuvered that an element which never exists by itself in nature can influence man almost as if it did so exist, bonds being formed with it that act almost or quite irrespective of the gross total situation in which it inheres. What happens can be most conveniently put in a general statement by using symbols.

Denote by $a + b$, $a + g$, $a + l$, $a + q$, $a + v$, and $a + B$ certain situations alike in the element a and different in all else. Suppose that, by original nature or training, a child responds to these situations respectively by $r_1 + r_2$, $r_1 + r_7$, $r_1 + r_{12}$, $r_1 + r_{17}$, $r_1 + r_{22}$, $r_1 + r_{27}$. Suppose that man's neurones are capable of such action that r_1 , r_2 , r_7 , r_{12} , r_{22} , and r_{27} , can each be made singly.

Case I. Varying Concomitants

Suppose that $a + b$, $a + g$, $a + l$, etc., occur once each.

We have	$a + b$	responded to by	$r_1 + r_2$,
	$a + g$	" "	$r_1 + r_7$,
	$a + l$	" "	$r_1 + r_{12}$,
	$a + q$	" "	$r_1 + r_{17}$,
	$a + v$	" "	$r_1 + r_{22}$, and
	$a + B$	" "	$r_1 + r_{27}$, as shown in Scheme I.

Scheme I

	<i>a</i>	<i>b</i>	<i>g</i>	<i>l</i>	<i>q</i>	<i>v</i>	<i>B</i>
r_1	6	1	1	1	1	1	1
r_2	1	1					
r_7	1		1				
r_{12}	1			1			
r_{17}	1				1		
r_{22}	1					1	
r_{27}	1						1

a is thus responded to by r_1 (that is, connected with r_1) each time, or six in all, but only once each with *b*, *g*, *l*, *q*, *v*, and *B*. *b*, *g*, *l*, *q*, *v*, and *B* are connected once each with r_1 and once respectively with r_2 , r_7 , r_{12} , etc. The bond from *a* to r_1 , has had six times as much exercise as the bond from *a* to r_2 , or from *a* to r_7 , etc. In any new gross situation, *a* 0, *a* will be more predominant in determining response than it would otherwise have been; and r_1 will be more likely to be made than r_2 , r_7 , r_{12} , etc., the other previous associates in the response to a situation containing *a*. That is, the bond from the element *a* to the response r_1 has been notably strengthened.

Case II. Contrasting Concomitants

Now suppose that *b* and *g* are very dissimilar elements (e.g., white and black), that *l* and *q* are very dissimilar (e.g., long and short), and that *v* and *B* are also very dissimilar. To be very dissimilar means to be responded to very differently, so that r_7 , the response to *g*, will be very unlike r_2 , the response to *b*. So r_7 may be thought of as $r_{\text{not } 2}$ or r_{-2} . In the same way r_{12} may be thought of as $r_{\text{not } 12}$ or r_{-12} , and r_{27} may be called $r_{\text{not } 22}$ or r_{-22} .

Then, if the situations *a b*, *a g*, *a l*, *a q*, *a v*, and *a B* are responded to, each once, we have:—

<i>a + b</i>	responded to by	$r_1 + r_2$,
<i>a + g</i>	" "	$r_1 + r_{\text{not } 2}$,
<i>a + l</i>	" "	

			$r_1 + r_{12}$,
$a + q$	"	"	$r_1 + r_{\text{not } 12}$,
$a + v$	"	"	$r_1 + r_{22}$, and
$a + B$	"	"	$r_1 + r_{\text{not } 22}$, as shown in Scheme II.

Scheme II

	a	b	g (opp. of b)	l	q (opp. of l)	v	B (opp. of v)
r_1	6	1	1	1	1	1	1
$r_{\text{not } 1}$							
r_2	1	1					
$r_{\text{not } 2}$	1		1				
r_{12}	1			1			
$r_{\text{not } 12}$	1				1		
r_{22}	1					1	
$r_{\text{not } 22}$	1						1

r_1 is connected to a by 6 repetitions. r_2 and $r_{\text{not } 2}$ are each connected to a by 1 repetition, but since they interfere, canceling each other so to speak, the net result is for a to have zero tendency to call up r_2 or $r_{\text{not } 2}$. r_{12} and $r_{\text{not } 12}$ are each connected to a by 1 repetition, but they interfere with or cancel each other with the net result that a has zero tendency to call up r_{12} or $r_{\text{not } 12}$. So with r_{22} and $r_{\text{not } 22}$. Here then the net result of the six connections of a to b , a to g , a to l , a to q , a to v , and a to B is to connect a with r , and with nothing else.

Case III. Contrasting Concomitants and Contrasting Element

Suppose now that the facts are as in Case II, but with the addition of six experiences where a certain element which is the opposite of, or very dissimilar to, a is connected with the response $r_{\text{not } 1}$, or r_{-1} which is opposite to, or very dissimilar to r_1 . Call this opposite of a , $-a$.

That is, we have not only

$a + b$	responded to by	$r_1 + r_2,$
$a + g$	" "	$r_1 + r_{\text{not } 2},$
$a + l$	" "	$r_1 + r_{12},$
$a + q$	" "	$r_1 + r_{\text{not } 12},$
$a + v$	" "	$r_1 + r_{22},$ and
$a + B$	" "	$r_1 + r_{\text{not } 22},$

but also

$-a + b$	responded to by	$r_{\text{not } 1} + r_2,$
$-a + g$	" "	$r_{\text{not } 1} + r_{\text{not } 2},$
$-a + l$	" "	$r_{\text{not } 1} + r_{12},$
$-a + q$	" "	$r_{\text{not } 1} + r_{\text{not } 12},$
$-a + v$	" "	$r_{\text{not } 1} + r_{22},$ and
$-a + B$	" "	$r_{\text{not } 1} + r_{\text{not } 22},$ as shown in Scheme III.

Scheme III

	a	<i>opp.</i> <i>of a</i>	b	g	l	q	v	B
			(<i>opp.</i> of b)		(<i>opp.</i> of l)		(<i>opp.</i> of v)	
r_1	6		1	1	1	1	1	1
$r_{\text{not } 1}$		6	1	1	1	1	1	1
r_2	1	1	2					
$r_{\text{not } 2}$	1	1		2				
r_{12}	1	1			2			
$r_{\text{not } 12}$	1	1				2		
r_{22}	1	1					2	
$r_{\text{not } 22}$	1	1						2

In this series of twelve experiences a connects with r_1 six times and the opposite of a connects with $r_{\text{not } 1}$ six times. a connects equally often with three pairs of mutual destructives r_2 and $r_{\text{not } 2}$, r_{12} and $r_{\text{not } 12}$, r_{22} and $r_{\text{not } 22}$,

and so has zero tendency to call them up. — a has also zero tendency to call up any of these responses except its opposite, $r_{\text{not } 1}$. $b, g, l, q, v,$ and B are made to connect equally often with r_1 and $r_{\text{not } 1}$. So, of these elements, a is the only one left with a tendency to call up r_1 .

Thus, by the mere action of frequency of connection, r_1 is connected with a ; the bonds from a to anything except r_1 are being counteracted, and the slight bonds from anything except a to r_1 are being counteracted. The element a becomes predominant in situations containing it; and its bond toward r_1 becomes relatively enormously strengthened and freed from competition.

These three processes occur in a similar, but more complicated, form if the situations $a + b, a + g,$ etc., are replaced by $a + b + c + d + e + f, a + g + h + i + j + k,$ etc., and the responses $r_1 + r_2, r_1 + r_7, r_1 + r_{12},$ etc., are replaced by $r_1 + r_2 + r_3 + r_4 + r_5 + r_6, r_1 + r_7 + r_8 + r_9 + r_{10} + r_{11},$ etc.—*provided the $r_1, r_2, r_3, r_4,$ etc., can be made singly*. In so far as any one of the responses is necessarily co-active with any one of the others (so that, for example, r_{13} always brings r_{26} with it and *vice versa*), the exact relations of the numbers recorded in schemes like schemes I, II, and III on pages 172 to 174 will change; but, unless r_1 has such an inevitable co-actor, the general results of schemes I, II, and III will hold good. If r_1 does have such an inseparable co-actor, say r_2 , then, of course, a can never acquire bonds with r_1 alone, but everywhere that r_1 or r_2 appears in the preceding schemes the other element must appear also. $r_1 r_2$ would then have to be used as a unit in analysis.

The ' $a + b,$ ' ' $a + g,$ ' ' $a + l,$ ' ... ' $a + B$ ' situations may occur unequal numbers of times, altering the exact numerical relations of the connections formed and presented in schemes I, II, and III; but the process in general remains the same.

So much for the effect of use and disuse in attaching appropriate response elements to certain subtle elements of situations. There are three main series of effects of satisfaction and discomfort. They serve, first, to emphasize, from the start, the desired bonds leading to the responses $r_1 + r_2, r_1 + r_7,$ etc., to the total situations, and to weed out the undesirable ones. They also act to

emphasize, in such comparisons and contrasts as have been described, every action of the bond from a to r_1 ; and to eliminate every tendency of a to connect with aught save r_1 , and of aught save a to connect with r_1 . Their third service is to strengthen the bonds produced of appropriate responses to a wherever it occurs, whether or not any formal comparisons and contrasts take place.

The process of learning to respond to the difference of pitch in tones from whatever instrument, to the 'square-root-ness' of whatever number, to triangularity in whatever size or combination of lines, to equality of whatever pairs, or to honesty in whatever person or instance, is thus a consequence of associative learning, requiring no other forces than those of use, disuse, satisfaction, and discomfort. "What happens in such cases is that the response, by being connected with many situations alike in the presence of the element in question and different in other respects, is bound firmly to that element and loosely to each of its concomitants. Conversely any element is bound firmly to any one response that is made to all situations containing it and very, very loosely to each of those responses that are made to only a few of the situations containing it. The element of triangularity, for example, is bound firmly to the response of saying or thinking 'triangle' but only very loosely to the response of saying or thinking white, red, blue, large, small, iron, steel, wood, paper, and the like. A situation thus acquires bonds not only with some response to it as a gross total, but also with responses to any of its elements that have appeared in any other gross totals. Appropriate response to an element regardless of its concomitants is a necessary consequence of the laws of exercise and effect if an animal learns to make that response to the gross total situations that contain the element and not to make it to those that do not. Such prepotent determination of the response by one or another element of the situation is no transcendental mystery, but, given the circumstances, a general rule of all learning." Such are at bottom only extreme cases of the same learning as a cat exhibits that depresses a platform in a certain box whether it faces north or south, whether the temperature is 50 or 80 degrees, whether one or two persons are in sight, whether she is exceedingly or moderately hungry, whether fish or milk is outside the box. All learning is analytic, representing the activity of elements within a total situation. In man, by virtue of certain instincts and the course of his training, very subtle elements of situations can so operate.

Learning by analysis does not often proceed in the carefully organized way represented by the most ingenious marshaling of comparing and contrasting activities. The associations with gross totals, whereby in the end an element is elevated to independent power to determine response, may come in a haphazard order over a long interval of time. Thus a gifted three-year-old boy will have the response element of 'saying or thinking *two*,' bound to the 'two-ness' element of very many situations in connection with the 'how-many' mental set; and he will have made this analysis without any formal, systematic training. An imperfect and inadequate analysis already made is indeed usually the starting point for whatever systematic abstraction the schools direct. Thus the kindergarten exercises in analyzing out number, color, size, and shape commonly assume that 'one-ness' *versus* 'more-than-one-ness,' black and white, big and little, round and not round are, at least vaguely, active as elements responded to in some independence of their contexts. Moreover, the tests of actual trial and success in further undirected exercises usually cooperate to confirm and extend and refine what the systematic drills have given. Thus the ordinary child in school is left, by the drills on decimal notation, with only imperfect power of response to the 'place-values.' He continues to learn to respond properly to them by finding that $4 \times 40 = 160$, $4 \times 400 = 1600$, $800 - 80 = 720$, $800 - 8 = 792$, $800 - 800 = 0$, $42 \times 48 = 2016$, $24 \times 48 = 1152$, and the like, are satisfying; while $4 \times 40 = 16$, $23 \times 48 = 832$, $800 - 8 = 0$, and the like, are not. The process of analysis is the same in such casual, unsystematized formation of connections with elements as in the deliberately managed, piecemeal inspection, comparison, and contrast described above.

SYSTEMATIC AND OPPORTUNISTIC STIMULI TO ANALYSIS

The arrangement of a pupil's experiences so as to direct his attention to an element, vary its concomitants instructively, stimulate comparison, and throw the element into relief by contrast may be by fixed, formal, systematic exercises. Or it may be by much less formal exercises, spread over a longer time, and done more or less incidentally in other connections. We may call these two extremes the 'systematic' and 'opportunistic,' since the chief feature

of the former is that it systematically provides experiences designed to build up the power of correct response to the element, whereas the chief feature of the latter is that it uses especially such opportunities as occur by reason of the pupil's activities and interests.

Each method has its advantages and disadvantages. The systematic method chooses experiences that are specially designed to stimulate the analysis; it provides these at a certain fixed time so that they may work together; it can then and there test the pupils to ascertain whether they really have the power to respond to the element or aspect or feature in question. Its disadvantages are, first, that many of the pupils will feel no need for and attach no interest or motive to these formal exercises; second, that some of the pupils may memorize the answers as a verbal task instead of acquiring insight into the facts; third, that the ability to respond to the element may remain restricted to the special cases devised for the systematic training, and not be available for the genuine uses of arithmetic.

The opportunistic method is strong just where the systematic is weak. Since it seizes upon opportunities created by the pupil's abilities and interests, it has the attitude of interest more often. Since it builds up the experiences less formally and over a wider space of time, the pupils are less likely to learn verbal answers. Since its material comes more from the genuine uses of life, the power acquired is more likely to be applicable to life.

Its disadvantage is that it is harder to manage. More thought and experimentation are required to find the best experiences; greater care is required to keep track of the development of an abstraction which is taught not in two days, but over two months; and one may forget to test the pupils at the end. In so far as the textbook and teacher are able to overcome these disadvantages by ingenuity and care, the opportunistic method is better.

ADAPTATIONS TO ELEMENTARY SCHOOL PUPILS

We may expect much improvement in the formation of abstract and general ideas in arithmetic from the application of three principles in addition to those already described. They are: (1) Provide enough actual experiences before asking the pupil to understand and use an abstract or

general idea. (2) Develop such ideas gradually, not attempting to give complete and perfect ideas all at once. (3) Develop such ideas so far as possible from experiences which will be valuable to the pupil in and of themselves, quite apart from their merit as aids in developing the abstraction or general notion. Consider these three principles in order.

Children, especially the less gifted intellectually, need more experiences as a basis for and as applications of an arithmetical abstraction or concept than are usually given them. For example, in paving the way for the principle, "Any number times 0 equals 0," it is not safe to say, "John worked 8 days for 0 minutes per day. How many minutes did he work?" and "How much is 0 times 4 cents?" It will be much better to spend ten or fifteen minutes as follows:^[14] "What does zero mean? (Not any. No.) How many feet are there in eight yards? In 5 yards? In 3 yards? In 2 yards? In 1 yard? In 0 yard? How many inches are there in 4 ft.? In 2 ft.? In 0 ft.? 7 pk. = qt. 5 pk. = qt. 0 pk. = qt. A boy receives 60 cents an hour when he works. How much does he receive when he works 3 hr.? 8 hr.? 6 hr.? 0 hr.? A boy received 60 cents a day for 0 days. How much did he receive? How much is 0 times \$600? How much is 0 times \$5000? How much is 0 times a million dollars? 0 times any number equals...."

232 (At the blackboard.) 0 time 232 equals what?

30 I write 0 under the 0.^[15] 3 times 232 equals what?

6960 Continue at the blackboard with

734	321	312	41	
20	40	30	60	etc."

Pupils in the elementary school, except the most gifted, should not be expected to gain mastery over such concepts as *common fraction*, *decimal fraction*, *factor*, and *root* quickly. They can learn a definition quickly and learn to use it in very easy cases, where even a vague and imperfect understanding of it will guide response correctly. But complete and exact understanding commonly requires them to take, not one intellectual step, but many; and mastery in use commonly comes only as a slow growth. For example, suppose that pupils are taught that .1, .2, .3, etc., mean $\frac{1}{10}$, $\frac{2}{10}$,

$\frac{3}{10}$, etc., that .01, .02, .03, etc., mean $\frac{1}{100}$, $\frac{2}{100}$, $\frac{3}{100}$, etc., that .001, .002, .003, etc., mean $\frac{1}{1000}$, $\frac{2}{1000}$, $\frac{3}{1000}$, etc., and that .1, .02, .001, etc., are decimal fractions. They may then respond correctly when asked to write a decimal fraction, or to state which of these,— $\frac{1}{4}$, .4, $\frac{3}{8}$, .07, .002, $\frac{5}{6}$,—are common fractions and which are decimal fractions. They may be able, though by no means all of them will be, to write decimal fractions which equal $\frac{1}{2}$ and $\frac{1}{5}$, and the common fractions which equal .1 and .09. Most of them will not, however, be able to respond correctly to "Write a decimal mixed number"; or to state which of these,— $\frac{1}{100}$, $4\frac{1}{2}$, $\frac{.007}{350}$, \$.25,—are common fractions, and which are decimals; or to write the decimal fractions which equal $\frac{3}{4}$ and $\frac{1}{3}$.

If now the teacher had given all at once the additional experiences needed to provide the ability to handle these more intricate and subtle features of decimal-fraction-ness, the result would have been confusion for most pupils. The general meaning of .32, .14, .99, and the like requires some understanding of .30, .10, .90, and .02, .04, .08; but it is not desirable to disturb the child with .30 while he is trying to master 2.3, 4.3, 6.3, and the like. Decimals in general require connection with place value and the contrasts of .41 with 41, 410, 4.1, and the like, but if the relation to place values in general is taught in the same lesson with the relation to $\frac{1}{10}$ s, $\frac{1}{100}$ s, $\frac{1}{1000}$ s, the mind will suffer from violent indigestion.

A wise pedagogy in fact will break up the process of learning the meaning and use of decimal fractions into many teaching units, for example, as follows:—

(1) Such familiarity with fractions with large denominators as is desirable for pupils to have, as by an exercise in reducing to lowest terms, $\frac{8}{10}$, $\frac{36}{64}$, $\frac{20}{25}$, $\frac{18}{24}$, $\frac{24}{32}$, $\frac{21}{30}$, $\frac{25}{100}$, $\frac{40}{100}$, and the like. This is good as a review of cancellation, and as an extension of the idea of a fraction.

(2) Objective work, showing $\frac{1}{10}$ sq. ft., $\frac{1}{50}$ sq. ft., $\frac{1}{100}$ sq. ft., and $\frac{1}{1000}$ sq. ft., and having these identified and the forms $\frac{1}{10}$ sq. ft., $\frac{1}{100}$ sq. ft., and $\frac{1}{1000}$ sq. ft. learned. Finding how many feet = $\frac{1}{10}$ mile and $\frac{1}{100}$ mile.

(3) Familiarity with $\frac{1}{100}$ s and $\frac{1}{1000}$ s by reductions of $\frac{750}{1000}$, $\frac{50}{100}$, etc., to lowest terms and by writing the missing numerators in $\frac{500}{1000} = \frac{1}{2} = \frac{1}{2}$ and the like, and by finding $\frac{1}{10}$, $\frac{1}{100}$, and $\frac{1}{1000}$ of 3000, 6000, 9000, etc.

(4) Writing $\frac{1}{10}$ as .1 and $\frac{1}{100}$ as .01, $\frac{11}{100}$, $\frac{12}{100}$, $\frac{13}{100}$, etc., as .11, .12, .13. United States money is used as the introduction. Application is made to miles.

(5) Mixed numbers with a first decimal place. The cyclometer or speedometer. Adding numbers like 9.1, 14.7, 11.4, etc.

(6) Place value in general from thousands to hundredths.

(7) Review of (1) to (6).

(8) Tenths and hundredths of a mile, subtraction when both numbers extend to hundredths, using a railroad table of distances.

(9) Thousandths. The names 'decimal fractions or decimals,' and 'decimal mixed numbers or decimals.' Drill in reading any number to thousandths. The work will continue with gradual extension and refinement of the understanding of decimals by learning how to operate with them in various ways.

Such may seem a slow progress, but in fact it is not, and many of these exercises whereby the pupil acquires his mastery of decimals are useful as organizations and applications of other arithmetical facts.

That, it will be remembered, was the third principle:—"Develop abstract and general ideas by experiences which will be intrinsically valuable." The reason is that, even with the best of teaching, some pupils will not, within any reasonable limits of time expended, acquire ideas that are fully complete, rigorous when they should be, flexible when they should be, and absolutely exact. Many children (and adults, for that matter) could not within any reasonable limits of time be so taught the nature of a fraction that they could decide unerringly in original exercises like:—

Is $2\frac{75}{25}$ a common fraction?

Is \$.25 a decimal fraction?

Is one x th of y a fraction?

Can the same words mean both a common fraction and a decimal fraction?

Express 1 as a common fraction.

Express 1 as a decimal fraction.

These same children can, however, be taught to operate correctly with fractions in the ordinary uses thereof. And that is the chief value of arithmetic to them. They should not be deprived of it because they cannot master its subtler principles. So we seek to provide experiences that will teach all pupils something of value, while stimulating in those who have the ability the growth of abstract ideas and general principles.

Finally, we should bear in mind that working with qualities and relations that are only partly understood or even misunderstood does under certain conditions give control over them. The general process of analytic learning in life is to respond as well as one can; to get a clearer idea thereby; to respond better the next time; and so on. For instance, one gets some sort of notion of what $\frac{1}{5}$ means; he then answers such questions as $\frac{1}{5}$ of 10 = ? $\frac{1}{5}$ of 5 = ? $\frac{1}{5}$ of 20 = ?; by being told when he is right and when he is wrong, he gets from these experiences a better idea of $\frac{1}{5}$; again he does his best with $\frac{1}{5} = \frac{2}{10}$, $\frac{1}{5} = \frac{2}{15}$, etc., and as before refines and enlarges his concept of $\frac{1}{5}$. He adds $\frac{1}{5}$ to $\frac{2}{5}$, etc., $\frac{1}{5}$ to $\frac{3}{10}$, etc., $\frac{1}{5}$ to $\frac{1}{2}$, etc., and thereby gains still further, and so on.

What begins as a blind habit of manipulation started by imitation may thus grow into the power of correct response to the essential element. The pupil who has at the start no notion at all of 'multiplying' may learn what multiplying is by his experience that '4 6 multiplying gives 24'; '3 9 multiplying gives 27,' etc. If the pupil keeps on doing something with numbers and differentiates right results, he will often reach in the end the abstractions which he is supposed to need in the beginning. It may even be the case with some of the abstractions required in arithmetic that elaborate provision for comprehension beforehand is not so efficient as the same amount of energy devoted partly to provision for analysis itself beforehand

and partly to practice in response to the element in question without full comprehension.

It certainly is not the best psychology and not the best educational theory to think that the pupil first masters a principle and then merely applies it—first does some thinking and then computes by mere routine. On the contrary, the applications should help to establish, extend, and refine the principle—the work a pupil does with numbers should be a main means of increasing his understanding of the principles of arithmetic as a science.

CHAPTER X

THE PSYCHOLOGY OF THINKING: REASONING IN ARITHMETIC

THE ESSENTIALS OF ARITHMETICAL REASONING

We distinguish aimless reverie, as when a child dreams of a vacation trip, from purposive thinking, as when he tries to work out the answer to "How many weeks of vacation can a family have for \$120 if the cost is \$22 a week for board, \$2.25 a week for laundry, and \$1.75 a week for incidental expenses, and if the railroad fares for the round trip are \$12?" We distinguish the process of response to familiar situations, such as five integral numbers to be added, from the process of response to novel situations, such as (for a child who has not been trained with similar problems):—"A man has four pieces of wire. The lengths are 120 yd., 132 meters, 160 feet, and $\frac{1}{8}$ mile. How much more does he need to have 1000 yd. in all?" We distinguish 'thinking things together,' as when a diagram or problem or proof is understood, from thinking of one thing after another as when a number of words are spelled or a poem in an unknown tongue is learned. In proportion as thinking is purposive, with selection from the ideas that come up, and in proportion as it deals with novel problems for which no ready-made habitual response is available, and in proportion as many bonds act together in an organized way to produce response, we call it reasoning.

When the conclusion is reached as the effect of many particular experiences, the reasoning is called inductive. When some principle already established leads to another principle or to a conclusion about some particular fact, the reasoning is called deductive. In both cases the process involves the analysis of facts into their elements, the selection of the elements that are deemed significant for the question at hand, the attachment

of a certain amount of importance or weight to each of them, and their use in the right relations. Thought may fail because it has not suitable facts, or does not select from them the right ones, or does not attach the right amount of weight to each, or does not put them together properly.

In the world at large, many of our failures in thinking are due to not having suitable facts. Some of my readers, for example, cannot solve the problem—"What are the chances that in drawing a card from an ordinary pack of playing-cards four times in succession, the same card will be drawn each time?" And it will be probably because they do not know certain facts about the theory of probabilities. The good thinkers among such would look the matter up in a suitable book. Similarly, if a person did not happen to know that there were fifty-two cards in all and that no two were alike, he could not reason out the answer, no matter what his mastery of the theory of probabilities. If a competent thinker, he would first ask about the size and nature of the pack. In the actual practice of reasoning, that is, we have to survey our facts to see if we lack any that are necessary. If we do, the first task of reasoning is to acquire those facts.

This is specially true of the reasoning about arithmetical facts in life. "Will $3\frac{1}{2}$ yards of this be enough for a dress?" Reason directs you to learn how wide it is, what style of dress you intend to make of it, how much material that style normally calls for, whether you are a careful or a wasteful cutter, and how big the person is for whom the dress is to be made. "How much cheaper as a diet is bread alone, than bread with butter added to the extent of 10% of the weight of the bread?" Reason directs you to learn the cost of bread, the cost of butter, the nutritive value of bread, and the nutritive value of butter.

In the arithmetic of the school this feature of reasoning appears in cases where some fact about common measures must be brought to bear, or some table of prices or discounts must be consulted, or some business custom must be remembered or looked up.

Thus "How many badges, each 9 inches long, can be made from $2\frac{1}{2}$ yd. ribbon?" cannot be solved without getting into mind $1 \text{ yd.} = 36 \text{ inches}$. "At Jones' prices, which costs more, $3\frac{3}{4}$ lb. butter or $6\frac{1}{2}$ lb. lard? How much more?" is a problem which directs the thinker to ascertain Jones' prices.

It may be noted that such problems are, other things being equal, somewhat better training in thinking than problems where all the data are given in the problem itself (*e.g.*, "Which costs more, $3\frac{3}{4}$ lb. butter at 48¢ per lb. or $6\frac{1}{2}$ lb. lard at 27¢ per lb.? How much more?"). At least it is unwise to have so many problems of the latter sort that the pupil may come to think of a problem in applied arithmetic as a problem where everything is given and he has only to manipulate the data. Life does not present its problems so.

The process of selecting the right elements and attaching proper weight to them may be illustrated by the following problem:—"Which of these offers would you take, supposing that you wish a D.C.K. upright piano, have \$50 saved, can save a little over \$20 per month, and can borrow from your father at 6% interest?"

A

A Reliable Piano. The Famous D.C.K. Upright. You pay \$50 cash down and \$21 a month for only a year and a half. *No interest* to pay. We ask you to pay only for the piano and allow you plenty of time.

B

We offer the well-known D.C.K. Piano for \$390. \$50 cash and \$20 a month thereafter. Regular interest at 6%. The interest soon is reduced to less than \$1 a month.

C

The D.C.K. Piano. Special Offer, \$375, cash. Compare our prices with those of any reliable firm.

If you consider chiefly the "only," "No interest to pay," "only," and "plenty of time" in offer A, attaching much weight to them and little to the thought, "How much will \$50 plus $(18 \times \$21)$ be?", you will probably decide wrongly.

The situations of life are often complicated by many elements of little or even of no relevance to the correct solution. The offerer of A may belong to your church; your dearest friend may urge you to accept offer B; you may dislike to talk with the dealer who makes offer C; you may have a prejudice against owing money to a relative; that prejudice may be wise or foolish; you may have a suspicion that the B piano is shopworn; that suspicion may be well-founded or groundless; the salesman for C says, "You don't want your friends to say that you bought on the installment plan. Only low-class persons do that," etc. The statement of arithmetical problems in school usually assists the pupil to the extent of ruling out all save definitely quantitative elements, and of ruling out all quantitative elements except those which should be considered. The first of the two simplifications is very beneficial, on the whole, since otherwise there might be different correct solutions to a problem according to the nature and circumstances of the persons involved. The second simplification is often desirable, since it will often produce greater improvement in the pupils, per hour of time spent, than would be produced by the problems requiring more selection. It should not, however, be a universal custom; for in that case the pupils are tempted to think that in every problem they must use all the quantities given, as one must use all the pieces in a puzzle picture.

It is obvious that the elements selected must not only be right but also be in the right relations to one another. For example, in the problems below, the 6 must be thought of in relation to a dozen and as being half of a dozen, and also as being 6 times 1. 1 must be mentally tied to "each." The 6 as half of a dozen must be related to the \$1.00, \$1.60, etc. The 6 as 6 times 1 must be related to the \$.09, \$.14, etc.

Buying in Quantity

These are a grocer's prices for certain things by the dozen and for a single one. He sells a half dozen at half the price of a dozen. Find out how much you save by buying 6 all at one time instead of buying them one at a time.

	Doz.	Each
1. Evaporated Milk	\$1.00	\$.09
2. Puffed Rice	1.60	.14
3. Puffed Wheat	1.10	.10
4. Canned Soup	1.90	.17
5. Sardines	1.80	.16
6. Beans (No. 2 cans)	1.50	.13
7. Pork and Beans	1.70	.15
8. Peas (No. 2 cans)	1.40	.12
9. Tomatoes (extra cans)	3.20	.28
10. Ripe olives (qt. cans)	7.20	.65

It is obvious also that in such arithmetical work as we have been describing, the pupil, to be successful, must 'think things together.' Many bonds must coöperate to determine his final response.

As a preface to reasoning about a problem we often have the discovery of the problem and the classification of just what it is, and as a postscript we have the critical inspection of the answer obtained to make sure that it is verified by experiment or is consistent with known facts. During the process of searching for, selecting, and weighting facts, there may be similar inspection and validation, item by item.

REASONING AS THE COÖPERATION OF ORGANIZED HABITS

The pedagogy of the past made two notable errors in practice based on two errors about the psychology of reasoning. It considered reasoning as a somewhat magical power or essence which acted to counteract and overrule the ordinary laws of habit in man; and it separated too sharply the 'understanding of principles' by reasoning from the 'mechanical' work of computation, reading problems, remembering facts and the like, done by 'mere' habit and memory.

Reasoning or selective, inferential thinking is not at all opposed to, or independent of, the laws of habit, but really is their necessary result under the conditions imposed by man's nature and training. A closer examination of selective thinking will show that no principles beyond the laws of readiness, exercise, and effect are needed to explain it; that it is only an extreme case of what goes on in associative learning as described under the 'piecemeal' activity of situations; and that attributing certain features of learning to mysterious faculties of abstraction or reasoning gives no real help toward understanding or controlling them.

It is true that man's behavior in meeting novel problems goes beyond, or even against, the habits represented by bonds leading from gross total situations and customarily abstracted elements thereof. One of the two reasons therefor, however, is simply that the finer, subtle, preferential bonds with subtler and less often abstracted elements go beyond, and at times against, the grosser and more usual bonds. One set is as much due to exercise and effect as the other. The other reason is that in meeting novel problems the mental set or attitude is likely to be one which rejects one after another response as their unfitness to satisfy a certain desideratum appears. What remains as the apparent course of thought includes only a few of the many bonds which did operate, but which, for the most part, were unsatisfying to the ruling attitude or adjustment.

Successful responses to novel data, associations by similarity and purposive behavior are in only apparent opposition to the fundamental laws of associative learning. Really they are beautiful examples of it. Man's successful responses to novel data—as when he argues that the diagonal on a right triangle of 796.278 mm. base and 137.294 mm. altitude will be 808.022 mm., or that Mary Jones, born this morning, will sometime die—are due to habits, notably the habits of response to certain elements or features, under the laws of piecemeal activity and assimilation.

Nothing is less like the mysterious operations of a faculty of reasoning transcending the laws of connection-forming, than the behavior of men in response to novel situations. Let children who have hitherto confronted only such arithmetical tasks, in addition and subtraction with one- and two-place numbers and multiplication with one-place numbers, as those exemplified in the first line below, be told to do the examples shown in the second line.

ADD	ADD	ADD	SUBT.	SUBT.	MULTIPLY	MULTIPLY	MULTIPLY
8	37	35	8	37	8	9	6
5	24	68	5	24	5	7	3
—	—	23	—	—	—	—	—

MULTIPLY	MULTIPLY	MULTIPLY
32	43	34
23	22	26
—	—	—

They will add the numbers, or subtract the lower from the upper number, or multiply 3×2 and 2×3 , etc., getting 66, 86, and 624, or respond to the element of 'Multiply' attached to the two-place numbers by "I can't" or "I don't know what to do," or the like; or, if one is a child of great ability, he may consider the 'Multiply' element and the bigness of the numbers, be reminded by these two aspects of the situation of the fact that

'9
9 multiply'

gave only 81, and that

'10
10 multiply'

gave only 100, or the like; and so may report an intelligent and justified "I can't," or reject the plan of 3×2 and 2×3 , with 66, 86, and 624 for answers, as unsatisfactory. What the children will do will, in every case, be a product of the elements in the situation that are potent with them, the responses which these evoke, and the further associates which these responses in turn evoke. If the child were one of sufficient genius, he might infer the procedure to be followed as a result of his knowledge of the principles of decimal notation and the meaning of 'Multiply,' responding correctly to the 'place-value' element of each digit and adding his 6 tens and 9 tens, 20 twos and 3 thirties; but if he did thus invent the shorthand addition of a collection of twenty-three collections, each of 32 units, he would still do it by the operation of bonds, subtle but real.

Association by similarity is, as James showed long ago, simply the tendency of an element to provoke the responses which have been bound to it. *abcde* leads to *vwx yz* because *a* has been bound to *vwx yz* by original nature, exercise, or effect.

Purposive behavior is the most important case of the influence of the attitude or set or adjustment of an organism in determining (1) which bonds shall act, and (2) which results shall satisfy. James early described the former fact, showing that the mechanism of habit can give the directedness or purposefulness in thought's products, provided that mechanism includes something paralleling the problem, the aim, or need, in question.

The second fact, that the set or attitude of the man helps to determine which bonds shall satisfy, and which shall annoy, has commonly been somewhat obscured by vague assertions that the selection and retention is of what is "in point," or is "the right one," or is "appropriate," or the like. It is thus asserted, or at least hinted, that "the will," "the voluntary attention," "the consciousness of the problem," and other such entities are endowed with magic power to decide what is the "right" or "useful" bond and to kill off the others. The facts are that in purposive thinking and action, as everywhere else, bonds are selected and retained by the satisfyingness, and are killed off by the discomfort, which they produce; and that the potency of the man's set or attitude to make this satisfy and that annoy—to put certain conduction-units in readiness to act and others in unreadiness—is in every way as important as its potency to set certain conduction-units in actual operation.

Reasoning is not a radically different sort of force operating against habit but the organization and coöperation of many habits, thinking facts together. Reasoning is not the negation of ordinary bonds, but the action of many of them, especially of bonds with subtle elements of the situation. Some outside power does not enter to select and criticize; the pupil's own total repertory of bonds relevant to the problem is what selects and rejects. An unsuitable idea is not killed off by some *actus purus* of intellect, but by the ideas which it itself calls up, in connection with the total set of mind of the pupil, and which show it to be inadequate.

Almost nothing in arithmetic need be taught as a matter of mere unreasoning habit or memory, nor need anything, first taught as a principle, ever become a matter of mere habit or memory. $5 \times 4 = 20$ should not be learned as an isolated fact, nor remembered as we remember that Jones' telephone number is 648 J 2. Almost everything in arithmetic should be taught as a habit that has connections with habits already acquired and will work in an organization with other habits to come. The use of this organized hierarchy of habits to solve novel problems is reasoning.

CHAPTER XI

ORIGINAL TENDENCIES AND ACQUISITIONS BEFORE SCHOOL

THE UTILIZATION OF INSTINCTIVE INTERESTS

The activities essential to acquiring ability in arithmetic can rely on little in man's instinctive equipment beyond the purely intellectual tendencies of curiosity and the satisfyingness of thought for thought's sake, and the general enjoyment of success rather than failure in an enterprise to which one sets oneself. It is only by a certain amount of artifice that we can enlist other vehement inborn interests of childhood in the service of arithmetical knowledge and skill. When this can be done at no cost the gain is great. For example, marching in files of two, in files of three, in files of four, etc., raising the arms once, two times, three times, showing a foot, a yard, an inch with the hands, and the like are admirable because learning the meanings of numbers thus acquires some of the zest of the passion for physical action. Even in late grades chances to make pictures showing the relations of fractional parts, to cut strips, to fold paper, and the like will be useful.

Various social instincts can be utilized in matches after the pattern of the spelling match, contests between rows, certain number games, and the like. The scoring of both the play and the work of the classroom is a useful field for control by the teacher of arithmetic.

Hunt [12] has noted the more important games which have some considerable amount of arithmetical training as a by-product and which are more or less suitable for class use. Flynn [12] has described games, most of them for home use, which give very definite arithmetical drill, though in many cases the drills are rather behind the needs of children old enough to understand and like the game itself.

It is possible to utilize the interests in mystery, tricks, and puzzles so as to arouse a certain form of respect for arithmetic and also to get computational work done. I quote one simple case from Miss Selkin's admirable collection [12, p. 69 f.]—

I. ADDITION

"We must admit that there is nothing particularly interesting in a long column of numbers to be added. Let the teacher, however, suggest that he can write the answer at sight, and the task will assume a totally different aspect.

"A very simple number trick of this kind can be performed by making use of the principle of complementary addition. The arithmetical complement of a number with respect to a larger number is the difference between these two numbers. Most interesting results can be obtained by using complements with respect to 9.

"The children may be called upon to suggest several numbers of two, three, or more digits. Below these write an equal number of addends and immediately announce the answer. The children, impressed by this apparently rapid addition, will set to work enthusiastically to test the results of this lightning calculation.

"Example:—

$$\begin{array}{r} 357 \\ 682 \\ 793 \end{array} \quad \left. \vphantom{\begin{array}{r} 357 \\ 682 \\ 793 \end{array}} \right\} \quad A \quad \begin{array}{r} 999 \\ \times 3 \\ \hline 2997 \end{array}$$

642	}	B
317		
206		

"Explanation:—The addends in group A are written down at random or suggested by the class. Those in group B are their complements. To write the first number in group B we look at the first number in group A and, starting at the left write 6, the complement of 3 with respect to 9; 4, the complement of 5; 2, the complement of 7. The second and third addends in group B are derived in the same way. Since we have three addends in each group, the problem reduces itself to multiplying 999 by 3, or to taking $3000 - 3$. Any number of addends may be used and each addend may consist of any number of digits."

Respect for arithmetic as a source of tricks and magic is very much less important than respect for its everyday services; and computation to test such tricks is likely to be undertaken zealously only by the abler pupils. Consequently this source of interest should probably be used only sparingly, and perhaps the teacher should give such exhibitions only as a reward for efficiency in the regular work. For example, if the work for a week is well done in four days the fifth day might be given up to some semi-arithmetical entertainment, such as the demonstration of an adding machine, the story of primitive methods of counting, team races in computation, an exhibition of lightning calculation and intellectual sleight-of-hand by the teacher, or the voluntary study of arithmetical puzzles.

The interest in achievement, in success, mentioned above is stronger in children than is often realized and makes advisable the systematic use of the practice experiment as a method of teaching much of arithmetic. Children who thus compete with their own past records, keeping an exact score from week to week, make notable progress and enjoy hard work in making it.

THE ORDER OF DEVELOPMENT OF ORIGINAL TENDENCIES

Negatively the difficulty of the work that pupils should be expected to do is conditioned by the gradual maturing of their capacities. Other things being equal, the common custom of reserving hard things for late in the elementary school course is, of course, sound. It seems probable that little is gained by using any of the child's time for arithmetic before grade 2, though there are many arithmetical facts that he can learn in grade 1. Postponement of systematic work in arithmetic to grade 3 or even grade 4 is allowable if better things are offered. With proper textbooks and oral and written exercises, however, a child in grades 2 and 3 can spend time profitably on arithmetical work. When all children can be held in school through the eighth grade it does not much matter whether arithmetic is begun early or late. If, however, many children are to leave in grades 5 and 6 as now, we may think it wise to provide somehow that certain minima of arithmetical ability be given them.

There are, so far as is known, no special times and seasons at which the human animal by inner growth is specially ripe for one or another section or aspect of arithmetic, except in so far as the general inner growth of intellectual powers makes the more abstruse and complex tasks suitable to later and later years.

Indeed, very few of even the most enthusiastic devotees of the recapitulation theory or culture-epoch theory have attempted to apply either to the learning of arithmetic, and Branford is the only mathematician, so far as I know, who has advocated such application, even tempered by elaborate shiftings and reversals of the racial order. He says:—

"Thus, for each age of the individual life—infancy, childhood, school, college—may be selected from the racial history the most appropriate form in which mathematical experience can be assimilated. Thus the capacity of the infant and early childhood is comparable with the capacity of animal consciousness and primitive man. The mathematics suitable to later childhood and boyhood (and, of course, girlhood) is comparable with Archæan mathematics passing on through Greek and Hindu to mediæval European mathematics; while the student is become sufficiently mature to begin the assimilation of modern and highly abstract European thought. The filling in of details must necessarily be left to the individual teacher, and also, within some such broadly marked limits, the precise order of the marshalling of the material for each age. For, though, on the whole, mathematical development has gone forward, yet there have been lapses from advances

already made. Witness the practical world-loss of much valuable Hindu thought, and, for long centuries, the neglect of Greek thought: witness the world-loss of the invention by the Babylonians of the Zero, until re-invented by the Hindus, passed on by them to the Arabs, and by these to Europe.

"Moreover, many blunders and false starts and false principles have marked the whole course of development. In a phrase, rivers have their backwaters. But it is precisely the teacher's function to avoid such racial mistakes, to take short cuts ultimately discovered, and to guide the young along the road ultimately found most accessible with such halts and retracings—returns up side-cuts—as the mental peculiarities of the pupils demand.

"All this, the practical realization of the spirit of the principle, is to be wisely left to the mathematical teacher, familiar with the history of mathematical science and with the particular limitations of his pupils and himself." [08, p. 245.]

The latitude of modification suggested by Branford reduces the guidance to be derived from racial history to almost *nil*. Also it is apparent that the racial history in the case of arithmetical achievement is entirely a matter of acquisition and social transmission. Man's original nature is destitute of all arithmetical ideas. The human germs do not know even that one and one make two!

INVENTORIES OF ARITHMETICAL KNOWLEDGE AND SKILL

A scientific plan for teaching arithmetic would begin with an exact inventory of the knowledge and skill which the pupils already possessed. Our ordinary notions of what a child knows at entrance to grade 1, or grade 2, or grade 3, and of what a first-grade child or second-grade child can do, are not adequate. If they were, we should not find reputable textbooks arranging to teach elaborately facts already sufficiently well known to over three quarters of the pupils when they enter school. Nor should we find other textbooks presupposing in their first fifty pages a knowledge of words which not half of the children can read even at the end of the 2 B grade.

We do find just such evidence that ordinary ideas about the abilities of children at the beginning of systematic school training in arithmetic may be in gross error. For example, a reputable and in many ways admirable recent book has fourteen pages of exercises to teach the meaning of two and the fact that one and one make two! As an example of the reverse error, consider putting all these words in the first twenty-five pages of a beginner's book:—*absentees, attendance, blanks, continue, copy, during, examples, grouped, memorize, perfect, similar, splints, therefore, total!*

Little, almost nothing, has been done toward providing an exact inventory compared with what needs to be done. We may note here (1) the facts relevant to arithmetic found by Stanley Hall, Hartmann, and others in their general investigations of the knowledge possessed by children at entrance to school, (2) the facts concerning the power of children to perceive differences in length, area, size of collection, and organization within a collection such as is shown in Fig. 24, and certain facts and theories about early awareness of number.

In the Berlin inquiry of 1869, knowledge of the meaning of two, three, and four appeared in 74, 74, and 73 percent of the children upon entrance to school. Some of those recorded as ignorant probably really knew, but failed to understand that they were expected to reply or were shy. Only 85 percent were recorded as knowing their fathers' names. Seven eighths as many children knew the meanings of two, three, and four as knew their fathers' names. In a similar but more careful experiment with Boston children in September, 1880, Stanley Hall found that 92 percent knew three, 83 percent knew four, and 71½ percent knew five. Three was known about as well as the color red; four was known about as well as the color blue or yellow or green. Hartmann [90] found that two thirds of the children entering school in Annaberg could count from one to ten. This is about as many as knew money, or the familiar objects of the town, or could repeat words spoken to them.

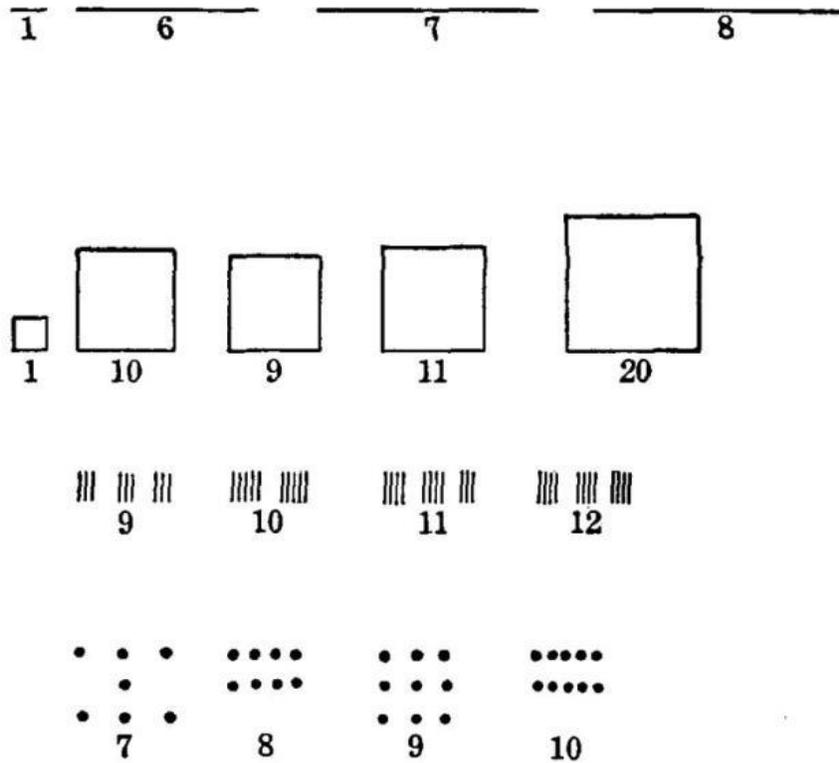

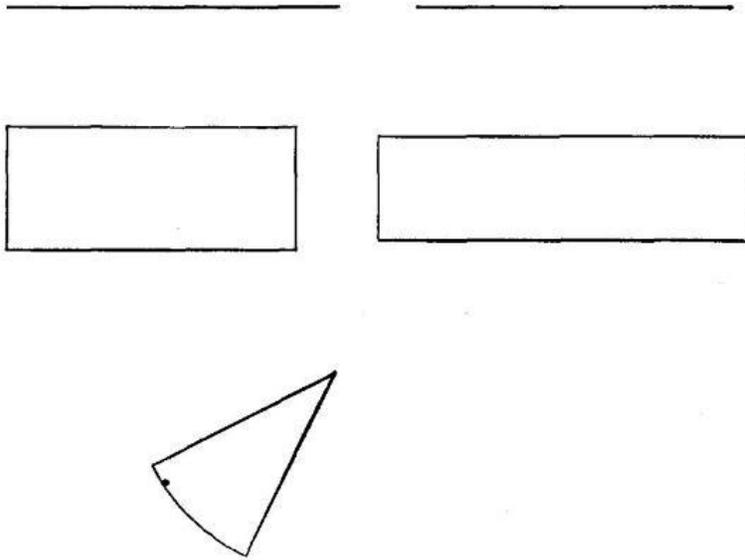

FIG. 24.—Objective presentation.

In the Stanford form of the Binet tests counting four pennies is given as an ability of the typical four-year-old. Counting 13 pennies correctly in at least one out of two trials, and knowing three of the four coins,—penny, nickel, dime, and quarter,—are given as abilities of the typical six-year-old.

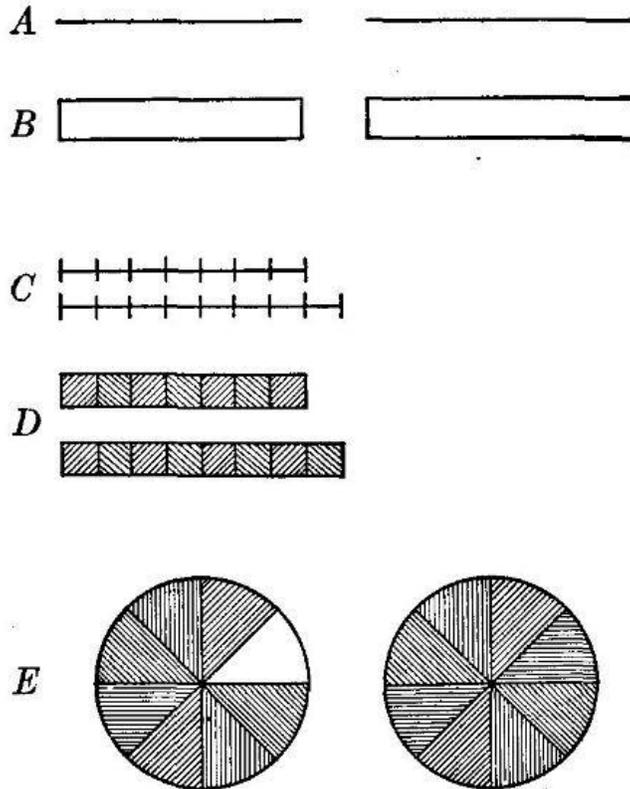

THE PERCEPTION OF NUMBER AND QUANTITY

We know that educated adults can tell how many lines or dots, etc., they see in a single glance (with an exposure too short for the eye to move) up to four or more, according to the clearness of the objects and their grouping. For example, Nanu ['04] reports that when a number of bright circles on a dark background are shown to educated adults for only .033 second, ten can be counted when arranged to form a parallelogram, but only five when arranged in a row. With certain groupings, of course, their 'perception' involves much inference, even conscious addition and multiplication. Similarly they can tell, up to twenty and beyond, the number of taps, notes, or other sounds in a series too rapid for single counting if the sounds are grouped in a convenient rhythm.

These abilities are, however, the product of a long and elaborate learning, including the learning of arithmetic itself. Elementary psychology and common experience teach us that the mere observation of groups or quantities, no matter how clear their number quality appears to the person who already knows the meanings of numbers, does not of itself create the knowledge of the meanings of numbers in one who does not. The experiments of Messenger ['03] and Burnett ['06] showed that there is no direct intuitive apprehension even of two as distinct from one. We have to *learn* to feel the two touches or see the two dots or lines as two.

We do not know by exact measurements the growth in children of this ability to count or infer the number of elements in a collection seen or series heard. Still less do we know what the growth would be without the influence of school training in counting, grouping, adding, and multiplying. Many textbooks and teachers seem to overestimate it greatly. Not all educated adults can, apart from measurement, decide with surety which of these lines is the longer, or which of these areas is the larger, or whether this is a ninth or a tenth or an eleventh of a circle.

Children upon entering school have not been tested carefully in respect to judgments of length and area, but we know from such studies as Gilbert's [94] that the difference required in their case is probably over twice that required for children of 13 or 14. In judging weights, for example, a difference of 6 is perceived as easily by children 13 to 15 years of age as a difference of 15 by six-year-olds.

A teacher who has adult powers of estimating length or area or weight and who also knows already which of the two is longer or larger or heavier, may use two lines to illustrate a difference which they really hide from the child. It is unlikely, for example, that the first of these lines _____ would be recognized as shorter than the second by every child in a fourth-grade class, and it is extremely unlikely that it would be recognized as being $\frac{7}{8}$ of the length of the latter, rather than $\frac{3}{4}$ of it or $\frac{5}{6}$ of it or $\frac{9}{10}$ of it or $\frac{11}{12}$ of it. If the two were shown to a second grade, with the question, "The first line is 7. How long is the other line?" there would be very many answers of 7 or 9; and these might be entirely correct arithmetically, the pupils' errors being all due to their inability to compare the lengths accurately.

The quantities used should be such that their mere discrimination offers no difficulty even to a child of blunted sense powers. If $\frac{7}{8}$ and 1 are to be compared, *A* and *B* are not allowable. *C*, *D*, and *E* are much better.

Teachers probably often underestimate or neglect the sensory difficulties of the tasks they assign and of the material they use to illustrate absolute and relative magnitudes. The result may be more pernicious when the pupils answer correctly than when they fail. For their correct answering may be due to their divination of what the teacher wants; and they may call a thing an inch larger to suit her which does not really seem larger to them at all. This, of course, is utterly destructive of their respect for arithmetic as an exact and matter-of-fact instrument. For example, if a teacher drew a series of lines 20, 21, 22, 23, 24,

and 25 inches long on the blackboard in this form— _____ and asked, "This is 20 inches long, how long is this?" she might, after some errors and correction thereof, finally secure successful response to all the lines by all the children. But their appreciation of the numbers 20, 21, 22, 23, 24, and 25 would be actually damaged by the exercise.

THE EARLY AWARENESS OF NUMBER

There has been some disagreement concerning the origin of awareness of number in the individual, in particular concerning the relative importance of the perception of how-many-ness and that of how-much-ness, of the perception of a defined aggregate and the perception of a defined ratio. (See McLellan and Dewey ['95], Phillips ['97 and '98], and Decroly and Degand ['12].)

The chief facts of significance for practice seem to be these: (1) Children with rare exceptions hear the names *one, two, three, four, half, twice, two times, more, less, as many as, again, first, second, and third*, long before they have analyzed out the qualities and relations to which these words refer so as to feel them at all clearly. (2) Their knowledge of the qualities and relations is developed in the main in close association with the use of these words to the child and by the child. (3) The ordinary experiences of the first five years so develop in the child awareness of the 'how many somethings' in various groups, of the relative magnitudes of two groups or quantities of any sort, and of groups and magnitudes as related to others in a series. For instance, if fairly gifted, a child comes, by the age of five, to see that a row of four cakes is an aggregate of four, seeing each cake as a part of the four and the four as the sum of its parts, to know that two of them are as many as the other two, that half of them would be two, and to think, when it is useful for him to do so, of four as a step beyond three on the way to five, or to think of hot as a step from warm on the way to very hot. The degree of development of these abilities depends upon the activity of the law of analysis in the individual and the character of his experiences.

(4) He gets certain bad habits of response from the ambiguity of common usage of 2, 3, 4, etc., for second, third, fourth. Thus he sees or hears his parents or older children or others count pennies or rolls or eggs by saying one, two, three, four, and so on. He himself is perhaps misled into so counting. Thus the names properly belonging to a series of aggregations varying in amount come to be to him the names of the positions of the parts in a counted whole. This happens especially with numbers above 3 or 4, where the correct experience of the number as a name for the group has rarely been present. This attaching to the cardinal numbers above three or four the meanings of the ordinal numbers seems to affect many children on entrance to school. The numbering of pages in books, houses, streets, etc., and bad teaching of counting often prolong this error.

(5) He also gets the habit, not necessarily bad, but often indirectly so, of using many names such as eight, nine, ten, eleven, fifteen, a hundred, a million, without any meaning.

(6) The experiences of half, twice, three times as many, three times as long, etc., are rarer; even if they were not, they would still be less easily productive of the analysis of the proper abstract element than are the experiences of two, three, four, etc., in connection with aggregates of things each of which is usually called one, such as boys, girls, balls, apples. Experiences of the names, two, three, and four, in connection with two twos, two threes, two fours, are very rare.

Hence, the names, two, three, etc., mean to these children in the main, "one something and one something," "one something usually called one, and one something usually called one, and another something usually called one," and more rarely and imperfectly "two times anything," "three times anything," etc.

With respect to Mr. Phillips' emphasis of the importance of the series-idea in children's minds, the matters of importance are: first, that the knowledge of a series of number names in order is of very little consequence to the teaching of arithmetic and of still less to the origin of awareness of number. Second,

the habit of applying this series of words in counting in such a way that 8 is associated with the eighth thing, 9 with the ninth thing, etc., is of consequence because it does so much mischief. Third, the really valuable idea of the number series, the idea of a series of groups or of magnitudes varying by steps, is acquired later, as a result, not a cause, of awareness of numbers.

With respect to the McLellan-Dewey doctrine, the ratio aspect of numbers should be emphasized in schools, not because it is the main origin of the child's awareness of number, but because it is *not*, and because the ordinary practical issues of child life do *not* adequately stimulate its action. It also seems both more economical and more scientific to introduce it through multiplication, division, and fractions rather than to insist that 4 and 5 shall from the start mean 4 or 5 times anything that is called 1, for instance, that 8 inches shall be called 4 two-inches, or 10 cents, 5 two-cents. If I interpret Professor Dewey's writings correctly, he would agree that the use of inch, foot, yard, pint, quart, ounce, pound, glassful, cupful, handful, spoonful, cent, nickel, dime, and dollar gives a sufficient range of units for the first two school years. Teaching the meanings of $\frac{1}{2}$ of 4, $\frac{1}{2}$ of 6, $\frac{1}{2}$ of 8, $\frac{1}{2}$ of 10, $\frac{1}{2}$ of 20, $\frac{1}{3}$ of 6, $\frac{1}{3}$ of 9, $\frac{1}{3}$ of 30, $\frac{1}{4}$ of 8, two 2s, five 2s, and the like, in early grades, each in connection with many different units of measure, provides a sufficient assurance that numbers will connect with relationships as well as with collections.

CHAPTER XII

INTEREST IN ARITHMETIC

CENSUSES OF PUPILS' INTERESTS

Arithmetic, although it makes little or no appeal to collecting, muscular manipulation, sensory curiosity, or the potent original interests in things and their mechanisms and people and their passions, is fairly well liked by children. The censuses of pupils' likes and dislikes that have been made are not models of scientific investigation, and the resulting percentages should not be used uncritically. They are, however, probably not on the average over-favorable to arithmetic in any unfair way. Some of their results are summarized below. In general they show arithmetic to be surpassed in interest clearly by only the manual arts (shopwork and manual training for boys, cooking and sewing for girls), drawing, certain forms of gymnastics, and history. It is about on a level with reading and science. It clearly surpasses grammar, language, spelling, geography, and religion.

Lobsien ['03], who asked one hundred children in each of the first five grades (*Stufen*) of the elementary schools of Kiel, "Which part of the school work (literally, 'which instruction period') do you like best?" found arithmetic led only by drawing and gymnastics in the case of the boys, and only by handwork in the case of the girls.

This is an exaggerated picture of the facts, since no count is made of those who especially dislike arithmetic. Arithmetic is as unpopular with some as it is popular with others. When full allowance is made for this, arithmetic still has popularity above the average. Stern ['05] asked, "Which subject do you like most?" and "Which subject do you like least?" The balance was greatly in favor of gymnastics for boys (28-1), handwork for girls (32-1½), and drawing for both (16½-6). Writing (6½-4), arithmetic (14½-13), history (9-6½), reading (8½-8), and singing (6-7½) come next. Religion, nature study, physiology, geography, geometry, chemistry, language, and grammar are low.

McKnight ['07] found with boys and girls in grades 7 and 8 of certain American cities that arithmetic was liked better than any of the school subjects except gymnastics and manual training. The vote as compared with history was:—

Arithmetic	327 liked greatly,	96 disliked greatly.
History	164 liked greatly,	113 disliked greatly.

In a later study Lobsien ['09] had 6248 pupils from 9 to 15 years old representing all grades of the elementary school report, so far as they could, the subject most disliked, the subject most liked, the subject next most liked, and the subject next in order. No child was forced to report all of these four judgments, or even any of them. Lobsien counts the likes and the dislikes for each subject. Gymnastics, handwork, and cooking are by far the most popular. History and drawing are next, followed by arithmetic and reading. Below these are geography, writing, singing, nature study, biblical history, catechism, and three minor subjects.

Lewis ['13] secured records from English children in elementary schools of the order of preference of all the studies listed below. He reports the results in the following table of percents:

	TOP THIRD		MIDDLE THIRD		LOWEST THIRD
--	------------------	--	---------------------	--	---------------------

	OF STUDIES FOR INTEREST	OF STUDIES FOR INTEREST	OF STUDIES FOR INTEREST
Drawing	78	20	2
Manual Subjects	66	26	8
History	64	24	12
Reading	53	38	9
Singing	32	48	20
Drill	20	55	25
Arithmetic	16	53	31
Science	23	37	40
Nature Study	16	36	48
Dictation	4	57	39
Composition	18	28	54
Scripture	4	38	58
Recitation	9	23	68
Geography	4	24	72
Grammar	—	6	94

Brandell ['13] obtained data from 2137 Swedish children in Stockholm (327), Norrköping (870), and Gothenburg (940).

In general he found, as others have, that handwork, shopwork for boys and household work for girls, and drawing were reported as much better liked than arithmetic. So also was history, and (in this he differs from most students of this matter) so were reading and nature study. Gymnastics he finds less liked than arithmetic. Religion, geography, language, spelling, and writing are, as in other studies, much less popular than arithmetic.

Other studies are by Lilius ['11] in Finland, Walsemann ['07], Wiederkehr ['07], Pommer ['14], Seekel ['14], and Stern ['13 and '14], in Germany. They confirm the general results stated.

The reasons for the good showing that arithmetic makes are probably the strength of its appeal to the interest in definite achievement, success, doing what one attempts to do; and of its appeal, in grades 5 to 8, to the practical interest of getting on in the world, acquiring abilities that the world pays for. Of these, the former is in my opinion much the more potent interest. Arithmetic satisfies it especially well, because, more than any other of the 'intellectual' studies of the elementary school, it permits the pupil to see his own progress and determine his own success or failure.

The most important applications of the psychology of satisfiers and annoyers to arithmetic will therefore be in the direction of utilizing still more effectively this interest in achievement. Next in importance come the plans to attach to arithmetical learning the satisfyingness of bodily action, play, sociability, cheerfulness, and the like, and of significance as a means of securing other desired ends than arithmetical abilities themselves. Next come plans to relieve arithmetical learning from certain discomforts such as the eyestrain of some computations and excessive copying of figures. These will be discussed here in the inverse order.

RELIEVING EYESTRAIN

At present arithmetical work is, hour for hour, probably more of a tax upon the eyes than reading. The task of copying numbers from a book to a sheet of paper is one of the very hardest tasks that the eyes of a

pupil in the elementary schools have to perform. A certain amount of such work is desirable to teach a child to write numbers, to copy exactly, and to organize material in shape for computation. But beyond that, there is no more reason for a pupil to copy every number with which he is to compute than for him to copy every word he is to read. The meaningless drudgery of copying figures should be mitigated by arranging much work in the form of exercises like those shown on pages 216, 217, and 218, and by having many of the textbook examples in addition, subtraction, and multiplication done with a slip of paper laid below the numbers, the answers being written on it. There is not only a resulting gain in interest, but also a very great saving of time for the pupil (very often copying an example more than quadruples the time required to get its answer), and a much greater efficiency in supervision. Arithmetical errors are not confused with errors of copying,^[16] and the teacher's task of following a pupil's work on the page is reduced to a minimum, each pupil having put the same part of the day's work in just the same place. The use of well-printed and well-spaced pages of exercises relieves the eyestrain of working with badly made gray figures, unevenly and too closely or too widely spaced. I reproduce in Fig. 25 specimens taken at random from one hundred random samples of arithmetical work by pupils in grade 8. Contrast the task of the eyes in working with these and their task in working with pages 216 to 218. The customary method of always copying the numbers to be used in computation from blackboard or book to a sheet of paper is an utterly unjustifiable cruelty and waste.

$7 \times 500 =$	$8 \times 200 =$	$30 \times 3 =$
$3 \times 40 =$	$2 \times 70 =$	$300 \times 3 = 900$
$3 \times 400 =$	$2 \times 700 =$	$300 \times 2 =$

Write the missing numbers: (*r* stands for remainder.)

$25 = \dots 3s$ and $\dots r.$	$30 = \dots 4s$ and $\dots r.$
$25 = \dots 4s$ " $\dots r.$	$30 = \dots 5s$ " $\dots r.$
$25 = \dots 5s$ " $\dots r.$	$30 = \dots 6s$ " $\dots r.$
$25 = \dots 6s$ " $\dots r.$	$30 = \dots 7s$ " $\dots r.$
$25 = \dots 7s$ " $\dots r.$	$30 = \dots 8s$ " $\dots r.$
$25 = \dots 8s$ " $\dots r.$	$30 = \dots 9s$ " $\dots r.$
$25 = \dots 9s$ " $\dots r.$	

$26 = \dots 3s$ and $\dots r.$	$31 = \dots 4s$ and $\dots r.$
$26 = \dots 4s$ " $\dots r.$	$31 = \dots 5s$ " $\dots r.$
$26 = \dots 5s$ " $\dots r.$	$31 = \dots 6s$ " $\dots r.$
$26 = \dots 6s$ " $\dots r.$	$31 = \dots 7s$ " $\dots r.$
$26 = \dots 7s$ " $\dots r.$	$31 = \dots 8s$ " $\dots r.$
$26 = \dots 8s$ " $\dots r.$	$31 = \dots 9s$ " $\dots r.$
$26 = \dots 9s$ " $\dots r.$	

Write the whole numbers or mixed numbers which these fractions equal:—

$\frac{5}{4}$	$\frac{4}{3}$	$\frac{9}{5}$	$\frac{4}{2}$	$\frac{7}{3}$
$\frac{7}{4}$	$\frac{5}{3}$	$\frac{11}{8}$	$\frac{3}{2}$	$\frac{8}{8}$
$\frac{8}{4}$	$\frac{6}{3}$	$\frac{9}{8}$	$\frac{9}{4}$	$\frac{16}{8}$
$\frac{11}{4}$	$\frac{7}{5}$	$\frac{13}{8}$	$\frac{8}{5}$	$\frac{6}{6}$

Write the missing figures:—

$$\frac{6}{8} = \frac{\quad}{4} \quad \frac{2}{4} = \frac{\quad}{2} \quad \frac{8}{10} = \frac{\quad}{5} \quad \frac{1}{5} = \frac{\quad}{10} \quad \frac{2}{3} =$$

Write the missing numerators:—

$\frac{1}{2} = \frac{\quad}{12}$	$\frac{\quad}{8}$	$\frac{\quad}{10}$	$\frac{\quad}{4}$	$\frac{\quad}{16}$	$\frac{\quad}{6}$	$\frac{\quad}{14}$
$\frac{1}{3} = \frac{\quad}{12}$	$\frac{\quad}{9}$	$\frac{\quad}{18}$	$\frac{\quad}{6}$	$\frac{\quad}{15}$	$\frac{\quad}{24}$	$\frac{\quad}{21}$
$1 =$						

$\frac{4}{5}$	=	$\frac{12}{10}$	$\frac{16}{20}$	$\frac{8}{15}$	$\frac{24}{25}$	$\frac{20}{40}$	$\frac{28}{35}$	$\frac{32}{30}$
$\frac{2}{3}$	=	$\frac{12}{18}$	$\frac{16}{21}$	$\frac{6}{21}$	$\frac{15}{15}$	$\frac{24}{15}$	$\frac{24}{24}$	$\frac{9}{9}$
$\frac{3}{4}$	=	$\frac{8}{8}$	$\frac{16}{16}$	$\frac{12}{12}$	$\frac{20}{20}$	$\frac{24}{24}$	$\frac{32}{32}$	$\frac{28}{28}$

Find the products. Cancel when you can:—

$$\frac{5}{16} \times 4 = \quad \frac{11}{12} \times 3 = \quad \frac{2}{3} \times 5 =$$

$$\frac{7}{12} \times 8 = \quad \frac{8}{5} \times 15 = \quad \frac{1}{6} \times 8 =$$

SIGNIFICANCE FOR RELATED ACTIVITIES

The use of bodily action, social games, and the like was discussed in the section on original tendencies. "Significance as a means of securing other desired ends than arithmetical learning itself" is therefore our next topic. Such significance can be given to arithmetical work by using that work as a means to present and future success in problems of sports, housekeeping, shopwork, dressmaking, self-management, other school studies than arithmetic, and general school life and affairs. Significance as a means to future ends alone can also be more clearly and extensively attached to it than it now is.

Whatever is done to supply greater strength of motive in studying arithmetic must be carefully devised so as not to get a strong but wrong motive, so as not to get abundant interest but in something other than arithmetic, and so as not to kill the goose that after all lays the golden eggs—the interest in intellectual activity and achievement itself. It is easy to secure an interest in laying out a baseball diamond, measuring ingredients for a cake, making a balloon of a certain capacity, or deciding the added cost of an extra trimming of ribbon for one's dress. The problem is to *attach* that interest to arithmetical learning. Nor should a teacher be satisfied with attaching the interest as a mere tail that steers the kite, so long as it stays on, or as a sugar-coating that deceives the pupil into swallowing the pill, or as an anodyne whose dose must be increased and increased if it is to retain its power. Until the interest permeates the arithmetical activity itself our task is only partly done, and perhaps is made harder for the next time.

One important means of really interfusing the arithmetical learning itself with these derived interests is to lead the pupil to seek the help of arithmetic himself—to lead him, in Dewey's phrase, to 'feel the need'—to take the 'problem' attitude—and thus appreciate the technique which he actively hunts for to satisfy the need. In so far as arithmetical learning is organized to satisfy the practical demands of the pupil's life at the time, he should, so to speak, come part way to get its help.

Even if we do not make the most skillful use possible of these interests derived from the quantitative problems of sports, housekeeping, shopwork, dressmaking, self-management, other school studies, and school life and affairs, the gain will still be considerable. To have them in mind will certainly preserve us from giving to children of grades 3 and 4 problems so devoid of relation to their interests as those shown below, all found (in 1910) in thirty successive pages of a book of excellent repute:—

A chair has 4 legs. How many legs have 8 chairs? 5 chairs?

A fly has 6 legs. How many legs have 3 flies? 9 flies? 7 flies?

(Eight more of the same sort.)

In 1890 New York had 1,513,501 inhabitants, Milwaukee had 206,308, Boston had 447,720, San Francisco 297,990. How many had these cities together?

(Five more of the same sort.)

Milton was born in 1608 and died in 1674. How many years did he live?

(Several others of the same sort.)

The population of a certain city was 35,629 in 1880 and 106,670 in 1890. Find the increase.

(Several others of this sort.)

A number of others about the words in various inaugural addresses and the Psalms in the Bible.

It also seems probable that with enough care other systematic plans of textbooks can be much improved in this respect. From every point of view, for example, the early work in arithmetic should be adapted to some extent to the healthy childish interests in home affairs, the behavior of other children, and the activities of material things, animals, and plants.

TABLE 9

FREQUENCY OF APPEARANCE OF CERTAIN WORDS ABOUT FAMILY LIFE, PLAY, AND ACTION IN EIGHT ELEMENTARY TEXTBOOKS IN ARITHMETIC, pp. 1-50.

	A	B	C	D	E	F	G	H

flower	1			4	1	1	2	
grow				1				
plant			2					
seed				3			1	
string					1	10	1	1
wheel	5					10		

The words used by textbooks give some indication of how far this aim is being realized, or rather of how far short we are of realizing it. Consider, for example, the words home, mother, father, brother, sister, help, plate, knife, fork, spoon, play, game, toy, tag, marbles, doll, run, jump, sing, plant, seed, grow, flower, car, wheel, string, cut, dig. The frequency of appearance in the first fifty pages of eight beginners' arithmetics was as shown in Table

9. The eight columns refer to the eight books (the first fifty pages of each). The numbers refer to the number of times the word in question appeared, the number 10 meaning 10 *or more* times in the fifty pages. Plurals, past tenses, and the like were counted. *Help, fork, knife, spoon, jump, sing, and tag* did not appear at all! *Toy* and *grow* appeared each once in the 400 pages! *Play, run, dig, plant, and seed* appeared once in a hundred or more pages. *Baby* did not appear as often as *buggy*. *Family* appeared no oftener than *fence* or *Friday*. *Father* appears about a third as often as *farmer*.

Book A shows only 10 of these thirty words in the fifty pages; book B only 4; book C only 12; and books D, E, F, G, and H only 13, 8, 14, 13, 10, respectively. The total number of appearances (counting the 10s as only 10 in each case) is 40 for A, 9 for B, 60 for C, 42 for D, 25 for E, 62 for F, 30 for G, and 37 for H. The five words—apple, egg, Mary, milk, and orange—are used oftener than all these thirty together.

If it appeared that this apparent neglect of childish affairs and interests was deliberate to provide for a more systematic treatment of pure arithmetic, a better gradation of problems, and a better preparation for later genuine use than could be attained if the author of the textbook were tied to the child's apron strings, the neglect could be defended. It is not at all certain that children in grade 2 get much more enjoyment or ability from adding the costs of purchases for Christmas or Fourth of July, or multiplying the number of cakes each child is to have at a party by the number of children who are to be there, than from adding gravestones or multiplying the number of hairs of bald-headed men. When, however, there is nothing gained by substituting remote facts for those of familiar concern to children, the safe policy is surely to favor the latter. In general, the neglect of childish data does not seem to be due to provision for some other end, but to the same inertia of tradition which has carried over the problems of laying walls and digging wells into city schools whose children never saw a stone wall or dug well.

I shall not go into details concerning the arrangement of courses of study, textbooks, and lesson-plans to make desirable connections between arithmetical learning and sports, housework, shopwork, and the rest. It may be worth while, however, to explain the term *self-management*, since this source of genuine problems of real concern to the pupils has been overlooked by most writers.

By self-management is meant the pupil's use of his time, his abilities, his knowledge, and the like. By the time he reaches grade 5, and to some extent before then, a boy should keep some account of himself, of how long it takes him to do specified tasks, of how much he gets done in a specified time at a certain sort of work and with how many errors, of how much improvement he makes month by month, of which things he can do best, and the like. Such objective, matter-of-fact, quantitative study of one's behavior is not a stimulus to morbid introspection or egotism; it is one of the best preventives of these. To treat oneself impersonally is one of the essential elements of mental balance and health. It need not, and should not, encourage priggishness. On the contrary, this matter-of-fact study of what one is and does may well replace a certain amount of the exhortations and admonitions concerning what one ought to do and be. All this is still truer for a girl.

The demands which such an accounting of one's own activities make of arithmetic have the special value of connecting directly with the advanced work in computation. They involve the use of large numbers, decimals, averaging, percentages, approximations, and other facts and processes which the pupil has to learn for later life, but to which his childish activities as wage-earner, buyer and seller, or shopworker from 10 to 14 do not lead. Children have little money, but they have time in thousands of units! They do not get discounts or bonuses from commercial houses, but they can discount their quantity of examples done for the errors made, and credit themselves with bonuses of all sorts for extra achievements.

INTRINSIC INTEREST IN ARITHMETICAL LEARNING

There remains the most important increase of interest in arithmetical learning—an increase in the interest directly bound to achievement and success in arithmetic itself. "Arithmetic," says David Eugene Smith, "is a game and all boys and girls are players." It should not be a *mere* game for them and they should not *merely* play, but their unpractical interest in doing it because they can do it and can see how well they do it is one of the school's most precious assets. Any healthy means to give this interest more and better stimulus should therefore be eagerly sought and cherished.

Two such means have been suggested in other connections. The first is the extension of training in checking and verifying work so that the pupil may work to a standard of approximately 100% success, and may know how nearly he is attaining it. The second is the use of standardized practice material and tests, whereby the pupil may measure himself against his own past, and have a clear, vivid, and trustworthy idea of just how much better or faster he can do the same tasks than he could do a month or a year ago, and of just how much harder things he can do now than then.

Another means of stimulating the essential interest in quantitative thinking itself is the arrangement of the work so that real arithmetical thinking is encouraged more than mere imitation and assiduity. This means the avoidance of long series of applied problems all of one type to be solved in the same way, the avoidance of miscellaneous series and review series which are almost verbatim repetitions of past problems, and in general the avoidance of excessive repetition of any one problem-situation. Stimulation to real arithmetical thinking is weak when a whole day's problem work requires no choice of methods, or when a review simply repeats without any step of organization or progress, or when a pupil meets a situation (say the 'buy x things at y per thing, how much pay' situation) for the five-hundredth time.

Another matter worthy of attention in this connection is the unwise tendency to omit or present in diluted form some of the topics that appeal most to real intellectual interests, just because they are hard. The best illustration, perhaps, is the problem of ratio or "How many times as large (long, heavy, expensive, etc.) as x is y ?" Mastery of the 'times as' relation is hard to acquire, but it is well worth acquiring, not only because of its strong intellectual appeal, but also because of its prime importance in the applications of arithmetic to science. In the older arithmetics it was confused by pedantries and verbal difficulties and penalized by unreal problems about fractions of men doing parts of a job in strange and devious times. Freed from these, it should be reinstated, beginning as early as grade 5 with such simple exercises as those shown below and progressing to the problems of food values, nutritive ratios, gears, speeds, and the like in grade 8.

John is 4 years old.
Fred is 6 years old.
Mary is 8 years old.
Nell is 10 years old.
Alice is 12 years old.
Bert is 15 years old.

Who is twice as old as John?
Who is half as old as Alice?
Who is three times as old as John?
Who is one and one half times as old as Nell?
Who is two thirds as old as Fred?
etc., etc., etc.

Alice is times as old as John.
John is as old as Mary.
Fred is times as old as John.
Alice is times as old as Fred.
Fred is as old as Mary.
etc., etc., etc.

Finally it should be remembered that all improvements in making arithmetic worth learning and helping the pupil to learn it will in the long run add to its interest. Pupils like to learn, to achieve, to gain mastery. Success is interesting. If the measures recommended in the previous chapters are carried out, there will be little need to entice pupils to take arithmetic or to sugar-coat it with illegitimate attractions.

CHAPTER XIII

THE CONDITIONS OF LEARNING

We shall consider in this chapter the influence of time of day, size of class, and amount of time devoted to arithmetic in the school program, the hygiene of the eyes in arithmetical work, the use of concrete objects, and the use of sounds, sights, and thoughts as situations and of speech and writing and thought as responses.^[17]

EXTERNAL CONDITIONS

Computation of one or another sort has been used by several investigators as a test of efficiency at different times in the day. When freed from the effects of practice on the one hand and lack of interest due to repetition on the other, the results uniformly show an increase in speed late in the school session with a falling off in accuracy that about balances it.^[18] There is no wisdom in putting arithmetic early in the session because of its *difficulty*. Lively and sociable exercises in mental arithmetic with oral answers in fact seem to be admirably fitted for use late in the session. Except for the general principles (1) of starting the day with work that will set a good standard of cheerful, efficient production and (2) of getting the least interesting features of the day's work done fairly early in the day, psychology permits practical exigencies to rule the program, so far as present knowledge extends. Adequate measurements of the effect of time of day on *improvement* have not been made, but there is no reason to believe that any one time between 9 A.M. and 4 P.M. is appreciably more favorable to arithmetical learning than to learning geography, history, spelling, and the like.

The influence of size of class upon progress in school studies is very difficult to measure because (1) within the same city system the average of the six (or more) sizes of class that a pupil has experienced will tend to approximate closely to the corresponding average for any other child; because further (2) there may be a tendency of supervisory officers to assign more pupils to the better teachers; and because (3) separate systems which differ in respect to size of class probably differ in other respects also so that their differences in achievement may be referable to totally different differences.

Elliott [14] has made a beginning by noting size of class during the year of test in connection with his own measures of the achievements of seventeen hundred pupils, supplemented by records from over four hundred other classes. As might be expected from the facts just stated, he finds no appreciable difference between classes of different sizes within the same school system, the effect of the few months in a small class being swamped by the antecedents or concomitants thereof.

The effect of the amount of time devoted to arithmetic in the school program has been studied extensively by Rice [02 and '03] and Stone [08].

Dr. Rice [02] measured the arithmetical ability of some 6000 children in 18 different schools in 7 different cities. The results of these measurements are summarized in Table 10. This table "gives two averages for each grade as well as for each school as a whole. Thus, the school at the top shows averages of 80.0 and 83.1, and the one at the bottom, 25.3 and 31.5. The first represents the percentage of answers which were absolutely correct; the second shows what per cent of the problems were correct in principle, *i.e.* the average that would have been received if no mechanical errors had been made."

The facts of Dr. Rice's table show that there is a positive relation between the general standing of a school system in the tests and the amount of time devoted to arithmetic by its program. The relation is not close, however, being that expressed by a correlation coefficient of .36½. Within any one school system there is no relation between the standing of a particular school and the amount of time devoted to arithmetic in that school's program. It must be kept in mind that the amount of time given in the school program may be counterbalanced by emphasizing work at home and during study periods, or, on the other hand, may be a symptom of correspondingly small or great emphasis on arithmetic in work set for the study periods at home.

A still more elaborate investigation of this same topic was made by Stone ['08]. I quote somewhat fully from it, since it is an instructive sample of the sort of studies that will doubtless soon be made in the case of every elementary school subject. He found that school systems differed notably in the achievements made by their sixth-grade pupils in his tests of computation (the so-called 'fundamentals') and of the solution of verbally described problems (the so-called 'reasoning'). The facts were as shown in Table 11.

TABLE 10

AVERAGES FOR INDIVIDUAL SCHOOLS IN ARITHMETIC

CITY	SCHOOL	6TH YEAR		7TH YEAR		8TH YEAR		SCHOOL AVERAGE		
		Result	Principle	Result	Principle	Result	Principle	Result	Principle	Percent of Mechanical Errors
III	1	79.3	80.3	81.1	82.3	91.7	93.9	80.0	83.1	3.7
I	1	80.4	81.5	64.2	67.2	80.9	82.8	76.6	80.3	4.6
I	2	80.9	83.4	43.5	50.9	72.7	79.1	69.3	75.1	7.7
I	3	72.2	74.0	63.5	66.2	74.5	76.6	67.8	72.2	6.1
I	4	69.9	72.2	54.6	57.8	66.5	69.1	64.3	70.3	8.5
II	1	71.2	75.3	33.6	35.7	36.8	40.0	60.2	64.8	7.1
III	2	43.7	45.0	53.9	56.7	51.1	53.1	54.5	58.9	7.4
IV	1	58.9	60.4	31.2	34.1	41.6	43.5	55.1	58.4	5.6
IV	2	59.8	63.1	—	—	22.5	22.5	53.9	58.8	8.3
IV	3	54.9	58.1	35.2	38.6	43.5	45.0	51.5	57.6	10.5
IV	4	42.3	45.1	16.1	19.2	48.7	48.7	42.8	48.2	11.2
V	1	44.1	48.7	29.2	32.5	51.1	58.3	45.9	51.3	10.5
VI	1	68.3	71.3	33.5	36.6	26.9	30.7	39.0	42.9	9.0
VI	2	46.1	49.5	19.5	24.2	30.2	40.6	36.5	43.6	16.2
VI	3	34.5	36.4	30.5	35.1	23.3	24.1	36.0	42.5	15.2
VII	1	35.2	37.7	29.1	32.5	25.1	27.2	40.5	45.9	11.7
VII	2	35.2	38.7	15.0	16.4	19.6	21.2	36.5	40.6	10.1
VII	3	27.6	33.7	8.9	10.1	11.3	11.3	25.3	31.5	19.6

High achievement by a system in computation went with high achievement in solving the problems, the correlation being about .50; and the system that scored high in addition or subtraction or multiplication or division usually showed closely similar excellence in the other three, the correlations being about .90.

TABLE 11

SCORES MADE BY THE SIXTH-GRADE PUPILS OF EACH OF TWENTY-SIX SCHOOL SYSTEMS

SYSTEM	SCORE IN TESTS WITH PROBLEMS	SCORE IN TESTS IN COMPUTING
23	356	1841
24	429	3513
17	444	3042
4	464	3563
25	464	2167

26	791	3682
19	848	4099
5	914	3569

Of the conditions under which arithmetical learning took place, the one most elaborately studied was the amount of time devoted to arithmetic. On the basis of replies by principals of schools to certain questions, he gave each of the twenty-six school systems a measure for the probable time spent on arithmetic up through grade 6. Leaving home study out of account, there seems to be little or no correlation between the amount of time a system devotes to arithmetic and its score in problem-solving, and not much more between time expenditure and score in computation. With home study included there is little relation to the achievement of the system in solving problems, but there is a clear effect on achievement in computation. The facts as given by Stone are:—

TABLE 12

CORRELATION OF TIME EXPENDITURES WITH ABILITIES

Without Home Study	Reasoning and Time Expenditure	-.01
{	Fundamentals and Time	.09
	Expenditure	
Including Home Study	Reasoning and Time Expenditure	.13
{	Fundamentals and Time	.49
	Expenditure	

These correlations, it should be borne in mind, are for school systems, not for individual pupils. It might be that, though the system which devoted the most time to arithmetic did not show corresponding superiority in the product over the system devoting only half as much time, the pupils within the system did achieve in exact proportion to the time they gave to study. Neither correlation would permit inference concerning the effect of different amounts of time spent by the same pupil.

Stone considered also the printed announcements of the courses of study in arithmetic in these twenty-six systems. Nineteen judges rated these announced courses of study for excellence according to the instructions quoted below:—

CONCERNING THE RATING OF COURSES OF STUDY

Judges please read before scoring

I. Some Factors Determining Relative Excellence.

(N. B. The following enumeration is meant to be suggestive rather than complete or exclusive. And each scorer is urged to rely primarily on his own judgment.)

1. Helpfulness to the teacher in teaching the subject matter outlined.
2. Social value or concreteness of sources of problems.
3. The arrangement of subject matter.
4. The provision made for adequate drill.
5. A reasonable minimum requirement with suggestions for valuable additional work.

6. The relative values of any predominating so-called methods—such as Speer, Grube, etc.
7. The place of oral or so-called mental arithmetic.
8. The merit of textbook references.

II. Cautions and Directions.

(Judges please follow as implicitly as possible.)

1. Include references to textbooks as parts of the Course of Study.
This necessitates judging the parts of the texts referred to.
2. As far as possible become equally familiar with all courses before scoring any.
3. When you are ready to begin to score, (1) arrange in serial order according to excellence, (2) starting with the middle one score it 50, then score above and below 50 according as courses are better or poorer, indicating relative differences in excellence by relative differences in scores, *i.e.* in so far as you find that the courses differ by about equal steps, score those better than the middle one 51, 52, etc., and those poorer 49, 48, etc., but if you find that the courses differ by unequal steps show these inequalities by omitting numbers.
4. Write ratings on the slip of paper attached to each course.

The systems whose courses of study were thus rated highest did not manifest any greater achievement in Stone's tests than the rest. The thirteen with the most approved announcements of courses of study were in fact a little inferior in achievement to the other thirteen, and the correlation coefficients were slightly negative.

Stone also compared eighteen systems where there was supervision of the work by superintendents or supervisors as well as by principals with four systems where the principals and teachers had no such help. The scores in his tests were very much lower in the four latter cities.

THE HYGIENE OF THE EYES IN ARITHMETIC

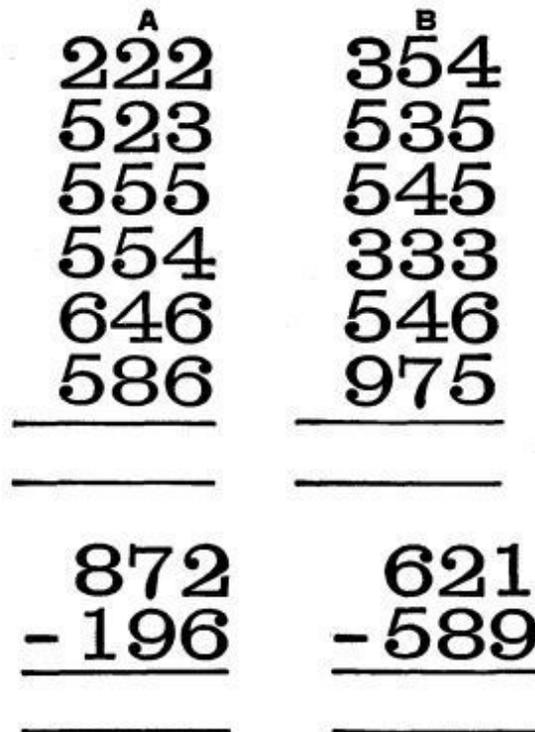

FIG. 26.—Type too large.

We have already noted that the task of reading and copying numbers is one of the hardest that the eyes have to perform in the elementary school, and that it should be alleviated by arranging much of the work so that only answers need be written by the pupil. The figures to be read and copied should obviously be in type of suitable size and style, so arranged and spaced on the page or blackboard as to cause a minimum of effort and strain.

FIG. 27.—12-point, 11-point, and 10-point type.

Size.—Type may be too large as well as too small, though the latter is the commoner error. If it is too large, as in Fig. 26, which is a duplicate of type actually used in a form of practice pad, the eye has to make too many fixations to take in a given content. All things considered, 12-point type in

grades 3 and 4, 11-point in grades 5 and 6, and 10-point in grades 7 and 8 seem the most desirable sizes. These are shown in Fig. 27. Too small type occurs oftenest in fractions and in the dimension-numbers or scale numbers of drawings. Figures 28, 29, and 30 are samples from actual school practice. Samples of the desirable size are shown in Figs. 31 and 32. The technique of modern typesetting makes it very difficult and expensive to make fractions of the horizontal type

$$\left(\frac{1}{4} \quad , \quad \frac{3}{8} \quad , \quad \frac{5}{6} \quad \right)$$

large enough without making the whole-number figures with which they are mingled too large or giving an uncouth appearance to the total. Consequently fractions somewhat smaller than are desirable may have to be used occasionally in textbooks.^[19] There is no valid excuse, however, for the excessively small fractions which often are made in blackboard work.

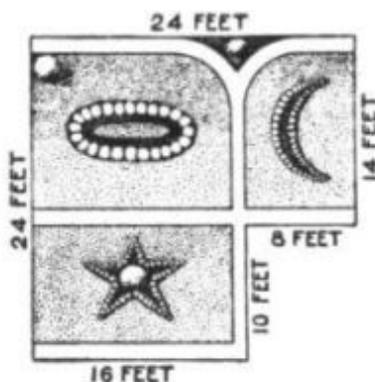

FIG. 28.—Type of measurements too small.

This is a picture of Mary's garden.
How many feet is it around the garden?

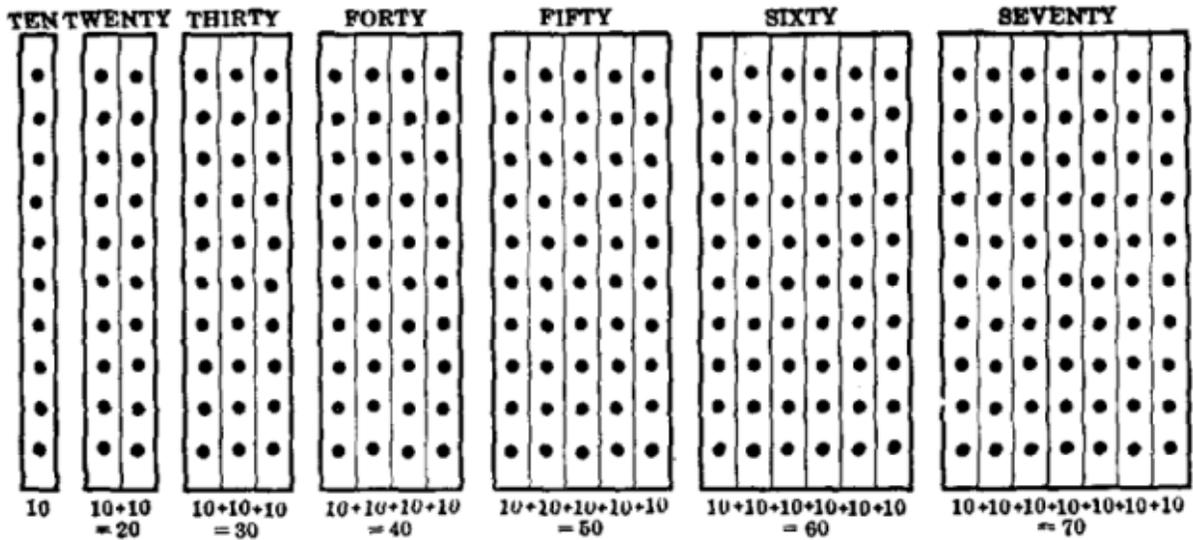

FIG. 29.—Type too small.

Find the area of:

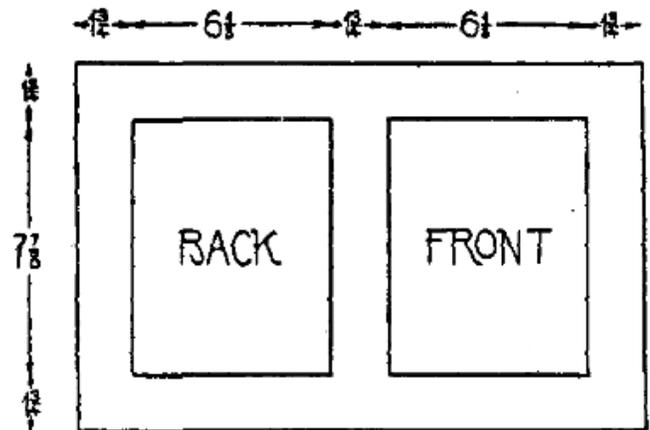

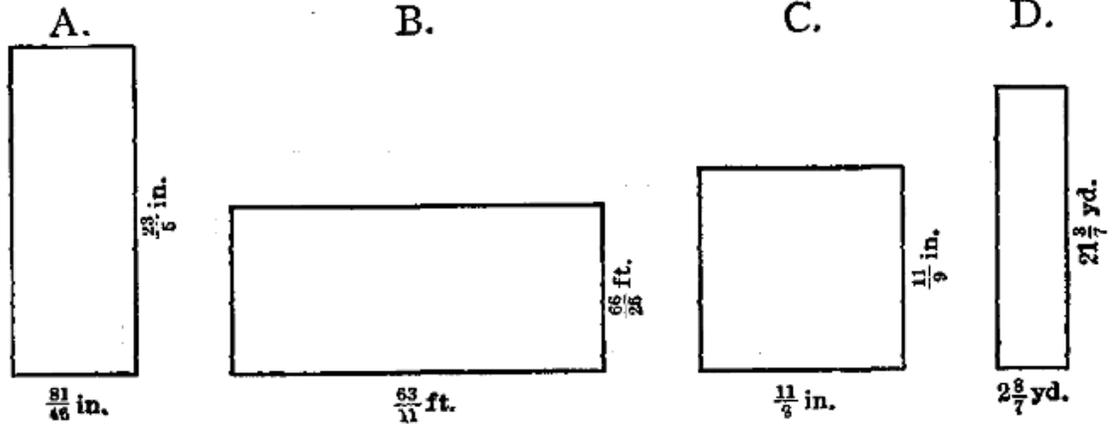

FIG. 30.—Numbers too small and badly designed.

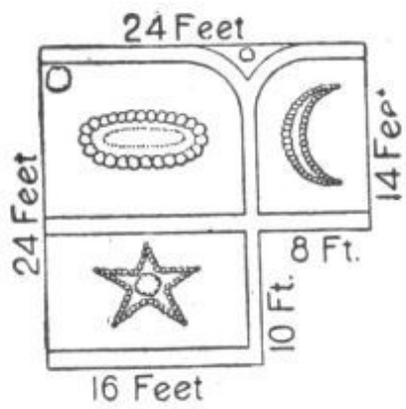

FIG. 31.—Figure 28 with suitable numbers.

Find the area of:

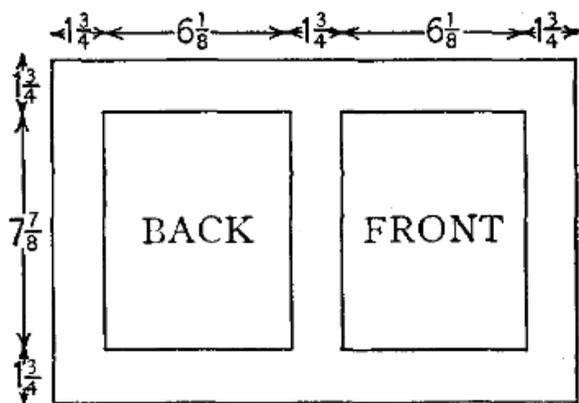

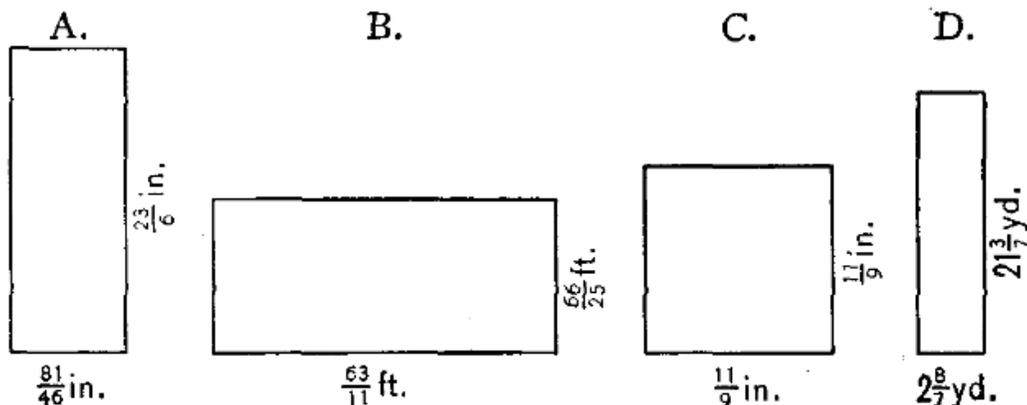

FIG. 32.—Figure 30 with suitable numbers.

Style.—The ordinary type forms often have 3 and 8 so made as to require strain to distinguish them. 5 is sometimes easily confused with 3 and even with 8. 1, 4, and 7 may be less easily distinguishable than is desirable. Figure 33 shows a specially good type in which each figure is represented by its essential^[20] features without any distracting shading or knobs or turns. Figure 34 shows some of the types in common use. There are no demonstrably great differences amongst these. In fractions there is a notable gain from using the slant form ($\frac{2}{3}$, $\frac{3}{4}$) for exercises in addition and subtraction, and for almost all mixed numbers. This appears clearly to the eye in the comparison of Fig. 35 below, where the same fractions all in 10-point type are displayed in horizontal and in slant form. The figures in the slant form are in general larger and the space between them and the fraction-line is wider. Also the slant form makes it easier for the eye to examine the denominators to see whether reductions are necessary. Except for a few

cases to show that the operations can be done just as truly with the horizontal forms, the book and the blackboard should display mixed numbers and fractions to be added or subtracted in the slant form. The slant line should be at an angle of approximately 45 degrees. Pupils should be taught to use this form in their own work of this sort.

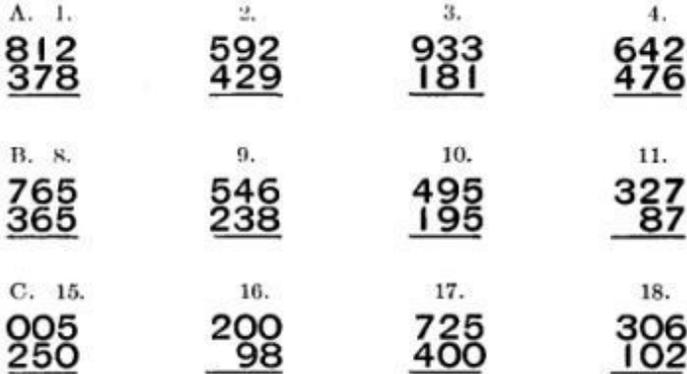

FIG. 33.—Block type; a very desirable type except that it is somewhat too heavy.

 1 2 3 4 5 6 7
 1 2 3 4 5 6 7

FIG. 34.—Common styles of printed numbers.

When script figures are presented they should be of simple design, showing clearly the essential features of the figure, the line being everywhere of equal or nearly equal width (that is, without shading, and without ornamentation or eccentricity of any sort). The opening of the 3 should be wide to prevent confusion with 8; the top of the 3 should be curved to aid its differentiation from 5; the down stroke of the 9 should be almost or quite straight; the 1, 4, 7, and 9 should be clearly distinguishable. There are many ways of distinguishing them clearly, the best probably being to use the straight line for 1, the open 4 with clear angularity, a wide top to the 7, and a clearly closed curve for the top of the 9.

FIGS. 38 (above) and 39 (below).—Good and bad left-right spacing.

The pupil's writing of figures should be clear. He will thereby be saved eyestrain and errors in his school work as well as given a valuable ability for life. Handwriting of figures is used enormously in spite of the development of typewriters; illegible figures are commonly more harmful than illegible letters or words, since the context far less often tells what the figure is intended to be; the habit of making clear figures is not so hard to acquire, since they are written unjoined and require only the automatic action of ten minor acts of skill. The schools have missed a great opportunity in this respect. Whereas the hand writing of words is often better than it needs to be

for life's purposes, the writing of figures is usually much worse. The figures presented in books on penmanship are also commonly bad, showing neglect or misunderstanding of the matter on the part of leaders in penmanship.

Spacing.—Spacing up and down the column is rarely too wide, but very often too narrow. The specimens shown in Figs. 36 and 37 show good practice contrasted with the common fault.

Spacing from right to left is generally fairly satisfactory in books, though there is a bad tendency to adopt some one routine throughout and so to miss chances to use reductions and increases of spacing so as to help the eye and the mind in special cases. Specimens of good and bad spacing are shown in Figs. 38 and 39. In the work of the pupils, the spacing from right to left is often too narrow. This crowding of letters, together with unevenness of spacing, adds notably to the task of eye and mind.

The composition or make-up of the page.—Other things being equal, that arrangement of the page is best which helps a child most to keep his place on a page and to find it after having looked away to work on the paper on which he computes, or for other good reasons. A good page and a bad page in this respect are shown in Figs. 40 and 41.

Suppose that you are a clerk selling butter and cheese at these prices. Find the cost of each purchase.

Butter		Cheese	
<i>Standard Creamery</i>	24¢ per pound	<i>Cottage</i>	16¢ per pound
<i>Oak Farm</i>	30¢ " "	<i>Full Cream</i>	22¢ " "
<i>Cedar Farm Special</i>	34¢ " "	<i>Old English</i>	32¢ " "
<i>XX Unsalted</i>	45¢ " "	<i>Swiss</i>	38¢ " "

1. $\frac{3}{4}$ lb. Oak Farm butter.	26. $2\frac{1}{4}$ lb. Cedar Farm butter.
2. $1\frac{3}{4}$ lb. Oak Farm butter.	27. $\frac{7}{8}$ lb. Full cream cheese.
3. $\frac{3}{8}$ lb. Cottage cheese.	28. $1\frac{3}{8}$ lb. Old English.
4. $\frac{3}{8}$ lb. Old English cheese.	29. $\frac{3}{4}$ lb. Full cream cheese.
5. $\frac{5}{8}$ lb. Old English cheese.	30. $1\frac{5}{8}$ lb. Swiss cheese.
6. $\frac{1}{2}$ lb. Swiss cheese.	31. $3\frac{7}{8}$ lb. Old English cheese.
7. $\frac{1}{4}$ lb. Swiss cheese.	32. $1\frac{1}{8}$ lb. Standard creamery.

Unsalted butter. 46. 11 oz. Swiss cheese. 47. 20 oz. Cottage cheese. 48. 1 lb. 6 oz. Oak Farm. 49. 10 oz. Unsalted butter. 50. 2 lb. 4 oz. Old English.

FIG. 41.—The same matter as in Fig. 40, much less well made up.

Objective presentations.—Pictures, diagrams, maps, and other presentations should not tax the eye unduly,

- (a) by requiring too fine distinctions, or
- (b) by inconvenient arrangement of the data, preventing easy counting, measuring, comparison, or whatever the task is, or
- (c) by putting too many facts in one picture so that the eye and mind, when trying to make out any one, are confused by the others.

Illustrations of bad practices in these respects are shown in Figs. 42 to 52. A few specimens of work well arranged for the eye are shown in Figs. 53 to 56.

Good rules to remember are:—

Other things being equal, make distinctions by the clearest method, fit material to the tendency of the eye to see an 'eyeful' at a time (roughly $1\frac{1}{2}$ inch by $\frac{1}{2}$ inch in a book; $1\frac{1}{2}$ ft. by $\frac{1}{2}$ ft. on the blackboard), and let one picture teach only one fact or relation, or such facts and relations as do not interfere in perception.

The general conditions of seating, illumination, paper, and the like are even more important when the eyes are used with numbers than when they are used with words.

FIG. 42.—Try to count the rungs on the ladder, or the shocks in the wagon.

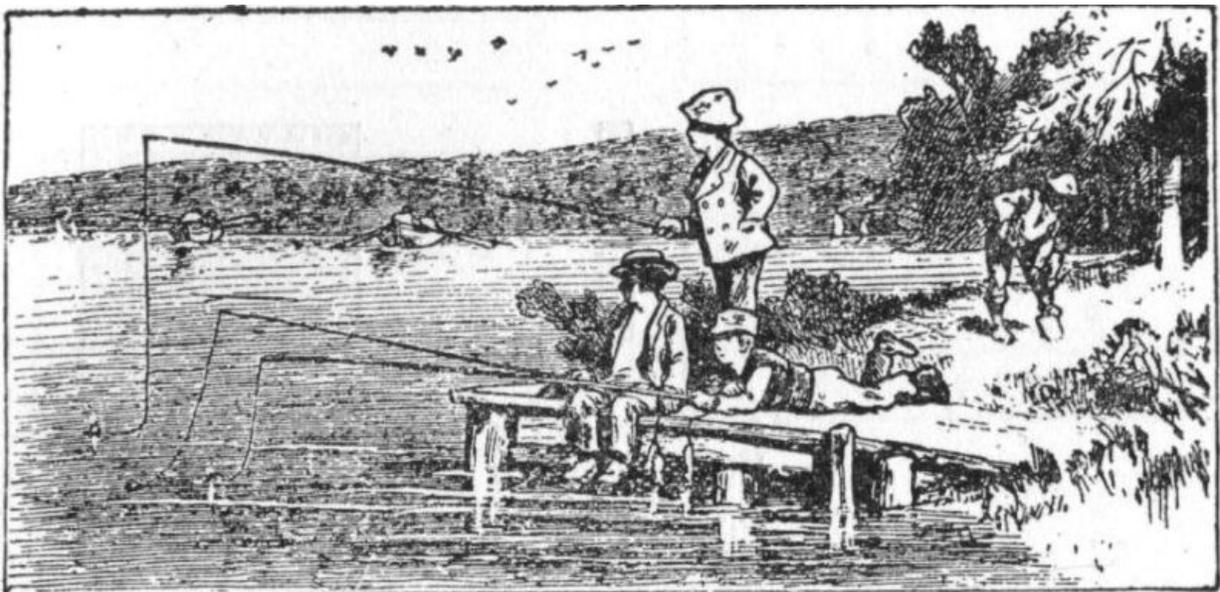

FIG. 43.—How many oars do you see? How many birds? How many fish?

FIG. 44.—Count the birds in each of the three flocks of birds.

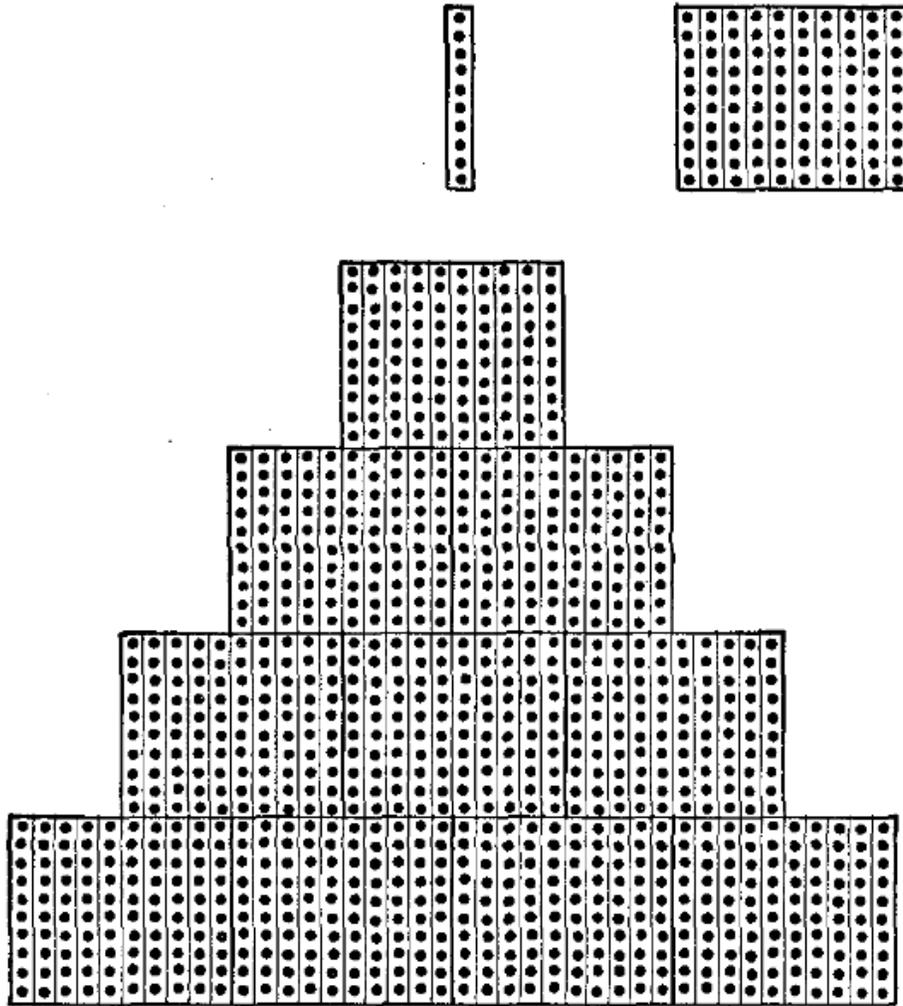

FIG. 45.—Note the lack of clear division of the hundreds. Consider the difficulty of counting one of these columns of dots.

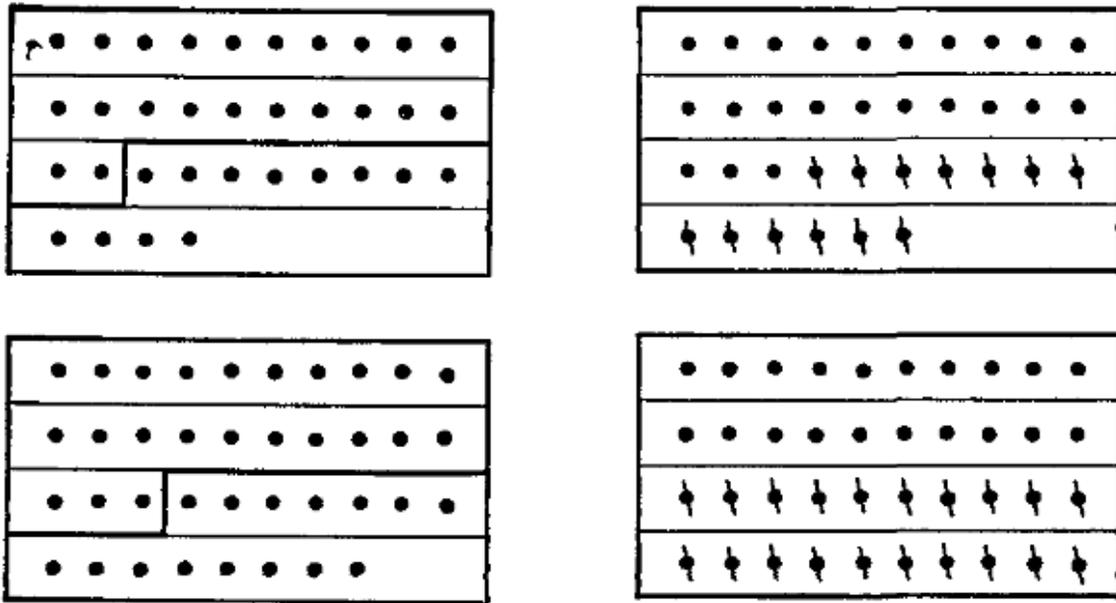

FIG. 46.—What do you suppose these pictures are intended to show?

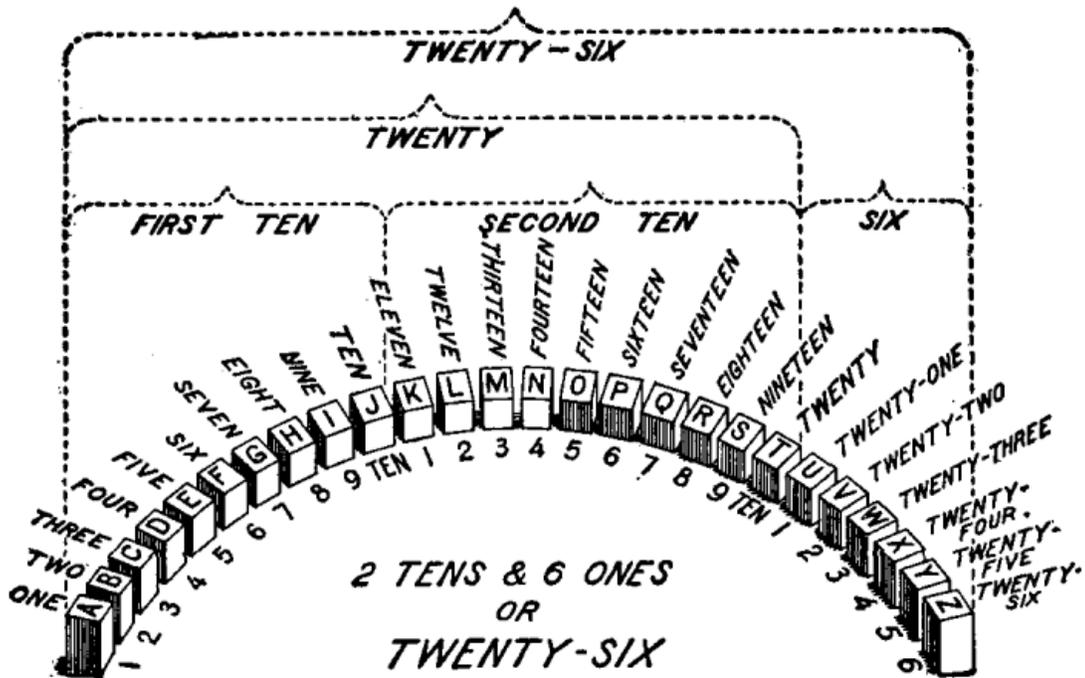

FIG. 47.—Would a beginner know that after THIRTEEN he was to switch around and begin at the other end? Could you read the SIX of TWENTY-SIX if you did not already know what it ought to be? What meaning would all the brackets have for a little child in grade 2? Does this picture illustrate or obfuscate?

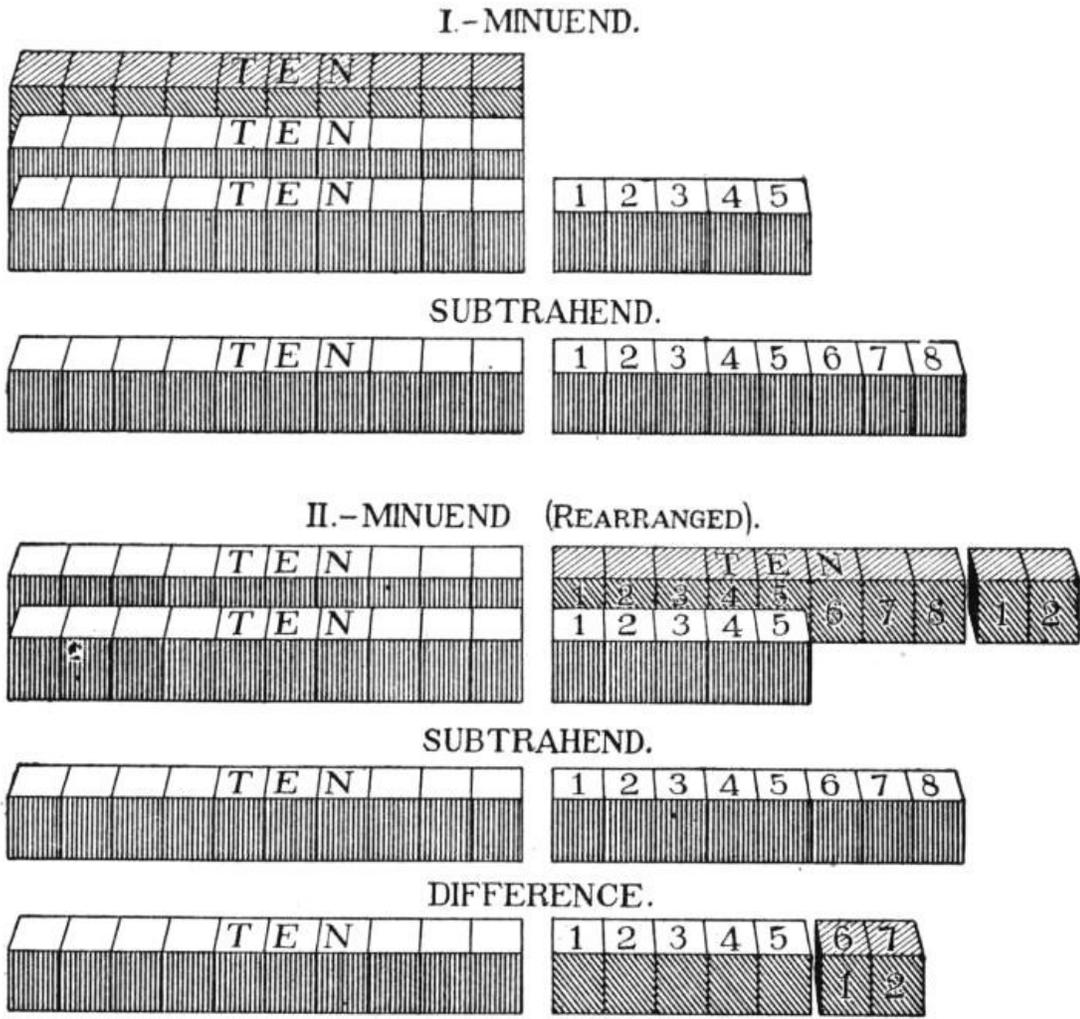

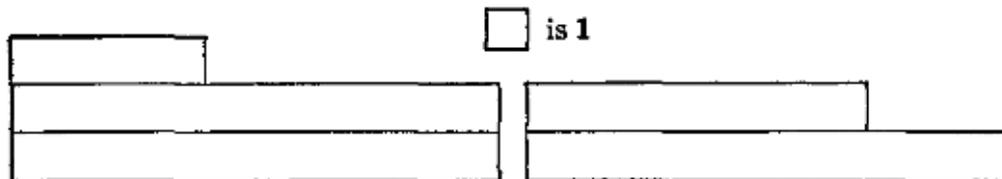

FIG. 48.—How long did it take you to find out what these pictures mean?

FIG. 49.—Count the figures in the first row, using your eyes alone; have some one make lines of 10, 11, 12, 13, and more repetitions of this figure spaced closely as here. Count 20 or 30 such lines, using the eye unaided by fingers, pencil, etc.

These oblongs show what numbers?

FIG. 50.—Can you answer the question without measuring? Could a child of seven or eight?

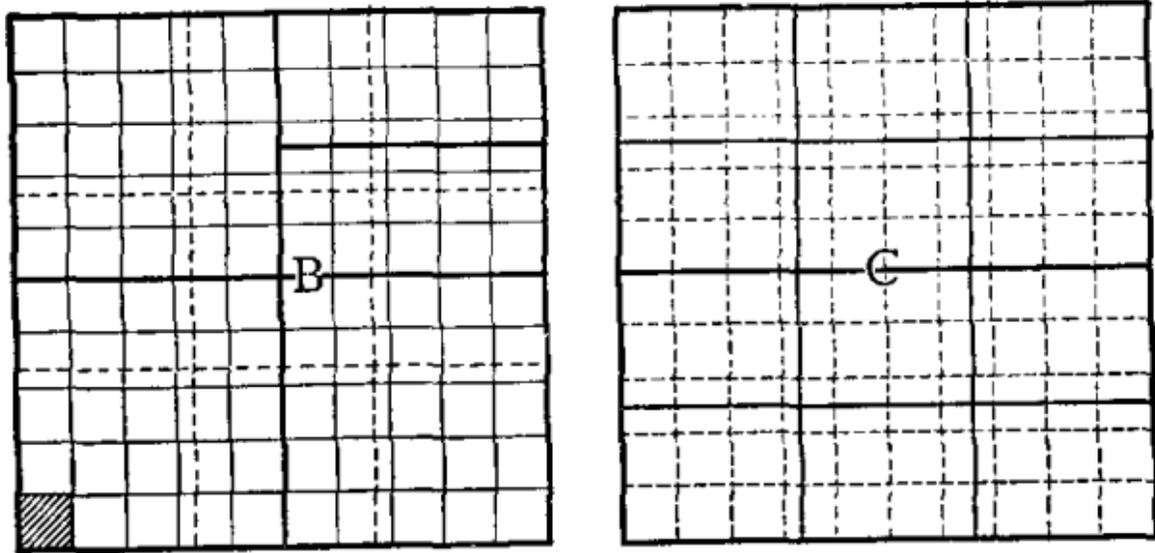

FIG. 51.—What are these drawings intended to show? Why do they show the facts only obscurely and dubiously?

1.

2.

FIG. 52.—What are these drawings intended to show? What simple change would make them show the facts much more clearly?

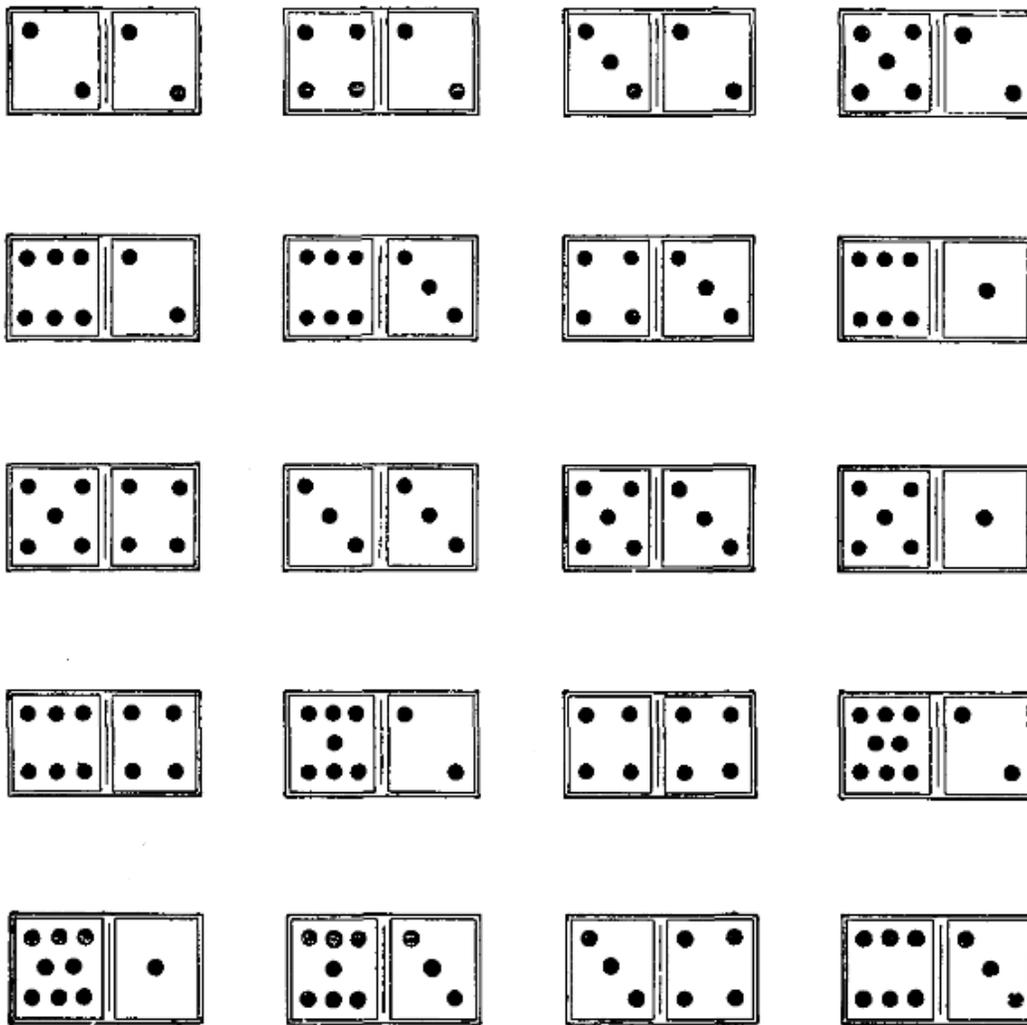

FIG. 53.—Arranged in convenient "eye-fulls."

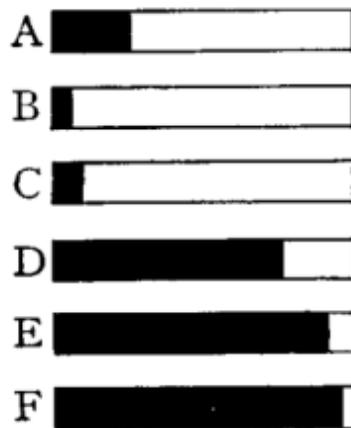

FIG. 54.—Clear, simple, and easy of comparison.

Tell which bar has—

1. About 5 percent of its length black.
2. About 10 percent of its length black.
3. About 25 percent of its length black.
4. About 75 percent of its length black.
5. About 90 percent of its length black.
6. About 95 percent of its length black.

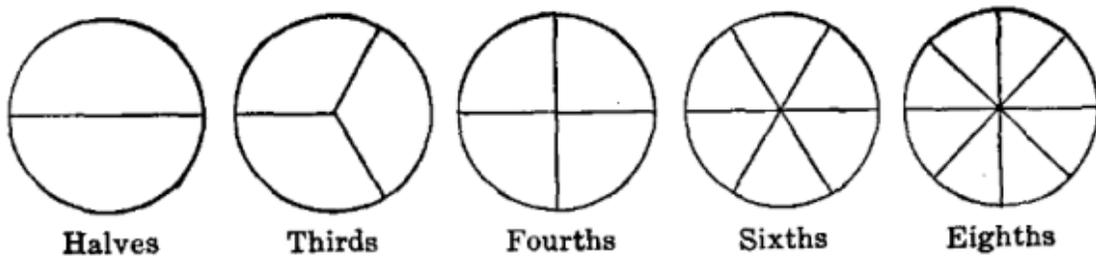

FIG. 55.—Clear, simple, and well spaced.

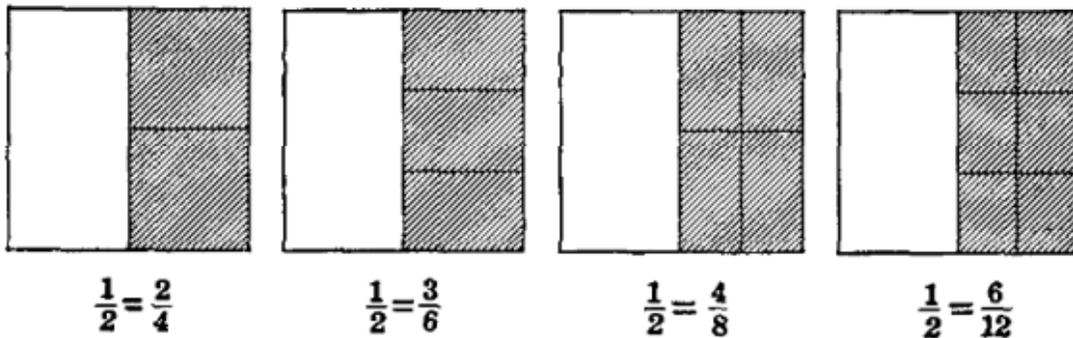

FIG. 56.—Well arranged, though a little wider spacing between the squares would make it even better.

THE USE OF CONCRETE OBJECTS IN ARITHMETIC

We mean by concrete objects actual things, events, and relations presented to sense, in contrast to words and numbers and symbols which mean or stand for these objects or for more abstract qualities and relations. Blocks, tooth-picks, coins, foot rules, squared paper, quart measures, bank books, and checks are such concrete things. A foot rule put successively along the three thirds of a yard rule, a bell rung five times, and a pound weight balancing sixteen ounce weights are such concrete events. A pint beside a quart, an inch beside a foot, an apple shown cut in halves display such concrete relations to a pupil who is attentive to the issue.

Concrete presentations are obviously useful in arithmetic to teach meanings under the general law that a word or number or sign or symbol acquires meaning by being connected with actual things, events, qualities, and relations. We have also noted their usefulness as means to verifying the results of thinking and computing, as when a pupil, having solved, "How many badges each 5 inches long can be made from $3\frac{1}{3}$ yd. of ribbon?" by using $10 \times \frac{12}{5}$, draws a line $3\frac{1}{3}$ yd. long and divides it into 5-inch lengths.

Concrete experiences are useful whenever the meaning of a number, like 9 or $\frac{7}{8}$ or .004, or of an operation, like multiplying or dividing or cubing, or of some term, like rectangle or hypotenuse or discount, or some procedure, like voting or insuring property against fire or borrowing money from a bank, is absent or incomplete or faulty. Concrete work thus is by no means confined to the primary grades but may be appropriate at all stages when new facts, relations, and procedures are to be taught.

How much concrete material shall be presented will depend upon the fact or relation or procedure which is to be made intelligible, and the ability and knowledge of the pupil. Thus 'one half' will in general require less concrete illustration than 'five sixths'; and five sixths will require less in the case of a bright child who already knows $\frac{2}{3}$, $\frac{3}{4}$, $\frac{3}{8}$, $\frac{5}{8}$, $\frac{7}{8}$, $\frac{2}{5}$, $\frac{3}{5}$, and $\frac{4}{5}$ than in the case of a dull child or one who only knows $\frac{2}{3}$ and $\frac{3}{4}$. As a general rule the same topic will require less concrete material the later it appears in the school course. If the meanings of the numbers are taught in grade 2 instead of grade 1, there will be less need of blocks, counters, splints, beans, and the

like. If $1\frac{1}{2} + \frac{1}{2} = 2$ is taught early in grade 3, there will be more gain from the use of $1\frac{1}{2}$ inches and $\frac{1}{2}$ inch on the foot rule than if the same relations were taught in connection with the general addition of like fractions late in grade 4. Sometimes the understanding can be had either by connecting the idea with the reality directly, or by connecting the two indirectly *via* some other idea. The amount of concrete material to be used will depend on its relative advantage per unit of time spent. Thus it might be more economical to connect $\frac{5}{12}$, $\frac{7}{12}$, and $\frac{11}{12}$ with real meanings indirectly by calling up the resemblance to the $\frac{2}{3}$, $\frac{3}{4}$, $\frac{3}{8}$, $\frac{5}{8}$, $\frac{7}{8}$, $\frac{2}{5}$, $\frac{3}{5}$, $\frac{4}{5}$, and $\frac{5}{6}$ already studied, than by showing $\frac{5}{12}$ of an apple, $\frac{7}{12}$ of a yard, $\frac{11}{12}$ of a foot, and the like.

In general the economical course is to test the understanding of the matter from time to time, using more concrete material if it is needed, but being careful to encourage pupils to proceed to the abstract ideas and general principles as fast as they can. It is wearisome and debauching to pupils' intellects for them to be put through elaborate concrete experiences to get a meaning which they could have got themselves by pure thought. We should also remember that the new idea, say of the meaning of decimal fractions, will be improved and clarified by using it (see page 183 f.), so that the attainment of a *perfect* conception of decimal fractions before doing anything with them is unnecessary and probably very wasteful.

A few illustrations may make these principles more instructive.

(a) Very large numbers, such as 1000, 10,000, 100,000, and 1,000,000, need more concrete aids than are commonly given. Guessing contests about the value in dollars of the school building and other buildings, the area of the schoolroom floor and other surfaces in square inches, the number of minutes in a week, and year, and the like, together with proper computations and measurements, are very useful to reënforce the concrete presentations and supply genuine problems in multiplication and subtraction with large numbers.

(b) Numbers very much smaller than one, such as $\frac{1}{32}$, $\frac{1}{64}$, .04, and .002, also need some concrete aids. A diagram like that of Fig. 57 is useful.

(c) *Majority* and *plurality* should be understood by every citizen. They can be understood without concrete aid, but an actual vote is well worth while

for the gain in vividness and surety.

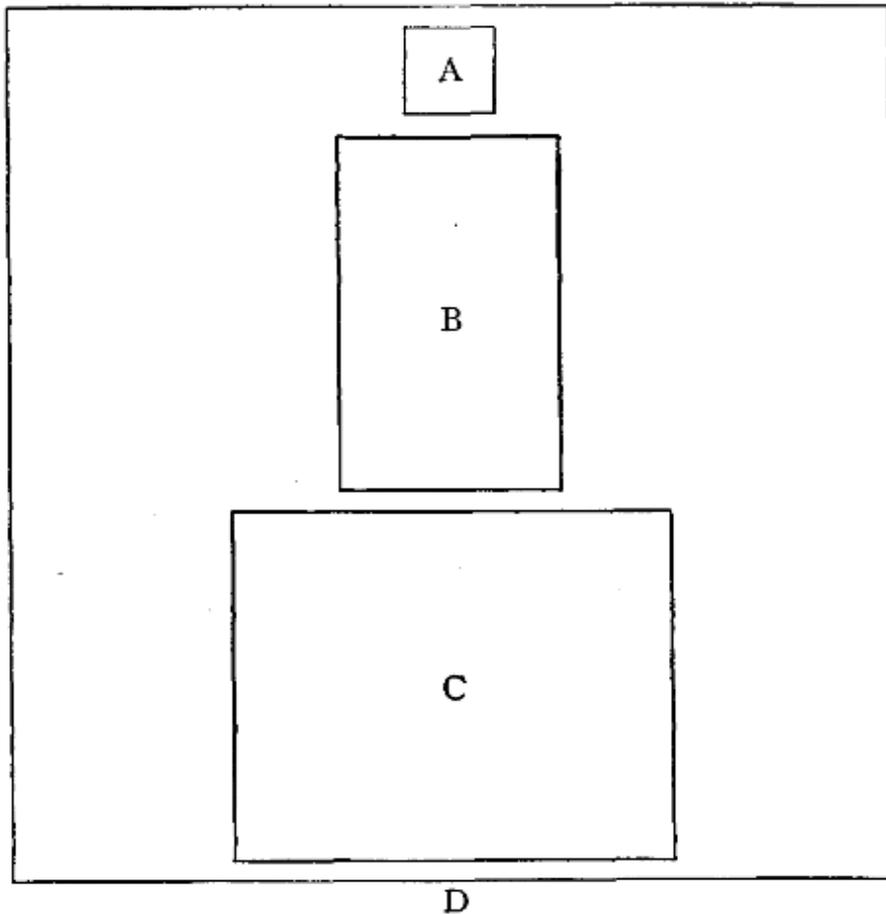

FIG. 57.—Concrete aid to understanding fractions with large denominators.

A = $\frac{1}{1000}$ sq. ft.; B = $\frac{1}{100}$ sq. ft.; C = $\frac{1}{50}$ sq. ft.; D = $\frac{1}{10}$ sq. ft.

(d) Insurance against loss by fire can be taught by explanation and analogy alone, but it will be economical to have some actual insuring and payment of premiums and a genuine loss which is reimbursed.

(e) Four play banks in the corners of the room, receiving deposits, cashing checks, and later discounting notes will give good educational value for the time spent.

(f) Trade discount, on the contrary, hardly requires more concrete illustration than is found in the very problems to which it is applied.

(g) The process of finding the number of square units in a rectangle by multiplying with the appropriate numbers representing length and width is probably rather hindered than helped by the ordinary objective presentation as an introduction. The usual form of objective introduction is as follows:—

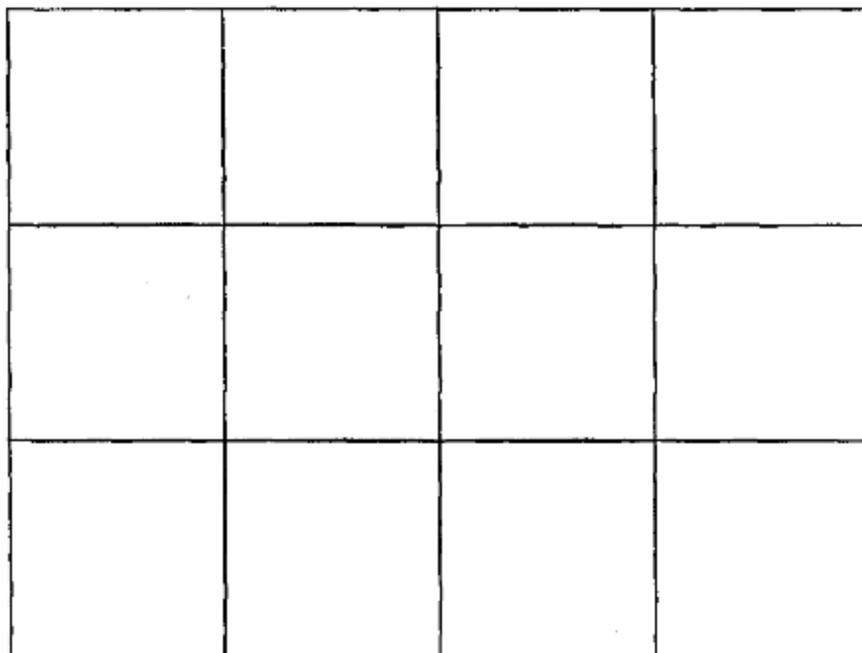

FIG. 58.

How long is this rectangle? How large is each square? How many square inches are there in the top row? How many rows are there? How many square inches are there in the whole rectangle? Since there are three rows each containing 4 square inches, we have 3×4 square inches = 12 square inches.

Draw a rectangle 7 inches long and 2 inches wide. If you divide it into inch squares how many rows will there be? How many inch squares will there be in each row? How many square inches are there in the rectangle?

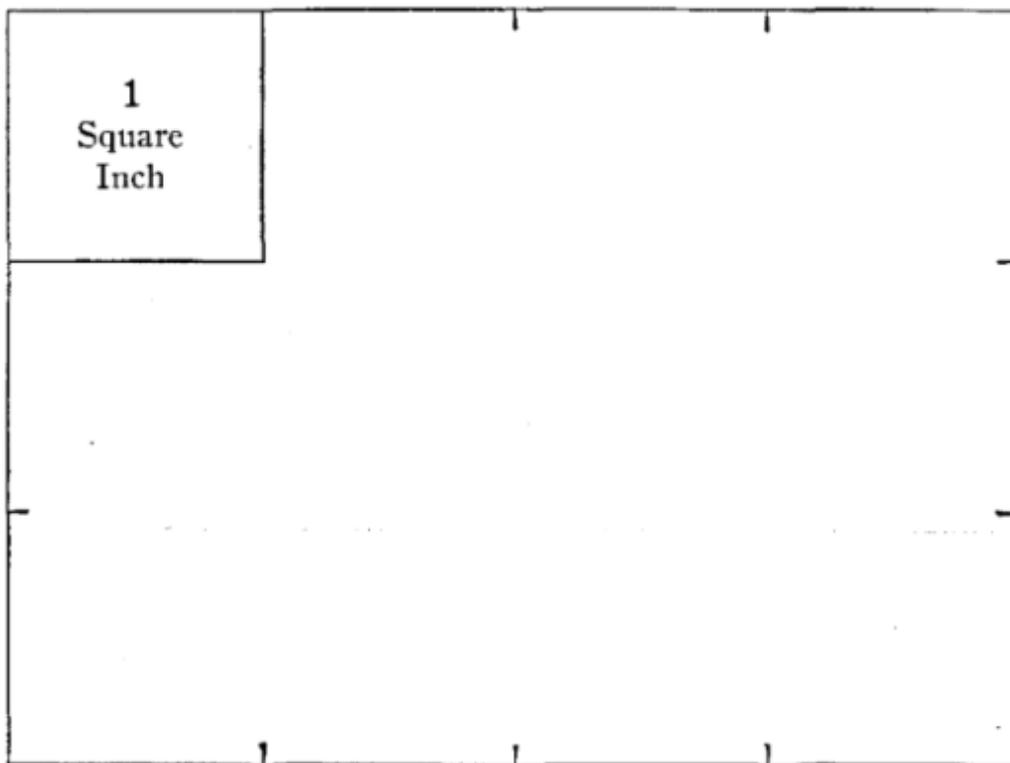

FIG. 59.

It is better actually to hide the individual square units as in Fig. 59. There are four reasons: (1) The concrete rows and columns rather distract attention from the essential thing to be learned. This is not that "x rows one square wide, y squares in a row will make xy squares in all," but that "by using proper units and the proper operation the area of any rectangle can be found from its length and width." (2) Children have little difficulty in learning to multiply rather than add, subtract, or divide when computing area. (3) The habit so formed holds good for areas like $1\frac{2}{3}$ by $4\frac{1}{2}$, with fractional dimensions, in which any effort to count up the areas of rows is very troublesome and confusing. (4) The notion that a square inch is an area 1' by 1' rather than $\frac{1}{2}$ ' by 2' or $\frac{1}{3}$ in. by 3 in. or $1\frac{1}{2}$ in. by $\frac{2}{3}$ in. is likely to be formed too emphatically if much time is spent upon the sort of concrete presentation shown above. It is then better to use concrete counting of rows of small areas as a means of *verification after* the procedure is learned, than as a means of deriving it.

There has been, especially in Germany, much argument concerning what sort of number-pictures (that is, arrangement of dots, lines, or the like, as

shown in Fig. 60) is best for use in connection with the number names in the early years of the teaching of arithmetic.

Lay ['98 and '07], Walsemann ['07], Freeman ['10], Howell ['14], and others have measured the accuracy of children in estimating the number of dots in arrangements of one or more of these different types.^[21] Many writers interpret a difference in favor of estimating, say, the square arrangements of Born or Lay as meaning that such is the best arrangement to use in teaching. The inference is, however, unjustified. That certain number-pictures are easier to estimate numerically does not necessarily mean that they are more instructive in learning. One set may be easier to estimate just because they are more familiar, having been oftener experienced. Even if the favored set was so after equal experience with all sets, accuracy of estimation would be a sign of superiority for use in instruction only if all other things were equal (or in favor of the arrangement in question). Obviously the way to decide which of these is best to use in teaching is by using them in teaching and measuring all relevant results, not by merely recording which of them are most accurately estimated in certain time exposures.

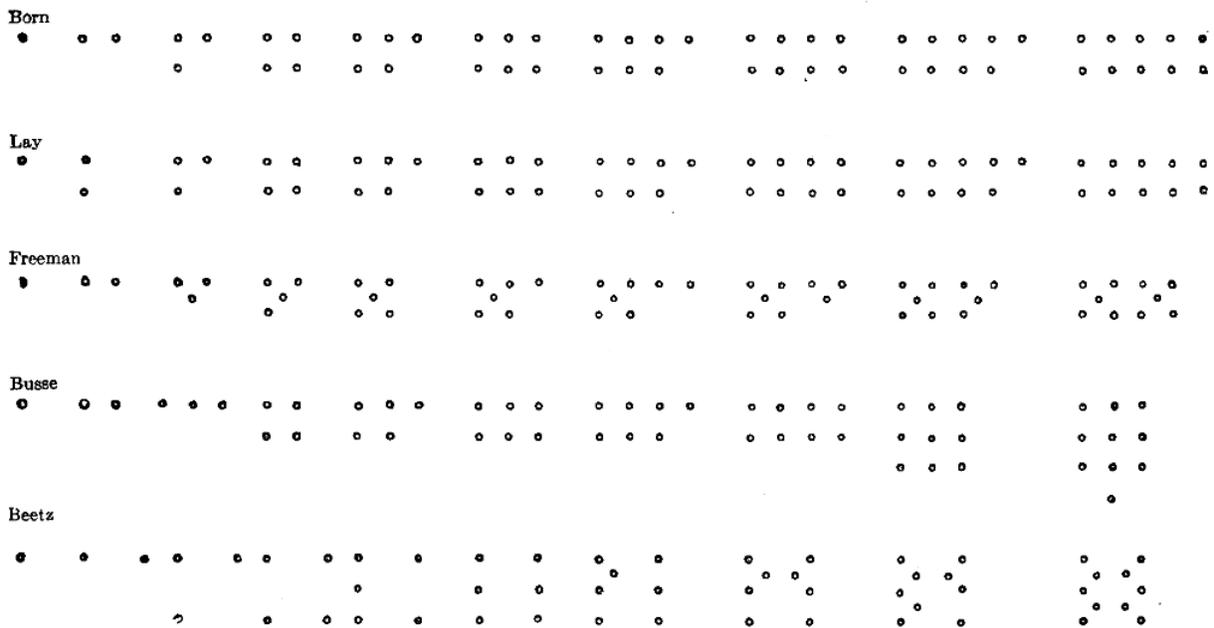

FIG. 60.—Various proposed arrangements of dots for use in teaching the meanings of the numbers 1 to 10.

It may be noted that the Born, Lay, and Freeman pictures have claims for special consideration on grounds of probable instructiveness. Since they are also superior in the tests in respect to accuracy of estimate, choice should probably be made from these three by any teacher who wishes to connect one set of number-pictures systematically with the number names, as by drills with the blackboard or with cards.

Such drills are probably useful if undertaken with zeal, and if kept as supplementary to more realistic objective work with play money, children marching, material to be distributed, garden-plot lengths to be measured, and the like, and if so administered that the pupils soon get the generalized abstract meaning of the numbers freed from dependence on an inner picture of any sort. This freedom is so important that it may make the use of many types of number-pictures advisable rather than the use of the one which in and of itself is best.

As Meumann says: "Perceptual reckoning can be overdone. It had its chief significance for the surety and clearness of the first foundation of arithmetical instruction. If, however, it is continued after the first operations become familiar to the child, and extended to operations which develop from these elementary ones, it necessarily works as a retarding force and holds back the natural development of arithmetic. This moves on to work with abstract number and with mechanical association and reproduction." ['07, Vol. 2, p. 357.]

Such drills are commonly overdone by those who make use of them, being given too often, and continued after their instructiveness has waned, and used instead of more significant, interesting, and varied work in counting and estimating and measuring real things. Consequently, there is now rather a prejudice against them in our better schools. They should probably be reinstated but to a moderate and judicious use.

ORAL, MENTAL, AND WRITTEN ARITHMETIC

There has been much dispute over the relative merits of oral and written work in arithmetic—a question which is much confused by the different meanings of 'oral' and 'written.' *Oral* has meant (1) work where the situations are presented orally and the pupil's final responses are given orally, or (2)

work where the situations are presented orally and the pupils' final responses are written or partly written and partly oral, or (3) work where the situations are presented in writing or print and the final responses are oral. *Written* has meant (1) work where the situations are presented in writing or print and the final responses are made in writing, or (2) work where also many of the intermediate responses are written, or (3) work where the situations are presented orally but the final responses and a large percentage of the intermediate computational responses are written. There are other meanings than these.

It is better to drop these very ambiguous terms and ask clearly what are the merits and demerits, in the case of any specified arithmetical work, of auditory and of visual presentation of the situations, and of saying and of writing each specified step in the response.

The disputes over mental *versus* written arithmetic are also confused by ambiguities in the use of 'mental.' Mental has been used to mean "done without pencil and paper" and also "done with few overt responses, either written or spoken, between the setting of the task and the announcement of the answer." In neither case is the word *mental* specially appropriate as a description of the total fact. As before, we should ask clearly, "What are the merits and demerits of making certain specified intermediate responses in inner speech or imaged sounds or visual images or imageless thought—that is, *without* actual writing or overt speech?"

It may be said at the outset that oral, written, and inner presentations of initial situations, oral, written, and inner announcements of final responses, and oral, written, and inner management of intermediate processes have varying degrees of merit according to the particular arithmetical exercise, pupil, and context. Devotion to oralness or mentalness as such is simply fanatical. Various combinations, such as the written presentation of the situation with inner management of the intermediate responses and oral announcement of the final response have their special merits for particular cases.

These merits the reader can evaluate for himself for any given sort of work for a given class by considering: (1) The amount of practice received by the class per hour spent; (2) the ease of correction of the work; (3) the ease of understanding the tasks; (4) the prevention of cheating; (5) the

cheerfulness and sociability of the work; (6) the freedom from eyestrain, and other less important desiderata.

It should be noted that the stock schemes A, B, C, and D below are only a few of the many that are possible and that schemes E, F, G, and H have special merits.

The common practice of either having no use made of pencil and paper or having all computations and even much verbal analysis written out elaborately for examination is unfavorable for learning. The demands which life itself will make of arithmetical knowledge and skill will range from tasks done with every percentage of written work from zero up to the case where every main result obtained by thought is recorded for later use by further thought. In school the best way is that which, for the pupils in question, has the best total effect upon quality of product, speed, and ease of production, reënforcement of training already given, and preparation for training to be given. There is nothing intellectually criminal about using a pencil as well as inner thought; on the other hand there is no magical value in writing out for the teacher's inspection figures that the pupil does not need in order to attain, preserve, verify, or correct his result.

PRESENTATION OF INITIAL SITUATION	MANAGEMENT OF INTERMEDIATE PROCESSES	ANNOUNCEMENT OF FINAL RESPONSE
A. Printed or written	Written	Written
B. " "	Inner	Oral by one pupil, inner by the rest
C. Oral (by teacher)	Written	Written
D. " "	Inner	Oral by one pupil, inner by the rest
E. As in A or C	A mixture, the pupil writing what he needs	As in A or B or H
F. The real situation itself, in part at least	As in E	As in A or B or H
G. Both read by the pupil and put orally	As in E	As in A or B or H

by the teacher

H. As in A or C or G

As in E

Written by all
pupils, announced
orally by one pupil

The common practice of having the final responses of all *easy* tasks given orally has no sure justification. On the contrary, the great advantage of having all pupils really do the work should be secured in the easy work more than anywhere else. If the time cost of copying the figures is eliminated by the simple plan of having them printed, and if the supervision cost of examining the papers is eliminated by having the pupils correct each other's work in these easy tasks, written answers are often superior to oral except for the elements of sociability and 'go' and freedom from eyestrain of the oral exercise. Such written work provides the gifted pupils with from two to ten times as much practice as they would get in an oral drill on the same material, supposing them to give inner answers to every exercise done by the class as a whole; it makes sure that the dull pupils who would rarely get an inner answer at the rate demanded by the oral exercise, do as much as they are able to do.

Two arguments often made for the oral statement of problems by the teacher are that problems so put are better understood, especially in the grades up through the fifth, and that the problems are more likely to be genuine and related to the life the pupils know. When these statements are true, the first is a still better argument for having the pupils read the problems *aided by the teacher's oral statement of them*. For the difficulty is largely that the pupils cannot read well enough; and it is better to help them to surmount the difficulty rather than simply evade it. The second is not an argument for oralness *versus* writtenness, but for good problems *versus* bad; the teacher who makes up such good problems should, in fact, take special care to write them down for later use, which may be by voice or by the blackboard or by printed sheet, as is best.

CHAPTER XIV

THE CONDITIONS OF LEARNING: THE PROBLEM ATTITUDE

Dewey, and others following him, have emphasized the desirability of having pupils do their work as active seekers, conscious of problems whose solution satisfies some real need of their own natures. Other things being equal, it is unwise, they argue, for pupils to be led along blindfold as it were by the teacher and textbook, not knowing where they are going or why they are going there. They ought rather to have some living purpose, and be zealous for its attainment.

This doctrine is in general sound, as we shall see, but it is often misused as a defense of practices which neglect the formation of fundamental habits, or as a recommendation to practices which are quite unworkable under ordinary classroom conditions. So it seems probable that its nature and limitations are not thoroughly known, even to its followers, and that a rather detailed treatment of it should be given here.

ILLUSTRATIVE CASES

Consider first some cases where time spent in making pupils understand the end to be attained before attacking the task by which it is attained, or care about attaining the end (well or ill understood) is well spent.

It is well for a pupil who has learned (1) the meanings of the numbers one to ten, (2) how to count a collection of ten or less, and (3) how to measure in inches a magnitude of ten, nine, eight inches, etc., to be confronted with the problem of true adding without counting or measuring, as in 'hidden' addition and measurement by inference. For example, the teacher has three pencils counted and put under a book; has two more counted and put under

the book; and asks, "How many pencils are there under the book?" Answers, when obtained, are verified or refuted by actual counting and measuring.

The time here is well spent because the children can do the necessary thinking if the tasks are well chosen; because they are thereby prevented from beginning their study of addition by the bad habit of pseudo-adding by looking at the two groups of objects and counting their number instead of real adding, that is, thinking of the two numbers and inferring their sum; and further, because facing the problem of adding as a real problem is in the end more economical for learning arithmetic and for intellectual training in general than being enticed into adding by objective or other processes which conceal the difficulty while helping the pupil to master it.

The manipulation of short multiplication may be introduced by confronting the pupils with such problems as, "How to tell how many Uneeda biscuit there are in four boxes, by opening only one box." Correct solutions by addition should be accepted. Correct solutions by multiplication, if any gifted children think of this way, should be accepted, even if the children cannot justify their procedure. (Inferring the manipulation from the place-values of numbers is beyond all save the most gifted and probably beyond them.) Correct solution by multiplication by some child who happens to have learned it elsewhere should be accepted. Let the main proof of the trustworthiness of the manipulation be by measurement and by addition. Proof by the stock arguments from the place-values of numbers may also be used. If no child hits on the manipulation in question, the problem of finding the length *without* adding may be set. If they still fail, the problem may be made easier by being put as "4 times 22 gives the answer. Write down what you think 4 times 22 will be." Other reductions of the difficulty of the problem may be made, or the teacher may give the answer without very great harm being done. The important requirement is that the pupils should be aware of the problem and treat the manipulation as a solution of it, not as a form of educational ceremonial which they learn to satisfy the whims of parents and teachers. In the case of any particular class a situation that is more appealing to the pupils' practical interests than the situation used here can probably be devised.

The time spent in this way is well spent (1) because all but the very dull pupils can solve the problem in some way, (2) because the significance of the manipulation as an economy over addition is worth bringing out, and (3)

because there is no way of beginning training in short multiplication that is much better.

In the same fashion multiplication by two-place numbers may be introduced by confronting pupils with the problem of the number of sheets of paper in 72 pads, or pieces of chalk in 24 boxes, or square inches in 35 square feet, or the number of days in 32 years, or whatever similar problem can be brought up so as to be felt as a problem.

Suppose that it is the 35 square feet. Solutions by $(5 \times 144) + (30 \times 144)$, however arranged, or by $(10 \times 144) + (10 \times 144) + (10 \times 144) + (5 \times 144)$, or by $3500 + (35 \times 40) + (35 \times 4)$, or by $7 \times (5 \times 144)$, however arranged, should all be listed for verification or rejection. The pupils need not be required to justify their procedures by a verbal statement. Answers like 432,720, or 720,432, or 1152, or 4220, or 3220 should be listed for verification or rejection. Verification may be by a mixture of short multiplication and objective work, or by a mixture of short multiplication and addition, or by addition abbreviated by taking ten 144s as 1440, or even (for very stupid pupils) by the authority of the teacher. Or the manipulation in cases like 53×9 or 84×7 may be verified by the reverse short multiplication. The deductive proof of the correctness of the manipulation may be given in whole or in part in connection with exercises like

$10 \times 2 =$	$30 \times 14 =$
$10 \times 3 =$	$3 \times 44 =$
$10 \times 4 =$	$30 \times 44 =$
$10 \times 14 =$	$3 \times 144 =$
$10 \times 44 =$	$20 \times 144 =$
10×144	$40 \times 144 =$
$=$	
$20 \times 2 =$	$30 \times 144 =$
$20 \times 3 =$	$5 \times 144 =$
$30 \times 3 =$	$35 = 30 + \dots$
$30 \times 4 =$	30×144 added to 5×144
	$=$
$3 \times 14 =$	

Certain wrong answers may be shown to be wrong in many ways; *e.g.*, 432,720 is too big, for 35 times a thousand square inches is only 35,000; 1152 is too small, for 35 times a hundred square inches would be 3500, or more than 1152.

The time spent in realizing the problem here is fairly well spent because (1) any successful original manipulation in this case represents an excellent exercise of thought, because (2) failures show that it is useless to juggle the figures at random, and because (3) the previous experience with short multiplication makes it possible for the pupils to realize the problem in a very few minutes. It may, however, be still better to give the pupils the right method just as soon as the problem is realized, without having them spend more time in trying to solve it. Thus:—

1 square foot has 144 square inches. How many square inches are there in 35 square feet (marked out in chalk on the floor as a piece 10 ft. \times 3 ft. plus a piece 5 ft. \times 1 ft.)?

1 yard = 36 inches. How many inches long is this wall (found by measure to be 13 yards)?

Here is a quick way to find the answers:—

$$\begin{array}{r} 144 \\ 35 \end{array}$$

$$\begin{array}{r} \underline{\quad} \\ 720 \\ 432 \\ \underline{\quad} \end{array}$$

5040 sq. inches in 35 sq. ft.

$$\begin{array}{r} 36 \\ 13 \\ \underline{\quad} \\ 108 \\ 36 \\ \underline{\quad} \end{array}$$

468 inches in 13 yd.

Consider now the following introduction to dividing by a decimal:—

Dividing by a Decimal

1. How many minutes will it take a motorcycle, to go 12.675 miles at the rate of .75 mi. per minute?

$$\begin{array}{r} 16.9 \\ .75 \overline{) 12.675} \\ \underline{75} \\ 517 \\ \underline{450} \\ 675 \\ \underline{675} \end{array}$$

2. Check by multiplying 16.9 by .75.
3. How do you know that the quotient cannot be as little as 1.69?
4. How do you know that the quotient cannot be as large as 169?
5. Find the quotient for $3.75 \div 1.5$.
6. Check your result by multiplying the quotient by the divisor.
7. How do you know that the quotient cannot be .25 or 25 ?
8. Look at this problem. $.25 \overline{) 7.5}$

How do you know that 3.0 is wrong for the quotient?

How do you know that 300 is wrong for the quotient?

State which quotient is right for each of these:—

9. $\begin{array}{r} .021 \text{ or } .21 \text{ or } 2.1 \text{ or } 21 \text{ or } 210 \\ 1.8 \overline{)3.78} \end{array}$

10. $\begin{array}{r} .021 \text{ or } .21 \text{ or } 21 \text{ or } 210 \\ 1.8 \overline{)37.8} \end{array}$

11. $\begin{array}{r} .03 \text{ or } .3 \text{ or } 3 \text{ or } 30 \text{ or } 300 \\ 1.25 \overline{)37.5} \end{array}$

12. $\begin{array}{r} .03 \text{ or } .3 \text{ or } 3 \text{ or } 30 \text{ or } 300 \\ 12.5 \overline{)37.5} \end{array}$

13. $\begin{array}{r} .05 \text{ or } .5 \text{ or } 5 \text{ or } 50 \text{ or } 500 \\ 1.25 \overline{)6.25} \end{array}$

14. $\begin{array}{r} .05 \text{ or } .5 \text{ or } 5 \text{ or } 50 \text{ or } 500 \\ 12.5 \overline{)6.25} \end{array}$

15. Is this rule true? If it is true, learn it.

In a correct result, the number of decimal places in the divisor and quotient together equals the number of decimal places in the dividend.

These and similar exercises excite the problem attitude in children *who have a general interest in getting right answers*. Such a series carefully arranged is a desirable introduction to a statement of the rule for placing the decimal point in division with decimals. For it attracts attention to the general principle (divisor \times quotient should equal dividend), which is more important than the rule for convenient location of the decimal point, and it gives training in placing the point by inspection of the divisor, quotient, and dividend, which suffices for nineteen out of twenty cases that the pupil will ever encounter outside of school. He is likely to remember this method by inspection long after he has forgotten the fixed rule.

It is well for the pupil to be introduced to many arithmetical facts by way of problems about their common uses. The clockface, the railroad distance table in hundredths of a mile, the cyclometer and speedometer, the recipe, and the like offer problems which enlist his interest and energy and also connect the resulting arithmetical learning with the activities where it is needed. There is no time cost, but a time-saving, for the learning as a means to the solution of the problems is quicker than the mere learning of the

arithmetical facts by themselves alone. A few samples of such procedure are shown below:—

GRADE 3

To be Done at Home

Look at a watch. Has it any hands besides the hour hand and the minute hand? Find out all that you can about how a watch tells seconds, how long a second is, and how many seconds make a minute.

GRADE 5

Measuring Rainfall

Rainfall per Week (cu. in. per sq. in. of area)

June	1-7	1.056
	8-14	1.103
	15-21	1.040
	22-28	.960
	29-July 5	.915
July	6-12	.782
	13-19	.790
	20-26	.670
	27-Aug. 2	.503
Aug.	3-9	.512
	10-16	.240
	17-23	.215
	24-30	.811

1. In which weeks was the rainfall 1 or more?
2. Which week of August had the largest rainfall for that month?
3. Which was the driest week of the summer? (Driest means with the least rainfall.)
4. Which week was the next to the driest?
5. In which weeks was the rainfall between .800 and 1.000?
6. Look down the table and estimate whether the average rainfall for one week was about .5, or about .6, or about .7, or about .8, or about .9.

Dairy Records

Record of Star Elsie

	Pounds of Milk	Butter-Fat per Pound of Milk
Jan.	1742	.0461
Feb.	1690	.0485
Mar.	1574	.0504
Apr.	1226	.0490
May	1202	.0466
June	1251	.0481

Read this record of the milk given by the cow Star Elsie. The first column tells the number of pounds of milk given by Star Elsie each month. The second column tells what fraction of a pound of butter-fat each pound of milk contained.

1. Read the first line, saying, "In January this cow gave 1742 pounds of milk. There were 461 ten thousandths of a pound of butter-fat per pound of milk." Read the other lines in the same way.

2. How many pounds of butter-fat did the cow produce in Jan.? 3. In Feb.? 4. In Mar.? 5. In Apr.? 6. In May? 7. In June?

GRADE 5 OR LATER

Using Recipes to Make Larger or Smaller Quantities

I. State how much you would use of each material in the following recipes: (a) To make double the quantity. (b) To make half the quantity. (c) To make $1\frac{1}{2}$ times the quantity. You may use pencil and paper when you cannot find the right amount mentally.

1. PEANUT

PENUCHE

1 tablespoon
butter

2 cups brown
sugar

$\frac{1}{3}$ cup milk or
cream

$\frac{3}{4}$ cup chopped
peanuts

$\frac{1}{3}$ teaspoon salt

2. MOLASSES

CANDY

$\frac{1}{2}$ cup butter

2 cups sugar

1 cup molasses

$1\frac{1}{2}$ cups boiling
water

3. RAISIN OPERA**CARAMELS**

2 cups light
brown sugar

$\frac{7}{8}$ cup thin
cream

$\frac{1}{2}$ cup raisins

4. WALNUT**MOLASSES SQUARES**

2 tablespoons
butter

1 cup molasses

$\frac{1}{3}$ cup sugar

$\frac{1}{2}$ cup walnut
meats

5. RECEPTION**ROLLS**

1 cup scalded
milk

$1\frac{1}{2}$ tablespoons
sugar

1 teaspoon salt

$\frac{1}{4}$ cup lard

1 yeast cake

$\frac{1}{4}$ cup lukewarm
water

White of 1 egg

$3\frac{1}{2}$ cups flour

6. GRAHAM RAISED**LOAF**

2 cups milk

6 tablespoons
molasses

$1\frac{1}{2}$ teaspoons salt

$\frac{1}{3}$ yeast cake

$\frac{1}{4}$ cup lukewarm
water

2 cups sifted
Graham flour

$\frac{1}{2}$ cup Graham
bran

$\frac{3}{4}$ cup flour (to
knead)

II. How much would you use of each material in the following recipes: (a) To make $\frac{2}{3}$ as large a quantity? (b) To make $1\frac{1}{3}$ times as much? (c) To make $2\frac{1}{2}$ times as much?

1. ENGLISH**DUMPLINGS**

$\frac{1}{2}$ pound beef
suet

2. WHITE MOUNTAIN**ANGEL CAKE**

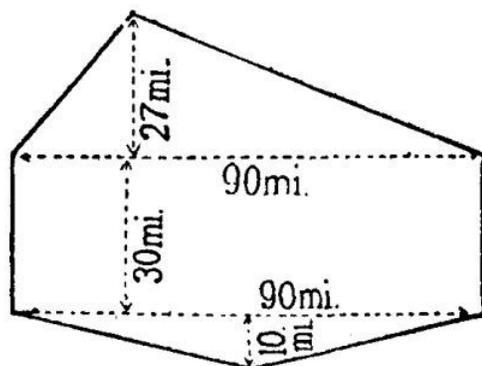

$1\frac{1}{2}$ cups egg whites

1¼ cups flour	1½ cups sugar
3 teaspoons baking powder	1 teaspoon cream of tartar
1 teaspoon salt	1 cup bread flour
½ teaspoon pepper	¼ teaspoon salt
1 teaspoon minced parsley	1 teaspoon vanilla
¼ cup cold water	

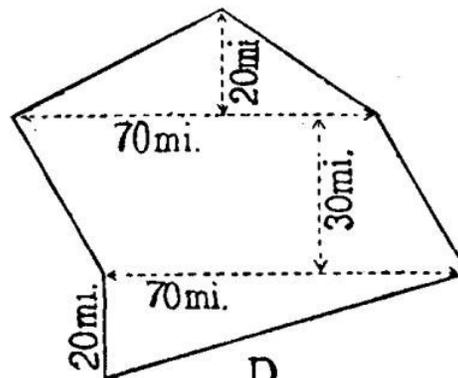

In many cases arithmetical facts and principles can be well taught in connection with some problem or project which is not arithmetical, but which has special potency to arouse an intellectual activity in the pupil which by some ingenuity can be directed to arithmetical learning. Playing store is the most fundamental case. Planning for a party, seeing who wins a game of bean bag, understanding the calendar for a month, selecting Christmas presents, planning a picnic, arranging a garden, the clock, the watch with second hand, and drawing very simple maps are situations suggesting problems which may bring a living purpose into arithmetical learning in grade 2. These are all available under ordinary conditions of class instruction. A sample of such problems for a higher grade (6) is shown below.

Estimating Areas

The children in the geography class had a contest in estimating the areas of different surfaces. Each child wrote his estimates for each of these maps, A, B, C, D, and E. (Only C and D are shown here.) In the arithmetic class they learned how to find the exact areas. Then they compared their estimates with the exact areas to find who came nearest.

C

D

Write your estimates for A, B, C, D, and E. Then study the next 6 pages and learn how to find the exact areas.

(The next 6 pages comprise training in the mensuration of parallelograms and triangles.)

In some cases the affairs of individual pupils include problems which may be used to guide the individual in question to a zealous study of arithmetic as a means of achieving his purpose—of making a canoe, surveying an island, keeping the accounts of a Girls' Canning Club, or the like. It requires much time and very great skill to direct the work of thirty or more pupils each busy with a special type of his own, so as to make the work instructive for each, but in some cases the expense of time and skill is justified.

GENERAL PRINCIPLES

In general what should be meant when one says that it is desirable to have pupils in the problem-attitude when they are studying arithmetic is substantially as follows:—

First.—Information that comes as an answer to questions is better attended to, understood, and remembered than information that just comes.

Second.—Similarly, movements that come as a step toward achieving an end that the pupil has in view are better connected with their appropriate situations, and such connections are longer retained, than is the case with movements that just happen.

Third.—The more the pupil is set toward getting the question answered or getting the end achieved, the greater is the satisfyingness attached to the bonds of knowledge or skill which mean progress thereto.

Fourth.—It is bad policy to rely exclusively on the purely intellectualistic problems of "How can I do this?" "How can I get the right answer?" "What is the reason for this?" "Is there a better way to do that?" and the like. It is bad policy to supplement these intellectualistic problems by only the remote problems of "How can I be fitted to earn a higher wage?" "How can I make sure of graduating?" "How can I please my parents?" and the like. The purely intellectualistic problems have too weak an appeal for many pupils; the remote problems are weak so long as they are remote and, what is worse, may be deprived of the strength that they would have in due time if we attempt to use them too soon. It is the extreme of bad policy to neglect those personal and practical problems furnished by life outside the class in arithmetic the solution of which can really be furthered by arithmetic then and there. It is good policy to spend time in establishing certain mental sets—stimulating, or even creating, certain needs—setting up problems themselves—when the time so spent brings a sufficient improvement in the quality and quantity of the pupils' interest in arithmetical learning.

Fifth.—It would be still worse policy to rely exclusively on problems arising outside arithmetic. To learn arithmetic is itself a series of problems of intrinsic interest and worth to healthy-minded children. The need for ability to multiply with United States money or to add fractions or to compute percents may be as truly vital and engaging as the need for skill to make a party dress or for money to buy it or for time to play baseball. The intellectualistic needs and problems should be considered along with all others, and given whatever weight their educational value deserves.

DIFFICULTY AND SUCCESS AS STIMULI

There are certain misconceptions of the doctrine of the problem-attitude. The most noteworthy is that difficulty—temporary failure—an inadequacy of already existing bonds—is the essential and necessary stimulus to thinking and learning. Dewey himself does not, as I understand him, mean this, but he has been interpreted as meaning it by some of his followers. ^[22]

Difficulty—temporary failure, inadequacy of existing bonds—on the contrary does nothing whatsoever in and of itself; and what is done by the annoying lack of success which sometimes accompanies difficulty sometimes hinders thinking and learning.

Mere difficulty, mere failure, mere inadequacy of existing bonds, does nothing. It is hard for me to add three eight-place numbers at a glance; I have failed to find as effective illustrations for pages 276 to 277 as I wished; my existing sensori-motor connections are inadequate to playing a golf course in 65. But these events and conditions have done nothing to stimulate me in respect to the behavior in question. In the first of the three there is no annoying lack and no dynamic influence at all; in the second there was to some degree an annoying lack—a slight irritation at not getting just what I wanted,—and this might have impelled me to further thinking (though it did not, and getting one tiptop illustration would as a rule stimulate me to hunt for others more than failing to get such). In the third case the lack of the 65 does not annoy me or have any noteworthy dynamic effect. The lack of 90 instead of 95-100 is annoying and is at times a stimulus to further learning, though not nearly so strong a stimulus as the attainment of the 90 would be! At other times this annoying lack is distinctly inhibitory—a stimulus to ceasing to learn. In the intellectual life the inhibitory effect seems far the commoner of the two. Not getting answers seems as a rule to make us stop trying to get them. The annoying lack of success with a theoretical problem most often makes us desert it for problems to whose solution the existing bonds promise to be more adequate.

The real issue in all this concerns the relative strength, in the pupil's intellectual life, of the "negative reaction" of behavior in general. An animal whose life processes are interfered with so that an annoying state of affairs is set up, changes his behavior, making one after another responses as his instincts and learned tendencies prescribe, until the annoying state of affairs is terminated, or the animal dies, or suffers the annoyance as less than the alternatives which his responses have produced. When the annoying state of affairs is characterized by the failure of things as they are to minister to a craving—as in cases of hunger, loneliness, sex-pursuit, and the like,—we have stimulus to action by an annoying lack or need, with relief from action by the satisfaction of the need.

Such is in some measure true of man's intellectual life. In recalling a forgotten name, in solving certain puzzles, or in simplifying an algebraic complex, there is an annoying lack of the name, solution, or factor, a trial of one after another response, until the annoyance is relieved by success or made less potent by fatigue or distraction. Even here the *difficulty* does not do anything—but only the annoying interference with our intellectual peace by the problem. Further, although for the particular problem, the annoying lack stimulates, and the successful attainment stops thinking, the later and more important general effect on thinking is the reverse. Successful attainment stops our thinking *on that problem* but makes us more predisposed later to thinking *in general*.

Overt negative reaction, however, plays a relatively small part in man's intellectual life. Filling intellectual voids or relieving intellectual strains in this way is much less frequent than being stimulated positively by things seen, words read, and past connections acting under modified circumstances. The notion of thinking as coming to a lack, filling it, meeting an obstacle, dodging it, being held up by a difficulty and overcoming it, is so one-sided as to verge on phantasy. The overt lacks, strains, and difficulties come perhaps once in five hours of smooth straightforward use and adaptation of existing connections, and they might as truly be called hindrances to thought—barriers which past successes help the thinker to surmount. Problems themselves come more often as cherished issues which new facts reveal, and whose contemplation the thinker enjoys, than as strains or lacks or 'problems which I need to solve.' It is just as true that the thinker gets many of his problems as results from, or bonuses along with, his information, as that he gets much of his information as results of his efforts to solve problems.

As between difficulty and success, success is in the long run more productive of thinking. Necessity is not the mother of invention. Knowledge of previous inventions is the mother; original ability is the father. The solutions of previous problems are more potent in producing both new problems and their solutions than is the mere awareness of problems and desire to have them solved.

In the case of arithmetic, learning to cancel instead of getting the product of the dividends and the product of the divisors and dividing the former by the latter, is a clear case of very valuable learning, with ease emphasized rather than difficulty, with the adequacy of existing bonds (when slightly

redirected) as the prime feature of the process rather than their inadequacy, and with no sense of failure or lack or conflict. It would be absurd to spend time in arousing in the pupil, before beginning cancellation, a sense of a difficulty—viz., that the full multiplying and dividing takes longer than one would like. A pupil in grade 4 or 5 might well contemplate that difficulty for years to no advantage. He should at once begin to cancel and prove by checking that errorless cancellation always gives the right answer. To emphasize before teaching cancellation the inadequacy of the old full multiplying and dividing would, moreover, not only be uneconomical as a means to teaching cancellation; it would amount to casting needless slurs on valuable past acquisitions, and it would, scientifically, be false. For, until a pupil has learned to cancel, the old full multiplying is not inadequate; it is admirable in every respect. The issue of its inadequacy does not truly appear until the new method is found. It is the best way until the better way is mastered.

In the same way it is unwise to spend time in making pupils aware of the annoying lacks to be supplied by the multiplication tables, the division tables, the casting out of nines, or the use of the product of the length and breadth of a rectangle as its area, the unit being changed to the square erected on the linear unit as base. The annoying lack will be unproductive, while the learning takes place readily as a modification of existing habits, and is sufficiently appreciated as soon as it does take place. The multiplication tables come when instead of merely counting by 7s from 0 up saying "7, 14, 21," etc., the pupil counts by 7s from 0 up saying "Two sevens make 14, three sevens make 21, four sevens make 28," etc. The division tables come as easy selections from the known multiplications; the casting out of nines comes as an easy device. The computation of the area of a rectangle is best facilitated, not by awareness of the lack of a process for doing it, but by awareness of the success of the process as verified objectively.

In all these cases, too, the pupil would be misled if we aroused first a sense of the inadequacy of counting, adding, and objective division, an awareness of the difficulties which the multiplication and division tables and nines device and area theorem relieve. The displaced processes are admirable and no unnecessary fault should be found with them, and they are *not* inadequate until the shorter ways have been learned.

FALSE INFERENCE

One false inference about the problem-attitude is that the pupil should always understand the aim or issue before beginning to form the bonds which give the method or process that provides the solution. On the contrary, he will often get the process more easily and value it more highly if he is taught what it is *for* gradually while he is learning it. The system of decimal notation, for example, may better be taken first as a mere fact, just as we teach a child to talk without trying first to have him understand the value of verbal intercourse, or to keep clean without trying first to have him understand the bacteriological consequences of filth.

A second inference—that the pupil should always be taught to care about an issue and crave a process for managing it before beginning to learn the process—is equally false. On the contrary, the best way to become interested in certain issues and the ways of handling them is to learn the process—even to learn it by sheer habituation—and then note what it does for us. Such is the case with ".1666 $\frac{2}{3}$ \times = divide by 6," ".333 $\frac{1}{3}$ \times = divide by 3," "multiply by .875 = divide the number by 8 and subtract the quotient from the number."

A third unwise tendency is to degrade the mere giving of information—to belittle the value of facts acquired in any other way than in the course of deliberate effort by the pupil to relieve a problem or conflict or difficulty. As a protest against merely verbal knowledge, and merely memoriter knowledge, and neglect of the active, questioning search for knowledge, this tendency to belittle mere facts has been healthy, but as a general doctrine it is itself equally one-sided. Mere facts not got by the pupil's thinking are often of enormous value. They may stimulate to active thinking just as truly as that may stimulate to the reception of facts. In arithmetic, for example, the names of the numbers, the use of the fractional form to signify that the upper number is divided by the lower number, the early use of the decimal point in U. S. money to distinguish dollars from cents, and the meanings of "each," "whole," "part," "together," "in all," "sum," "difference," "product," "quotient," and the like are self-justifying facts.

A fourth false inference is that whatever teaching makes the pupil face a question and think out its answer is thereby justified. This is not necessarily

so unless the question is a worthy one and the answer that is thought out an intrinsically valuable one and the process of thinking used one that is appropriate for that pupil for that question. Merely to think may be of little value. To rely much on formal discipline is just as pernicious here as elsewhere. The tendency to emphasize the methods of learning arithmetic at the expense of what is learned is likely to lead to abuses different in nature but as bad in effect as that to which the emphasis on disciplinary rather than content value has led in the study of languages and grammar, or in the old puzzle problems of arithmetic.

The last false inference that I shall discuss here is the inference that most of the problems by which arithmetical learning is stimulated had better be external to arithmetic itself—problems about Noah's Ark or Easter Flowers or the Merry Go Round or A Trip down the Rhine.

Outside interests should be kept in mind, as has been abundantly illustrated in this volume, but it is folly to neglect the power, even for very young or for very stupid children, of the problem "How can I get the right answer?" Children do have intellectual interests. They do like dominoes, checkers, anagrams, and riddles as truly as playing tag, picking flowers, and baking cake. With carefully graded work that is within their powers they like to learn to add, subtract, multiply, and divide with integers, fractions, and decimals, and to work out quantitative relations.

In some measure, learning arithmetic is like learning to typewrite. The learner of the latter has little desire to present attractive-looking excuses for being late, or to save expense for paper. He has no desire to hoard copies of such and such literary gems. He may gain zeal from the fact that a school party is to be given and invitations are to be sent out, but the problem "To typewrite better" is after all his main problem. Learning arithmetic is in some measure a game whose moves are motivated by the general set of the mind toward victory—winning right answers. As a ball-player learns to throw the ball accurately to first-base, not primarily because of any particular problem concerning getting rid of the ball, or having the man at first-base possess it, or putting out an opponent against whom he has a grudge, but because that skill is required by the game as a whole, so the pupil, in some measure, learns the technique of arithmetic, not because of particular concrete problems whose solutions it furnishes, but because that

technique is required by the game of arithmetic—a game that has intrinsic worth and many general recommendations.

CHAPTER XV

INDIVIDUAL DIFFERENCES

The general facts concerning individual variations in abilities—that the variations are large, that they are continuous, and that for children of the same age they usually cluster around one typical or modal ability, becoming less and less frequent as we pass to very high or very low degrees of the ability—are all well illustrated by arithmetical abilities.

NATURE AND AMOUNT

The surfaces of frequency shown in Figs. 61, 62, and 63 are samples. In these diagrams each space along the baseline represents a certain score or degree of ability, and the height of the surface above it represents the number of individuals obtaining that score. Thus in Fig. 61, 63 out of 1000 soldiers had no correct answer, 36 out of 1000 had one correct answer, 49 had two, 55 had three, 67 had four, and so on, in a test with problems (stated in words).

Figure 61 shows that these adults varied from no problems solved correctly to eighteen, around eight as a central tendency. Figure 62 shows that children of the same year-age (they were also from the same neighborhood and in the same school) varied from under 40 to over 200 figures correct. Figure 63 shows that even among children who have all reached the same school grade and so had rather similar educational opportunities in arithmetic, the variation is still very great. It requires a range from 15 to over 30 examples right to include even nine tenths of them.

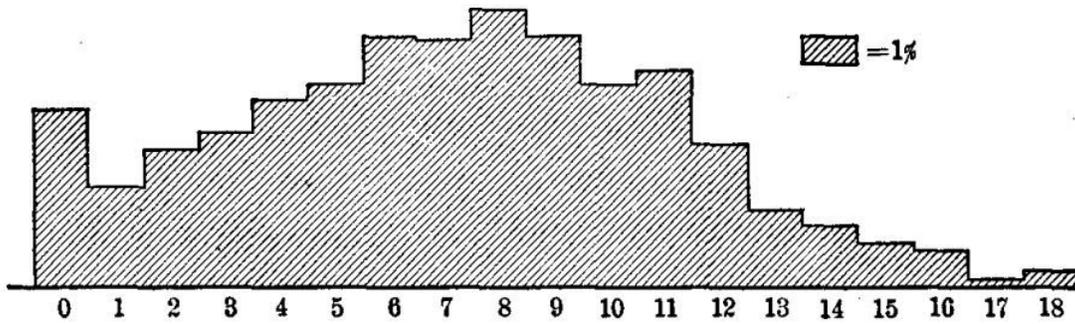

FIG. 61.—The scores of 1000 soldiers in the National Army born in English-speaking countries, in Test 2 of the Army Alpha. The score is the number of correct answers obtained in five minutes. Probably 10 to 15 percent of these men were unable to read or able to read only very easy sentences at a very slow rate. Data furnished by the Division of Psychology in the office of the Surgeon General.

It should, however, be noted that if each individual had been scored by the average of his work on eight or ten different days instead of by his work in just one test, the variability would have been somewhat less than appears in Figs. 61, 62, and 63.

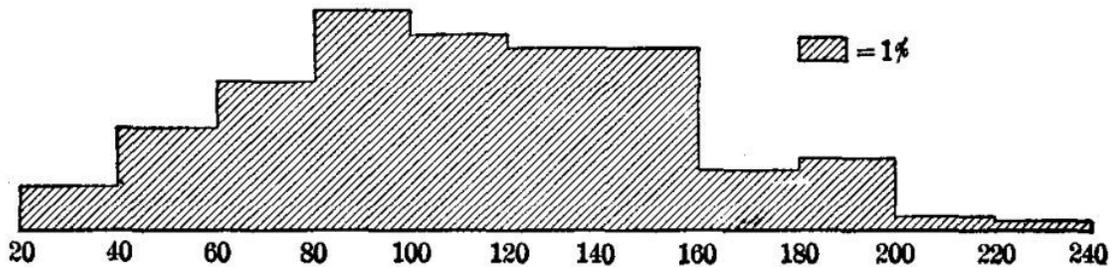

FIG. 62.—The scores of 100 11-year-old pupils in a test of computation. Estimated from the data given by Burt ['17, p. 68] for 10-, 11-, and 12-year-olds. The score equals the number of correct figures.

It is also the case that if each individual had been scored, not in problem-solving alone or division alone, but in an elaborate examination on the whole field of arithmetic, the variability would have been somewhat less than appears in Figs. 61, 62, and 63. On the other hand, if the officers and the soldiers rejected for feeblemindedness had been included in Fig. 61, if the 11-year-olds in special classes for the very dull had been included in Fig. 62,

and if all children who had been to school six years had been included in Fig. 63, no matter what grade they had reached, the effect would have been to *increase* the variability.

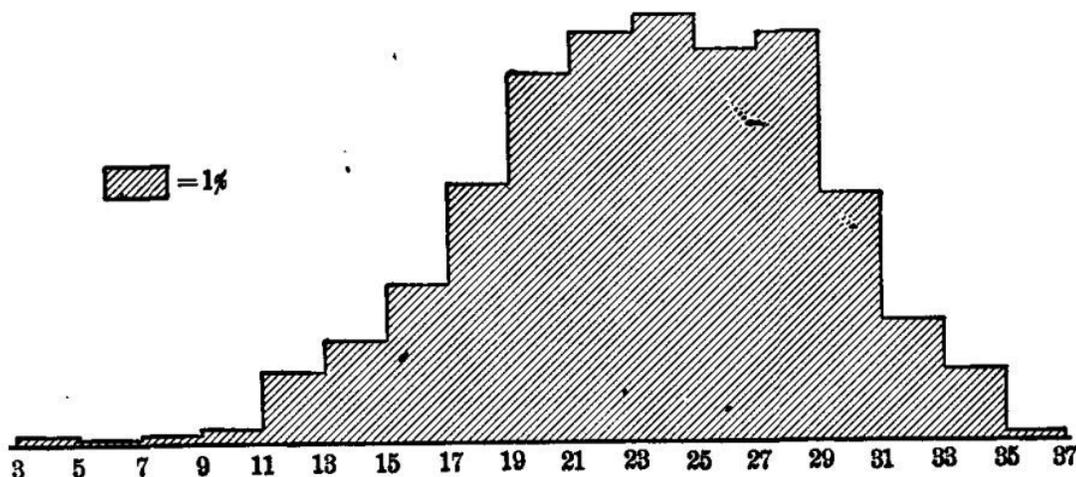

FIG. 63.—The scores of pupils in grade 6 in city schools in the Woody Division Test A. The score is the number of correct answers obtained in 20 minutes. From Woody ['16, p. 61].

In spite of the effort by school officers to collect in any one school grade those somewhat equal in ability or in achievement or in a mixture of the two, the population of the same grades in the same school system shows a very wide range in any arithmetical ability. This is partly because promotion is on a more general basis than arithmetical ability so that some very able arithmeticians are deliberately held back on account of other deficiencies, and some very incompetent arithmeticians are advanced on account of other excellencies. It is partly because of general inaccuracy in classifying and promoting pupils.

In a composite score made up of the sum of the scores in Woody tests,—Add. A, Subt. A, Mult. A, and Div. A, and two tests in problem-solving (ten and six graded problems, with maximum attainable credits of 30 and 18), Kruse ['18] found facts from which I compute those of Table 13, and Figs. 64 to 66, for pupils all having the training of the same city system, one which sought to grade its pupils very carefully.

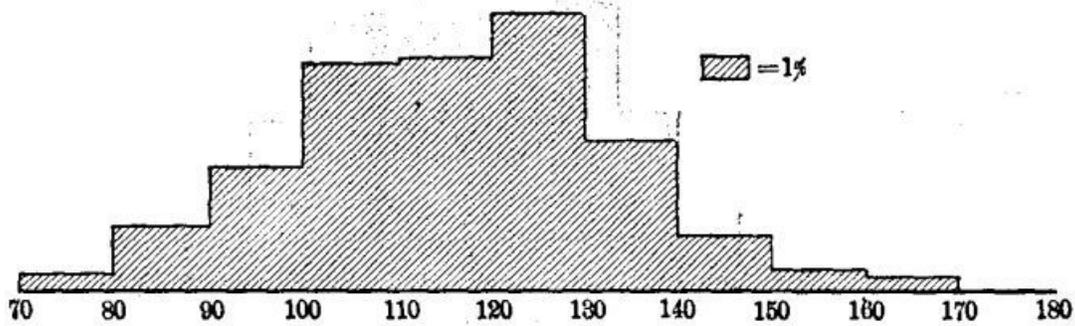

FIG. 64.

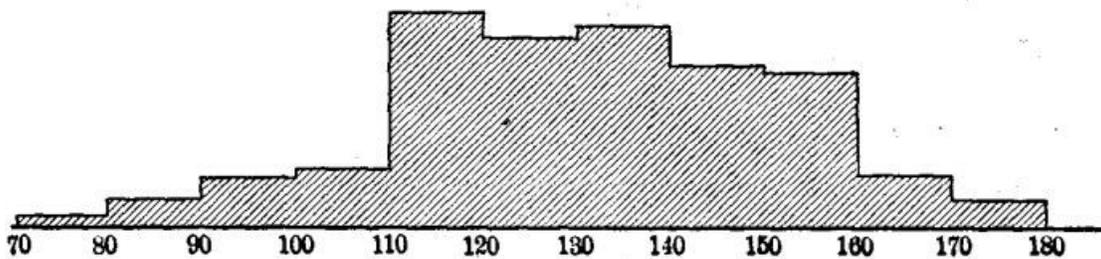

FIG. 65.

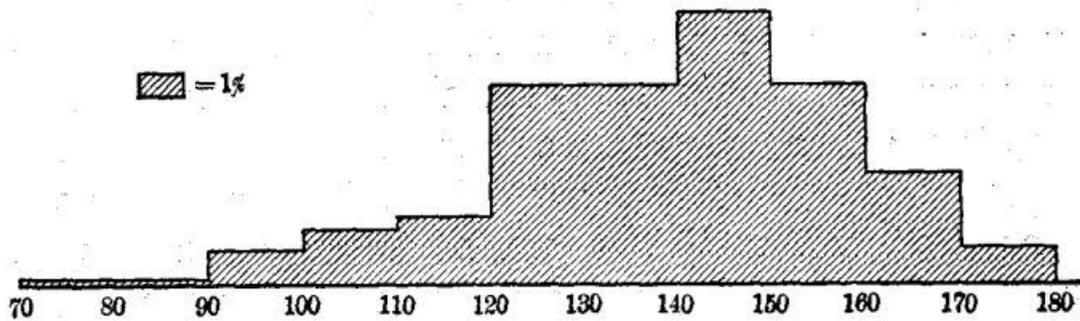

FIG. 66.

FIGS. 64, 65, and 66.—The scores of pupils in grade 6 (Fig. 64), grade 7 (Fig. 65), and grade 8 (Fig. 66) in a composite of tests in computation and problem-solving. The time was about 120 minutes. The maximum score attainable was 196.

The overlapping of grade upon grade should be noted. Of the pupils in grade 6 about 18 percent do better than the average pupil in grade 7, and about 7 percent do better than the average pupil in grade 8. Of the pupils in

grade 8 about 33 percent do worse than the average pupil in grade 7 and about 12 percent do worse than the average pupil in grade 6.

TABLE 13

RELATIVE FREQUENCIES OF SCORES IN AN EXTENSIVE TEAM OF ARITHMETICAL TESTS.^[23] IN PERCENTS

SCORE	GRADE 6	GRADE 7	GRADE 8
70 to 79	1.3	.9	.4

170 " 179		2.5	3.3

DIFFERENCES WITHIN ONE CLASS

The variation within a single class for which a single teacher has to provide is great. Even when teaching is departmental and promotion is by subjects, and when also the school is a large one and classification within a grade is by ability—there may be a wide range for any given special component ability. Under ordinary circumstances the range is so great as to be one of the chief limiting conditions for the teaching of arithmetic. Many methods appropriate to the top quarter of the class will be almost useless for the bottom quarter, and *vice versa*.

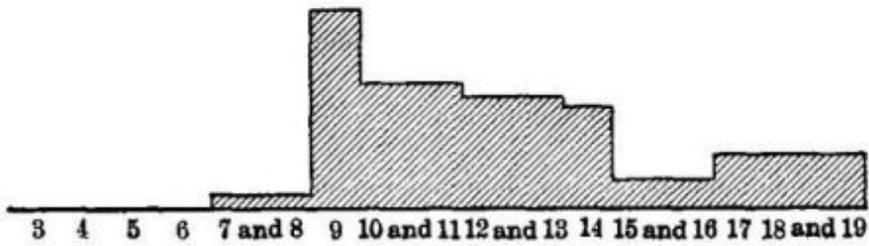

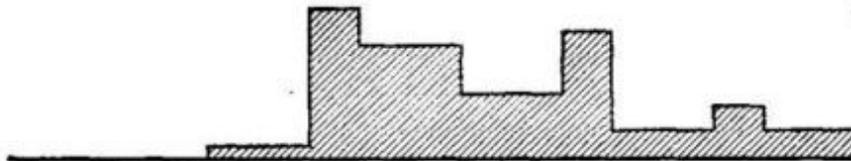

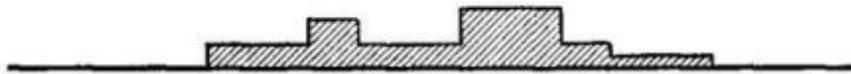

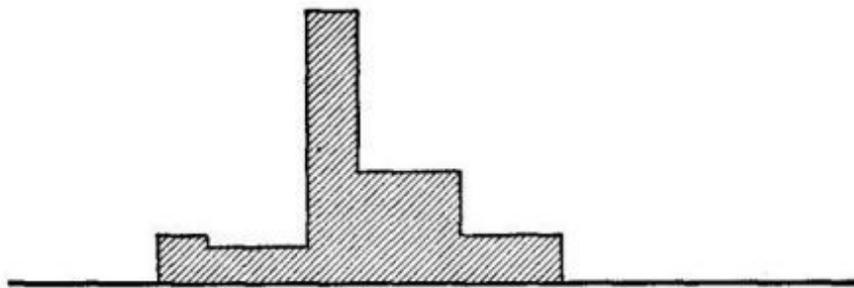

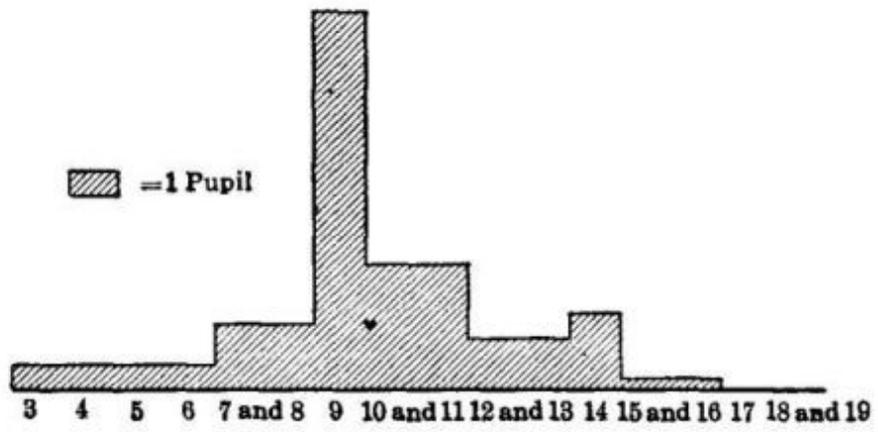

FIG. 67.

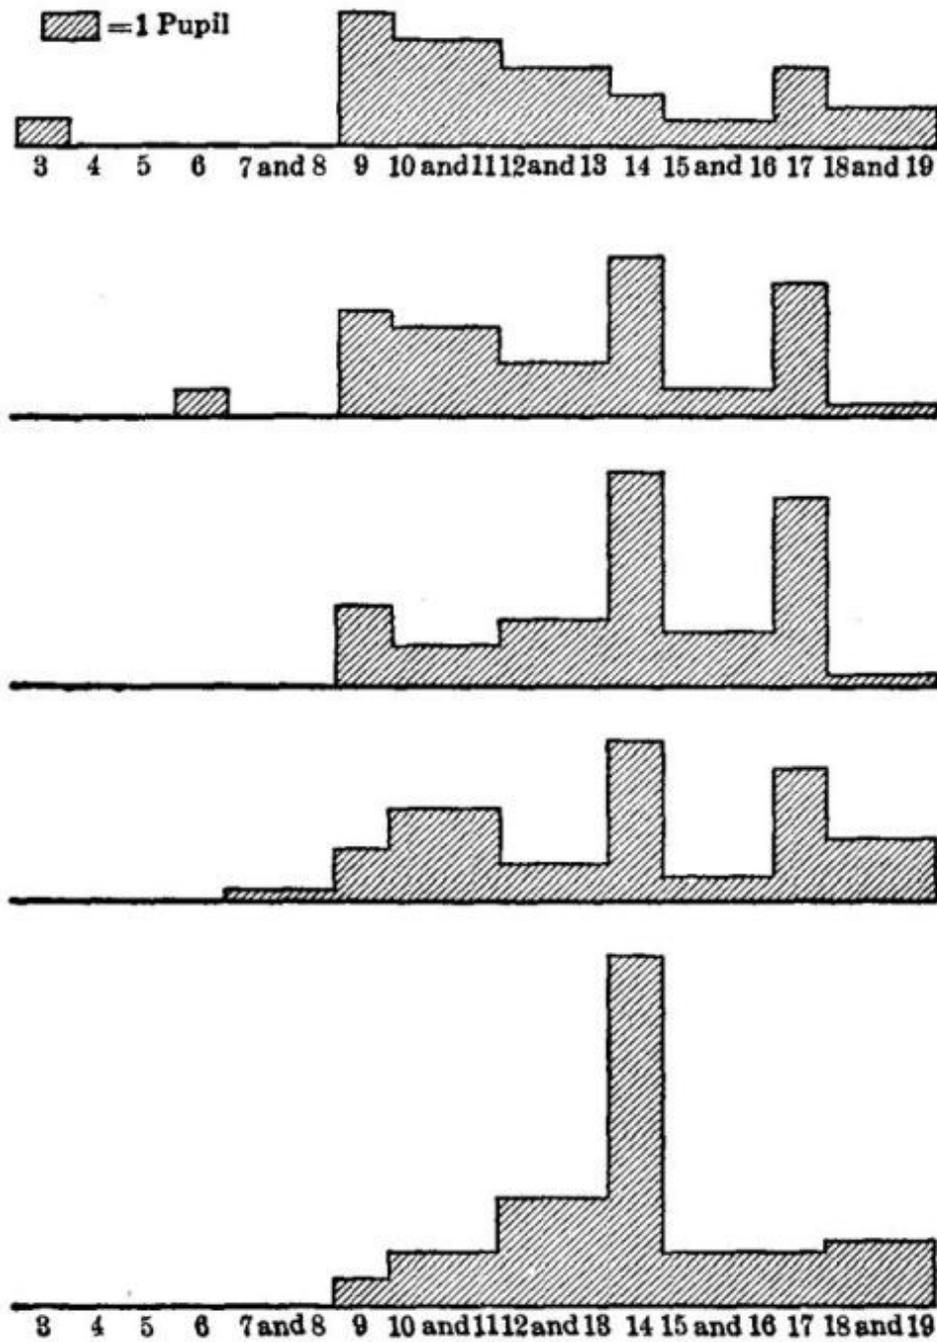

FIG. 68.

FIGS. 67 and 68.—The scores of ten 6 B classes in a 12-minute test in computation with integers (the Curtis Test 7). The score is the number of units done. Certain long tasks are counted as two units.

Figures 67 and 68 show the scores of ten classes taken at random from ninety 6 B classes in one city by Curtis [13, p. 64] in amount of computation done in 12 minutes. Observe the very wide variation present in the case of every class. The variation within a class would be somewhat reduced if each pupil were measured by his average in eight or ten such tests given on different days. If a rather generous allowance is made for this we still have a variation in speed as great as that shown in Fig. 69, as the fact to be expected for a class of thirty-two 6 B pupils.

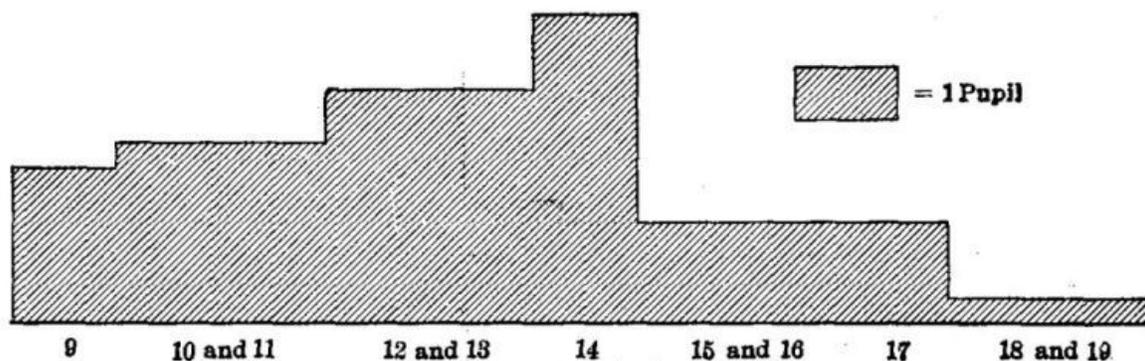

FIG. 69.—A conservative estimate of the amount of variation to be expected within a single class of 32 pupils in grade 6, in the number of units done in Courtis Test 7 when all chance variations are eliminated.

The variations within a class in respect to what processes are understood so as to be done with only occasional errors may be illustrated further as follows:—A teacher in grade 4 at or near the middle of the year in a city doing the customary work in arithmetic will probably find some pupil in her class who cannot do column addition even without carrying, or the easiest written subtraction

$$\left(\begin{array}{cc} 8 & 9 \\ \underline{5} & \underline{3} \end{array} \quad \text{or} \quad \begin{array}{c} 78 \\ \underline{37} \end{array} \right),$$

who does not know his multiplication tables or how to derive them, or understand the meanings of $+$ $-$ \times and \div , or have any useful ideas whatever about division.

There will probably be some child in the class who can do such work as that shown below, and with very few errors.

Add

$$\frac{3}{8} + \frac{5}{8} + \frac{7}{8} + \frac{1}{8} \qquad \begin{array}{r} 2\frac{1}{2} \\ 6\frac{3}{8} \\ \underline{3\frac{3}{4}} \end{array} \qquad \frac{1}{6} + \frac{3}{8}$$

Subtract

$$\begin{array}{r} 10.00 \\ \underline{3.49} \end{array} \qquad \begin{array}{r} 4 \text{ yd. } 1 \text{ ft. } 6 \text{ in.} \\ \underline{2 \text{ yd. } 2 \text{ ft. } 3 \text{ in.}} \end{array}$$

Multiply

$$\begin{array}{r} 1\frac{1}{4} \times 8 \\ \hline \end{array} \qquad \begin{array}{r} 16 \\ 2\frac{5}{8} \\ \hline \end{array} \qquad \begin{array}{r} 145 \\ 206 \\ \hline \end{array}$$

Divide

$$2 \overline{) 13.50} \qquad 25 \overline{) 9750}$$

The invention of means of teaching thirty so different children at once with the maximum help and minimum hindrance from their different capacities and acquisitions is one of the great opportunities for applied science.

Courtis, emphasizing the social demand for a certain moderate arithmetical attainment in the case of nearly all elementary school children of, say, grade 6, has urged that definite special means be taken to bring the deficient children up to certain standards, without causing undesirable 'overlearning' by the more gifted children. Certain experimental work to this end has been carried out by him and others, but probably much more must be done before an authoritative program for securing certain minimum standards for all or nearly all pupils can be arranged.

THE CAUSES OF INDIVIDUAL DIFFERENCES

The differences found among children of the same grade in the same city are due in large measure to inborn differences in their original natures. If, by a miracle, the children studied by Courtis, or by Woody, or by Kruse had all received exactly the same nurture from birth to date, they would still have varied greatly in arithmetical ability, perhaps almost as much as they now do vary.

The evidence for this is the general evidence that variation in original nature is responsible for much of the eventual variation found in intellectual and moral traits, plus certain special evidence in the case of arithmetical abilities themselves.

Thorndike found [05] that in tests with addition and multiplication twins were very much more alike than siblings^[24] two or three years apart in age, though the resemblance in home and school training in arithmetic should be nearly as great for the latter as for the former. Also the young twins (9-11) showed as close a resemblance in addition and multiplication as the older twins (12-15), although the similarities of training in arithmetic have had twice as long to operate in the latter case.

If the differences found, say among children in grade 6 in addition, were due to differences in the quantity and quality of training in addition which they have had, then by giving each of them 200 minutes of additional identical training the differences should be reduced. For the 200 minutes of identical training is a step toward equalizing training. It has been found in many investigations of the matter that when we make training in arithmetic more nearly equal for any group the variation within the group is not reduced.

On the contrary, equalizing training seems rather to increase differences. The superior individual seems to have attained his superiority by his own superiority of nature rather than by superior past training, for, during a period of equal training for all, he increases his lead. For example, compare the gains of different individuals due to about 300 minutes of practice in mental multiplication of a three-place number by a three-place number shown in Table 14 below, from data obtained by the author [08].^[25]

TABLE 14

THE EFFECT OF EQUAL AMOUNTS OF PRACTICE UPON INDIVIDUAL DIFFERENCE IN
THE MULTIPLICATION OF THREE-PLACE NUMBERS

	AMOUNT		PERCENTAGE OF CORRECT FIGURES	
	Initial Score	Gain	Initial Score	Gain
Initially highest five individuals	85	61	70	18
next five "	56	51	68	10
next six "	46	22	74	8
next six "	38	8	58	12
next six "	29	24	56	14

THE INTERRELATIONS OF INDIVIDUAL DIFFERENCES

Achievement in arithmetic depends upon a number of different abilities. For example, accuracy in copying numbers depends upon eyesight, ability to perceive visual details, and short-term memory for these. Long column addition depends chiefly upon great strength of the addition combinations especially in higher decades, 'carrying,' and keeping one's place in the column. The solution of problems framed in words requires understanding of language, the analysis of the situation described into its elements, the selection of the right elements for use at each step and their use in the right relations.

Since the abilities which together constitute arithmetic ability are thus specialized, the individual who is the best of a thousand of his age or grade in respect to, say, adding integers, may occupy different stations, perhaps from 1st to 600th, in multiplying with integers, placing the decimal point in division with decimals, solving novel problems, copying figures, etc., etc. Such specialization is in part due to his having had, relatively to the others in the thousand, more or better training in certain of these abilities than in others, and to various circumstances of life which have caused him to have, relatively to the others in the thousand, greater interest in certain of these achievements than in others. The specialization is not wholly due thereto, however. Certain inborn characteristics of an individual predispose him to different degrees of superiority or inferiority to other men in different features of arithmetic.

We measure the extent to which ability of one sort goes with or fails to go with ability of some other sort by the coefficient of correlation between the two. If every individual keeps the same rank in the second ability—if the individual who is the best of the thousand in one is the best of the group in the other, and so on down the list—the correlation is 1.00. In proportion as the ranks of individuals vary in the two abilities the coefficient drops from 1.00, a coefficient of 0 meaning that the best individual in ability A is no more likely to be in first place in ability B than to be in any other rank.

The meanings of coefficients of correlation of .90, .70, .50, and 0 are shown by Tables 15, 16, 17 and 18.^[26]

TABLE 15

10th tenth	10	10	10	10	10	10	10	10

The significance of any coefficient of correlation depends upon the group of individuals for which it is determined. A correlation of .40 between computation and problem-solving in eighth-grade pupils of 14 years would mean a much closer real relation than a correlation of .40 in all 14-year-olds, and a very, very much closer relation than a correlation of .40 for all children 8 to 15.

Unless the individuals concerned are very elaborately tested on several days, the correlations obtained are "attenuated" toward 0 by the "accidental" errors in the original measurements. This effect was not known until 1904; consequently the correlations in the earlier studies of arithmetic are all too low.

In general, the correlation between ability in any one important feature of computation and ability in any other important feature of computation is high. If we make enough tests to measure each individual exactly in:—

(A) Subtraction with integers and decimals,

- (B) Multiplication with integers and decimals,
- (C) Division with integers and decimals,
- (D) Multiplication and division with common fractions, and
- (E) Computing with percents,

we shall probably find the intercorrelations for a thousand 14-year-olds to be near .90. Addition of integers (*F*) will, however, correlate less closely with any of the above, being apparently dependent on simpler and more isolated abilities.

The correlation between problem-solving (*G*) and computation will be very much less, probably not over .60.

It should be noted that even when the correlation is as high as .90, there will be some individuals very high in one ability and very low in the other. Such disparities are to some extent, as Curtis ['13, pp. 67-75] and Cobb ['17] have argued, due to inborn characteristics of the individual in question which predispose him to very special sorts of strength and weakness. They are often due, however, to defects in his learning whereby he has acquired more ability than he needs in one line of work or has failed to acquire some needed ability which was well within his capacity.

In general, all correlations between an individual's divergence from the common type or average of his age for one arithmetical function, and his divergences from the average for any other arithmetical function, are positive. The correlation due to original capacity more than counterbalances the effects that robbing Peter to pay Paul may have.

Speed and accuracy are thus positively correlated. The individuals who do the most work in ten minutes will be above the average in a test of accuracy. The common notion that speed is opposed to accuracy is correct when it means that the same person will tend to make more errors if he works at too rapid a rate; but it is entirely wrong when it means that the kind of person who works more rapidly than the average person is likely to be less accurate than the average person.

Interest in arithmetic and ability at arithmetic are probably correlated positively in the sense that the pupil who has more interest than other pupils of his age tends in the long run to have more ability than they. They are certainly correlated in the sense that the pupil who 'likes' arithmetic better than geography or history tends to have relatively more ability in arithmetic, or, in other words, that the pupil who is more gifted at arithmetic than at drawing or English tends also to like it better than he likes these. These correlations are high.

It is correct then to think of mathematical ability as, in a sense, a unitary ability of which any one individual may have much or little, most individuals possessing a moderate amount of it. This is consistent, however, with the occasional appearance of individuals possessed of very great talents for this or that particular feature of mathematical ability and equally notable deficiencies in other features.

Finally it may be noted that ability in arithmetic, though occasionally found in men otherwise very stupid, is usually associated with superior intelligence in dealing with ideas and symbols of all sorts, and is one of the best early indications thereof.

FOOTNOTES

[1] The following and later problems are taken from actual textbooks or courses of study or state examinations; to avoid invidious comparisons, they are not exact quotations, but are equivalents in principle and form, as stated in the preface.

[2] The work of Mitchell has not been published, but the author has had the privilege of examining it.

[3] The form of Test 6 quoted here is that given by Curtis ['11-'12, p. 20]. This differs a little from the other series of Test 6, shown on pages 43 and 44.

[4] Eight or ten times *in all*, not eight or ten times for each fact of the tables.

[5] The facts concerning the present inaccuracy of school work in arithmetic will be found on pages 102 to 105.

[6] McLellan and Ames, *Public School Arithmetic* [1900].

[7] These concern allowances for two errors occurring in the same example and for the same wrong answer being obtained in both original work and check work.

[8] The very early learning of 2×2 , 2×3 , 3×2 , 2×4 , 4×2 , 3×3 , and perhaps a few more multiplications is not considered here. It is advisable. The treatment of 0×0 , 0×1 , 1×0 , etc., is not considered here. It is probably best to defer the ' $\times 0$ ' bonds until after all the others are formed and are being used in short multiplication, and to form them in close connection with their use in short multiplication. The ' $0 \times$ ' bonds may well be deferred until they are needed in 'long' multiplication, 0×0 coming last of all.

[9] See page 76.

[10] At the end of a volume or part, the count may be from as few as 5 or as many as 12 pages.

[11] Certain paragraphs in this and the following chapter are taken from the author's *Educational Psychology*, with slight modifications.

[12] It should be noted that just as concretes give rise to abstractions, so these in turn give rise to still more abstract abstractions. Thus founness, fiveness, twentyness, and the like give rise to 'integral-number-ness.' Similarly just as individuals are grouped into general classes, so classes are grouped into still more general classes. Half, quarter, sixth, and tenth are general notions, but 'one ...th' is more general; and 'fraction' is still more general.

[13] They may, of course, also result in a fusion or an alternation of responses, but only rarely.

[14] The more gifted children may be put to work using the principle after the first minute or two.

[15] If desired this form may be used, with the appropriate difference in the form of the questions and statements.

$$\begin{array}{r} 232 \\ \underline{30} \\ 000 \\ \underline{696} \\ 6960 \end{array}$$

[16] Curtis finds in the case of addition that "of all the individuals making mistakes at any given time in a class, at least one third, and usually two thirds, will be making mistakes in carrying or copying."

[17] Facts concerning the conditions of learning in general will be found in the author's *Educational Psychology*, Vol. 2, Chapter 8, or in the *Educational Psychology, Briefer Course*, Chapter 15.

[18] See Thorndike ['00], King ['07], and Heck ['13].

[19] A special type could be constructed that would use a large type body, say 14 point, with integers in 10 or 12 point and fractions much larger than now.

[20] It will be still better if the 4 is replaced by an open-top 4.

[21] For an account in English of their main findings see Howell ['14], pp. 149-251.

[22] In his *How We Think*.

[23] Compiled from data on p. 89 of Kruse ['18].

[24] Siblings is used for children of the same parents.

[25] Similar results have been obtained in the case of arithmetical and other abilities by Thorndike ['08, '10, '15, '16], Whitley ['11], Starch ['11], Wells ['12], Kirby ['13], Donovan and Thorndike ['13], Hahn and Thorndike ['14], and on a very large scale by Race in a study as yet unpublished.

[26] Unless he has a thorough understanding of the underlying theory, the student should be very cautious in making inferences from coefficients of correlation.

INDEX

Abilities, arithmetical, nature of, [1 ff.](#);
measurement of, [27 ff.](#);
constitution of, [51 ff.](#);
organization of, [137 ff.](#)

Abstract numbers, [85 ff.](#)

Abstraction, [169 ff.](#)

Accuracy, in relation to speed, [31](#);
in fundamental operations, [102 ff.](#)

Addition, measurement of, [27 ff.](#), [34](#);
constitution of, [52 f.](#);
habit in relation to, [71 f.](#);
in the higher decades, [75 f.](#);
accuracy in, [108 f.](#);
amount of practice in, [122 ff.](#);
interest in [196 f.](#)

Aims of the teaching of arithmetic, [23 f.](#)

AMES, A. F., [89](#)

Analysis, learning by, [169 ff.](#);
systematic and opportunistic stimuli to, [178 f.](#);
gradual progress in, [180 ff.](#)

Area, [257 f.](#), [275](#)

Arithmetic, sociology of, [24 ff.](#)

Arithmetical abilities. *See* Abilities.

Arithmetical language, [8 f.](#), [19](#), [89 ff.](#), [94 ff.](#)

Arithmetical learning, before school, [199 ff.](#);
conditions of, [227 ff.](#);
in relation to time of day, [227 ff.](#);
in relation to time devoted to arithmetic, [228 ff.](#)

Arithmetical reasoning. *See* Reasoning.

Arithmetical terms, [8](#), [19](#)

Averages, [40 f.](#); [135 f.](#)

BALLOU, F. W., [34](#), [38](#)

Banking, [256 f.](#)

BINET, A., [201](#)

Bonds, selection of, [70 ff.](#);
strength of, [102 ff.](#);
for temporary service, [111 ff.](#);
order of formation of, [141 ff.](#)
See also Habits.

BRANDELL, G., [211](#)

BRANDFORD, B., [198 f.](#)

BROWN, J. C., [xvi](#), [103](#)

BURGERSTEIN, L., [103](#)

BURNETT, C. J., [202](#)

BURT, C., [286](#)

Cardinal and ordinal numbers confused, [206](#)

Catch problems, [21 ff.](#)

CHAPMAN, J. C., [49](#)

Class, size of, in relation to arithmetical learning, [228](#);
variation within a, [289 ff.](#)

COBB, M. V., [299](#)

COFFMAN, L. D., [xvi](#)

Collection meaning of numbers, [3 ff.](#)

Computation, measurements of, [33 ff.](#);
explanations of the processes in, [60 ff.](#);
accuracy in, [102 ff.](#)
See also Addition, Subtraction, Multiplication, Division, Fractions, Decimal numbers, Percents.

Concomitants, law of varying, [172 ff.](#);
law of contrasting, [173 ff.](#)

Concrete numbers, [85 ff.](#)

Concrete objects, use of, [253 ff.](#)

Conditions of arithmetical learning, [227 ff.](#)

Constitution of arithmetical abilities, [51 ff.](#)

Copying of numbers, eyestrain due to, [212 f.](#)

Correlations of arithmetical abilities, [295 ff.](#)

Courses of study, [232 f.](#)

COURTIS, S. A., [28 ff.](#), [43 ff.](#), [49](#), [103](#), [291](#), [293](#), [299](#)

Crutches, [112 f.](#)

Culture-epoch theory, [198 f.](#)

Dairy records, [273](#)

Decimal numbers, uses of, [24 f.](#);
measurement of ability with, [36 ff.](#);
learning, [181 ff.](#);
division by, [270 f.](#)

DE CROLY, M., [205](#)

Deductive reasoning, [60 ff.](#), [185 ff.](#)

DEGAND, J., [205](#)

Denominate numbers, [141 f.](#), [147 f.](#)

Described problems, [10 ff.](#)

Development of knowledge of number, [205 ff.](#)

DE VOSS, J. C., [49](#)

DEWEY, J., [3](#), [83](#), [150](#), [205](#), [207](#), [208](#), [219](#), [266](#), [277](#)

Differences in arithmetical ability, [285 ff.](#);
within a class, [289 ff.](#)

Difficulty as a stimulus, [277 ff.](#)

Drill, [102 ff.](#)

Discipline, mental, [20](#)

Distribution of practice, [156 ff.](#)

Division, measurement of, [35 f.](#), [37](#);
constitution of, [57 ff.](#);
deductive explanations of, [63](#), [64 f.](#);
inductive explanations of, [63 f.](#), [65 f.](#);
habit in relation to, [72](#);
with remainders, [76](#);
with fractions, [78 ff.](#);
amount of practice in, [122 ff.](#);
distribution of practice in, [167](#);
use of the problem attitude in teaching, [270 f.](#)

DONOVAN, M. E., [295](#)

Elements, responses to, [169 ff.](#)

Eleven, multiples of, [85](#)

ELLIOTT, C. H., [228](#)

Equation form, importance of, [77 f.](#)

Explanations of the processes of computation, [60 ff.](#);
memory of, [115 f.](#);
time for giving, [154 ff.](#)

Eyestrain in arithmetical work, [212 ff.](#)

Facilitation, [143 ff.](#)

Figures, printing of, [235 ff.](#);
writing of, [214 f.](#), [241](#)

FLYNN, F. J., [196](#)

Fractions, uses of, [24 f.](#);
measurement of ability with, [36 ff.](#);
knowledge of the meaning of, [54 ff.](#)

FREEMAN, F. N., [259](#), [261](#)

FRIEDRICH, J., [103](#)

Generalization, [169 ff.](#)

GILBERT, J. A., [203](#)

Graded tests, [28 ff.](#), [36 ff.](#)

Greatest common divisor, [88 f.](#)

Habits, importance of, in arithmetical learning, [70 ff.](#);
now neglected, [75 ff.](#);
harmful or wasteful, [83 ff.](#); [91 ff.](#);
propædeutic, [117 ff.](#);
organization of, [137 ff.](#);
arrangement of, [141 ff.](#)

HAHN, H. H., [295](#)

HALL, G. S., [200 f.](#)

HARTMANN, B., [200 f.](#)

HECK, W. H., [227](#)

Heredity in arithmetical abilities, [293 ff.](#)

Highest common factor, [88 f.](#)

HOKÉ, K. J., [49](#)

HOLMES, M. E., [103](#)

HOWELL, H. B., [259](#)

HUNT, C. W., [196](#)

Hygiene of arithmetic, [212 ff.](#), [234 ff.](#)

Individual differences, [285 ff.](#)

Inductive reasoning, [60 ff.](#), [169 ff.](#)

Insurance, [256](#)

Interest as a principle determining the order of topics, [150 ff.](#)

Interests, instinctive [195 ff.](#);
censuses of, [209 ff.](#);
neglect of childish, [226 ff.](#);
in self-management, [223 f.](#);
intrinsic, [224 ff.](#)

Interference, [143 ff.](#)

Inventories of arithmetical knowledge and skill, [199 ff.](#)

End of the Project Gutenberg EBook of The Psychology of Arithmetic, by Edward L. Thorndike

*** END OF THIS PROJECT GUTENBERG EBOOK THE PSYCHOLOGY OF ARITHMETIC ***

***** This file should be named 39300-h.htm or 39300-h.zip *****
This and all associated files of various formats will be found in:
<http://www.gutenberg.org/3/9/3/0/39300/>

Produced by Jonathan Ingram and the Online Distributed Proofreading Team at <http://www.pgdp.net>

Updated editions will replace the previous one--the old editions will be renamed.

Creating the works from public domain print editions means that no one owns a United States copyright in these works, so the Foundation (and you!) can copy and distribute it in the United States without permission and without paying copyright royalties. Special rules, set forth in the General Terms of Use part of this license, apply to copying and distributing Project Gutenberg-tm electronic works to protect the PROJECT GUTENBERG-tm concept and trademark. Project Gutenberg is a registered trademark, and may not be used if you charge for the eBooks, unless you receive specific permission. If you do not charge anything for copies of this eBook, complying with the rules is very easy. You may use this eBook for nearly any purpose such as creation of derivative works, reports, performances and research. They may be modified and printed and given away--you may do practically ANYTHING with public domain eBooks. Redistribution is subject to the trademark license, especially commercial redistribution.

*** START: FULL LICENSE ***

THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg-tm mission of promoting the free

distribution of electronic works, by using or distributing this work (or any other work associated in any way with the phrase "Project Gutenberg"), you agree to comply with all the terms of the Full Project Gutenberg-tm License (available with this file or online at <http://gutenberg.org/license>).

Section 1. General Terms of Use and Redistributing Project Gutenberg-tm electronic works

1.A. By reading or using any part of this Project Gutenberg-tm electronic work, you indicate that you have read, understand, agree to and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg-tm electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg-tm electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. "Project Gutenberg" is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg-tm electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg-tm electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg-tm electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation ("the Foundation" or PGLAF), owns a compilation copyright in the collection of Project Gutenberg-tm electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is in the public domain in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg-tm mission of promoting free access to electronic works by freely sharing Project Gutenberg-tm works in compliance with the terms of this agreement for keeping the Project Gutenberg-tm name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg-tm License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg-tm work. The Foundation makes no representations concerning the copyright status of any work in any country outside the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg-tm License must appear prominently

whenever any copy of a Project Gutenberg-tm work (any work on which the phrase "Project Gutenberg" appears, or with which the phrase "Project Gutenberg" is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org/license

1.E.2. If an individual Project Gutenberg-tm electronic work is derived from the public domain (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase "Project Gutenberg" associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg-tm trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg-tm electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg-tm License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg-tm License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg-tm.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg-tm License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg-tm work in a format other than "Plain Vanilla ASCII" or other format used in the official version posted on the official Project Gutenberg-tm web site (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original "Plain Vanilla ASCII" or other form. Any alternate format must include the full Project Gutenberg-tm License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg-tm works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg-tm electronic works provided that

- You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg-tm works calculated using the method you already use to calculate your applicable taxes. The fee is

owed to the owner of the Project Gutenberg-tm trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, "Information about donations to the Project Gutenberg Literary Archive Foundation."

- You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg-tm License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg-tm works.
- You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- You comply with all other terms of this agreement for free distribution of Project Gutenberg-tm works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg-tm electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from both the Project Gutenberg Literary Archive Foundation and Michael Hart, the owner of the Project Gutenberg-tm trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread public domain works in creating the Project Gutenberg-tm collection. Despite these efforts, Project Gutenberg-tm electronic works, and the medium on which they may be stored, may contain "Defects," such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the "Right of Replacement or Refund" described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg-tm trademark, and any other party distributing a Project Gutenberg-tm electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH 1.F.3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a

defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS' WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg-tm electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg-tm electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg-tm work, (b) alteration, modification, or additions or deletions to any Project Gutenberg-tm work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need, are critical to reaching Project Gutenberg-tm's goals and ensuring that the Project Gutenberg-tm collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg-tm and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation web page at <http://www.pgla.org>.

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non profit 501(c)(3) educational corporation organized under the laws of the

state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Its 501(c)(3) letter is posted at <http://pglaf.org/fundraising>. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's principal office is located at 4557 Melan Dr. S. Fairbanks, AK, 99712., but its volunteers and employees are scattered throughout numerous locations. Its business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887, email business@pglaf.org. Email contact links and up to date contact information can be found at the Foundation's web site and official page at <http://pglaf.org>

For additional contact information:

Dr. Gregory B. Newby
Chief Executive and Director
gbnewby@pglaf.org

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide spread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit <http://pglaf.org>

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: <http://pglaf.org/donate>

Section 5. General Information About Project Gutenberg-tm electronic works.

Professor Michael S. Hart is the originator of the Project Gutenberg-tm concept of a library of electronic works that could be freely shared

with anyone. For thirty years, he produced and distributed Project Gutenberg-tm eBooks with only a loose network of volunteer support.

Project Gutenberg-tm eBooks are often created from several printed editions, all of which are confirmed as Public Domain in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility:

<http://www.gutenberg.org>

This Web site includes information about Project Gutenberg-tm, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.
