The principle of mediate comparison is only one form of a law which holds in many series of homogeneously related terms, the law that *skipping intermediary terms leaves relations the same*. This AXIOM OF SKIPPED INTERMEDIARIES OR OF TRANSFERRED RELATIONS occurs, as we soon shall see, in logic as the fundamental principle of inference, in arithmetic as the fundamental property of the number-series, in geometry as that of the straight line, the plane and the parallel. *It seems to be on the whole the broadest and deepest law of man's thought*.

In certain lists of terms the result of comparison may be to find no-difference, or equality in place of difference. Here also intermediaries may be skipped, and mediate comparison be carried on with the general result expressed by the *axiom of mediate equality*, "equals of equals are equal," which is the great principle of the mathematical sciences. This too as a result of the mind's mere acuteness, and in utter independence of the order in which experiences come associated together. Symbolically, again: $a = b = c = d...$, with the same consequence as regards expunging terms which we saw before.

CLASSIFICATORY SERIES.

Thus we have a rather intricate system of necessary and immutable *ideal truths of comparison*, a system applicable to terms *experienced* in any order of sequence or frequency, or even to terms never experienced or to be experienced, such as the mind's imaginary constructions would be. These truths of comparison result in *Classifications*. It is, for some unknown reason, a great æsthetic delight for the mind to break the order of

experience, and class its materials in serial orders, proceeding from step to step of difference, and to contemplate untiringly the crossings and inosculation of the series among themselves. The first steps in most of the sciences are purely classificatory. Where facts fall easily into rich and intricate series (as plants and animals and chemical compounds do), the mere sight of the series fills the mind with a satisfaction *sui generis*; and a world whose *real* materials naturally lend themselves to serial classification is *pro tanto* a more rational world, a world with which the mind will feel more intimate, than with a world in which they do not. By the pre-revolutionary naturalists, whose generation has hardly passed away, classifications were supposed to be ultimate insights into God's mind, filling us with adoration of his ways. The fact that Nature lets us make them was a proof of the presence of his Thought in her bosom. So far as the facts of experience can *not* be serially classified, therefore, so far experience fails to be rational in *one* of the ways, at least, which we crave.

THE LOGIC-SERIES.

Closely akin to the function of comparison is that of *judging, predicating, or subsuming*. In fact, these elementary intellectual functions run into each other so, that it is often only a question of practical convenience whether we shall call a given mental operation by the name of one or of the other. Comparisons result in groups of like things; and presently (through discrimination and abstraction) in conceptions of the *respects* in which the likenesses obtain. The groups are *genera* or *classes*, the respects are *characters* or *attributes*. The attributes again may be compared, forming genera of higher orders, and their characters singled out; so that we have a new sort of series, *that of predication, or of kind including kind*. Thus horses are quadrupeds, quadrupeds animals, animals machines, machines liable to wear out, etc. In such a series as this the several couplings of terms may have been made out originally at widely different times and under different circumstances. But memory may bring them together afterwards; and whenever it does so, our faculty of apprehending serial increase makes us conscious of them as a single system of successive terms united by the same relation.^[539]

Now whenever we become thus conscious, we may become aware of an additional relation which is of the highest intellectual importance, inasmuch as upon it the whole structure of logic is reared. *The principle of mediate predication or subsumption* is only the axiom of skipped intermediaries applied to a series of successive predications. It expresses the fact that any earlier term in the series stands to any later term in the same relation in which it stands to any intermediate term; in other words, that *whatever has an attribute has all the attributes of that attribute*; or more briefly still, that *whatever is of a kind is of that kind's kind*. A little explanation of this statement will bring out all that it involves.

We learned in the chapter on Reasoning what our great motive is for abstracting attributes and predicating them. It is that our varying practical purposes require us to lay hold of different angles of the reality at different times. But for these we should be satisfied to 'see it whole,' and always alike. The purpose, however, makes one aspect essential; so, to avoid dispersion of the attention, we treat the reality as if for the time being it were nothing but that aspect, and we let its supernumerary determinations go. In short, we substitute the aspect for the whole real thing. *For our purpose* the aspect *can* be substituted for the whole, and the two treated as the same; and the word *is* (which couples the whole with its aspect or attribute in the categoric judgment) expresses (among other things) the identifying operation performed. The predication-series *a is b, b is c, c is d,...* closely resembles for certain practical purposes the equation-series *a = b, b = c, c = d, etc.*

But what is our purpose in predicating? Ultimately, it may be anything we please; but proximately and immediately, it is always the gratification of a certain curiosity as to whether the object in hand is or is not *of a kind* connected with that ultimate purpose. Usually the connection is not obvious, and we only find that the object S is of a kind connected with P, after first finding that it is of a kind M, which itself is connected with P. Thus, to fix our ideas by an example, we have a curiosity (our ultimate purpose being conquest over nature) as to how Sirius may move. It is not obvious whether Sirius is a kind of thing which moves in the line of sight or not. When, however, we find it to be a kind of thing in whose spectrum the hydrogen-line is shifted, and when we reflect that *that* kind of thing is a kind of thing which moves in the line of sight; we conclude that Sirius does

so move. Whatever Sirius's attribute is, Sirius is; its adjective's adjective can supersede its own adjective in our thinking, and this with no loss to our knowledge, *so long as we stick to the definite purpose in view.*

Now please note that this elimination of intermediary kinds and transfer of *is's* along the line, results from our insight into the very meaning of the word *is*, and into the constitution of any series of terms connected by that relation. It has naught to do with what any particular thing is or is not; but, *whatever* any given thing may be, we see that it also is whatever *that* is, indefinitely. To grasp in one view a succession of *is's* is to apprehend this relation between the terms which they connect; just as to grasp a list of successive equals is to apprehend their *mutual* equality throughout. The principle of mediate subsumption thus expresses relations of ideal objects as such. It can be discovered by a mind left at leisure with any set of meanings (however originally obtained), of which some are predicable of others. The moment we string them in a serial line, that moment we see that we can drop intermediaries, treat remote terms just like near ones, and put a genus in the place of a species. This shows that *the principle of mediate subsumption has nothing to do with the particular order of our experiences, or with the outer coexistences and sequences of terms.* Were it a mere outgrowth of habit and association, we should be forced to regard it as having no universal validity; for every hour of the day we meet things which we consider to be of this kind or of that, but later learn that they have none of the kind's properties, that they *do not* belong to the kind's kind. Instead, however, of correcting the principle by these cases, we correct the cases by the principle. We say that if the thing we named an M has not M's properties, then we were either mistaken in calling it an M, or mistaken about M's properties; or else that it is no longer M, but has changed. But we never say that it is an M without M's properties; for by conceiving a thing as of the kind M I mean that it *shall* have M's properties, be of M's kind, even though I should never be able to find in the real world anything which is an M. The principle emanates from my perception of what a lot of successive *is's* *mean*. This perception can no more be confirmed by one set, or weakened by another set, of outer facts, than the perception that black is not white can be confirmed by the fact that snow never blackens, or weakened by the fact that photographer's paper blackens as soon as you lay it in the sun.

The abstract scheme of successive predications, extended indefinitely, with all the possibilities of substitution which it involves, is thus an immutable system of truth which flows from the very structure and form of our thinking. *If* any real terms ever do fit into such a scheme, they will obey its laws; *whether* they do is a question as to nature's facts, the answer to which can only be empirically ascertained. *Formal logic* is the name of the Science which traces in skeleton form all the remote relations of terms connected by successive *is*'s with each other, and enumerates their possibilities of mutual substitution. To our principle of mediate subsumption she has given various formulations, of which the best is perhaps this broad expression, that *the same can be substituted for the same in any mental operation.* [540]

The ordinary logical series contains but three terms—"Socrates, man, mortal." But we also have 'Sorites'—Socrates, man, animal, machine, run down, mortal, etc.—and it violates psychology to represent these as syllogisms with terms suppressed. The ground of there being any logic at all is our power to grasp any series as a whole, and the more terms it holds the better. This synthetic consciousness of an uniform direction of advance through a multiplicity of terms is, apparently, what the brutes and lower men cannot accomplish, and what gives to us our extraordinary power of ratiocinative thought. The mind which can grasp a string of *is*'s as a whole—the objects linked by them may be ideal or real, physical, mental, or symbolic, indifferently—can also apply to it the principle of skipped intermediaries. *The logic-list is thus in its origin and essential nature just like those graded classificatory lists which we erewhile described.* The 'rational proposition' which lies at the basis of all reasoning, the *dictum de omni et nullo* in all the various forms in which it may be expressed, the fundamental law of thought, is thus *only the result of the function of comparison* in a mind which has come by some lucky variation to apprehend a series of more than two terms at once. [541] So far, then, *both Systematic Classification and Logic are seen to be incidental results of the mere capacity for discerning difference and likeness*, which capacity is a thing with which the *order of experience*, properly so styled, has absolutely nothing to do.

But how comes it (it may next be asked) when systematic classifications have so little ultimate theoretic importance—for the conceiving of things according to their mere degrees of resemblance always yields to other modes of conceiving when these can be obtained—that the logical relations among things should form such a mighty engine for dealing with the facts of life?

Chapter XXII already gave the reason (see [p. 335](#), above). This world *might* be a world in which all things differed, and in which what properties there were were ultimate and had no farther predicates. In such a world there would be as many kinds as there were separate things. We could never subsume a new thing under an old kind; or if we could, no consequences would follow. Or, again, this might be a world in which innumerable things were of a kind, but in which no concrete thing remained of the same kind long, but all objects were in a flux. Here again, though we could subsume and infer, our logic would be of no practical use to us, for the subjects of our propositions would have changed whilst we were talking. In such worlds, logical relations would obtain, and be known (doubtless) as they are now, but they would form a merely theoretic scheme and be of no use for the conduct of life. But our world is no such world. It is a very peculiar world, and plays right into logic's hands. *Some* of the things, at least, which it contains are of the same kind as other things; *some* of them remain always of the kind of which they once were; and some of the properties of them cohere indissolubly and are always found together. *Which* things these latter things are we learn by experience in the strict sense of the word, and the results of the experience are embodied in 'empirical propositions.' Whenever such a thing is met with by us now, our sagacity notes it to be of a certain kind; our learning immediately recalls that kind's kind, and then *that* kind's kind, and so on; so that a moment's thinking may make us aware that the thing is of a kind so remote that we could never have directly perceived the connection. The flight to this last kind *over the heads of the intermediaries* is the essential feature of the intellectual operation here. Evidently it is a pure outcome of our sense for apprehending serial increase; and, unlike the several propositions themselves which make up the series (and which may all be empirical), it has nothing to do with the time- and space-order in which the things have been experienced.

MATHEMATICAL RELATIONS.

So much for the *a priori* necessities called systematic classification and logical inference. The other couplings of data which pass for *a priori* necessities of thought are the *mathematical* judgments, and certain metaphysical propositions. These latter we shall consider farther on. As regards the mathematical judgments, they are all 'rational propositions' in the sense defined on [p. 644](#), for they express results of comparison and nothing more. The mathematical sciences deal with similarities and equalities exclusively, and not with coexistences and sequences. Hence they have, in the first instance, no connection with the order of experience. The comparisons of mathematics are between numbers and extensive magnitudes, giving rise to arithmetic and geometry respectively.

Number seems to signify primarily the strokes of our attention in discriminating things. These strokes remain in the memory in groups, large or small, and the groups can be compared. The discrimination is, as we know, psychologically facilitated by the mobility of the thing as a total ([p. 173](#)). But within each thing we discriminate parts; so that the number of things which any one given phenomenon may be depends in the last instance on our way of taking it. A globe is one, if undivided; two, if composed of hemispheres. A sand-heap is one thing, or twenty thousand things, as we may choose to count it. We amuse ourselves by the counting of *mere* strokes, to form rhythms, and these we compare and name. Little by little in our minds the number-series is formed. This, like all lists of terms in which there is a direction of serial increase, carries with it the sense of those mediate relations between its terms which we expressed by the axiom "the more than the more is more than the less." That axiom seems, in fact, only a way of stating that the terms do form an increasing series. But, in addition to this, we are aware of certain other relations among our strokes of counting. We may interrupt them where we like, and go on again. All the while we feel that the interruption does not alter the strokes themselves. We may count 12 straight through; or count 7 and pause, and then count 5, but still the strokes will be the same. We thus distinguish between our acts of

counting and those of interrupting or grouping, as between an unchanged matter and an operation of mere shuffling performed on it. The matter is the original units or strokes; which all modes of grouping or combining simply give us back unchanged. In short, *combinations of numbers are combinations of their units*, which is the fundamental axiom of arithmetic, [542] leading to such consequences as that $7 + 5 = 8 + 4$ because both = 12. The general axiom of mediate equality, that equals of equals are equal, comes in here. [543] The principle of constancy in our meanings, when applied to strokes of counting, also gives rise to the axiom that the same number, operated on (interrupted, grouped) in the same way will always give the same result or be the same. How shouldn't it? Nothing is supposed changed.

Arithmetic and its fundamental principles are thus independent of our experiences or of the order of the world. The matter of arithmetic is *mental matter*; its principles flow from the fact that the matter forms a series, which can be cut into by us wherever we like without the matter changing. The empiricist school has strangely tried to interpret the truths of number as results of coexistences among outward things. John Mill calls number a physical property of things. 'One,' according to Mill, means one sort of passive sensation which we receive, 'two' another, 'three' a third. The same things, however, can give us different number-sensations. Three things arranged thus, ---, for example, impress us differently from three things arranged thus, -_- . But experience tells us that every real object-group which can be arranged in one of these ways can always be arranged in the other also, and that $2 + 1$ and 3 are thus modes of numbering things which 'coexist' invariably with each other. The indefeasibility of our belief in their 'coexistence' (which is Mill's word for their equivalence) is due solely to the enormous amount of experience we have of it. For all things, whatever other sensations they may give us, give us at any rate number-sensations. Those number-sensations which the same thing may be successively made to arouse are the numbers which we deem equal to each other; those which the same thing refuses to arouse are those which we deem unequal.

This is as clear a restatement as I can make of Mill's doctrine. [544] And its failure is written upon its front. Woe to arithmetic, were such the only grounds for its validity! The same real things are countable in numberless ways, and pass from one numerical form, not only to its equivalent (as Mill

implies), but to its other, as the sport of physical accidents or of our mode of attending may decide. How could our notion that one and one are eternally and necessarily two ever maintain itself in a world where every time we add one drop of water to another we get not two but one again? in a world where every time we add a drop to a crumb of quicklime we get a dozen or more?—had it no better warrant than such experiences? At most we could then say that one and one are *usually* two. Our arithmetical propositions would never have the confident tone which they now possess. That confident tone is due to the fact that they deal with abstract and ideal numbers exclusively. *What we mean* by one plus one *is* two; we *make* two out of it; and it would mean two still even in a world where *physically* (according to a conceit of Mill's) a third thing was engendered every time one thing came together with another. We are masters of our meanings, and discriminate between the things we mean and our ways of taking them, between our strokes of numeration themselves, and our bundlings and separatings thereof.

Mill ought not only to have said, "All things are numbered." He ought, in order to prove his point, to have shown that they are *unequivocally* numbered, which they notoriously are not. Only the abstract numbers themselves are unequivocal, only those which we create mentally and hold fast to as ideal objects always the same. A concrete natural thing can always be numbered in a great variety of ways. "We need only conceive a thing divided into four equal parts (and all things may be conceived as so divided)," as Mill is himself compelled to say, to find the number four in it, and so on.

The relation of numbers to experience is just like that of 'kinds' in logic. So long as an experience will keep its kind we can handle it by logic. So long as it will keep its number we can deal with it by arithmetic. *Sensibly*, however, things are constantly changing their numbers, just as they are changing their kinds. They are forever breaking apart and fusing. Compounds and their elements are never numerically identical, for the elements are sensibly many and the compounds sensibly one. Unless our arithmetic is to remain without application to life, we must somehow *make* more numerical continuity than we spontaneously find. Accordingly Lavoisier discovers his weight-units which remain the same in compounds and elements, though volume-units and quality-units all have changed. A

great discovery! And modern science outdoes it by denying that compounds exist at all. There is no such thing as 'water' for 'science;' that is only a handy name for H₂ and O when they have got into the position H-O-H, and then affect our senses in a novel way. The modern theories of atoms, of heat, and of gases are, in fact, only intensely artificial devices for gaining that constancy in the numbers of things which sensible experience will not show. "Sensible things are not the things for me," says Science, "because in their changes they will not keep their numbers the same. Sensible qualities are not the qualities for me, because they can with difficulty be numbered at all. These hypothetic atoms, however, are the things, these hypothetic masses and velocities are the qualities for me; they will stay numbered all the time."

By such elaborate inventions, and at such a cost to the imagination, do men succeed in making for themselves a world in which real things shall be coerced *per fas aut nefas* under arithmetical law.

The other branch of mathematics is *geometry*. Its objects are also ideal creations. Whether nature contain circles or not, I can know what I mean by a circle and can stick to my meaning; and when I mean two circles I mean two things of an identical kind. The axiom of constant results (see above, [p. 645](#)) holds in geometry. The same forms, treated in the same way (added, subtracted, or compared), give the same results—how shouldn't they? The axioms of mediate comparison ([p. 645](#)), of logic ([p. 648](#)), and of number ([p. 654](#)) all apply to the forms which we imagine in space, inasmuch as these resemble or differ from each other, form kinds, and are numerable things. But in addition to these general principles, which are true of space-forms only as they are of other mental conceptions, there are certain axioms relative to space-forms exclusively, which we must briefly consider.

Three of them give marks of identity among straight lines, planes, and parallels. Straight lines which have two points, planes which have three points, parallels to a given line which have one point, in common, coalesce throughout. Some say that the certainty of our belief in these axioms is due to repeated experiences of their truth; others that it is due to an intuitive

acquaintance with the properties of space. It is neither. We experience lines enough which pass through two points only to separate again, only we won't call them straight. Similarly of planes and parallels. We have a definite idea of what we mean by each of these words; and when something different is offered us, we see the difference. Straight lines, planes, and parallels, as they figure in geometry, are mere inventions of our faculty for apprehending serial increase. The farther continuations of these forms, we say, *shall* bear the same relation to their last visible parts which these did to still earlier parts. It thus follows (from that axiom of skipped intermediaries which obtains in all regular series) that parts of these figures separated by other parts must agree in direction, just as contiguous parts do. This uniformity of direction throughout is, in fact, all that makes us care for these forms, gives them their beauty, and stamps them into fixed conceptions in our mind. But obviously if two lines, or two planes, with a common segment, were to part company beyond the segment, it could only be because the direction of at least one of them had changed. Parting company in lines and planes *means* changing direction, means assuming a new relation to the parts that pre-exist; and assuming a new relation means ceasing to be straight or plane. If we mean by a parallel a line that will never meet a second line; and if we have one such line drawn through a point, any new line drawn through that point which does not coalesce with the first must be inclined to it, and if inclined to it must approach the second, i.e., cease to be parallel with it. No properties of outlying space need come in here: only a definite conception of uniform direction, and constancy in sticking to one's point.

The other two axioms peculiar to geometry are that figures can be moved in space without change, and that no variation in the way of subdividing a given amount of space alters its total quantity.^[545] This last axiom is similar to what we found to obtain in numbers. 'The whole is equal to its parts' is an abridged way of expressing it. A man is not the same biological whole if we cut him in two at the neck as if we divide him at the ankles; but geometrically he is the same whole, no matter in which place we cut him. The axiom about figures being movable in space is rather a postulate than an axiom. *So far as they are* so movable, then certain fixed equalities and differences obtain between forms, *no matter where placed*. But if translation through space warped or magnified forms, then the relations of equality, etc., would always have to be expressed with a position-

qualification added. A geometry as absolutely certain as ours could be invented on the supposition of such a space, if the laws of its warping and deformation were fixed. It would, however, be much more complicated than our geometry, which makes the simplest possible supposition; and finds, luckily enough, that it is a supposition with which the space of our experience seems to agree.

By means of these principles, all playing into each other's hands, the mutual equivalences of an immense number of forms can be traced, even of such as at first sight bear hardly any resemblance to each other. We move and turn them mentally, and find that parts of them will superpose. We add imaginary lines which subdivide or enlarge them, and find that the new figures resemble each other in ways which show us that the old ones are equivalent too. We thus end by expressing all sorts of forms in terms of other forms, enlarging our knowledge of the kinds of things which certain other kinds of things are, or to which they are equivalent.

The result is a new system of mental objects which can be treated as identical for certain purposes, a new series of *is's* almost indefinitely prolonged, just like the series of equivalencies among numbers, part of which the multiplication-table expresses. And all this is in the first instance regardless of the coexistences and sequences of nature, and regardless of whether the figures we speak of have ever been outwardly experienced or not.

CONSCIOUSNESS OF SERIES IS THE BASIS OF RATIONALITY.

Classification, logic, and mathematics all result, then, from the mere play of the mind comparing its conceptions, no matter whence the latter may have come. The essential condition for the formation of all these sciences is that we should have grown capable of apprehending series as such, and of distinguishing them as homogeneous or heterogeneous, and as possessing definite directions of what I have called 'increase.' This consciousness of series is a human perfection which has been gradually evolved, and which varies greatly from man to man. There is no accounting for it as a result of habitual associations among outward impressions, so we must simply ascribe it to the factors, whatever they be, of inward cerebral growth. Once this consciousness attained to, however, *mediate* thought becomes possible;

with our very awareness of a series may go an awareness that dropping terms out of it will leave identical relations between the terms that remain; and thus arises a perception of relations between things so naturally separate that we should otherwise never have compared them together at all.

The axiom of skipped intermediaries applies, however, only to certain particular series, and among them to those which we have considered, in which the recurring relation is either of difference, of likeness, of kind, of numerical addition, or of prolongation in the same linear or plane direction. It is therefore not a purely formal law of thinking, but flows from the nature of the matters thought about. It will not do to say universally that in all series of homogeneously related terms the remote members are related to each other as the near ones are; for that will often be untrue. The series A is not B is not C is not D.... does not permit the relation to be traced between remote terms. From two negations no inference can be drawn. Nor, to become more concrete, does the lover of a woman generally love her beloved, or the contradictor of a contradictor contradict whomever he contradicts. The slayer of a slayer does not slay the latter's victim; the acquaintances or enemies of a man need not be each other's acquaintances or enemies; nor are two things which are on top of a third thing necessarily on top of each other.

All skipping of intermediaries and transfer of relations occurs within homogeneous series. But not all homogeneous series allow of intermediaries being skipped and relations transferred. It depends on which series they are, on what relations they contain.^[546] Let it not be said that it is a mere matter of verbal association, due to the fact that language sometimes permits us to transfer the *name* of a relation over skipped intermediaries, and sometimes does not; as where we call men 'progenitors' of their remote as well as of their immediate posterity, but refuse to call them 'fathers' thereof. There are relations which are *intrinsically* transferable, whilst others are not. The relation of *condition*, e.g., is intrinsically transferable. What conditions a condition conditions what it conditions—"cause of cause is cause of effect." The relations of negation and *frustration*, on the other hand, are not transferable: what frustrates a frustration does not frustrate what it frustrates. No changes of terminology would annul the intimate difference between these two cases.

Nothing but the clear sight of the ideas themselves shows whether the axiom of skipped intermediaries applies to them or not. Their connections, immediate and remote, flow from their inward natures. We try to consider them in certain ways, to bring them into certain relations, and we find that sometimes we can and sometimes we cannot *The question whether there are or are not inward and essential connections between conceived objects as such, really is the same thing as the question whether we can get any new perception from mentally coupling them together, or pass from one to another by a mental operation which gives a result.* In the case of some ideas and operations we get a result; but no result in the case of others. Where a result comes, it is due exclusively to the *nature* of the ideas and of the operation. Take blueness and yellowness, for example. We can operate on them in some ways, but not in other ways. We can compare them; but we cannot add one to or subtract it from the other. We can refer them to a common kind, color; but we cannot make one a kind of the other, or infer one from the other. This has nothing to do with experience. For we *can* add blue *pigment* to yellow *pigment*, and subtract it again, and get a result both times. Only we know perfectly that this is no addition or subtraction of the blue and yellow qualities or natures themselves.^[547]

There is thus no denying the fact that *the mind is filled with necessary and eternal relations which it finds between certain of its ideal conceptions, and which form a determinate system, independent of the order of frequency in which experience may have associated the conception's originals in time and space.*

Shall we continue to call these sciences 'intuitive,' innate,' or '*a priori*' bodies of truth, or not?^[548] Personally I should like to do so. But I hesitate to use the terms, on account of the odium which controversial history has made the whole of their connotation for many worthy persons. The most politic way not to alienate these readers is to flourish the name of the immortal Locke. For in truth I have done nothing more in the previous pages than to make a little more explicit the teachings of Locke's fourth book:

"The immutability of the same relations between the same immutable things is now the idea that shows him that if the three angles of a triangle were once equal to two right angles, they will always be equal to two right ones. And hence he comes to be certain that what was once true in the case is always true; what ideas once agreed will always agree.... Upon this ground it is that particular demonstrations in mathematics afford general knowledge. If, then, the perception that the same ideas will eternally have the same habitudes and relations be not a sufficient ground of knowledge, there could be no knowledge of general propositions in mathematics.... All general knowledge lies only in our own thoughts, and consists barely in the contemplation of our abstract ideas. Wherever we perceive any agreement or disagreement amongst them, there we have general knowledge; and by putting the names of those ideas together accordingly in propositions, can with certainty pronounce general truths.... What is once known of such ideas will be perpetually and forever true. So that, as to all general knowledge, we must search and find it only in our own minds and it is only the examining of our own ideas that furnisheth us with that. Truths belonging to essences of things (that is, to abstract ideas) are eternal, and are to be found out only by the contemplation of those essences.... Knowledge is the consequence of the ideas (be they what they will) that are in our minds, producing there certain general propositions.... Such propositions are therefore called 'eternal truths,'... because, being once made about abstract ideas so as to be true, they will, whenever they can be supposed to be made again, at any time past or to come, by a mind having those ideas, always actually be true. For names being supposed to stand perpetually for the same ideas, and the same ideas having immutably the same habitudes one to another, propositions concerning any abstract ideas that are once true must needs be eternal verities."

But what are these eternal verities, these 'agreements,' which the mind discovers by barely considering its own fixed meanings, except what I have said?—relations of likeness and difference, immediate or mediate, between the terms of certain series. Classification is serial comparison, logic mediate subsumption, arithmetic mediate equality of different bundles of attention-strokes, geometry mediate equality of different ways of carving space. None

of these eternal verities has anything to say about facts, about what is or is not in the world. Logic does not say whether Socrates, men, mortals or immortals *exist*; arithmetic does not tell us where her 7's, 5's, and 12's are to be *found*; geometry affirms not that circles and rectangles are *real*. All that these sciences make us sure of is, that *if* these things are anywhere to be found, the eternal verities will obtain of them. Locke accordingly never tires of telling us that the

"universal propositions of whose truth or falsehood we can have certain knowledge, concern not existence.... These universal and self-evident principles, being only our constant, clear, and distinct knowledge of our own ideas more general or comprehensive, can assure us of nothing that passes without the mind; their certainty is founded only upon the knowledge of each idea by itself, and of its distinction from others; about which we cannot be mistaken whilst they are in our minds.... The mathematician considers the truth and properties belonging to a rectangle or circle only as they are in idea in his own mind. For it is possible he never found either of them existing mathematically, i.e., precisely true, in his life. But yet the knowledge he has of any truths or properties belonging to a circle, or any other mathematical figure, are nevertheless true and certain even of real things existing; because real things are no farther concerned nor intended to be meant by any such propositions, than as things really agree to those archetypes in his mind. Is it true of the idea of a triangle, that its three angles are equal to two right ones? It is true also of a triangle wherever it really exists. Whatever other figure exists that is not exactly answerable to that idea in his mind is not at all concerned in that proposition. And therefore he is certain all his knowledge concerning such ideas is real knowledge: because, intending things no farther than they agree with those his ideas, he is sure what he knows concerning those figures when they have barely an ideal existence in his mind will hold true of them also when they have a real existence in matter." But "that any or what bodies do exist, that we are left to our senses to discover to us as far as they can."^[549]

Locke accordingly distinguishes between 'mental truth' and 'real truth.'^[550] The former is intuitively certain; the latter dependent on experience. Only

hypothetically can we affirm intuitive truths of real things—by *supposing*, namely, that real things exist which correspond exactly with the ideal subjects of the intuitive propositions.

If our senses corroborate the supposition all goes well. But note the strange descent in Locke's hands of the dignity of *a priori* propositions. By the ancients they were considered, without farther question, to reveal the constitution of Reality. Archetypal things existed, it was assumed, in the relations in which we had to think them. The mind's necessities were a warrant for those of Being; and it was not till Descartes' time that scepticism had so advanced (in 'dogmatic' circles) that the warrant must itself be warranted, and the veracity of the Deity invoked as a reason for holding fast to our natural beliefs.

But the intuitive propositions of Locke leave us as regards outer reality none the better for their possession. We still have to "go to our senses" to find what the reality is. The vindication of the intuitionist position is thus a barren victory. The eternal verities which the very structure of our mind lays hold of do not necessarily themselves lay hold on extra-mental being, nor have they, as Kant pretended later,^[551] a legislating character even for all possible experience. They are primarily interesting only as subjective facts. They stand waiting in the mind, forming a beautiful ideal network; and the most we can say is that we *hope* to discover outer realities over which the network may be flung so that ideal and real may coincide.

And this brings us back to 'science' from which we diverted our attention so long ago (see [p. 640](#)). Science thinks that she has discovered the outer realities in question. Atoms and ether, with no properties but masses and velocities expressible by numbers, and paths expressible by analytic formulas, these at last are things over which the mathematico-logical network may be flung, and by supposing which instead of sensible phenomena science becomes yearly more able to manufacture for herself a world about which rational propositions may be framed. Sensible phenomena are pure delusions for the mechanical philosophy. The 'things' and qualities we instinctively believe in do not exist. The only realities are

swarming solids in everlasting motion, undulatory or continued, whose expressionless and meaningless changes of position form the history of the world, and are deducible from initial collocations and habits of movement hypothetically assumed. Thousands of years ago men started to cast the chaos of nature's sequences and juxtapositions into a form that might seem intelligible. Many were their ideal prototypes of rational order: teleological and æsthetic ties between things, causal and substantial bonds, as well as logical and mathematical relations. The most promising of these ideal systems at first were of course the richer ones, the sentimental ones. The baldest and least promising were the mathematical ones; but the history of the latter's application is a history of steadily advancing successes, whilst that of the sentimentally richer systems is one of relative sterility and failure.^[552] Take those aspects of phenomena which interest you as a human being most, and class the phenomena as perfect and imperfect, as ends and means to ends, as high and low, beautiful and ugly, positive and negative, harmonious and discordant, fit and unfit, natural and unnatural, etc., and barren are all your results. In the ideal world the kind 'precious' has characteristic properties. What is precious should be preserved; unworthy things should be sacrificed for its sake; exceptions made on its account; its preciousness is a reason for other things' actions, and the like. But none of these things need happen to your 'precious' object in the real world. Call the things of nature as much as you like by sentimental, moral, and æsthetic names, no natural consequences follow from the naming. They may be of the kinds you allege, but they are not of '*the kind's kind*': and the last great system-maker of this sort, Hegel, was obliged explicitly to repudiate logic in order to make any inferences at all from the names he called things by.

But when you give things mathematical and mechanical names and call them just so many solids in just such positions, describing just such paths with just such velocities, all is changed. Your sagacity finds its reward in the verification by nature of all the deductions which you may next proceed to make. Your 'things' realize all the *consequences* of the names by which you classed them. The modern mechanico-physical philosophy of which we are all so proud, because it includes the nebular cosmogony, the

conservation of energy, the kinetic theory of heat and gases, etc., etc., begins by saying that the *only* facts are collocations and motions of primordial solids, and the only laws the changes of motion which changes in collocation bring. The ideal which this philosophy strives after is a mathematical world-formula, by which, if all the collocations and motions at a given moment were known, it would be possible to reckon those of any wished-for future moment, by simply considering the necessary geometrical, arithmetical, and logical implications. Once we have the world in this bare shape, we can fling our net of *a priori* relations over all its terms, and pass from one of its phases to another by inward thought-necessity. Of course it is a world with a very minimum of rational *stuff*. The sentimental facts and relations are butchered at a blow. But the rationality yielded is so superbly complete in *form* that to many minds this atones for the loss, and reconciles the thinker to the notion of a purposeless universe, in which all the things and qualities men love, *dulcissima mundi nomina*, are but illusions of our fancy attached to accidental clouds of dust which will be dissipated by the eternal cosmic weather as carelessly as they were formed.

The popular notion that 'Science' is forced on the mind *ab extra*, and that our interests have nothing to do with its constructions, is utterly absurd. The craving to believe that the things of the world belong to kinds which are related by inward rationality together, is the parent of Science as well as of sentimental philosophy; and the original investigator always preserves a healthy sense of how plastic the materials are in his hands.

"Once for all," says Helmholtz in beginning that little work of his which laid the foundations of the 'conservation of energy,' "it is the task of the physical sciences to seek for laws by which particular processes in nature may be referred to general rules, and deduced from such again. Such rules (for example the laws of reflection or refraction of light, or that of Mariotte and Gay-Lussac for gas-volumes) are evidently nothing but generic-concepts for embracing whole classes of phenomena. The search for them is the business of the experimental division of our Science. Its theoretic division, on the other hand, tries to discover the unknown causes of processes from their visible effects; tries to understand them by the law of causality.... The ultimate goal of theoretic physics is to find the last *unchanging* causes of the processes

in Nature. Whether all processes be really ascribable to such causes, whether, in other words, *nature be completely intelligible*, or whether there be changes which would elude the law of a necessary causality, and fall into a realm of spontaneity or freedom, is not here the place to determine; but at any rate it is clear that the Science whose aim it is to make nature appear intelligible [*die Natur zu begreifen*] must start with the *assumption* of her intelligibility, and draw consequences in conformity with this assumption, until irrefutable facts show the limitations of this method.... The postulate that natural phenomena must be reduced to changeless ultimate causes next shapes itself so that *forces unchanged by time* must be found to be these causes. Now in Science we have already found portions of matter with changeless forces (indestructible qualities), and called them (chemical) elements. If, then, we imagine the world composed of elements with inalterable qualities, the only changes that can remain possible in such a world are spatial changes, i.e. movements, and the only outer relations which can modify the action of the forces are spatial too, or, in other words, the forces are motor forces dependent for their effect only on spatial relations. More exactly still: The phenomena of nature must be reduced to [*zurückgeföhrt*, conceived as, classed as] motions of material points with inalterable motor forces acting according to space-relations alone.... But points have no mutual space-relations except their distance,... and a motor force which they exert upon each other can cause nothing but a change of distance—i.e. be an attractive or a repulsive force.... And its intensity can only depend on distance. So that at last the task of Physics resolves itself into this, to refer phenomena to inalterable attractive and repulsive forces whose intensity varies with distance. The solution of this task would at the same time be the condition of Nature's complete intelligibility."^[553]

The subjective interest leading to the assumption could not be more candidly expressed. What makes the assumption 'scientific' and not merely poetic, what makes a Helmholtz and his kin *discoverers*, is that the things of Nature turn out to act as if they *were* of the kind assumed. They behave as such mere drawing and driving atoms would behave; and so far as they have been distinctly enough translated into molecular terms to test the point, so far a certain fantastically ideal object, namely, the mathematical

sum containing their mutual distances and velocities, is found to be constant throughout all their movements. This sum is called the total energy of the molecules considered. Its constancy or 'conservation' gives the name to the hypothesis of molecules and central forces from which it was logically deduced.

Take any other mathematico-mechanical theory and it is the same. They are all translations of sensible experiences into other forms, substitutions of items between which ideal relations of kind, number, form, equality, etc., obtain, for items between which no such relations obtain; coupled with declarations that the experienced form is false and the ideal form true, declarations which are justified by the appearance of new sensible experiences at just those times and places at which we logically infer that their ideal correlates ought to be. Wave-hypotheses thus make us predict rings of darkness and color, distortions, dispersions, changes of pitch in sonorous bodies moving from us, etc.; molecule-hypotheses lead to predictions of vapor-density, freezing point, etc.,—all which predictions fall true.

Thus the world grows more orderly and rational to the mind, which passes from one feature of it to another by deductive necessity, as soon as it conceives it as made up of so few and so simple phenomena as bodies with no properties but number and movement to and fro.

METAPHYSICAL AXIOMS.

But alongside of these ideal relations between terms which the world verifies, there are other ideal relations not as yet so verified. I refer to those propositions (no longer expressing mere results of comparison) which are formulated in such metaphysical and æsthetic axioms as "The Principle of things is one;" "The quantity of existence is unchanged;" "Nature is simple and invariable;" "Nature acts by the shortest ways;" "*Ex nihilo nihil fit*;" "Nothing can be evolved which was not involved;" "Whatever is in the effect must be in the cause;" "A thing can only work where it is;" "A thing can only affect another of its own kind;" "*Cessante causa, cessat et effectus*;" "Nature makes no leaps;" "Things belong to discrete and permanent kinds;" "Nothing is or happens without a reason;" "The world is throughout rationally intelligible;" etc., etc., etc. Such principles as these,

which might be multiplied to satiety,^[554] are properly to be called *postulates of rationality*, not propositions of fact. If nature *did* obey them, she *would* be *pro tanto* more intelligible; and we seek meanwhile so to conceive her phenomena as to show that she does obey them. To a certain extent we succeed. For example, instead of the 'quantity of existence' so vaguely postulated as unchanged, Nature allows us to suppose that curious sum of distances and velocities which for want of a better term we call 'energy.' For the effect being 'contained in the cause,' nature lets us substitute 'the effect *is* the cause,' so soon as she lets us conceive both effect and cause as the same molecules, in two successive positions.—But all around these incipient successes (as all around the molecular world, so soon as we add to it as its 'effects' those illusory 'things' of common-sense which we had to butcher for its sake), there still spreads a vast field of irrationalized fact whose items simply *are* together, and from one to another of which we can pass by no ideally 'rational' way.

It is not that these more metaphysical postulates of rationality are absolutely barren—though barren enough they were when used, as the scholastics used them, as immediate propositions of fact.^[555] They have a fertility as ideals, and keep us uneasy and striving always to recast the world of sense until its lines become more congruent with theirs. Take for example the principle that 'nothing can happen without a cause.' We have no definite idea of what we mean by cause, or of what causality consists in. But the principle expresses a demand for *some* deeper sort of inward connection between phenomena than their merely habitual time-sequence seems to us to be. The word 'cause' is, in short, an altar to an unknown god; an empty pedestal still marking the place of a hoped-for statue. *Any* really inward belonging-together of the sequent terms, if discovered, would be accepted as what the word cause was meant to stand for. So we seek, and seek; and in the molecular systems we find a sort of inward belonging in the notion of identity of matter with change of collocation. Perhaps by still seeking we may find other sorts of inward belonging, even between the molecules and those 'secondary qualities,' etc., which they produce upon our minds.

It cannot be too often repeated that the triumphant application of any one of our ideal systems of rational relations to the real world justifies our hope that other systems may be found also applicable. Metaphysics should take heart from the example of physics, simply confessing that hers is the longer

task. Nature *may* be remodelled, nay, certainly will be remodelled, far beyond the point at present reached. Just how far?—is a question which only the whole future history of Science and Philosophy can answer.^[556] Our task being Psychology, we cannot even cross the threshold of that larger problem.

Besides the mental structure which results in such metaphysical principles as those just considered, there is a mental structure which expresses itself in

ÆSTHETIC AND MORAL PRINCIPLES.

The æsthetic principles are at bottom such axioms as that a note sounds good with its third and fifth, or that potatoes need salt. We are once for all so made that when certain impressions come before our mind, one of them will seem to call for or repel the others as its companions. To a certain extent the principle of habit will explain these æsthetic connections. When a conjunction is repeatedly experienced, the cohesion of its terms grows grateful, or at least their disruption grows unpleasant. But to explain *all* æsthetic judgments in this way would be absurd; for it is notorious how seldom natural experiences come up to our æsthetic demands. Many of the so-called metaphysical principles are at bottom only expressions of æsthetic feeling. Nature is simple and invariable; makes no leaps, or makes nothing but leaps; is rationally intelligible; neither increases nor diminishes in quantity; flows from one principle, etc., etc.,—what do all such principles express save our sense of how pleasantly our intellect would feel if it had a Nature of that sort to deal with? The subjectivity of which feeling is of course quite compatible with Nature also turning out objectively to be of that sort, later on.

The *moral* principles which our mental structure engenders are quite as little explicable *in toto* by habitual experiences having bred inner cohesions. Rightness is not *mere* usualness, wrongness not *mere* oddity, however numerous the facts which might be invoked to prove such identity. Nor are the moral judgments those most invariably and emphatically impressed on us by public opinion. The most characteristically and peculiarly moral

judgments that a man is ever called on to make are in unprecedented cases and lonely emergencies, where no popular rhetorical maxims can avail, and the hidden oracle alone can speak; and it speaks often in favor of conduct quite unusual, and suicidal as far as gaining popular approbation goes. The forces which conspire to this resultant are subtle harmonies and discords between the elementary ideas which form the data of the case. Some of these harmonies, no doubt, have to do with habit; but in respect to most of them our sensibility must assuredly be a phenomenon of supernumerary order, correlated with a brain-function quite as secondary as that which takes cognizance of the diverse excellence of elaborate musical compositions. No more than the higher musical sensibility can the higher moral sensibility be accounted for by the frequency with which outer relations have cohered.^[557] Take judgments of justice or equity, for example. Instinctively, one judges everything differently, according as it pertains to one's self or to some one else. Empirically one notices that everybody else does the same. But little by little there dawns in one the judgment "nothing can be right for me which would not be right for another similarly placed;" or "the fulfilment of my desires is intrinsically no more imperative than that of anyone else's;" or "what it is reasonable that another should do for me, it is also reasonable that I should do for him,"^[558] and forthwith the whole mass of the habitual gets overturned. It gets *seriously* overturned only in a few fanatical heads. But its overturning is due to a back-door and not to a front-door process. Some minds are preternaturally sensitive to logical consistency and inconsistency. When they have ranked a thing under a kind, they *must* treat it as of that kind's kind, or feel all out of tune. In many respects we do class ourselves with other men, and call them and ourselves by a common name. They agree with us in having the same Heavenly Father, in not being consulted about their birth, in not being themselves to thank or blame for their natural gifts, in having the same desires and pains and pleasures, in short in a host of fundamental relations. Hence, *if these things be our essence*, we should be substitutable for other men, and they for us, in any proposition in which either of us is involved. The more fundamental and common the essence chosen, and the more simple the reasoning,^[559] the more wildly radical and unconditional will the justice be which is aspired to. Life is one long struggle between conclusions based on abstract ways of conceiving cases, and opposite conclusions prompted by our instinctive perception of them as individual facts. The

logical stickler for justice always seems pedantic and mechanical to the man who goes by tact and the particular instance, and who usually makes a poor show at argument. Sometimes the abstract conceiver's way is better, sometimes that of the man of instinct. But just as in our study of reasoning we found it impossible to lay down any mark whereby to distinguish *right* conception of a concrete case from *confusion* (see [pp. 336, 350](#)), so here we can give no general rule for deciding when it is morally useful to treat a concrete case as *sui generis*, and when to lump it with others in an abstract class.^[560]

An adequate treatment of the way in which we come by our æsthetic and moral judgments would require a separate chapter, which I cannot conveniently include in this book. Suffice it that these judgments express inner harmonies and discords between objects of thought; and that whilst outer cohesions frequently repeated will often seem harmonious, all harmonies are not thus engendered, but our feeling of many of them is a secondary and incidental function of the mind. Where harmonies are asserted of the real world, they are obviously mere postulates of rationality, so far as they transcend experience. Such postulates are exemplified by the ethical propositions that the individual and universal good are one, and that happiness and goodness are bound to coalesce in the same subject.

SUMMARY OF WHAT PRECEDES.

I will now sum up our progress so far by a short summary of the most important conclusions which we have reached.

The mind has a native structure in this sense, that certain of its objects, if considered together in certain ways, give definite results; and that no other ways of considering, and no other results, are possible if the same objects be taken.

The results are 'relations' which are all expressed by judgments of subsumption and of comparison.

The judgments of subsumption are themselves subsumed under the *laws of logic*.

Those of comparison are expressed in *classifications*, and in the *sciences of arithmetic and geometry*.

Mr. Spencer's opinion that our consciousness of classificatory, logical, and mathematical relations between ideas is due to the frequency with which the corresponding 'outer relations' have impressed our minds, is unintelligible.

Our consciousness of these relations, no doubt, has a natural genesis. But it is to be sought rather in the inner forces which have made the brain grow, than in any mere paths of 'frequent' association which outer stimuli may have ploughed in that organ.

But let our sense for these relations have arisen as it may, the relations themselves form a fixed system of lines of cleavage, so to speak, in the mind, by which we naturally pass from one object to another; and the objects connected by these lines of cleavage are often not connected by any regular time- and space-associations. We distinguish, therefore, between the empirical order of things, and this their rational order of comparison; and, so far as possible, we seek to translate the former into the latter, as being the more congenial of the two to our intellect.

Any classification of things into kinds (especially if the kinds form series, or if they successively involve each other) is a more rational way of conceiving the things than is that mere juxtaposition or separation of them as individuals in time and space which is the order of their crude perception. Any assimilation of things to terms between which such classificatory relations, with their remote and mediate transactions, obtain, is a way of bringing the things into a more rational scheme.

Solids in motion are such terms; and the mechanical philosophy is only a way of conceiving nature so as to arrange its items along some of the more natural lines of cleavage of our mental structure.

Other natural lines are the moral and æsthetic relations. Philosophy is still seeking to conceive things so that these relations also may seem to obtain between them.

As long as things have not successfully been so conceived, the moral and æsthetic relations obtain only between *entia rationis*, terms in the mind; and the moral and æsthetic principles remain but postulates, not propositions, with regard to the real world outside.

There is thus a large body of *a priori* or intuitively necessary truths. As a rule, these are truths of *comparison* only, and in the first instance they express relations between merely mental terms. Nature, however, acts as if some of her realities were identical with these mental terms. So far as she does this, we can make *a priori* propositions concerning natural fact. The aim of both science and philosophy is to make the identifiable terms more numerous. So far it has proved easier to identify nature's things with mental terms of the mechanical than with mental terms of the sentimental order.

The widest postulate of rationality is that the world *is* rationally intelligible throughout, after the pattern of *some* ideal system. The whole war of the philosophies is over that point of faith. Some say they can see their way already to the rationality; others that it is hopeless in any other but the mechanical way. To some the very fact that there is a world at all seems irrational. Nonentity would be a more natural thing than existence, for these minds. One philosopher at least says that the relatedness of things to each other is irrational anyhow, and that a world of relations can never be made intelligible.^[561]

With this I may be assumed to have completed the programme which I announced at the beginning of the chapter, so far as the *theoretic* part of our organic mental structure goes. It can be due neither to our own nor to our ancestors' experience. I now pass to those practical parts of our organic mental structure. Things are a little different here; and our conclusion, though it lies in the same direction, can be by no means as confidently expressed.

To be as short and simple as possible, I will take the case of instincts, and, supposing the reader to be familiar with [Chapter XXIV](#), I will plunge *in medias res*.

THE ORIGIN OF INSTINCTS.

Instincts must have been either

- 1) Each specially created in complete form, or
- 2) Gradually evolved.

As the first alternative is nowadays obsolete, I proceed directly to the second. The two most prominent suggestions as to the way in which instincts may have been evolved are associated with the names of Lamarck and Darwin.

Lamarck's statement is that animals have *wants*, and contract, to satisfy them, *habits* which transform themselves gradually into so many propensities which they can neither resist nor change. These *propensities*, once acquired, propagate themselves by way of transmission to the young, so that they come to exist in new individuals, anteriorly to all exercise. Thus are the same emotions, the same habits, the same *instincts*, perpetuated without variation from one generation to another, so long as the outward conditions of existence remain the same.^[562] Mr. Lewes calls this the theory of 'lapsed intelligence.' Mr. Spencer's words are clearer than Lamarck's, so that I will quote from him:^[563]

"Setting out with the unquestionable assumption, that every new form of emotion making its appearance in the individual or the race is a modification of some pre-existing emotion, or a compounding of several pre-existing emotions, we should be greatly aided by knowing what always are the pre-existing emotions. When, for example, we find that very few, if any, of the lower animals show any love of accumulation, and that this feeling is absent in infancy; when we see that an infant in arms exhibits anger, fear, wonder, while yet it manifests no desire of permanent possession; and that a brute which has no acquisitive emotion can nevertheless feel attachment, jealousy, love of approbation,—we may suspect that the feeling which property satisfies is compounded out of simpler and deeper feelings. We may conclude that as when a dog hides a bone there must exist in him a prospective gratification of hunger, so there must similarly, at first, in all cases where anything is secured or taken possession of, exist an ideal excitement of the feeling which that thing will gratify. We may further conclude that when the intelligence is such that a variety of objects come to be utilized for different purposes; when, as among savages, divers wants are satisfied through the articles appropriated for weapons, shelter, clothing, ornament,—the act of appropriating comes to be one constantly involving agreeable associations, and one which is therefore pleasurable, irrespective of the end subserved. And when, as

in civilized life, the property acquired is of a kind not conducing to one order of gratifications, but is capable of ministering to all gratifications, the pleasure of acquiring property grows more distinct from each of the various pleasures subserved—is more completely differentiated into a separate emotion.^[564] It is well known that on newly-discovered islands not inhabited by man, birds are so devoid of fear as to allow themselves to be knocked over with sticks, but that in the course of generations they acquire such a dread of man as to fly on his approach, and that this dread is manifested by young as well as old. Now unless this change be ascribed to the killing off of the least fearful, and the preservation and multiplication of the more fearful, which, considering the small number killed by man, is an inadequate cause, it must be ascribed to accumulated experiences, and each experience must be held to have a share in producing it. We must conclude that in each bird that escapes with injuries inflicted by man, or is alarmed by the outcries of other members of the flock,... there is established an association of ideas between the human aspect and the pains, direct and indirect, suffered from human agency. And we must further conclude that the state of consciousness which impels the bird to take flight is at first nothing more than an ideal reproduction of those painful impressions which before followed man's approach; that such ideal reproduction becomes more vivid and more massive as the painful experiences, direct or sympathetic, increase; and that thus the emotion, in its incipient state, is nothing else than an aggregation of the revived pains before experienced. As, in the course of generations, the young birds of this race begin to display a fear of man before they have been injured by him, it is an unavoidable inference that the nervous system of the race has been organically modified by these experiences; we have no choice but to conclude that when a young bird is thus led to fly, it is because the impression produced on its senses by the approaching man entails, through an incipiently reflex action, a partial excitement of all those nerves which, in its ancestors, had been excited under the like conditions; that this partial excitement has its accompanying painful consciousness; and that the vague painful consciousness thus arising constitutes emotion proper—*emotion undecomposable into specific experiences, and therefore seemingly homogeneous. If such be the explanation of the fact in this case, then it*

is in all cases. If the emotion is so generated here, then it is so generated throughout. If so, we must perforce conclude that the emotional modifications displayed by different nations, and those higher emotions by which civilized are distinguished from savage, are to be accounted for on the same principle. And, concluding this, we are led strongly to suspect that the emotions in general have severally thus originated."^[565]

Obviously the word 'emotion' here means instinct as well,—the actions we call instinctive are expressions or manifestations of the emotions whose genesis Mr. Spencer describes. Now if habit could thus bear fruit outside the individual life, and if the modifications so painfully acquired by the parents' nervous systems could be found ready-made at birth in those of the young, it would be hard to overestimate the importance, both practical and theoretical, of such an extension of its sway. In principle, instincts would then be assimilated to 'secondarily-automatic' habits, and the origin of many of them out of tentative experiments made during ancestral lives, perfected by repetition, addition, and association through successive generations, would be a comparatively simple thing to understand.

Contemporary students of instinct have accordingly been alert to discover all the facts which would seem to establish the possibility of such an explanation. The list is not very long, considering what a burden of conclusions it has to bear. Let acquisitiveness and fear of man, as just argued for by Spencer, lead it off. Other cases of the latter sort are the increased shyness of the woodcock noticed to have occurred within sixty years' observation by Mr. T. A. Knight, and the greater shyness everywhere shown by large than by small birds, to which Darwin has called attention. Then we may add—

The propensities of 'pointing,' 'retrieving,' etc., in sporting dogs, which seem partly, at any rate, to be due to training, but which in well-bred stock are all but innate. It is in these breeds considered bad for a litter of young if its sire or dam have not been trained in the field.

Docility of domestic breeds of horses and cattle.

Tameness of young of tame rabbit—young wild rabbits being invincibly timid.

Young foxes are most wary in those places where they are most severely hunted.

Wild ducks, hatched out by tame ones, fly off. But if kept close for some generations, the young are said to become tame.^[566]

Young savages at a certain age will revert to the woods.

English greyhounds taken to the high plateau of Mexico could not at first run well, on account of rarefied air. Their whelps entirely got over the difficulty.

Mr. Lewes somewhere^[567] tells of a terrier pup whose parents had been taught to 'beg,' and who constantly threw himself spontaneously into the begging attitude. Darwin tells of a French orphan-child, brought up out of France, yet *shrugging* like his ancestors.^[568]

Musical ability often increases from generation to generation in the families of musicians.

The hereditarily epileptic guinea-pigs of Brown-Séguard, whose parents had become epileptic through surgical operations on the spinal cord or sciatic nerve. The adults often lose some of their hind toes, and the young, in addition to being epileptic, are frequently born with the corresponding toes lacking. The offspring of guinea-pigs whose cervical sympathetic nerve has been cut on one side will have the ear larger, the eyeball smaller, etc., just like their parents after the operation. Puncture of the 'restiform body' of the medulla will, in the same animal, congest and enlarge one eye, and cause gangrene of one ear. In the young of such parents the same symptoms occur.

Physical refinement, delicate hands and feet, etc., appear in families well-bred and rich for several generations.

The 'nervous' temperament also develops in the descendants of sedentary brain-working people.

Inebriates produce offspring in various ways degenerate.

Nearsightedness is produced by indoor occupation for generations. It has been found in Europe much more frequent among schoolchildren in towns than among children of the same age in the country.

These latter cases are of the inheritance of structural rather than of functional peculiarities. But as structure gives rise to function it may be said that the principle is the same. Amongst other inheritances of adaptive^[569] structural change may be mentioned:

The 'Yankee' type.

Scrofula, rickets, and other diseases of bad conditions of life.

The udders and permanent milk of the domestic breeds of cow.

The 'fancy' rabbit's ears, drooping through lack of need to erect them. Dog's, ass's, etc., in some breeds ditto.

The obsolete eyes of mole and various cave-dwelling animals.

The diminished size of the wing-bones of domesticated ducks, due to ancestral disuse of flight.^[570]

These are about all the facts which, by one author or another, have been invoked as evidence in favor of the 'lapsed intelligence' theory of the origin of instincts.

Mr. Darwin's theory is that of the natural selection of accidentally produced tendencies to action.

"It would," says he, "be the most serious error to suppose that the greater number of instincts have been acquired by habit in one generation, and then transmitted by inheritance in succeeding generations. It can clearly be shown that the most wonderful instincts with which we are acquainted, namely, those of the hive-bee and of many ants, could not possibly have been thus acquired."^[571] It will be universally admitted that instincts are as important as corporeal structure for the welfare of each species, under its present conditions of life. Under changed conditions of life, it is at least possible that slight modifications of instinct might be profitable to a species; and if it can be shown that instincts do vary ever so little, then I can see no difficulty in natural selection preserving and continually accumulating variations of instinct to any extent that may be profitable. It is thus, as I believe, that all the most complex and wonderful instincts have arisen.... I believe that the effects of habit are of quite subordinate importance to the effects of the natural selection of what may be called accidental variations of instincts;—that is, of variations produced by

the same unknown causes which produce slight deviations of bodily structure."^[572]

The evidence for Mr. Darwin's view is too complex to be given in this place. To my own mind it is quite convincing. If, with the Darwinian theory in mind, one re-reads the list of examples given in favor of the Lamarckian theory, one finds that many of the cases are irrelevant, and that some make for one side as well as for the other. This is so obvious in many of the cases that it is needless to point it out in detail. The shrugging child and the begging pup, e.g., prove somewhat too much. They are examples so unique as to suggest spontaneous variation rather than inherited habit. In other cases the observations much need corroboration, e.g., the effects of not training for a generation in sporting dogs and race-horses, the difference between young wild rabbits born in captivity and young tame ones, the cumulative effect of many generations of captivity on wild ducks, etc.

Similarly, the increased wariness of the large birds, of those on islands frequented by men, of the woodcock, of the foxes, may be due to the fact that the bolder families have been killed off, and left none but the naturally timid behind, or simply to the individual experience of older birds being imparted by example to the young so that a new *educational tradition* has occurred.—The cases of physical refinement, nervous temperament, Yankee type, etc., also need much more discriminating treatment than they have yet received from the Lamarckians. There is no real evidence that physical refinement and nervousity tend to accumulate from generation to generation in aristocratic or intellectual families; nor is there any that the change in that direction which Europeans transplanted to America undergo is not all completed in the first generation of children bred on our soil. To my mind, the facts all point that way. Similarly the better breathing of the greyhounds born in Mexico was surely due to a post-natal adaptation of the pups' thorax to the rarer air.

Distinct neurotic *degeneration* may undoubtedly accumulate from parent to child, and as the parent usually in this case grows worse by his own irregular habits of life, the temptation lies near to ascribe the child's deterioration to this cause. This, again, is a hasty conclusion. For neurotic degeneration is unquestionably a disease whose original causes are unknown; and like other 'accidental variations' it is hereditary. But it

ultimately ends in sterility; and it seems to me quite unfair to draw any conclusions from its natural history in favor of the transmission of acquired peculiarities. Nor does the degeneration of the children of alcoholics prove anything in favor of their having inherited the shattered nervous system which the alcohol has induced in their parents: because the poison usually has a chance to directly affect their own bodies before birth, by acting on the germinal matter from which they are formed whilst it is still nourished by the alcoholized blood of the parent. In many cases, moreover, the parental alcoholics are themselves degenerates neurotically, and the drink-habit is only a symptom of their disease, which in some form or other they also propagate to their children.

There remain the inherited mutilations of the guinea-pig. But these are such startling exceptions to the ordinary rule with animals that they should hardly be used as examples of a typical process. The docility of domestic cattle is certainly in part due to man's selection, etc., etc. In a word, the proofs form rather a beggarly array.

Add to this that the writers who have tried to carry out the theory of transmitted habit with any detail are always obliged *somewhere* to admit inexplicable variation. Thus Spencer allows that

"Sociality can begin only where, through some slight variation, there is less tendency than usual for the individuals to disperse.... That slight variations of mental nature, sufficient to initiate this process, may be fairly assumed, all our domestic animals show us: differences in their characters and likings are conspicuous. Sociality having thus commenced, and survival of the fittest tending ever to maintain and increase it, it will be further strengthened by the inherited effects of habit."^[573] Again, in writing of the pleasure of pity, Mr. Spencer says: "This feeling is not one that has arisen through the inherited effects of experiences, but belongs to a quite different group, traceable to the survival of the fittest simply—to the natural selection of incidental variations. In this group are included all the bodily appetites, together with those simpler instincts, sexual and parental, by which every race is maintained; and which must exist before the higher processes of mental evolution can commence."^[574]

The inheritance of tricks of manner and trifling peculiarities, such as handwriting, certain odd gestures when pleased, peculiar movements during sleep, etc., have also been quoted in favor of the theory of transmission of acquired habits. Strangely enough; for of all things in the world these tricks seem most like idiosyncratic variations. They are usually defects or oddities which the education of the individual, the pressure of what is really *acquired* by him, would counteract, but which are too native to be repressed, and breaks through all artificial barriers, in his children as well as in himself.

I leave my text practically just as it was written in 1885. I proceeded at that time to draw a tentative conclusion to the effect that the origin of *most* of our instincts must certainly be deemed fruits of the back-door method of genesis, and not of ancestral experience in the proper meaning of the term. Whether acquired ancestral habits played any part at all in their production was still an open question in which it would be as rash to affirm as to deny. Already before that time, however, Professor Weismann of Freiburg had begun a very serious attack upon the Lamarckian theory,^[575] and his polemic has at last excited such a widespread interest among naturalists that the whilom almost unhesitatingly accepted theory seems almost on the point of being abandoned.

I will therefore add some of Weismann's criticisms of the supposed evidence to my own. In the first place, he has a captivating theory of descent of his own,^[576] which makes him think it *a priori* impossible that any peculiarity acquired during lifetime by the parent should be transmitted to the germ. Into the nature of that theory this is not the place to go. Suffice to say that it has made him a keener critic of Lamarck's and Spencer's theory than he otherwise might have been. The only way in which the germinal products can be influenced whilst in the body of the parent is, according to Weismann, by good or bad nutrition. Through this they may degenerate in various ways or lose vitality altogether. They may also be infected through the blood by small-pox, syphilis, or other virulent diseases, and otherwise be poisoned. But peculiarities of neural structure and habit in the parents *which the parents themselves were not born with*, they can never

acquire unless perhaps accidentally through some coincidental variation of their own. *Accidental* variations develop of course into idiosyncrasies which tend to pass to later generations in virtue of the well-known law which no one doubts.

Referring to the often-heard assertion that the increase of talent found in certain families from one generation to another is due to the transmitted effects of *exercise* of the faculty concerned (the Bachs, the Bernoullis, Mozart, etc.), he sensibly remarks, that the talent being kept in exercise, it ought to have gone on growing for an indefinite number of generations. As a matter of fact, it quickly reaches a maximum, and then we hear no more of it, which is what happens always when an idiosyncrasy is exposed to the effects of miscellaneous intermarriage.

The hereditary epilepsy and other degenerations of the operated guinea-pigs are explained by Professor Weismann as results of *infection* of the young by the parent's blood. The latter he supposes to undergo a pathologic change in consequence of the original traumatic injury. The obsolescence of disused organs he explains very satisfactorily, without invoking any transmission of the direct effects of disuse, by his theory of *panmixy*, for which I must refer to his own writings. Finally, he criticises searchingly the stories we occasionally hear of inherited mutilations in animals (dogs' ears and tails, etc.), and cites a prolonged series of experiments of his own on mice, which he bred for many generations, cutting off both parental tails each time, without interfering in the least with the length of tail with which the young continued to be born.

The strongest argument, after all, in favor of the Lamarckian theory remains the *a priori* one urged by Spencer in his little work (much the solidest thing, by the way, which he has ever written) 'The Factors of Organic Evolution.' Since, says Mr. Spencer, the accidental variations of all parts of the body are independent of each other, if the entire organization of animals were due to such accidental variations alone, the amount of mutual adaptation and harmony that we now find there could hardly possibly have come about in any finite time. We must rather suppose that the divers varying parts *brought* the other parts into harmony with themselves by *exercising them ad hoc*, and that the effects of the exercise remained and were passed on to the young. This forms, of course, a great *presumption* against the all-sufficiency of the view of selection of accidental variations exclusively. But it must be

admitted that in favor of the contrary view, that adaptive changes are inherited, we have as yet perhaps not one single unequivocal item of positive proof.

I must therefore end this chapter on the genesis of our mental structure by reaffirming my conviction that the so-called Experience-philosophy has failed to prove its point. No more if we take ancestral experiences into account than if we limit ourselves to those of the individual after birth, can we believe that the couplings of terms within the mind are simple copies of corresponding couplings impressed upon it by the environment. This indeed is true of a small part of our cognitions. But so far as logical and mathematical, ethical, æsthetical, and metaphysical propositions go, such an assertion is not only untrue but altogether unintelligible; for these propositions say nothing about the time- and space-order of things, and it is hard to understand how such shallow and vague accounts of them as Mill's and Spencer's could ever have been given by thinking men.

The causes of our mental structure are doubtless natural, and connected, like all our other peculiarities, with those of our nervous structure. Our interests, our tendencies of attention, our motor impulses, the æsthetic, moral, and theoretic combinations we delight in, the extent of our power of apprehending schemes of relation, just like the elementary relations themselves, time, space, difference and similarity, and the elementary kinds of feeling, have all grown up in ways of which at present we can give no account. Even in the clearest parts of Psychology our insight is insignificant enough. And the more sincerely one seeks to trace the actual course of *psychogenesis*, the steps by which as a race we may have come by the peculiar mental attributes which we possess, the more clearly one perceives "the slowly gathering twilight close in utter night."

THE END.

[526] 'Accidental' in the Darwinian sense, as belonging to a cycle of causation inaccessible to the present order of research.

[527] The passage is in § 207 of the Principles of Psychology, at the end of the chapter entitled 'Reason.' I italicize certain words in order to show that the essence of this explanation is to demand *numerically frequent* experiences. The bearing of this remark will later appear. (Cf. pp. 641-2, *infra*.)

[528] Principles of Biology, part iii. chaps. xi, xii.—Goltz and Loeb have found that dogs become mild in character when their occipital, and fierce when their frontal, brain-lobes are cut off. "A dog which originally was cross in an extreme degree, never suffering himself to be touched, and even refusing, after two days' fasting, to take a piece of bread from my hand, became, after a bilateral operation on the occipital lobes, perfectly trustful and harmless. He underwent five operations on these parts.... Each one of them made him more good-natured; so that at last (just as Goltz observed of his dogs) he would let other dogs take away the very bones which he was gnawing" (Loeb, Pflüger's Archiv, xxxix. 300). A course of kind treatment and training might have had a similar effect. But how absurd to call two such different causes by the same name, and to say both times that the beast's 'experience of outer relations' is what educates him to good-nature. This, however, is virtually what all writers do who ignore the distinction between the 'front-door' and the back-door' manners of producing mental change.

One of the most striking of these back-door affections is *susceptibility to the charm of drunkenness*. This (taking drunkenness in the broadest sense, as teetotalers use the word) is one of the deepest functions of human nature. Half of both the poetry and the tragedy of human life would vanish if alcohol were taken away. As it is, the thirst for it is such that in the United States the cash-value of its sales amounts to that of the sales of meat and of bread put together. And yet what ancestral 'outer relation' is responsible for this peculiar reaction of ours? The only 'outer relation' could be the alcohol itself, which, comparatively speaking, came into the environment but yesterday, and which, so far from creating, is tending to eradicate, the love of itself from our mental structure, by letting only those families of men survive in whom it is not strong. The love of drunkenness is a purely accidental susceptibility of a brain, evolved for entirely different uses, and its causes are to be sought in the molecular realm, rather than in any possible order of 'outer relations.'

[529] Mr. Grant Allen, in a brilliant article entitled Idiosyncrasy (Mind, viii. 498), seeks to show that accidental morphological changes in the brain cannot possibly be imagined to result in any mental change of a sort which would *fit the animal to its environment*. If spontaneous variation ever works on the brain, its product, says Mr. Allen, ought to be an idiot or a raving madman, not a minister and interpreter of Nature. Only the environment can change us in the direction of accommodation *to itself*. But I think we ought to know a little better just what the molecular changes in the brain are on which thought depends, before we talk so confidently about what the effect can be of their possible variations. Mr. Allen, it should be said, has made a laudable effort to conceive them distinctly. To me his conception remains too purely anatomical. Meanwhile this essay and another by the same author in the Atlantic Monthly are probably as serious attempts as any that have been made towards applying the Spencerian theory in a radical way to the facts of human history.

[530] In my own previous chapters on habit, memory, association, and perception, justice has been done to all these facts.

[531] "The order of nature, as perceived at a first glance, presents at every instant a chaos followed by another chaos. We must decompose each chaos into single facts. We must learn to see in the chaotic antecedent a multitude of distinct antecedents, in the chaotic consequent a multitude of distinct consequents. This, supposing it done, will not of itself tell us on which of the antecedents each consequent is invariably attendant. To determine that point, we must endeavor to effect a separation of the facts from one another, not in our minds only, but in nature. The mental analysis,

however, must take place first. And every one knows that in the mode of performing it, one intellect differs immensely from another." (J. S. Mill, *Logic*, bk. iii. chap. vii. § 1.)

[532] I quote from an address entitled 'Reflex Action and Theism,' published in the 'Unitarian Review' for November 1881, and translated in the *Critique Philosophique* for January and February 1882. "The conceiving or theorizing faculty works exclusively for the sake of ends that do not exist at all in the world of the impressions received by way of our senses, but are set by our emotional and practical subjectivity. It is a transformer of the world of our impressions into a totally different world, the world of our conception; and the transformation is effected in the interests of our volitional nature, and for no other purpose whatsoever. Destroy the volitional nature, the definite subjective purposes, preferences, fondness for certain effects, forms, orders, and not the slightest motive would remain for the brute order of our experience to be remodelled at all. But, as we have the elaborate volitional constitution we do have, the remodelling must be effected, there is no escape. The world's contents are *given* to each of us in an order so foreign to our subjective interests that we can hardly by an effort of the imagination picture to ourselves what it is like. We have to break that order altogether, and by picking out from it the items that concern us, and connecting them with others far away, which we say 'belong' with them, we are able to make out definite threads of sequence and tendency, to foresee particular liabilities and get ready for them, to enjoy simplicity and harmony in the place of what was chaos. Is not the sum of your actual experience taken at this moment and impartially added together an utter chaos? The strains of my voice, the lights and shades inside the room and out, the murmur of the wind, the ticking of the clock, the various organic feelings you may happen individually to possess, do these make a whole at all? Is it not the only condition of your mental sanity in the midst of them that most of them should become non-existent for you, and that a few others—the sounds, I hope, which I am uttering—should evoke from places in your memory, that have nothing to do with this scene, associates fitted to combine with them in what we call a rational train of thought?—rational because it leads to a conclusion we have some organ to appreciate. We have no organ or faculty to appreciate the simply given order. The real world as it is given at this moment is the sum total of all its beings and events now. But can we think of such a sum? Can we realize for an instant what a cross-section of all existence at a definite point of time would be? While I talk and the flies buzz, a sea gull catches a fish at the mouth of the Amazon, a tree falls in the Adirondack wilderness, a man sneezes in Germany, a horse dies in Tartary, and twins are born in France. What does that mean? Does the contemporaneity of these events with each other and with a million more as disjointed as they form a rational bond between them, and unite them into anything that means for us a world? Yet just such a collateral contemporaneity, and nothing else, is the *real* order of the world. It is an order with which we have nothing to do but to get away from it as fast as possible. As I said, we break it: we break it into histories, and we break it into arts, and we break it into sciences; and then we begin to feel at home. We make ten thousand separate serial orders of it. On any one of these, we may react as if the rest did not exist. We discover among its parts relations that were never given to sense at all,—mathematical relations, tangents, squares, and roots and logarithmic functions,—and out of an infinite number of these we call certain ones essential and lawgiving, and ignore the rest. Essential these relations are, but only *for our purpose*, the other relations being just as real and present as they; and our purpose is to *conceive simply* and to *foresee*. Are not simple conception and prevision subjective ends, pure and simple? They are the ends of what we call science; and the miracle of miracles, a miracle not yet exhaustively cleared up by any philosophy, is that the given order lends itself to the remodelling. It shows itself plastic to many of our scientific, to many of our æsthetic, to many of our practical purposes and ends." Cf. also Hodgson: *Philos. of Refl.*, ch. v; Lotze: *Logik*, §§ 342-351; Sigwart: *Logik*, §§ 60-63, 105.

[533] In an article entitled 'Great Men, Great Thoughts, and the Environment,' published in the *Atlantic Monthly* for October 1880, the reader will find some ampler illustrations of these remarks. I have there tried to show that both mental and social evolution are to be conceived after the Darwinian

fashion, and that the function of the environment properly so called is much more that of *selecting* forms, produced by invisible forces, than *producing* of such forms,—producing being the only function thought of by the pre-Darwinian evolutionists, and the only one on which stress is laid by such contemporary ones as Mr. Spencer and Mr. Allen.

[534] "It is perfectly true that our world of experience begins with such associations as lead us to expect that what has happened to us will happen again. These associations lead the babe to look for milk from its nurse and not from its father, the child to believe that the apple he sees will taste good; and whilst they make him wish for it, they make him fear the bottle which contains his bitter medicine. But whereas a part of these associations grows confirmed by frequent repetition, another part is destroyed by contradictory experiences; and the world becomes divided for us into two provinces, one in which we are at home and anticipate with confidence always the same sequences; another filled with alternating, variable, accidental occurrences....

"Accident is, in a wide sphere, such an every-day matter that we need not be surprised if it sometimes invades the territory where order is the rule. And one personification or another of the capricious power of chance easily helps us over the difficulties which further reflection might find in the exceptions. Yes, indeed, Exception has a peculiar fascination; it is a subject of astonishment, a θαῦμα, and the credulity with which in this first stage of pure association we adopt our supposed rules is matched by the equal credulity with which we adopt the miracles that interfere with them.

"The whole history of popular beliefs about nature refutes the notion that the thought of an universal physical order can possibly have arisen through the purely passive reception and association of particular perceptions. Indubitable as it is that all men infer from known cases to unknown, it is equally certain that this procedure, if restricted to the phenomenal materials that spontaneously offer themselves, would never have led to the belief in a general uniformity, but only to the belief that law and lawlessness rule the world in motley alternation. From the point of view of strict empiricism nothing exists but the sum of particular perceptions with their coincidences on the one hand, their contradictions on the other.

"That there is more order in the world than appears at first sight is not discovered till the order is looked for. The first impulse to look for it proceeds from practical needs: where ends must be attained, we must know trustworthy means which infallibly possess a property or produce a result. But the practical need is only the first occasion for our reflection on the conditions of a true knowledge; even were there no such need, motives would still be present to carry us beyond the stage of mere association. For not with an equal interest, or rather with an equal lack of interest, does man contemplate those natural processes in which like is joined to like, and those in which like and unlike are joined; the former processes harmonize with the conditions of his thinking, the latter do not; in the former his concepts, judgments, inferences apply to realities, in the latter they have no such application. And thus the intellectual satisfaction which at first comes to him without reflection, at last excites in him the conscious wish to find realized throughout the entire phenomenal world those rational continuities, uniformities, and necessities which are the fundamental element and guiding principle of his own thought." (C. Sigwart: Logik, ii. 380-2.)

[535] Cf. Hodgson: Philosophy of Reflection, book ii, chap. v.

[536] The aspiration to be 'scientific' is such an idol of the tribe to the present generation, is so sucked in with his mother's milk by every one of us, that we find it hard to conceive of a creature who should not feel it, and harder still to treat it freely as the altogether peculiar and one-sided subjective interest which it is. But as a matter of fact, few even of the cultivated members of the race have shared it; it was invented but a generation or two ago. In the middle ages it meant only impious magic; and the way in which it even now strikes orientals is charmingly shown in the letter of a Turkish *cadi* to an English traveller asking him for statistical information, which Sir A. Bayard prints

at the end of his 'Nineveh and Babylon.' The document is too full of edification not to be given in full. It runs thus:

"My Illustrious Friend, and Joy of my Liver!

"The thing you ask of me is both difficult and useless. Although I have passed all my days in this place, I have neither counted the houses nor inquired into the number of the inhabitants; and as to what one person loads on his mules and the other stows away in the bottom of his ship, that is no business of mine. But, above all, as to the previous history of this city, God only knows the amount of dirt and confusion that the infidels may have eaten before the coming of the sword of Islam. It were unprofitable for us to inquire into it.

"O my soul! O my lamb! seek not after the things which concern thee not. Thou camest unto us and we welcomed thee: go in peace.

"Of a truth thou hast spoken many words; and there is no harm done, or the speaker is one and the listener is another. After the fashion of thy people thou hast wandered from one place to another, until thou art happy and content in none. We (praise be to God) were born here, and never desire to quit it. Is it possible, then, that the idea of a general intercourse between mankind should make any impression on our understandings? God forbid!

"Listen, O my son! There is no wisdom equal unto the belief in God! He created the world, and shall we liken ourselves unto Him in seeking to penetrate into the mysteries of His creation? Shall we say, Behold this star spinneth round that star, and this other star with a tail goeth and cometh in so many years! Let it go! He from whose hand it came will guide and direct it.

"But thou wilt say unto me, Stand aside, O man, for I am more learned than thou art, and have seen more things. If thou thinkest that thou art in this respect better than I am, thou art welcome. I praise God that I seek not that which I require not. Thou art learned in the things I care not for; and as for that which thou hast seen, I spit upon it. Will much knowledge create thee a double belly, or wilt thou seek Paradise with thine eyes?

"O my friend! if thou wilt be happy, say, There is no God but God! Do no evil, and thus wilt thou fear neither man nor death: for surely thine hour will come!

"The meek in spirit (El Fakir)

"*IMAUM ALI ZADI.*"

[537] "Though a man in a fever should from sugar have a bitter taste which at another time would produce a sweet one, yet the idea of bitter in that man's mind would be as clear and distinct from the idea of sweet as if he had tasted only gall. Nor does it make any more confusion between the two ideas of sweet and bitter that the same sort of body produces at one time one and at another time another idea by the taste, than it makes a confusion in two ideas of white and sweet, or white and round, that the same piece of sugar produces them both in the mind at the same time." Locke's Essay, bk. ii. ch. xi. § 3.

[538] Cf. Bradley, Logic, p. 226.

[539] This apprehension of them as forming a single system is what Mr. Bradley means by the act of *construction* which underlies all reasoning. The awareness, which then supervenes, of the additional relation of which I speak in the next paragraph of my text, is what this author calls the act of *inspection*. Cf. Principles of Logic, bk. ii. pt. i. chap. iii.

[540] Realities fall under this only so far as they prove to *be* the same. So far as they cannot be substituted for each other, for the purpose in hand, so far they are not the same; though for other

purposes and in other respects they might be substituted, and then be treated as the same. Apart from purpose, of course, no realities ever are absolutely and exactly the same.

[541] A mind, in other words, which has got *beyond* the merely *dichotomic* style of thought which Wundt alleges to be the essential form of human thinking (Physiol. Psych., ii. 312).

[542] Said to be expressed by Grassman in the fundamental Axiom of Arithmetic $(a + b) + 1 = a + (b + 1)$.

[543] Compare Helmholtz's more technically expressed Essay Zählen u. Messen, in the Philosophische Aufsätze, Ed. Zeller gewidmet (Leipzig, 1887), p. 17.

[544] For the original statements, cf. J. S. Mill's Logic, bk. ii. chap. vi. §§ 2, 3; and bk. iii. chap. xxiv. § 5.

[545] The subdivision itself consumes none of the space. In all practical experience our subdivisions do consume space. They consume it in our geometrical figures. But for simplicity's sake, in geometry we postulate subdivisions which violate experience and consume none of it.

[546] Cf. A. de Morgan: Syllabus of a proposed System of Logic (1860), pp. 46-56.

[547] Cf. Locke's Essay, bk. ii. chap. xvii. § 6.

[548] Some readers may expect me to plunge into the old debate as to whether the *a priori* truths are 'analytic' or 'synthetic.' It seems to me that the distinction is one of Kant's most unhappy legacies, for the reason that it is impossible to make it sharp. No one will say that such analytic judgments as "equidistant lines can nowhere meet" are *pure* tautologies. The predicate is a somewhat new way of conceiving as well as of naming the subject. There is *something* 'ampliative' in our greatest truisms, our state of mind is richer after than before we have uttered them. This being the case, the question "at what point does the new state of mind cease to be *implicit* in the old?" is too vague to be answered. The only sharp way of defining synthetic propositions would be to say that they express a relation between *two data* at least. But it is hard to find any proposition which cannot be construed as doing this. Even verbal definitions do it. Such painstaking attempts as that latest one by Mr. D. G. Thompson to prove all necessary judgments to be analytic (System of Psychology, ii. pp. 232 ff.) seem accordingly but *nugæ difficiles*, and little better than wastes of ink and paper. All philosophic interest vanishes from the question, the moment one ceases to ascribe to *any a priori* truths (whether analytic or synthetic) that "legislative character for all possible experience" which Kant believed in. We ourselves have denied such legislative character, and contended that it was for experience itself to prove whether its data can or cannot be assimilated to those ideal terms between which *a priori* relations obtain. The analytic-synthetic debate is thus for us devoid of all significance. On the whole, the best recent treatment of the question known to me is in one of A. Spir's works, his Denken und Wirklichkeit, I think, but I cannot now find the page.

[549] Book iv. chaps. ix. § 1; vii. 14.

[550] Chap. v. §§ 6, 8.

[551] Kant, by the way, made a strange tactical blunder in his way of showing that the forms of our necessary thought are underived from experience. He insisted on thought-forms with which experience largely *agrees*, forgetting that the only forms which could not by any possibility be the results of experience would be such as experience *violated*. The first thing a Kantian ought to do is to discover forms of judgment to which *no* order in 'things' runs parallel. These would indeed be features native to the mind. I owe this remark to Herr A. Spir, in whose 'Denken und Wirklichkeit' it is somewhere contained. I have myself already to some extent proceeded, and in the pages which follow shall proceed still farther, to show the originality of the mind's structure in this way.

[552] Yet even so late as Berkeley's time one could write: "As in reading other books a wise man will choose to fix his thoughts on the sense and apply it to use, rather than lay them out in grammatical remarks on the language: so in perusing the volume of nature methinks it is beneath the dignity of the mind to affect an exactness in reducing each particular phenomenon to general rules, or showing how it follows from them. We should propose to ourselves nobler views, namely, to recreate and exalt the mind with a prospect of the beauty, order, extent, and variety of natural things: hence, by proper inferences, to enlarge our notions of the grandeur, wisdom, and beneficence of the Creator," etc., etc., etc. (Principles of Human Knowledge, § 109.)

[553] Die Erhaltung der Kraft (1847), pp. 2-6.

[554] Perhaps the most influential of all these postulates is that the nature of the world must be such that sweeping statements may be made about it.

[555] Consider, e.g., the use of the axioms '*nemo potest supra seipsum*,' and '*nemo dat quod non habet*,' in this refutation of 'Darwinism,' which I take from the much-used scholastic compendium of Logic and Metaphysics of Liberatore, 3d ed. (Rome, 1880): "Hæc hypothesis... aperte contradicit principiis Metaphysicæ, quæ docent essentias rerum esse immutabiles, et effectum non posse superare causam. Et sane, quando, juxta Darwin, species inferior se evolvit in superiorem, unde trahit maiorem illam nobilitatem? Ex ejus carentia. At nihil dat quod non habet; et minus gignere nequit plus, aut negatio positionem. Præterea in transformatione quæ fingitur, nature prioris speciei, servatur aut destruitur? Si primum, mutatio erit tantum accidentalis, qualem reapse videmus in diversis stirpibus animantium. Sin alterum asseritur, ut reapse fert hypothesis darwiniana, res tenderet ad seipsam destruendam; cum contra omnia naturaliter tendant ad sui conservationem, et nonnisi per actionem contrarii agentis corruant." It is merely a question of fact whether these ideally proper relations do or do not obtain between animal and vegetable ancestors and descendants. If they do not, what happens? simply this, that we cannot continue to class animal and vegetal facts under the *kinds* between which those ideal relations obtain. Thus, we can no longer call animal breeds by the name of 'species'; cannot call generating a kind of 'giving,' or treat a descendant as an 'effect' of his ancestor. The ideal scheme of terms and relations can remain, if you like; but it must remain purely mental, and without application to life, which 'gangs its ain gait' regardless of ideal schemes. Most of us, however, would prefer to doubt whether such abstract axioms as that 'a thing cannot tend to its own destruction' express ideal relations of an important sort at all.

[556] Compare A. Riehl: Der Philosophische Criticismus, Bd. ii. Thl. i Abschn. i. Cap. iii. § 6.

[557] As one example out of a thousand of exceptionally delicate idiosyncrasy in this regard, take this: "I must quit society. I would rather undergo twice the danger from beasts and ten times the danger from rocks. It is not pain, it is not death, that I dread,—it is the hatred of a man; there is something in it so shocking that I would rather submit to any injury than incur or increase the hatred of a man by revenging it.... Another sufficient reason for suicide is that I was this morning out of temper with Mrs. Douglas (for no fault of hers). I did not betray myself in the least, but I reflected that to be exposed to the possibility of such an event once a year, was evil enough to render life intolerable. The disgrace of using an impatient word is to me overpowering." (Elton Hammond, quoted in Henry Crabb Robinson's Diary, vol. i. p. 424.)

[558] Compare H. Sidgwick, Methods of Ethics, bk. iii. chap. xiii. § 3.

[559] A gentleman told me that he had a conclusive argument for opening the Harvard Medical School to women. It was this: "Are not women human?"—Which major premise of course had to be granted. "Then are they not entitled to all the rights of humanity?" My friend said that he had never met anyone who could successfully meet this reasoning.

[560] You reach the Mephistophelian point of view as well as the point of view of justice by treating cases as if they belonged rigorously to abstract classes. Pure rationalism, complete immunity from prejudice, consists in refusing to see that the case before one is absolutely unique. It is always possible to treat the country of one's nativity, the house of one's fathers, the bed in which one's mother died, nay, the mother herself if need be, on a naked equality with all other specimens of so many respective genera. It shows the world in a clear frosty light from which all fuliginous mists of affection, all swamp-lights of sentimentality, are absent. Straight and immediate action becomes easy then—witness a Napoleon's or a Frederick's career. But the question always remains, "Are not the mists and vapors *worth* retaining?" The illogical refusal to treat certain concretes by the mere law of their genus has made the drama of human history. The obstinate insisting that tweedledum is *not*

tweedledee is the bone and marrow of life. Look at the Jews and the Scots, with their miserable factions and sectarian disputes, their loyalties and patriotisms and exclusions,—their annals now become a classic heritage, because men of genius took part and sang in them. A thing is important if any one *think* it important. The process of history consists in certain folks becoming possessed of the mania that certain special things are important infinitely, whilst other folks cannot agree in the belief. The Shah of Persia refused to be taken to the Derby Day, saying "It is already known to me that one horse can run faster than another." He made the question "*which* horse?" immaterial. Any question can be made immaterial by subsuming all its answers under a common head. Imagine what college ball-games and races would be if the teams were to forget the absolute distinctness of Harvard from Yale and think of both as One in the higher genus College. The sovereign road to indifference, whether to evils or to goods, lies in the thought of the higher genus. "When we have meat before us," says Marcus Aurelius, seeking indifference to *that* kind of good, "we must receive the impression that this is the dead body of a fish, and this is the dead body of a bird or of a pig; and again that this Falernian is only a little grape-juice, and this purple robe some sheep's wool dyed with the blood of a shell-fish. Such, then, are these impressions, and they reach the things themselves and penetrate them, and we see what kind of things they are. Just in the same way ought we to act through life, and where there are things which appear most worthy of our approbation, we ought to lay them bare and look at their worthlessness and strip them of all the words by which they are exalted." (Long's Translation, vi. 13.)

[561] "*An sich, in seinem eignen Wesen, ist jedes reale Object mit sich selbst identisch und unbedingt*"—that is, the "*allgemeinste Einsicht a priori*" and the "*allgemeinste aus Erfahrung*" is "*Alles erkennbare ist bedingt*." (A. Spir: Denken und Wirklichkeit. Compare also Herbart and Hegel.)

[562] Philosophie Zoölogique, 3me partie, chap. v., 'de l'Instinct.'

[563] It should be said that Mr. Spencer's most formal utterance about instinct is in his Principles of Psychology, in the chapter under that name. Dr. Romanes has reformulated and criticised the doctrine of this chapter in his Mental Evolution in Animals, chapter xvii. I must confess my inability to state its vagueness in intelligible terms. It treats instincts as a further development of reflex actions, and as forerunners of intelligence,—which is probably true of many. But when it ascribes their formation to the mere 'multiplication of experiences,' which, at first simple, mould the nervous system to 'correspond to outer relations' by simple reflex actions, and, afterwards complex, make it 'correspond' by 'compound reflex actions,' it becomes too mysterious to follow without more of a key than is given. The whole thing becomes perfectly simple if we suppose the reflex actions to be accidental inborn idiosyncrasies preserved.

[564] This account of acquisitiveness differs from our own. Without denying the associationist account to be a true description of a great deal of our proprietary feeling, we admitted in addition an entirely primitive form of desire. (See above, p. 420 ff.) The reader must decide as to the plausibilities of the case. Certainly appearances are in favor of there being in us *some* cupidities quite disconnected with the ulterior uses of the things appropriated. The source of their fascination lies in their appeal to our æsthetic sense, and we wish thereupon simply to *own* them. Glittering, hard, metallic, odd, pretty things; curious things especially; natural objects that look as if they were artificial, or that mimic other objects,—these form a class of things which human beings snatch at as magpies snatch rags. They simply fascinate us. What house does not contain some drawer or cupboard full of senseless odds and ends of this sort, with which nobody knows what to do, but which a blind instinct saves from the ash-barrel? Witness people returning from a walk on the seashore or in the woods, each carrying some *lusus naturæ* in the shape of stone or shell, or strip of bark or odd-shaped fungus, which litter the house and grow daily more unsightly, until at last reason triumphs over blind propensity and sweeps them away.

[565] Review of Bain in H. Spencer: Illustrations of Universal Progress (New York, 1864), pp. 311, 315.

[566] Ribot: De l'Herédité, 2me éd. p. 26.

[567] Quoted (without reference) in Spencer's Biology, vol. i. p. 247.

[568] Expression of Emotions (N. Y.), p. 287.

[569] 'Adaptive' changes are those produced by the direct effect of outward conditions on an organ or organism. Sunburned complexion, horny hands, muscular toughness, are illustrations.

[570] For these and other facts cf. Th. Ribot: De l'Hérédité; W. B. Carpenter: Contemporary Review, vol. 21, p. 295, 779, 867; H. Spencer: Princ. of Biol. pt. ii. ch. v, viii, ix, x; pt. iii. ch. xi, xii; C. Darwin: Animals and Plants under Domestication, ch. xii, xiii. xiv; Sam'l Butler: Life and Habit; T. A. Knight: Philos. Trans. 1837; E. Dupuy: Popular Science Monthly, vol. xi. p. 332; F. Papillon: Nature and Life, p. 330; Crothers, in Pop. Sci. M., Jan. (or Feb.) 1889.

[571] [Because, being exhibited by neuter insects, the effects of mere practice cannot accumulate from one generation to another.—W. J.]

[572] Origin of Species, chap. vii.

[573] Princ. of Psychol., ii. 561.

[574] *Ibid.* p. 263.

[575] Ueber die Vererbung (Jena, 1883). Prof. Weismann's Essays on Heredity have recently (1889) been published in English in a collected form.

[576] Best expressed in the Essay on the *Continuitat des Keimplasmas* (1885).

INDEX.

A. B. C. D. E. F. G. H. I. J. K. L. M. N. O. P.
Q. R. S. T. U. V. W. X. Y. Z.

Authors the titles only of whose works are cited are not, as a rule, referred to in this index.

ABBOTT, T. K., II. [221](#)

Abstract ideas, I. 468, 508; II. [48](#)

Abstract qualities, II. [329-37](#), [340](#)

Abstraction, I. 505; II. [346](#) ff. See [distraction](#)

Accommodation, feeling of, II. [93](#), [235](#)

Acquaintance, I. 220

Acquired characters, see [inheritance](#)

Acquisitiveness, II. [422](#), [679](#)

Actors, their emotions whilst playing, II. [464](#)

Adaptation of mind to environment results in our knowing the impressing circumstances, II. [625](#) ff.

Æsthetic principles, II. [639](#), [672](#)

After-images, I. 645-7; II. [67](#), [200](#), [604](#)

Agoraphobia, II. [421](#)

Agraphia, I. 40, 62

ALFIERI, II. [543](#)

ALLEN, G., I. 144; II. [631](#)

Alteration of one impression by another one simultaneously taking place, II. [28](#) ff., [201](#)

Alternating personality, I. 379 ff.

Ambiguity of optical sensations, II. [231-7](#)

AMIDON, I. 100

Amnesia in hysterical disease, I. 384 ff.;
 accompanies anæsthesia, 386, 682;
 in hypnotic trance, II. [602](#).
 See *forgetting*

Amputated limbs, feeling of, II. [38-9](#), [105](#)

Anæsthesia, in hysterics, I. 203 ff.;
 involves correlated amnesia, 386;
 movements executed during, II. [105](#), [489-92](#), [520-1](#);
 and emotion, [455-6](#);
 in hypnotism, [606-9](#)

Analogies, the perception of, I. 530

Analysis, I. 502; II. [344](#)

Anger, II. [409](#), [460](#), [478](#)

Aphasia, motor, I. 37, 62;
 sensory, I. 53-4-5;
 optical, I. 60;
 amnesia in, 640, 684; II. [58](#)

Apperception, II. [107](#) ff.

Apperception, transcendental Unity of, I. 362

Appropriateness, characterizes mental acts, I. 13

Apraxia, I. 52

A priori connections exist only between objects of perception and movements, not between sensory ideas, II. [581](#).

A priori ideas and experience, [Chapter XXVIII](#).

A priori propositions, II. [661-5](#)

ARCHER, W., II. [464](#)

Arithmetic, II. [654](#).

Articular sensibility, II. [189](#) ff.

Association, Chapter XIV:

is not of ideas, but of things thought of, I. 554;

examples of, 555 ff.;

its rapidity, 557 ff.;

by contiguity, 561;

elementary law of, 566;

'mixed' association, 571;

conditions of, 575 ff.;

by similarity, 578;

three kinds of association compared, 580;

in voluntary thought, 583;

by contrast, 593;

history of the doctrine of, 594;

association the means of localization, II. [158](#) ff.;

connection of association by similarity with reasoning, [345](#) ff.

Associationism, I. 161

Associationist theory of the self, I. 342, 350 ff.;

of space-perception, II. [271](#) ff.

Asymbolia, I. 52

Attention, Chapter XI: to how many things possible, I. 405 ff.;

to simultaneous sight and sound, 411 ff.;

its varieties, 416;

passive, 417;
voluntary, 42 ff.;
its effects, 424 ff.;
its influence on reaction-time, 427-34;
accompanied by feelings of tension due to adaptation of sense-organs,
434-8;
involves imagination or preperception of object, 438-44;
conceivable as a mere effect, 448 ff.

AUBERT, H., II. [235](#)

Auditory centre in brain, I. 52-6

Auditory type of imagination, II. [60](#)

'Ausfallserscheinungen,' I. 75

Automatic writing, I. 393 ff.

AUSTEN, JANE, I. 571

Automaton-Theory, Chapter V:
postulated rather than proved, I. 134-8;
reasons against it, 138-144;
applied to attention, 448
disregarded in this book, II. [583](#)

AZAM, Dr., I. 380.

Babe and candle, scheme of, I. 25

Baby's first perception, II. [8](#), [84](#);
his early instinctive movements, [404](#) ff.

BAER, VON, I. 639

BAGEHOT, W., I. 582; II. [283](#), [308](#)

BAIN, on series conscious of itself, I. 162;

on self-esteem, 313;

on self-love, 328, 354;

on attention, 444;

on association, 485, 530, 561, 589, 601, 653; II. [6](#), [12](#), [69](#), [186](#), [271](#), [282](#),
[296](#), [319](#), [322](#), [372-3](#), [463](#), [466](#), [551](#), [554-5](#)

BALLARD, I. 266

BALZAC, I. 374

BARTELS, I. 432

BASTIAN, H. C., II. [488](#)

BAUMANN, II. [409](#)

BAXT, I. 648

BEAUNIS, E., II. [492](#)

BECHTEREW, I. 407

Belief, [Chapter XXI](#):

in sensations, II. [299](#) ff.;

in objects of emotion, [306](#) ff.;

in theories, [311](#) ff.;

and will, [319](#).

See [reality](#).

BELL, C., II. [483](#), [492](#)

BERGSON, J., II. [609](#)

BERKELEY, I. 254, 469, 476; II. [43](#), [49](#), [77](#), [212](#), [240](#), [666](#)

BERNHARDT, II. [502](#)

BERNHEIM, I. 206

BERTRAND, A., II. [518](#)

BESSEL, I. 413

BINET, A., I. 203 ff.; II. [71](#), [74](#), [128](#) ff., [130](#), [167](#), [491](#), [520](#)

BLACK, R. W., II. [339](#)

BLEEK, II. [358](#)

Blind, the, their space-perception, II. [202](#) ff.;
after restoration to sight, [211-2](#);
hallucination of a blind man, [323](#);
dreams of the, [44](#)

Blindness, mental, I. 41, 50, 66. See [Sight](#), [Hemianopsia](#), etc.

Blix, II. [170](#)

BLOCH, II. [515](#)

Blood, its exciting effect on the nerves, II. [412-3](#)

BLOOD, B. P., II. [284](#)

Blood-supply to brain, I. 97

BOURNE, A., I. 391

BOURRU, Dr., I. 388

BOWDITCH, H. P., his reaction-timer, I. 87;

on contrast in seen motion, II. [247](#);
on knee-jerk, [380](#);
comparison of touch and sight, [520](#)

BOWEN, F., I. 214

BOWNE, B. P., on knowledge, I. 219

BRADLEY, F. H., I. 452, 474, 604; II. [7](#), [9](#), [284](#), [648](#)

Brain, its functions, Chapter II:

of frog, I. 14;

of dog, 33;

of monkey, 34;

of man, 36;

lower centres compared with hemispheres, 9-10, 75;

circulation in, 97;

instability, 139;

its connection with Mind, 176;

'entire' brain not a real physical fact, 176;

its changes as subtle as those of thought, 234;

its dying vibrations operative in producing consciousness, 242

Influence of environment upon it, 626 ff.

Brain-process, see [neural process](#)

Brain-structure, the two modes of its genesis, II. [624](#)

BRENTANO, I. 187, 547

BRIDGEMAN, LAURA, II. [62](#), [358](#), [420](#)

Broca's convolution, I. 39, 54

BRODHUN, I. 542

BROWN, THOS., I. 248, 277, 371; II. [271](#)

BROWN-SÉQUARD, I. 43, 67, 69; II. [695](#)

Brutes, the intellect of, II. [348](#) ff.

BUCKE, R. M., II. [460](#)

BUBNOFF, I. 82

BURKE, II. [464](#)

BURNHAM, W. H., I. 689

BUROT, Dr., I. 388

CAIRD, E., I. 366, 469, 471; II. [11](#)

CALMEIL, A., II. [524](#)

CAMPANELLA, II. [464](#)

CAMPBELL, G., I. 261

CARDAILLAC, I. 247

CARLYLE, T., I. 311

CARPENTER, W. B., on formation of habits, I. 110;
ethical remarks on habit, 120;
mistakes in speech, 257;
lapses of memory, 374;
on not feeling pain, 419;
on ideo-motor action, II. [522](#)

CARVILLE, I. 69

Catalepsy, I. 229; II. [583](#)

CATTELL, on reaction-time, I. 92, 432; 524;
on recognition, 407, 648;
on attention, 420;
on association-time, 558 ff.

Cause, consciousness a, I. 187; II. [583](#), [592](#)

Centres, cortical, I. 30 ff.;

- motor, 31;
- visual, 41;
- auditory, 52;
- olfactory, 57;
- gustatory, 58;
- tactile, 58

Cerebral process, see [neural process](#)

Cerebrum, see [Brain](#), [Hemispheres](#)

CHADBOURNE, P A., II. [383](#)

Characters, general, II. [329](#) ff.

CHARCOT, I. 54-5; II. [58](#), [596](#)

Chloroform, I. 531

Choice, see [selection](#), [interest](#)

Circulation in brain, I. 97;
effects of sensory stimuli upon, II. [374](#) ff.;

- in grief, [443-4](#)

Classic and romantic, II. [469](#)

Classifications, II. [646](#)

CLAY, E. C. R., I. 609

Cleanliness, II. [434](#)

Clearness, I. 426

CLIFFORD, I. 130-2

CLOUSTON, II. [114](#), [284-5](#), [537](#), [539](#)

COBBE, F. P., I. 374

Cochlea, theory of its action, II. [169](#)

Cognition, see [knowing](#)

COHEN, H., I. 365

COLERIDGE, S. T., I. 572, 681

Collateral innervation, see [vicarious function](#)

Comparison, Chapter XIII:

relations discovered by comparison have nothing to do with the time and space order of their terms, II. [641](#);

mediate, [489](#), [644](#);

see [difference](#), [likeness](#)

Composition, of Mind out of its elements, see [Mind-Stuff theory](#);
differences due to, I. 491

COMTE, A., I. 187

Conceivability, I. 463

Conceptions, Chapter XII:

- defined, I. 461;
- their permanence, 464 ff.;
- do not develop of themselves, 466 ff.;
- abstract, 468;
- universal, 478;
- essentially teleological, II. [332](#)

Conceptual order different from perceptual, I. 482

Concomitants, law of varying, I. 506

Confusion, II. [352](#)

Consciousness, its seat, I. 65;
its distribution, 142-3;
its function of selection, 139-41;
is *personal* in form, 225;
is continuous, 237, 488;
of lack, 251;
of self not essential, 273;
of *object* comes first, 274;
always partial and selective, 284 ff., see [Selection](#);
of the process of thinking, 300 ff.;

the span of, 405

Consent, in willing, II. [568](#)

Considerations, I. 20

Constructiveness, II. [426](#)

Contiguity, association by, I. 561

Continuity of object of consciousness, I. 488

Contrast, of colors, II. [13-27](#);

of temperatures, [14](#);
two theories of, [17](#) ff., [245](#);
of movements, [245](#) ff., [250](#)

Convolutions, motor, I. 41

Cortex, of brain, experiments on, I. 31 ff.

Cramming, I. 663

Credulity, our primitive, II. [319](#)

CUDWORTH, R., II. [9](#)

'Cue,' the mental, II. [497](#), [518](#)

CUMBERLAND, S., II. [525](#)

Curiosity, II. [429](#)

CZERMAK, II. [170](#), [175](#)

DARWIN, C., II. [432](#), [446](#), [479](#), [484](#), [678](#), [681-2-4](#)

Darwinism, scholastic reputation of, II. [670](#)

Data, the, of psychology, I. 184

DAVIDSON, T., I. 474

Deaf-mute's thought in infancy, I. 266

Deafness, mental, I. 50, 55-6. See [hearing](#)

DEAN, S., I. 394

Decision, five types of, II. [531](#)

Degenerations, descending in nerve-centres, I. 37, 52

DELABARRE, E., II. [13-27](#), [71](#)

DELBŒUF, J., I. 455, 531, 541, 542, 548-9; II. [100](#), [189](#), [249](#), [264](#), [605](#), [609](#), [612](#)

Deliberation, II. [528](#) ff.

Delusions, insane, I. 375; II. [114](#) ff.

Depth, see [third dimension](#)

DESCARTES, I. 180, 200, 214, 344

DESTUTT DE TRACY, I. 247

Determinism must be postulated by psychology, II. [576](#)

DEWEY, J., I. 473

Dichotomy in thinking, II. [654](#)

DICKENS, C., I. 374

DIETZE, I. 407, 617

Difference, not resolvable into composition, I. 490;
noticed most between species of a genus, 529;
the magnitude of, 531;
least discernible, 537 ff.;
methods for ascertaining, 540 ff.

Difference, local, II. [167](#) ff.;
genesis of our perception of, [642](#)

Diffusion of movements, the law of, II. [372](#)

Dimension, third, II. [134](#) ff., [212](#) ff., [220](#)

Dipsomania, II. [543](#)

Disbelief, II. [284](#)

Discrimination, Chapter XIII:
conditions which favor it, I. 494;
improves by practice, 508;
spatial, II. [167](#) ff.
See [difference](#)

Dissociation, I. 486-7;
law of, by varying concomitants, 506

Dissociation, ditto, II. [345](#), [359](#)

Dissociation, of one part of the mind from another, see [Janet, Pierre](#)

Distance, between terms of a series, I. 530

Distance, in space, see [third dimension](#)

Distraction, I. 401. See [inattention](#)

Dizziness, see [vertigo](#)

Dog's cortical centres, after Ferrier, I. 33;
after Munk, I. 44-5;
after Luciani, I. 46, 53, 58, 60;
for special muscles, 64;
hemispheres ablated, 70

DONALDSON, II. [170](#)

DONDERS, II. [235](#)

Double images, II. [225-30](#), [252](#)

Doubt, II. [284](#), [318](#) ff.;
the mania of, [545](#)

DOUGAL, J. D., II. [222](#)

Drainage of one brain-cell by another, II. [583](#) ff.

Dreams, II. [294](#)

DROBISCH, I. 632, 660

Drunkard, II. [565](#)

Drunkenness, I. 144; II. [543](#), [565](#), [628](#)

Dualism of object and knower, I. 218, 220

Duality, of Brain, I. 390, 399

DUDLEY, A. T., on mental qualities of an athlete, II. [539](#)

DUFOUR, II. [211](#)

DUNAN, CH., II. [176](#), [206](#), [208-9](#)

Duration, the primitive object in time-perception, I. 609;
our estimate of short, 611 ff.

'Dynamogeny,' II. [379](#) ff., [491](#)

EBBINGHAUS, H., I. 548, 676

Eccentric projection of sensations, II. [31](#) ff., [195](#) ff.

Education of hemispheres, I. 76

See [pedagogic remarks](#)

Effort, II. [534-7](#);

Muscular effort, [562](#);

Moral effort, [549](#), [561](#), [578-9](#)

EGGER, V., I. 280-1-2; II. [256](#)

Ego, Empirical, I. 291 ff.;

pure, 342 ff.;

'transcendental,' 362;

criticised, 364

Elementary factors of mind, see [Units of consciousness](#)

ELSAS, I. 548

EMERSON, R. W., I. 582, II. [307](#)

Emotion, [Chapter XXV](#):

continuous with instinct, II. [442](#);

description of typical emotions, [443-9](#);

results from reflex effects of stimulus upon organism, [449](#) ff.;

their classification, [454](#);

in anæsthetic subjects, [455](#);

in the absence of normal stimulus, [458-60](#);

effects of expressing, [463](#) ff.;

of repressing, [466](#);

the subtler, [469](#) ff.;

the neural process in, [472](#);

differences in individuals, [474](#);

evolution of special emotions, [477](#) ff.

Empirical ego, I. 290

Empirical propositions, II. [644](#)

Emulation, II. [409](#)

Ennui, I. 626

Entoptic sensations, I. 515 ff.

Equation, personal, I. 413

'Equilibration,' direct and indirect, II. [627](#)

Essences, their meaning, II. [329](#) ff.;
sentimental and mechanical, [665](#)

Essential qualities, see [essences](#)

ESTEL, I. 613, 618

Evolutionism demands a 'mind-dust,' 146

EXNER, on human cortical centres, I. 36;

HORSLEY, V., I. 35, 59, 63

HORWICZ, I. 314, 325-7

HOWE, S. G., II. [358](#)

Human intellect, compared with that of brute, II. [348](#) ff.;
depends on association by similarity, [353](#) ff.;
various orders of, [360](#);
what brain-peculiarity it depends on, [366](#), [638](#)

HUME, I. 254;
on personal identity, 351-3, 360;
association, 597;
due to brain-laws, 564;
on mental images, II. [45-6](#);
on belief, [295-6](#), [302](#);
on pleasure and will, [558](#)

Hunting instinct, II. [411](#)

HUXLEY, I. 130-1, 254; II. [46](#)

HYATT, A., II. [102](#)

Hylozoism, see [Mind-stuff theory](#)

Hyperæsthesia, in hypnotism, II. [609](#)

Hypnotism, I. 407; II. [128](#), [351](#);
general account of, [Chapter XXVII](#);
methods, II. [593](#);
theories of, [596](#);
symptoms of trance, [602](#) ff.;
post-hypnotic suggestion, [618](#)

Hysterics, their so-called anæsthesias, and unconsciousness, I. 202 ff.

Ideal objects, eternal and necessary relations between, II. [639](#), [661](#).
See [conceptions](#)

'Ideas,' the theory of, I. 230;
confounded with objects, 231, 276, 278, 399, 521;
they do not exist as parts of our thought, 279, 405, 553;
platonian, 462;
abstract, 468 ff.;
universal, 473 ff.;
never come twice the same, 480-1

Ideation, no distinct centres for, I. 564; II. [78](#)

Identity, sense of, I. 459;
three principles of, 460;
not the foundation of likeness, 492

Identity, personal, I. 238, 330 ff.;
based on ordinary judgment of sameness, 334;
due to resemblance and continuity of our feelings, 336;

Lotze on, 350;
only relatively true, 372

Ideo-motor action the type of all volition, II. [522](#)

Idiosyncrasy, II. [631](#)

'Idomenians,' II. [214](#)

Illusions, II. [85](#) ff., [129](#), [232](#) ff., [243-66](#).
See [hallucinations](#)

Images, double, in vision, II. [225-30](#)

Images, mental, not lost in mental blindness, etc., I. 50, 66; II. [73](#)

Images, are usually vague, II. [45](#);
visual, [51](#) ff.;
auditory, [160](#);
motor, [61](#);
tactile, [165](#);
between sleep and waking, [124-6](#)

Imagination, [Chapter XVIII](#):
it differs in individuals, II. [51](#) ff.;
sometimes leaves an after-image, [67](#);
the cerebral process of, [68](#) ff.;
not locally distinct from that of sensation, [73](#);
is *figured*, [82](#)

Imitation, II. [408](#)

Immortality, I. 348-9

Impulses, morbid, II. [542](#) ff. See [instincts](#)

Impulsiveness of all consciousness, II. [526](#) ff.

Inattention, I. 404, 455 ff.

Increase, serial, I. 490

Indeterminism, II. [569](#) ff.

INGERSOLL, R., II. [469](#)

Inheritance of acquired characters, II. [367](#), [678](#) ff.

Inhibition, I. 43, 67, 404; II. [126](#), [373](#);
of instincts, [391](#), [394](#);
of one cortical process by another, [583](#)

Innervation, feeling of, II. [236](#), [493](#);
it is unnecessary, [494](#) ff.;
no evidence for it, [499](#), [518](#)

Innervation, collateral, see [*vicarious function*](#)

Insane delusions, I. 375; II. [113](#)

Insistent ideas, II. [545](#)

Instinct. [Chapter XXIV](#);
defined, II. [384](#);
is a reflex impulse, [385](#) ff.;
is neither blind nor invariable, [389](#);
contrary instincts in same animal, [392](#);
man has more than other mammals, [393](#), [441](#);
their transitoriness, [398](#);
special instincts, [404-441](#);
the origin of instincts, [678](#)

'Integration' of feelings, Spencer's theory of, I. 151 ff.

Intelligence, the test of its presence, I. 8;
of lower brain-centres, 78 ff.

Intention to speak, I. 253

Interest, I. 140, 284 ff., 402-3, 482, 515 ff., 572, 594; II. [312](#) ff., [344-5](#), [634](#)

Intermediaries, the axiom of skipped, II. [646](#)

Introspection, I. 185

Inverted head, vision with, II. [213](#)

Monism, I. 366-7

Monkey's cortical centres, I. 34-5, 46, 59

MONTGOMERY, E., I. 158

Moral principles, II. [639](#), [672](#)

MORRIS, G. S., I. 365

Mosso, on blood-supply to brain, I. 97-9
plethysmographic researches, II. [378](#);
on fear, [419](#), [483](#)

Motor centres, I. 31 ff.

'Motor circle,' II. [583](#)

Motor strands, I. 38;
for special muscles, I. 64

Motor type of imagination, II. [61](#)

Movement, perception of, by sensory surfaces, II. [171](#) ff.;
part played by, in vision, [197](#), [203](#), [234-7](#)
the, Production of, [Chap. XXII](#)
requires guiding sensations, [490](#)
illusory perception of, during anæsthesia, [489](#);
results from every kind of consciousness, [526](#)

MOZART, I. 255

MÜLLER, G. E., I. 445, 456-8; II. [198](#), [280](#), [491](#), [502](#), [508](#), [517](#)

MÜLLER, J., I. 68; II. [640](#)

MÜLLER, J. J., II. [213](#)

MÜLLER, MAX, I. 269

MUNK, H., I. 41-3-4-5-6, 57-8-9, 63

MÜNSTERBERG, on Meynert's scheme, I. 77;
on reaction times with intellectual operation, 432:
on association, 562;
on time-perception, 620, 637;
on imagination, II. [74](#);
on muscular sensibility, [189](#);
on volition, [505](#);
on feeling of innervation, [514](#);
on association, [590](#)

Muscles, how represented in nerve-centres, I. 19

Muscle-reading, II. [525](#)

Muscular sense, its cortical centre, I. 61;
its existence, II. [189](#) ff., [197](#) ff.;;
its insignificance in space-perception, [197-203](#), [234-7](#)

Music, its accidental genesis, II. [627](#); [687](#)

MUSSEY, II. [543](#)

Mutilations, inherited, II. [627](#)

MYERS, F. W. H., I. 400; II. [133](#)

Mysophobia, II. [435](#), [545](#)

Nature, the order of, its incongruence with that of our thought, II. [634](#) ff.

NAUNYN, I. 55

Necessary truths are all truths of comparison, II. [641](#) ff., [651](#), [662](#).

See [experience](#), [a priori connections](#), etc.

NEIGLICK, I. 543

Neural process, in perception. I. 78 ff.;

in habit, 105 ff.;

in association, 566;

in memory, 655;

in imagination, II. [68](#) ff.;

in perception, [82](#) ff., [103](#) ff.;

in hallucination, [122](#) ff.;

in space-perception, [143](#);

in emotion, [474](#);

in volition, [580](#) ff.;

in association, [587](#) ff.

Nitrous oxide intoxication, II. [284](#)

Nonsense, how it escapes detection, I. 261

Normal position in vision, II. [238](#)

NOTHNAGEL, I. 51, 60-1

Number, II. [653](#)

OBERSTEINER, I. 87, 445

Object, use of the word, I. 275, 471;
confusion of, with thought that knows it, 278

Objective world, known before self, I. 273;
its primitive unity, 487-8;
ditto, II. [8](#)

Objects *versus* ideas, I. 230, 278

Old-fogyism, II. [110](#)

ORCHANSKY, I. 95

'Overtone' (psychic), I. 258, 281-2

Pain, I. 143,
its relations to the will, II. [549](#) ff., [583-4](#)

PANETH, I. 64, 65

Parallelism, theory of, between mental and cerebral phenomena, see [Automaton-theory](#).

Paresis of external rectus muscle, II. [236](#), [507](#)

PARINAUD, II. [71](#)

Partiality of mind, see [interest](#), [teleology](#), [intelligence](#), [selection](#), [essences](#)

Past time, known in a present feeling, I. 627;
the immediate past is a portion of the present duration-block, 608 ff.

Patellar reflex, II. [380](#)

Paths through cortex, I. 71;
their formation, 107-12; II. [584](#) ff.;

association depends on them, [567](#) ff.;
memory depends on them, [655](#) ff., [661](#), [686](#)

PAULHAN, F., I. 250, 408, 670; II. [64](#), [476](#)

Pedagogic remarks: I. 121-7; II. [110](#), [401-2](#), [409](#), [463](#), [466](#)

Perception. [Chapter XIX](#):

compared with sensation, II. [1](#), [76](#);
involves reproductive processes, [78](#);
is of *probable* objects, [82](#) ff.;
not an unconscious inference, [111](#) ff.;
rapidity of, [131](#)

Perception-time, II. [131](#)

PEREZ, B., I. 446; II. [416](#)

Personal equation, I. 413

Personality, alterations of, I. 373 ff.

PFLÜGER, on frog's spinal cord, I. 9, 134

Philosophies, their test, II. [312](#)

Phosphorus and thought, I. 101

Phrenology, I. 27

PICK, E., I. 669

PITRES, I. 206

Planchette-writing, I. 208-9, 393 ff.

Plasticity, as basis of habit, defined, I. 105

PLATNER, II. [208](#)

PLATO, I. 462

Play, II. [427](#)

Pleasure, as related to will, I. 143; II. [549](#), [583-4](#)

Points, identical, theory of, II. [222](#) ff.

Possession, Spirit-, I. 393 ff.

Post-hypnotic suggestion, II. [613](#)

Practical interests, their effects on discrimination, I. 515 ff.

Prayer, I. 316

'Preperception,' I. 439

Present, the present moment, I. 606 ff.

PREYER, II. [403](#)

Probability determines what object shall be perceived, II. [82](#), [104](#), [258](#), [260-3](#)

Problematic conceptions, I. 463

Problems, the process of solution of, I. 584

Projection of sensations, eccentric, II. [31](#) ff.

Projection, theory of, II. [228](#)

Psychologist's fallacy, the, see [Fallacy](#)

Psychophysics law, I. 539

Pugnacity, II. [409](#)

Pure Ego, I. 342

PUTNAM, J. J., I. 61

Questioning mania, II. [284](#)

RABIER, I. 470, 604

Rational propositions, II. [644](#)

Rationality is based on apprehension of series, II. [659](#)

Rationality, postulates of, II. [670](#), [677](#)

Rationality, sense of, I. 260-4; II. [647](#)

Reaction-time, I. 87;

simple, 88;

what it measures is not conscious thought, 90;

Lange's distinction between muscular and sensorial, 92;

its variations, 94-7;

influenced by expectant attention, 427 ff.;

after intellectual process, 432;

after discrimination, 523;

after association, 557;

after perception, II. [131](#)

Real size and shape of visual objects, II. [179](#), [237](#) ff.

Reality, the Perception of, [Chapter XXI](#);

not a distinct content of consciousness, II. [286](#);
various orders of, [287](#) ff.;
every object has *some* kind of reality, [291](#) ff.;
the choice of, [290](#);
practical, [293](#) ff.;
means relation to the self, [295-8](#);
relation of sensations to, [299](#);
of emotions, [306](#)

Reason, I. 551. See [Logic](#)

Reasoning, [Chapter XXII](#);
its definition, II. [325](#);
involves the picking out of essences, or sagacity, [329](#);
and abstraction, [332](#);
its utility depends on the peculiar constitution of this world, [337](#) ff., [651](#);
depends on association by similarity, [345](#)

Recall, I. 578, 654

'Recepts,' II. [327](#), [349](#), [351](#)

Recognition, I. 673

Recollection, voluntary, I. 585 ff.

Redintegration, I. 569

'Reductives,' II. [125](#), [291](#)

Reflex acts, I. 12;
reaction-time measures one, 90;
concatenated habits are constituted by a chain of, 116

REID, THOMAS, I. 609, 78; II. [214](#), [216](#), [218](#), [240](#), [309](#)

Relating principle, I. 687-8

Relation, feelings of, I. 243 ff.;
space-relations, II. [148](#) ff.

Relations, inward, between ideas, II. [639](#), [642](#), [661](#), [671](#);
the principle of transferred, [646](#)

Relief, II. [254-7](#). See [*third dimension*](#)

RENOUVIER, CH., I. 551; II. [309](#)

Reproduction in memory, I. 574 ff., 654;
voluntary, 585 ff.

Resemblance, I. 528

Respiration, effects of sensory stimuli upon, II. [376](#)

Restitution of function, I. 67 ff.

Restoration of function, I. 67 ff.

Retention in memory, I. 653 ff.

Retentiveness, organic, I. 659 ff.;
it is unchangeable, 663 ff.

Retinal image, II. [92](#)

Retinal sensibility, see [*vision*](#), [*space*](#), [*identical points*](#), [*third dimension*](#),
[*projection*](#), etc.

Revival in memory, I. 574 ff., 654

REYNOLDS, MARY, I. 381

RIBOT, TH., I. 375;

on attention, 444, 446, 680, 682

RICHET, CH., I. 638, 644-6-7

RIEHL, A., II. [32](#)

ROBERTSON, G. C., I. 461; II. [86](#)

ROMANES, G. J., II. [95](#), [132](#), [327-9](#), [349](#), [351](#), [355](#), [397](#)

Romantic and classic, II. [469](#)

RUTHERFORD, II. [170](#)

Sagacity, II. [331](#), [343](#)

Sameness, I. 272, 459, 480; II. [650](#)

SCHAEFER, W., I. 35, 53, 59, 63

SCHIFF, M., I. 58, 78, 100

SCHMID, I. 683

SCHMIDT, H. D., II. [399-400](#)

SCHNEIDER, G. H., on Habits, I. 112, 118-20;
on perception of motion, II. [173](#);

on evolution of movements, [380](#);
on instincts, [387-8](#), [411](#), [418](#), [439](#)

SCHOPENHAUER, II. [33](#), [273](#)

SCHRADER, I. 72 ff.

Science, the genesis of, II. [665-9](#)

Sea-sickness, susceptibility to, an accident, II. [627](#)

Seat of consciousness, I. 65;
of Soul, 214;
of sensations, no original, II. [34](#)

Sciences, the natural, the factors of their production, II. [633](#) ff.;
a Turkish cadı upon, [640](#);
postulate things with unchangeable properties, [656](#)

Sciences, the pure, they express results of comparison exclusively, II. [641](#);
classifications, [646](#);
logic, [647](#);
mathematics, [653](#)

Secretiveness, II. [432](#)

SEGUIN, I. 48, 75

Selection, a cardinal function of consciousness, 284 ff., 402, 594; II. [584](#);
of visual reality, II. [177](#) ff., [237](#);
of reality in general, [290](#), [294](#);
of essential quality, [333](#), [370](#), [634](#)

Self, consciousness of, Chap. X:
not primary, I. 273;
the empirical self, I. 291;
its constituents, 292;

the material self, 292;
the social self, 293;
the spiritual self, 296;
resolvable into feelings localized in head, 300 ff.;
consciousness of personal identity, 330 ff.;
its alterations, 373 ff.

Self-feeling, I. 305 ff.

Self-love, I. 317;

the name for active impulses and emotions towards certain *objects*; we do not love our bare principle of individuality, 323

Self-seeking, I. 307 ff.

Selves, their rivalry, I. 309 ff.

Semi-reflex acts, I. 13

Sensation, does attention increase its strength? I. 425;
terminus of thought, 471

Sensation, [Chapter XVII](#);

distinguished from perception, II. [1](#), [76](#);

its cognitive function, [3](#);

pure sensation an abstraction, [3](#);

the terminus of thought, [7](#)

Sensations, are not compounds, I. 158 ff.; II. [2](#);

their supposed combination by a higher principle, I. 687; II. [27-30](#);

their influence on each other, II. [28-30](#);

their eccentric projection, [31](#) ff., [195](#) ff.;

their localization inside of one another, [183](#) ff.;

their relation to reality, [299](#) ff.;

to emotions, [453](#);

their fusion, see [Mind-stuff theory](#)

Sensationalism, I. [243](#);
criticised by spiritualism, [687](#)

Sensationalism, II. [5](#);
in the field of space-perception, criticised, [216](#) ff.;
its difficulties, [231-7](#);
defended, [237](#) ff., [517](#)

SERGI, II. [34](#)

Serial increase, I. 490; II. [644](#)

Series, II. [644-51](#), [659](#) ff.

SETH, A., II. [4](#)

Sexual function, I. 22

Shadows, colored, II. [25](#)

Shame, II. [435](#)

SHOEMAKER, Dr., I. 273

Shyness, II. [430](#)

Sight, its cortical centre, I. 41 ff., 66

Sign-making, a differentia of man, II. [356](#)

Signs, local, II. [155](#) ff.

SIGWART, C., II. [634-6](#)

SIKORSKY, II. [465](#)

Similarity, I. 528

Similarity, association by, I. 578; II. [345](#), [353](#)

Skin, discrimination of points on, I. 512

Sleep, partial consciousness during, I. 213

Sociability, II. [430](#)

Somnambulism, see [hypnotism](#), [hysterics](#)

Soul, theory of the, I. 180;
inaccessibility of, 187;
its essence is to think (according to Descartes), 200;
seat of, 214;
arguments for its existence, 343 ff.;
an unnecessary hypothesis for psychology, 350;
compared with transcendental Ego, 365;
a relating principle, 499

Space, the perception of, [Chapter XX](#);
primitive extensity in three dimensions, II. [134-9](#);
spatial order, [145](#);
space-relations, [148](#);
localization in, [153](#) ff.;
how real space is mentally constructed, [166](#) ff.;
part played by movement in, [171-6](#);
measurement of extensions, [177](#) ff.;
synthesis of originally chaotic sensations of extension, [181](#) ff.;
part played by articular surfaces in, [189](#) ff.;
by muscles, [197](#) ff.;
how the blind perceive space, [203](#) ff.;
visual space, [211-268](#);
theory of identical points, [222](#);
of projection, [228](#);
difficulties of sensation-theory expounded and replied to, [231-268](#);
historical sketch of opinion, [270](#) ff.

SPALDING, D. A., II. [396](#), [398](#), [400](#), [406](#)

Span of consciousness, I. 405, 640

Speech, the 'centre' of, I. 55;

its misleading influence in psychology, I. 194;

thought possible without it, 269.

See [Aphasia](#), [Phrenology](#).

SPENCER, his formula of 'adjustment,' I. 6;

on formation of paths in nerve-centres, 109;

on chasm between mind and matter, 147;

on origin of consciousness, 148;

on 'integration' of nervous shocks, 151-3;

on feelings of relation, 247;

on unity of self, 354;

on conceivability, 464;

on abstraction, 506;

on association, 600;

on time perception, 622, 639;

on memory, 649;

on recognition, 673;

on feeling and perception, II. [113](#), [180](#);

on space-perception, [272](#), [282](#);

on genesis of emotions, [478](#) ff.;

on free-will, [576](#);

on inheritance of acquired peculiarities, [620](#) ff., [679](#);

on 'equilibration,' [627](#);

on genesis of cognition, [643](#);

on that of sociality and pity, [685](#)

SPINOZA, II. [288](#)

SPIR, A., II. [665](#), [677](#)

'Spirit-control,' I. 228

Spiritualist theory of the self, I. 342; II. [5](#)

Spiritualists, I. 161

STANLEY, HENRY M., II. [310](#)

Tedium, I. 626

Teleology, created by consciousness, I. 140-1;
essence of intelligence, 482
involved in the fact of essences, II. [335](#);

its barrenness in the natural sciences, [665](#)

Tendency, feelings of, I. 250-4

THACKERAY, W. M., II. [434](#)

Thermometry, cerebral, I. 99

'Thing,' II. [184](#), [259](#)

Thinking, the consciousness of, I. 300 ff.

Thinking principle, I. 342

Third dimension of space, II. [134](#) ff., [212](#) ff., [220](#)

THOMPSON, D. G., I. 354; II. [662](#)

THOMSON, ALLEN, I. 84

Thought, synonym for consciousness at large, I. 186;
the stream of, Chapter IX:
it tends to personal form, 225;
same thought never comes twice, 231 ff.;
sense in which it is continuous, 237;
can be carried on in any terms, 260-8;
what constitutes its rational character, 269;
is cognitive, 271;
not made up of parts, 276 ff., II. [79](#) ff.;
always partial to some of its objects, I. 284 ff.;
the consciousness of it as a process, 300 ff.;
the present thought is the thinker, 369, 401;
depends on material conditions, 553

'Thought reading,' II. [525](#)

Time, occupied by neural and mental processes, see [reaction-time](#)

Time, unconscious registration of, I. 201

Time, the perception of, Chapter XV;
begins with duration, I. 609;
compared with perception of space, 610 ff.;
empty time not perceived, 619;
its discrete flow, 621, 637;
long intervals conceived symbolically, 622 ff.;
variations in our estimate of its length, 623 ff.;
cerebral process underlying, 627 ff.

TISCHER, I. 524, 527

Touch, cortical centre for, I. 58

Trance, see [hypnotism](#)

Transcendentalist theory of the Self, I. 342, 360 ff.;
criticised, 363 ff.

Updated editions will replace the previous one--the old editions will
be renamed.

Creating the works from print editions not protected by U.S. copyright
law means that no one owns a United States copyright in these works,
so the Foundation (and you!) can copy and distribute it in the United
States without permission and without paying copyright
royalties. Special rules, set forth in the General Terms of Use part
of this license, apply to copying and distributing Project
Gutenberg-tm electronic works to protect the PROJECT GUTENBERG-tm
concept and trademark. Project Gutenberg is a registered trademark,
and may not be used if you charge for the eBooks, unless you receive
specific permission. If you do not charge anything for copies of this
eBook, complying with the rules is very easy. You may use this eBook
for nearly any purpose such as creation of derivative works, reports,
performances and research. They may be modified and printed and given
away--you may do practically ANYTHING in the United States with eBooks
not protected by U.S. copyright law. Redistribution is subject to the
trademark license, especially commercial redistribution.

START: FULL LICENSE

THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg-tm mission of promoting the free
distribution of electronic works, by using or distributing this work
(or any other work associated in any way with the phrase "Project
Gutenberg"), you agree to comply with all the terms of the Full
Project Gutenberg-tm License available with this file or online at
www.gutenberg.org/license.

Section 1. General Terms of Use and Redistributing Project
Gutenberg-tm electronic works

1.A. By reading or using any part of this Project Gutenberg-tm
electronic work, you indicate that you have read, understand, agree to

and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg-tm electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg-tm electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. "Project Gutenberg" is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg-tm electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg-tm electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg-tm electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation ("the Foundation" or PGLAF), owns a compilation copyright in the collection of Project Gutenberg-tm electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is unprotected by copyright law in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg-tm mission of promoting free access to electronic works by freely sharing Project Gutenberg-tm works in compliance with the terms of this agreement for keeping the Project Gutenberg-tm name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg-tm License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg-tm work. The Foundation makes no representations concerning the copyright status of any work in any country outside the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg-tm License must appear prominently whenever any copy of a Project Gutenberg-tm work (any work on which the phrase "Project Gutenberg" appears, or with which the phrase "Project Gutenberg" is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located in the

United States, you'll have to check the laws of the country where you are located before using this ebook.

1.E.2. If an individual Project Gutenberg-tm electronic work is derived from texts not protected by U.S. copyright law (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase "Project Gutenberg" associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg-tm trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg-tm electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg-tm License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg-tm License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg-tm.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg-tm License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg-tm work in a format other than "Plain Vanilla ASCII" or other format used in the official version posted on the official Project Gutenberg-tm web site (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original "Plain Vanilla ASCII" or other form. Any alternate format must include the full Project Gutenberg-tm License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg-tm works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg-tm electronic works provided that

* You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg-tm works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg-tm trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project

Gutenberg Literary Archive Foundation at the address specified in Section 4, "Information about donations to the Project Gutenberg Literary Archive Foundation."

- * You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg-tm License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg-tm works.
- * You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- * You comply with all other terms of this agreement for free distribution of Project Gutenberg-tm works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg-tm electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from both the Project Gutenberg Literary Archive Foundation and The Project Gutenberg Trademark LLC, the owner of the Project Gutenberg-tm trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread works not protected by U.S. copyright law in creating the Project Gutenberg-tm collection. Despite these efforts, Project Gutenberg-tm electronic works, and the medium on which they may be stored, may contain "Defects," such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the "Right of Replacement or Refund" described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg-tm trademark, and any other party distributing a Project Gutenberg-tm electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH 1.F.3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in

lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS', WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg-tm electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg-tm electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg-tm work, (b) alteration, modification, or additions or deletions to any Project Gutenberg-tm work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need are critical to reaching Project Gutenberg-tm's goals and ensuring that the Project Gutenberg-tm collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg-tm and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation information page at www.gutenberg.org Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's principal office is in Fairbanks, Alaska, with the

mailing address: PO Box 750175, Fairbanks, AK 99775, but its volunteers and employees are scattered throughout numerous locations. Its business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887. Email contact links and up to date contact information can be found at the Foundation's web site and official page at www.gutenberg.org/contact

For additional contact information:

Dr. Gregory B. Newby
Chief Executive and Director
gbnewby@pglaf.org

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide spread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit www.gutenberg.org/donate

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: www.gutenberg.org/donate

Section 5. General Information About Project Gutenberg-tm electronic works.

Professor Michael S. Hart was the originator of the Project Gutenberg-tm concept of a library of electronic works that could be freely shared with anyone. For forty years, he produced and distributed Project Gutenberg-tm eBooks with only a loose network of volunteer support.

Project Gutenberg-tm eBooks are often created from several printed editions, all of which are confirmed as not protected by copyright in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility: www.gutenberg.org

This Web site includes information about Project Gutenberg-tm, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.

COLLECTED PAPERS
OF
ANALYTICAL PSYCHOLOGY

C.G. JUNG

SECOND EDITION

Project Gutenberg's Collected Papers on Analytical Psychology, by C. G. Jung

This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located in the United States, you'll have to check the laws of the country where you are located before using this ebook.

Title: Collected Papers on Analytical Psychology

Author: C. G. Jung

Editor: Constance E. Long

PRINTED IN GREAT BRITAIN.

EDITOR'S PREFACE TO SECOND EDITION

The following papers have been gathered together from various sources, and are now available for the first time to English readers. The subject of psychoanalysis is much in evidence, and is likely to occupy still more attention in the near future, as the psychological content of the psychoses and neuroses is more generally appreciated and understood. It is of importance, therefore, that the fundamental writings of both the Viennese and Zürich Schools should be accessible for study. Several of Freud's works have already been translated into English. Dr. Jung's "Wandlungen und Symbole der Libido" was published in America in 1916 under the title of "The Psychology of the Unconscious." That work, read in conjunction with these papers, offers a fairly complete picture of the scientific and philosophic standpoint of the leader of the Zürich School. It is the task of the future to judge and expand the findings of both schools, and to work at the development of the new psychology, which is still in its infancy.

It will be a relief to many students of the unconscious to see it in another aspect than that of "a wild beast couched, waiting its hour to spring." Some readers have gathered that view of it from the writings of the Viennese School, a view which is at most that dangerous thing "a half-truth."

In the papers appearing for the first time in this edition (Chapters XIV. and XV.), Dr. Jung develops his ideas of introversion and extroversion, a contribution of the first importance to psychology. He agrees with Freud in regarding the neuroses to be the result of repression, but differs in his view as to the origin of repression. He finds this to lie not in sexuality *per se*, but rather in man's natural tendency to adapt to the demands of life one-sidedly, according to his type of mentality. The born extrovert adapts by means of feeling, thought being under repression and relatively infantile. The introvert's natural adaptation is by means of thought; feeling being more or less repressed remains undeveloped. In either type the neglected co-function is behind the adapted function. This inequality operating in the unconscious, brings about a conflict, which in certain subjects amounts to a neurosis, and in others produces a limitation of individual development. This view shifts the interpretation of repression on to a much more comprehensive basis than that of sexuality, although there can scarcely be a repression that does not include this instinct on account of its deep and far-reaching importance in man.

There is no doubt that some even scientific persons have a certain fear of whither the study of the unconscious may lead. These fearful persons should be reminded that they possess an unconscious in spite of themselves, and that they share it in common with every human being. It is an extension of the individual. To study it is to deepen the self. All new discoveries have at one stage been called dangerous, and all new philosophies have been deemed heresies. It is as though we would once more consign radium to its dust-heaps, lest some day the new radiance should over-power mankind. Indeed this particular thing has proved at once most dangerous and most precious. Man must learn to use his treasure, and in using it to *submit to its own laws*, which can only become known when it is handled and investigated.

Those who read this book with the attention it requires, will find they gain an impression of many new truths. The second edition is issued towards the end of the third year of the Great European war, at a time when much we have valued and held sacred is in the melting-pot. But we believe that out of the crucible new forms will arise. The study of psychoanalysis produces something of

the effect of a war in the psyche; indeed, we need to make conscious this war in the inner things of the mind and soul if we would be delivered in the future from war in the external world. There is a parallelism between individual and international neurosis. In the pain of the upheaval, one recognises the birth-pangs of newer, and let us hope, truer thought, and more natural adaptations. We need a renewal of our philosophy of life to replace much that has perished in the general cataclysm, and it is because I see in the analytical psychology, which grows out of a scientific study of the unconscious, the germs of such a new construction, that I have gathered the following essays together. The translation is the work of various hands, the names of the different translators being given in a footnote at the beginning of each essay; for the editing I am responsible. The essays are, as far as possible, printed in chronological order, and those readers who are sufficiently interested will be able to discern in them the gradual development of Dr. Jung's present position in psychoanalysis.

CONSTANCE E. LONG.

2, HARLEY PLACE, W.
June, 1917.

AUTHOR'S PREFACE TO SECOND EDITION

In agreement with my honoured collaborator, Dr. C. E. Long, I have made certain additions to the second edition. It should especially be mentioned that a new chapter upon "The Concept of the Unconscious" has been added. This is a lecture I gave early in 1916 before the Zürich Union for Analytical Psychology. It gives a general orientation of a most important problem in practical analysis, viz. of the relation of the psychological ego to the psychological non-ego. Chapter XIV. has been fundamentally altered, and I have used the opportunity to incorporate an article that should describe the results of more recent researches. In accordance with my usual mode of working, the description is as generalised as possible. My habit in my daily practical work is to confine myself for some time to studying my human material. I then abstract as generalised a formula as possible from the data collected, obtaining from it a point of view and applying it in my practical work, until it has either been confirmed, modified, or else abandoned. If it has been confirmed, I publish it as a general view-point, without giving the empirical material. I only introduce the material amassed in the course of my practice in the form of example or illustration. I therefore beg the reader not to consider the views I present as mere fabrications of my brain. They are, as a matter of fact, the results of extensive experience and ripe reflection.

These additions will enable the reader of the second edition to become familiar with the recent views of the Zürich School.

As regards the criticism encountered by the first edition of this work, I was pleased to find my writings were received with much more open-mindedness among English critics than was the case in Germany, where they are met with the silence born of contempt. I am particularly grateful to Dr. Agnes Savill for an exceptionally understanding criticism in the *Medical Press*. My thanks are also due to Dr. T. W. Mitchell for an exhaustive review in the *Proceedings of the Society for Psychical Research*. This critic takes exception to my heresy respecting causality. He considers that I am entering upon a perilous, because unscientific, course, when I question the sole validity of the causal view-point in psychology. I sympathise with him, but in my opinion the nature of the human mind compels us to take the final point of view. For it cannot be disputed that, psychologically speaking, we are living and working, day by day, according to the principle of directed aim or purpose, as well as that of causality. A psychological theory must necessarily adapt itself to this fact. What is plainly directed towards a goal cannot be given an exclusively causalistic explanation, otherwise we should be led to the conclusion expressed in Moleschott's famous enunciation: "Man *is*, what he eats." We must always bear the fact in mind that *causality is a point of view*. It affirms the inevitable and immutable relation of a series of events: a-b-d-z. Since this relation is fixed, and according to the view-point must necessarily be so, looked at logically the order may also be reversed. *Finality is also a view-point*, that is justified empirically solely by the existence of series of events, wherein the causal connection is indeed evident, *but the meaning of which only becomes intelligible as producing final effect*. Ordinary daily life furnishes the best instances of this. The causal explanation must be mechanistic, if we are not to postulate a metaphysical entity as first cause. For instance, if we adopt Freud's sexual theory and assign primary importance psychologically to the function of the genital glands, the brain is viewed as an appendage of the genital glands. If we approach the Viennese idea of sexuality with all its vague omnipotence, and trace it in a strictly scientific manner down to its psychological basis, we shall

arrive at the first cause, according to which psychic life is for the most, or the most important part, tension and relaxation of the genital glands. If we assume for the moment that this mechanistic explanation be "true," it would be the sort of truth which is exceptionally tiresome and rigidly limited in scope. A similar statement would be that the genital glands cannot function without adequate *nourishment*, with its inference that sexuality is an appendage-function of nutrition! The truth contained in this is really an important chapter in the biology of lower forms of life.

But if we wish to work in a really psychological way, we shall want to know the *meaning* of psychological phenomena. After learning the kinds of steel the various parts of a locomotive are made of, and from what ironworks and mines they come, we do not really know anything about the locomotive's *function*, that is to say, its *meaning*. But "function" as conceived by modern science is by no means solely a causal concept; it is especially a final or "teleological" one. For it is utterly impossible to consider the soul from the causal view-point only; we are obliged to consider it also from the final point of view. As Dr. Mitchell also points out, it is impossible for us to think of the causal determination conjointly with a final connection. That would be an obvious contradiction. But our theory of cognition does not need to remain on a pre-Kantian level. It is well known that Kant showed very clearly that the mechanistic and the teleological view-points are not *constituent* (objective) principles, in some degree qualities of the object, but that they are purely *regulative* (subjective) principles of thought, and as such they are not mutually inconsistent. I can, for example, easily conceive the following thesis and antithesis:—

Thesis: Everything came into existence according to mechanistic laws.

Antithesis: Some things did not come into existence according to mechanistic laws only.

Kant says to this: Reason cannot prove either of these principles, because *a priori* purely empirical laws of nature cannot give us a determinative principle regarding the potentiality of things.

As a matter of fact, modern physics has necessarily been converted from the idea of pure mechanism to the final concept of the conservation of energy, because the mechanistic explanation only recognises reversible processes, whereas the actual truth is that the process of nature is irreversible. This fact led to the concept of an energy that tends towards relief of tension, and therewith also towards a definite final state.

Obviously, I consider both these points of view necessary, the causal as well as the final, but would at the same time lay stress upon the fact that since Kant's time we have come to know that the two view-points are not antagonistic if they are regarded as regulative principles of thought, and not as constituent principles of the process of nature itself.

When speaking of the reviews, I must also mention those that seem to me beside the mark. I was once more struck by the fact that certain critics cannot distinguish between the theoretical explanation given by the author, and the phantastic ideas provided by the patient. One of my critics makes this confusion when discussing "Number Dreams." The associations to the quotation from the Bible in Chapter V. are, as every attentive reader must readily perceive, not arbitrary explanations of my own, but a cryptomnesic conglomeration emanating, not from my brain at all, but from that of the patient. Surely it is not difficult to perceive upon reflection that this conglomeration of numbers corresponds exactly to that unconscious psychological function from which proceeded all the mysticism of numbers, Pythagoric, Kabbalistic, and so forth, existent from untold ages.

I am grateful to my serious reviewers, and should like here to also express my thanks to Mrs. Harold F. McCormick for her generous help in the production of this book.

C. G. JUNG.

June, 1917.

AUTHOR'S PREFACE TO FIRST EDITION

This volume contains a selection of articles and pamphlets on analytical psychology written at intervals during the past fourteen years. These years have seen the development of a new discipline, and as is usual in such a case, have involved many changes of view-point, of concept, and of formulation.

It is not my intention to give a presentation of the fundamental concepts of analytical psychology in this book; it throws some light, however, on a certain line of development which is especially characteristic of the Zürich School of psychoanalysis.

As is well known, the merit of the discovery of the new analytical method of general psychology belongs to Professor Freud of Vienna. His original view-points had to undergo many essential modifications, some of them owing to the work done at Zürich, in spite of the fact that he himself is far from agreeing with the standpoint of this school.

I am unable to explain fully the fundamental differences between the two schools, but would indicate the following points: The Vienna School takes the standpoint of an exclusive sexualistic conception, while that of the Zürich School is symbolistic. The Vienna School interprets the psychological symbol semiotically, as a sign or token of certain primitive psychosexual processes. Its method is analytical and causal.

The Zürich School recognises the scientific feasibility of such a conception, but denies its exclusive validity, for it does not interpret the psychological symbol semiotically only, but also symbolistically, that is, it attributes a positive value to the symbol.

The value does not depend merely on historical causes; its chief importance lies in the fact that it has a meaning for the actual present, and for the future, in their psychological aspects. For to the Zürich School the symbol is not merely a sign of something repressed and concealed, but is at the same time an attempt to comprehend and to point out the way of the further psychological development of the individual. Thus we add a prospective import to the retrospective value of the symbol.

The method of the Zürich School is therefore not only analytical and causal, but also synthetic and prospective, in recognition that the human mind is characterised by "causæ" and also by "fines" (aims). The latter fact needs particular emphasis, because there are two types of psychology, the one following the principle of hedonism, and the other following the principle of power. Scientific materialism is pertinent to the former type, and the philosophy of Nietzsche to the latter. The principle of the Freudian theory is hedonism, while that of Adler (one of Freud's earliest personal pupils) is founded upon the principle of power.

The Zürich School, recognising the existence of these two types (also remarked by the late Professor William James), considers that the views of Freud and Adler are one-sided, and only valid within the limits of their corresponding type. Both principles exist within every individual, but not in equal proportions.

Thus, it is obvious that each psychological symbol has two aspects, and should be interpreted according to the two principles. Freud and Adler interpret in the analytical and causal way,

reducing to the infantile and primitive. Thus with Freud the conception of the "aim" is the fulfilment of desire, with Adler it is the usurpation of power. Both authors take the standpoint in their practical analytical work which brings to view only infantile and gross egoistic aims.

The Zürich School is convinced of the fact that within the limits of a diseased mental attitude the psychology is such as Freud and Adler describe. It is, indeed, just on account of such impossible and childish psychology that the individual is in a state of inward dissociation and hence neurotic. The Zürich School, therefore, in agreement with them so far, also reduces the psychological symbol (the phantasy products of the patient) to the fundamental infantile hedonism, or to the infantile desire for power. But Freud and Adler content themselves with the result of mere reduction, according to their scientific biologism and naturalism.

But here a very important question arises. Can man obey the fundamental and primitive impulses of his nature without gravely injuring himself or his fellow beings? He cannot assert either his sexual desire or his desire for power unlimitedly, and the limits are moreover very restricted. The Zürich School has in view also the final result of analysis, and regards the fundamental thoughts and impulses of the unconscious, as symbols, indicative of a definite line of future development. We must admit there is, however, *no scientific justification* for such a procedure, because our present-day science is based as a whole upon causality. But causality is only one principle, and psychology essentially cannot be exhausted by causal methods only, because the mind lives by aims as well. Besides this disputable philosophical argument, we have another of much greater value in favour of our hypothesis, namely, that of *vital necessity*. It is impossible to live according to the intimations of infantile hedonism, or according to a childish desire for power. If these are to be retained they must be taken symbolically. Out of the symbolic application of infantile trends, an attitude evolves which may be termed philosophic or religious, and these terms characterise sufficiently the lines of further development of the individual. The individual is not only an established and unchangeable complex of psychological facts, but also an extremely changeable entity. By exclusive reduction to causes, the primitive trends of a personality are reinforced; this is only helpful when at the same time these primitive tendencies are balanced by recognition of their symbolic value. Analysis and reduction lead to causal truth; this by itself does not help living, but brings about resignation and hopelessness. On the other hand, the recognition of the intrinsic value of a symbol leads to constructive truth and helps us to live. It induces hopefulness and furthers the possibility of future development.

The functional importance of the symbol is clearly shown in the history of civilisation. For thousands of years the religious symbol proved a most efficacious means in the moral education of mankind. Only a prejudiced mind could deny such an obvious fact. Concrete values cannot take the place of the symbol; only new and more efficient symbols can be substituted for those that are antiquated and outworn, such as have lost their efficacy through the progress of intellectual analysis and understanding. The further development of mankind can only be brought about by means of symbols which represent something far in advance of himself, and whose intellectual meanings cannot yet be grasped entirely. The individual unconscious produces such symbols, and they are of the greatest possible value in the moral development of the personality.

Man almost invariably has philosophic and religious views of the meaning of the world and of his own life. There are some who are proud to have none. These are exceptions outside the common path of mankind; they miss an important function which has proved itself to be indispensable to the human mind.

In such cases we find in the unconscious, instead of modern symbolism, an antiquated archaic view of the world and of life. If a requisite psychological function is not represented in the sphere of consciousness, it exists in the unconscious in the form of an archaic or embryonic prototype.

This brief *résumé* may show what the reader cannot find in this collection of papers. The essays are stations on the way of the more general views developed above.

C. G. JUNG.

ZÜRICH,

. *January, 1916.*

AUTHOR'S PREFACE TO SECOND EDITION	ix
AUTHOR'S PREFACE TO FIRST EDITION	xiii

CHAPTER I

ON THE PSYCHOLOGY AND PATHOLOGY OF SO-CALLED OCCULT PHENOMENA [1](#)

Difficulty of demarcation in borderline cases between epilepsy, hysteria, and mental deficiency—Somnambulism an hysterical manifestation—A case of spontaneous somnambulism, with some characters of protracted hysterical delirium—Other cases quoted—Charcot's classification of somnambulism—Naef's and Azam's cases of periodic amnesia—Proust's and Boileau's wandering-impulse cases—William James' case of Rev. Ansel Bourne—Other examples showing changes in consciousness—Hypnagogic hallucinations—Neurasthenic mental deficiency, Bleuler's case—Summing up of Miss Elsie K.'s case—Need of further scientific investigation in the field of psychological peculiarities.

CASE OF SOMNAMBULISM IN A PERSON WITH NEUROPATHIC INHERITANCE (SPIRITUALISTIC MEDIUM) [16](#)

History of case—Accidental discovery of her mediumistic powers—Her somnambulant attacks, "*attitudes passionelles*," catalepsy, tachypnoea, trance speeches, etc.—Ecstasies—Her conviction of the reality of her visions—Her dreams, hypnagogic and hypnopompic visions—The elevation of her somnambulant character—Mental thought transference—S. W.'s double life—Psychographic communications—Description of séances—The Prophetess of Prevorst—Automatic writing—The two grandfathers—Appearance of other somnambulant personalities.

DEVELOPMENT OF THE SOMNAMBULIC PERSONALITIES [30](#)

The psychograph and spiritualistic wonders—The grandfather the medium's "guide" or "control"—Ulrich von Gerbenstein—The somnambulant personalities have access to the medium's memory—Ivenes—S. W.'s amnesia for her ecstasies—Later séances—Her journeys on the other side—Oracular sayings—Conventi—Ivenes' dignity and superiority to her "guides"—Her previous incarnations—Her race-motherhood.

MYSTIC SCIENCE AND MYSTIC SYSTEM OF POWERS [40](#)

Her growing wilful deception—The waking state—Her peculiarities—Instability—Hysterical tendencies—Misreading—Errors of dispersion of attention discussed.

SEMI-SOMNAMBULISM

[48](#)

AUTOMATISMS

[49](#)

Table movements—Unconscious motor phenomena—Verbal suggestion and auto-suggestion—The experimenter's participation—The medium's unconscious response—Thought-reading—Table-tilting experiment, illustrated—Experiments with beginners—Myers' experiments in automatic writing—Janet's conversation with Lucie's subconsciousness—Example of the way the subconscious personality is constructed—Hallucinations appear with deepening hypnosis; some contributing factors—Comparison between dream symbols and appearance of somnambulant personalities—Extension of the unconscious sphere—The somnambulant's thinking is in plastic images, which are made objective in hallucinations—Why visual and not auditory hallucinations occur—Origin of hypnagogic hallucinations—Those of Jeanne d'Arc and others.

THE CHANGE IN CHARACTER

[64](#)

Noticeable in S. W.'s case, also in Mary Reynolds'—Association with amnesic disturbances—Influence of puberty in our case—S. W.'s systematic anaesthesia—Ivenes not so much a case of double consciousness as one in which she dreams herself into a higher ideal state—Similar pathological dreaming found in the lives of saints—Mechanism of hysterical identification—S. W.'s dreams break out explosively—Their origin and meaning, and their subjective roots.

RELATION TO THE HYSTERICAL ATTACK

[75](#)

In considering the origin of attack, two moments, viz. irruption of hypnosis, and the psychic stimulation, must be taken into account—In susceptible subjects relatively small stimuli suffice to bring about somnambulism—Our case approaches to hysterical lethargy—The automatisms transform lethargy into hypnosis—Her ego-consciousness is identical in all states—Secondary somnambulant personalities split off from the primary unconscious personality—All group themselves under two types, the gay-hilarious, and serio-religious—The automatic speaking occurs—This facilitates the study of the subconscious personalities—Their share of the consciousness—The irruption of the hypnosis is complicated by an hysterical attack—The automatism arising in the motor area plays the part of hypnotist—When the hypnotism flows over into the visual sphere the hysterical attack occurs—Grandfathers I. and II.—Hysterical dissociations belong to the superficial layers of the ego-complex—There are layers beyond the reach of dissociation—Effect of the hysterical attack.

RELATIONSHIP TO THE UNCONSCIOUS PERSONALITY

[82](#)

The serio-religious and the gay-hilarious explained by the anamnesis—Two halves of S. W.'s character—She is conscious of the painful contrast—She seeks a middle way—Her aspirations bring her to the puberty dream of the ideal Ivenes—The repressed ideas begin an autonomous existence—This corroborates Freud's disclosures concerning dreams—The relation of the somnambulant ego-complex and the waking consciousness.

COURSE

[83](#)

The progress of this affection reached its maximum in 4-8 weeks—Thenceforth a decline in the plasticity of the phenomena—All degrees of somnambulism were observable—Her manifest character improved—Similar improvements seen in certain cases of double consciousness—Conception that this phenomenon has a teleological meaning for the future personality—As seen in Jeanne d'Arc and Mary Reynolds II.

THE UNCONSCIOUS ADDITIONAL CREATIVE WORK

[84](#)

S. W. shows primary susceptibility of the unconscious—Binet affirms the susceptibility of the hysteric is fifty times greater than that of normal—Cryptomnesia, a second additional creation—Cryptomnesic picture may enter consciousness intra-physically—Unconscious plagiarism explained—Zarathustra example—Glossolalia—Helen Smith's Martian language—The names in Ivenes' mystic system show rudimentary glossolalia—The Cryptomnesic picture may enter consciousness as a hallucination—Or arrive at consciousness by motor automatism—By automatisms regions formerly sealed are made accessible—Hypermnnesia—Thought-reading a prototype for extraordinary intuitive knowledge of somnambulists and some normal persons—Association-concordance—Possibility that concept and feeling are not always clearly separated in the unconscious—S. W.'s mentality must be regarded as extraordinary.

CHAPTER II

THE ASSOCIATION METHOD

[94](#)

LECTURE I.—Formula for test—Disturbances of reaction as complex-indicators—Discovery of a culprit by means of test—Disturbances of reaction show emotional rather than intellectual causes—Principal types—Value of the experiment in dealing with neurotics.

LECTURE II.—FAMILIAR CONSTELLATIONS

[119](#)

Dr. Fürst's researches—Effect of environment and education on reactions—Effect of parental discord on children—Unconscious tendency to repetition of parental mistakes—Case of pathological association-concordance between mother and daughter—Neurosis, a counter-argument against the personality with which the patient is most nearly concerned—How to free the individual from unconscious attachments to the milieu.

LECTURE III.—EXPERIENCES CONCERNING THE PSYCHIC LIFE OF THE CHILD

[132](#)

Importance of emotional processes in children—Little Anna's questions—Arrival of the baby brother—Anna's embarrassment and hostility—Introversion of the child—Of the adolescent—Her pathological interest in the Messina earthquake—The meaning of her fear—Anna's theories of birth—Meaning of her questions—Her father tells her something of origin of her little brother—Her fears now subside—The unconscious meaning of the child's wish to sit up late—Anna's equivalent to the "lumpf-theory" of little Hans—The stork-theory again—Author's remarks on the sexual enlightenment of the child.

CHAPTER III

THE SIGNIFICANCE OF THE FATHER IN THE DESTINY OF THE INDIVIDUAL

[156](#)

Psychosexual relationship of child to father—Fürst's experiments quoted—The association experiment typical for man's psychological life—Adaptation to father—Father-complex productive of neurosis—Father-complex in man with masochistic and homosexual trends—Peasant woman "her father's favourite," tragic effect of the unconscious constellation—Case of eight-year-old boy with enuresis—Enuresis a sexual surrogate—Importance of infantile sexuality in life—Hence necessity for psychoanalytic investigation—The Jewish religion and the father-complex—Parental power guides the child like a higher controlling fate—The conflict for the development of the individual—Father-complex in Book of Tobias.

CHAPTER IV

A CONTRIBUTION TO THE PSYCHOLOGY OF RUMOUR

[176](#)

Investigation of a rumour in a girls' school—The rumour arose from a dream—Teacher's suspicions—Was the rumour an invention and not, as alleged, the recital of a dream?—Interpolations in dreams—Collection of evidence—Duplication of persons an expression of their significance both in dreams and in dementia præcox—The additions and interpolations represent intensive unconscious participation—Hearsay evidence—Remarks.

EPICRISIS

[188](#)

The dream is analysed by rumour—Psychoanalysis explains the construction of rumour—The dream gives the watchword for the unconscious—It brings to expression the ready-prepared sexual complexes—Marie X.'s unsatisfactory conduct brought her under reproof—Her indignation and repressed feelings lead to the dream—She uses this as an instrument of revenge against the teacher—More investigation needed in the field of rumour.

CHAPTER V

ON THE SIGNIFICANCE OF NUMBER-DREAMS

[191](#)

Symbolism of numbers has acquired fresh interest from Freud's investigations—Example of number dream of middle-aged man—How the number originates—A second dream also contains a number—Analysis—The wife's dream "Luke 137"—This dream is an example of cryptomnesia.

CHAPTER VI

Bleuler's concept of ambivalency and ambitendency—Every tendency balanced by its opposite—Schizophrenic negativism—Bleuler's summary of its causes—The painfulness of the complex necessitates a censorship of its expression—Thought disturbance the result of a complex—Thought pressure due to schizophrenic introversion—Resistance springs from peculiar sexual development—Schizophrenia shows a preponderance of introversion mechanisms—The value of the complex theory concept.

CHAPTER VII

Doctors know too little of psychology, and psychologists of medicine—Strong prejudice aroused by Freud's conception of the importance of the sexual moment—The commoner prejudices discussed—Psychoanalysis not a method of suggestion or reasoning—The unconscious content is reached *via* the conscious—Case of neurotic man with ergophobia for professional work—Case of neurotic woman who wants another child—Resistances against the analyst—Dream analysis the efficacious instrument of analysis—The scientist's fear of superstition—The genesis of dreams—Dream material is collected according to scientific method—The rite of baptism analysed—When the unconscious material fails, use the conscious—The physician's own complexes a hindrance—Interpretations of Viennese School too one-sided—Sexual phantasies both realistic and symbolic—The dream the subliminal picture of the individual's present psychology—Symbolism a process of comprehension by analogy—Analysis helps the neurotic to exchange his unconscious conflict for the real conflict of life.

CHAPTER VIII

Difficulties of public discussion—Competence to form an opinion presupposes a knowledge of the fundamental literature—The abandoned trauma theory—Fixation—The importance of the infantile past—Analysis discloses existence of innumerable unconscious phantasies—Oedipus complex—Fixation discussed—The critical moment for the outbreak of the neurosis—Predisposition—Author's energetic view point—Application of the libido to the obstacle—Repression—Neurosis an act of adaptation that has failed—The energetic view does not alter the technique of analysis—Analysis re-establishes the connection between the conscious and unconscious—Is a constructive task of great importance.

CHAPTER IX

ON SOME CRUCIAL POINTS IN PSYCHOANALYSIS [236](#)

LETTER I.—LOY [236](#)

The dream a means of re-establishing the moral equipoise—The dreamer finds therein the material for reconstruction—Methods discussed—The part played by "faith in the doctor"—Abreaction.

LETTER II.—JUNG [238](#)

For the patient any method that works is good, though some more valuable than others—The doctor must choose what commends itself to his scientific conscience—Why the author gave up the use of hypnotism—Three cases quoted—Breuer and Freud's method a great advance in psychic treatment—Evolution of author's views—Importance of conception that behind the neurosis lies a moral conflict—Divergence from Freud's sexual theory of neurosis—The doctor's responsibility for the cleanliness of his own hands—Necessity that the psychoanalyst should be analysed—He is successful in so far as he has succeeded in his own moral development.

LETTER III.—LOY [244](#)

Opportunism *v.* scientific honour—Psychoanalysis no more than hypnotism gets rid of "transference"—Cases of enuresis nocturna, and of washing-mania treated by hypnosis—On what grounds should such useful treatment be dispensed with?—The difficulty of finding a rational solution for the moral conflict—The doctor's dilemma of the two consciences.

LETTER IV.—JUNG [248](#)

Author's standpoint that of the scientist, not practical physician—The analyst works in spite of the transference—Psychoanalysis not the only way—Sometimes less efficacious than any known method—Cases must be selected—For the author and his patients it is the best way—The real solution of the moral conflict comes from within, and then only because the patient has been brought to a new standpoint.

LETTER V.—LOY [252](#)

"What is truth?"—Parable of the prism—All man attains is relative truth—Fanaticism is the enemy to science—Psychoanalysis a method of dealing with basic motives of the human soul—Must not each case be treated individually?—Morals are above all relative.

LETTER VI.—JUNG [256](#)

Definition of psychoanalysis—Technique—So-called chance is the law—Rules well-nigh impossible—The patients' unconscious is the analysts' best confederate—Questions of morality and education find solutions for themselves in later stages of analysis.

LETTER VII.—LOY [258](#)

Contradictions in psychoanalytic literature—Should the doctor canalise the patient's libido?—Does he not indirectly suggest dreams to patient?

LETTER VIII.—JUNG

[261](#)

Different view-points in psychoanalysis—*Vide* Freud's causality and Adler's finality—Discussion of meaning of transference—The meaning of "line of least resistance"—Man as a herd-animal—Rich endowment with social sense—Should take pleasure in life—Error as necessary to progress as truth—Patient must be trained in independence—Analyst is caught in his own net if he makes hard-and-fast rules—Through the analyst's suggestion only the outer form, never the content, is determined—The patient may mislead the doctor, but this is disadvantageous and delays him.

LETTER IX.—LOÿ

[267](#)

The line of least resistance is a compromise with all necessities—The analyst as accoucheur—The neurotic's faith in authority—Altruism innate in man—He advances in response to his own law.

LETTER X.—JUNG

[270](#)

Transference is the central problem of analysis—It may be positive or negative—Projection of infantile phantasies on the doctor—Biological "duties"—The psyche does not only react, but gives its individual reply—We have an actual sexual problem to-day—Evidences thereof—We have no real sexual morality, only a legal attitude—Our moral views are too undifferentiated—The neurotic is ill not because he has lost his faith in morality, but because he has not found the new authority in himself.

CHAPTER X

ON THE IMPORTANCE OF THE UNCONSCIOUS IN PSYCHOPATHOLOGY

[278](#)

Content of the unconscious—Defined as sum of all psychical processes below the threshold of consciousness—Answer to question how does the unconscious behave in neurosis found in its effect on normal consciousness—Example of a merchant—Compensating function of the unconscious—Symptomatic acts—Nebuchadnezzar's dream discussed—Intuitive ideas, and insane manifestations both emanate from the unconscious—Eccentricities pre-exist a breakdown—In mental disorder unconscious processes break-through into consciousness and disturb equilibrium—True also in fanaticism—Pathological compensation in case of paranoia—Unconscious processes have to struggle against resistances in the conscious mind—Distortion—In morbid conditions the function of the unconscious is one of compensation.

CHAPTER XI

Striking contrast between hysteria and dementia præcox—Extroversion and Introversion—Repression—Hysterical transference and repression the mechanism of extroversion—Depreciation of the external world the mechanism of introversion—The nervous temperament pre-exists the illness—Examples of the two types from literature—James's Tough and Tender-minded—Warringer's Sympathy and Abstraction—Schiller's Naïf and Sentimental—Nietzsche's Apollinian and Dionysian—Gross's Weakness and Reinforcement of Consecutive Function—Freud and Adler's Causalism and Finality—The fundamental need for further study of the two types.

CHAPTER XII

Psychic structure of dream contrasted with that of conscious thought—Why a dream seems meaningless—Freud's empirical evidence—Technique, analysis of a dream—The causal and teleological view of the dream—A typical dream with mythological content—Compensating function of dreams—Phallic symbols.

CHAPTER XIII

Discussion of psychological *v.* physical origin of mental disease—Mediæval conception of madness as work of evil spirits—Development of materialistic idea that diseases of the mind are diseases of the brain—Psychiatrists have come to regard function as accessory to the organ—Analysis of patients entering Burgholzi Asylum—A quarter only show lesions of the brain—The psychiatry of the future must advance by way of psychology—Cases of dementia præcox illustrating recent methods in psychiatry—The development of the outbreak at a moment of great emotion—Delusions determined by deficiencies in the patient's personality—Difficulties of investigation—Temporary remission of mental symptoms proves that reason survives in spite of preoccupation with diseased thoughts—Case of dementia præcox, showing exceeding richness of phantasy formations, and the continuity of ideas.

Freud's case of paranoid dementia—(Schreber case)—Two ways of regarding Goethe's "Faust"—Retrospective and prospective understanding—The scientific mind thinks causally—This is but one half of comprehension—Pathological and mythological formations, both structures of the imagination—Flournoy's case—Misunderstanding of author's analysis of it—Adaptations only possible to the introverted type by means of a world-philosophy—The extroverted type always arrives at a general theory subsequently—Psychasthenia is the neurosis of introversion, hysteria of extroversion—These diseases typify the general attitude

of the types to the phenomena of the external world—The extreme difference in type a great obstacle to common understanding—The general result of the constructive method is a subjective view, not a scientific theory.

CHAPTER XIV

FOREWORD TO NEW EDITION

[352](#)

Adler's views more fully discussed—The psychological events of the war force the problems of the unconscious on society—The psychology of individuals corresponds to the psychology of nations.

THE PSYCHOLOGY OF THE UNCONSCIOUS PROCESSES

[354](#)

I. THE BEGINNING OF PSYCHOANALYSIS

The evolution of psychology—How little it has had to offer to the psychiatrist till Freud's discoveries—The origin and reception of psychoanalysis—The prejudiced attitude of certain physicians—Freud's view that his best work arouses greatest resistances—The Nancy School—Breuer's first case—"The talking cure"—The English "shock theory"—Followed by the trauma theory—Discussion of predisposition—Author's case of hysteria following fright from horses—The pathogenic importance of the hidden erotic conflict.

II. THE SEXUAL THEORY

[367](#)

Humanity evolves its own restrictions on sexuality for the sake of the advance of civilisation—The presence of a grave sexual problem testifies to the need of more differentiated conceptions—The erotic conflict largely unconscious—Neurosis represents the unsuccessful attempt of the individual to solve the problem in his own case—To understand the idea of the dream as a wish-fulfilment the manifest and latent content must be taken in review—The nature of unconscious wishes—Dream analysis leads to the deepest recesses of the unconscious—The analyst compared to the accoucheur—The highest development of the individual is sometimes in complete conflict with the herd-morality—Psychoanalysis provides the patient with a philosophy of life founded upon insight—Man has within himself the essence of morals—Both the moral and immoral man must accept the corrective of the unconscious—Our sexual morality too undifferentiated—Freud's sexual theory right to a point but too one-sided.

III. THE OTHER VIEWPOINT: THE WILL TO POWER

[381](#)

The superman—Nietzsche's failure to justify his theories by his life—His view also too one-sided—Adler's theory of neurosis founded upon the principle of power—Case of hysteria discussed from the standpoint of unconscious motivation.

IV. THE TWO TYPES OF PSYCHOLOGY

[391](#)

Thinking the natural adaptive function for introvert, feeling for the extrovert—The sexual theory promulgated from the standpoint of feeling, the power theory from that of thought—Criticism of both theories indispensable—Symptoms of neurosis are aims at a new synthesis of life—Definition of positive value as energy in a useful form—In neurosis energy is located in an inferior form—Sublimation a transference of sexual energy to another sphere—Destiny often frustrates purely rational sublimations—Rationalism, the world-war an example of its breakdown—So-called "disposable energy"—Case of American business-man—The types have different problems—The feelings of the introvert relatively conventional and undifferentiated—The thinking of the extrovert colourless and dry—The types apt to marry, but not to understand one another—The theories of the types led to a new theory of psychogenic disturbances—Neurosis postulates the existence of an unconscious conflict—New theory declares it to lie between the natural conscious function and the repressed undifferentiated co-function—Repressed feelings of introvert projected as vague physical symptoms—Repressed thought of extrovert projected as hysterical symptoms—In analysis the libido liberated from the unconscious phantasies is projected on to the physician—It finds its way into the transference, which in turn is dissolved—The new channel for the libido is already found.

V. THE PERSONAL AND THE IMPERSONAL UNCONSCIOUS

[408](#)

Transference a projection of unconscious contents on to the physician—Contents of the unconscious at first personal, later impersonal—Primordial images—A differentiation of the unconscious contents necessary—The deepest layers are now designated impersonal, absolute, collective, or super-personal—The libido now liberated in analysis sinks down into the unconscious, reviving original "thought-feelings"—Example in Mayer's idea of conservation of energy—The world-wide existence of the primordial images—The concept of God—Enantiodromia, the world-war an example of this—In analysis the pairs of opposites are torn asunder—This necessitates that patients learn to differentiate between the ego and non-ego.

VI. THE SYNTHETIC OR CONSTRUCTIVE METHOD

[417](#)

The transcendental function, a new way of regarding the psychological materials as a bridge between the two sides of the psyche—Example of method of synthesis of symbols of absolute unconscious—Dream of the crab.

VII. ANALYTICAL (CAUSAL-REDUCTIVE) INTERPRETATION

[419](#)

The unconscious homosexual tendencies—The causal-reductive method does not strictly follow the patient's own associations—It does not interpret the dream as subjective phenomenon—Interpretation on both objective and subjective planes necessary.

VIII. THE SYNTHETIC (CONSTRUCTIVE) INTERPRETATION

[422](#)

Homosexuality in this case an unconscious defence against acceptance of "more dangerous" tendencies—Fascination an unconscious compulsion—"Identifications" have power so long as they remain unconscious—Union of subjective and objective view of dream gives its full meaning.

IX. THE DOMINANTS OF THE SUPER-PERSONAL UNCONSCIOUS

[426](#)

Projection in relation to transference—Projection of certain attributes not explicable on the ground of personal contents, but must be referred to the super-personal—Collective unconscious is sediment of all the experience of the universe throughout time—Certain features that have become prominent, *e.g.* gods and demons, are called "dominants" and have a character of universal psychological truth—These dominants become conscious as projections, explaining infatuations, incompatibilities, unconscious conflicts, etc.—The "magical demon" is the most primitive concept of God—Analysis traces home these projections to the non-ego—Fear belongs to the dominants of the collective unconscious—The next step is the detachment of these projections from the objects of consciousness—This liberates energy for further progress—The transcendental function—The hero-myth symbolises this differentiation of ego from non-ego.

X. THE DEVELOPMENT OF THE TYPES OF INTROVERSION AND EXTROVERSION

[437](#)

The types apprehend life by opposite methods—All psychic images have two sides, one directed towards the object, the other towards the soul (idea)—The feelings of the introvert are under repression, the thoughts of the extrovert—Analytical development of the unconscious brings out the secondary function in each type—The pairs of opposites being thus demonstrated need for synthesis arises—This is a compensatory process leading to enrichment of the individual.

XI. GENERAL REMARKS ON THE THERAPY

[441](#)

The unconscious is a source of danger when the individual is not at one with it—It also creates harmonious prospective combinations which can be an effective source of wisdom for the individual—The use of the phantasies in conjunction with conscious elaboration is the transcendental function—Not every individual passes through all the stages described—For some the end of analysis is reached when the cure is achieved—Others are under a moral necessity to reach a full psychological development.

CONCLUSION

[443](#)

CHAPTER XV

THE CONCEPT OF THE UNCONSCIOUS

[445](#)

I. THE DISTINCTION BETWEEN THE PERSONAL AND IMPERSONAL UNCONSCIOUS.

Development of concepts—Removal of repression does not empty the unconscious—Repression is a special phenomenon—The unconscious contains not only repressed material, but subliminal sense-impressions which have never reached consciousness—It is constantly busied with new phantasy formation—Patients are urged to retain their hold on repressed materials that analysis has brought into consciousness—Prolonged analysis reveals contents other than those of a personal nature—Necessity to differentiate a layer called the "personal" unconscious whose materials originate in the personal past—Their omission from

consciousness constitutes a defect or neglect—The moral reaction against this neglect shows they could become conscious if sufficient trouble were taken—The gradual transference of the personal unconscious contents into consciousness extends the periphery of consciousness.

II. THE CONSEQUENCES OF ASSIMILATION OF THE UNCONSCIOUS

[449](#)

First result is increased self-consciousness—May lead to a sense of God-Almightiness in one type, or to overwhelming self-depreciation in the other—A result of ascribing to oneself qualities or vices that do not belong individually but collectively—The collective psyche divided into collective mind and collective soul—The collective contains the "parties inférieures" of Janet; the conscious and personal unconscious contains the "parties supérieures"—Incorporation of the impersonal unconscious leads to a dissolution of the pairs of opposites—As seen in neurotic, who combines megalomania and sense of inferiority in extreme degree—Primitive man possesses the collective vices and virtues in an undifferentiated way—Mental conflict only begins with conscious personal development—Desire to be good brings about repression of the bad—Collective view-point, though necessary, is dangerous to individuality—Collective psyche is the result of psychological differentiation of the gregarious instincts—Dangers of identification with collective psyche—Recognition of the different psychology of the types a safeguard, promoting a proper respect for individuality of the opposite type—Individuation hampered by man's suggestibility and tendency to imitation.

III. THE INDIVIDUAL AS AN EXCERPT OF THE COLLECTIVE PSYCHE

[456](#)

The personal unconscious contains repressed materials capable of becoming conscious—By also incorporating the impersonal contents the state of God-Almightiness is brought about—The "persona" a mask for the collective psyche—Development of God-Almightiness, physical concomitants—Dissolution of the persona results in release of phantasy—Analogy with mental derangement—Difference consists in that the unconscious is at first deliberately brought into consciousness by consent, and later that it is recognised as having psychic validity only.

IV. ENDEAVOURS TO FREE THE INDIVIDUALITY FROM THE COLLECTIVE PSYCHE

[459](#)

(i) *The Regressive Restoration of the Persona*—Three ways open, (a) Regressive application of a reductive theory; (b) application of God-Almightiness as a "virile protest;" (c) recognition of the primitive archaic collective psychology in man—Temptation to solve the difficulty by forgetting one has an unconscious—This does not work—The unconscious cannot be deprived of libido, nor its activity stilled for any length of time.

(ii) *Identification with the Collective Psyche*—God-Almightiness developed into a system—Identification increases feeling for life or sense of power, according to the type—This, mystically understood, is the "yearning for the mother" of the hero-myth, or the "incest-wish" of Freud—It is the collective psyche that has to be overcome—Identification with the collective psyche is a failure because being lost in it, a bearable or satisfactory life is impossible.

V. LEADING PRINCIPLES FOR THE TREATMENT OF COLLECTIVE PSYCHE

[468](#)

Neither regressive restoration of the persona, nor identification with collective psyche solves the problem—Psychology will have to admit a plurality of principles—Only the collective part of individual psychology can be the subject of scientific study—What belongs to the psychology of the individual requires its own text-book—The persona must be strictly separated from the concept of the individual—What is individual is the remnant which can never be merged into the collective—Analysis of the persona transfers greater value on to the individuality, increasing its conflict with collectivity—The persona is identical with a one-sided attitude, being a typical attitude in which thought or feeling or intuition dominates, causing relative repression of the other functions—Dissolution of persona indispensable to individuation—The more individual a person is the more he assimilates and develops those attributes that are the basis of a collective concept of human nature—Unifying function between the conscious and unconscious, between the collective and individual is found in the phantasies—Phantasy the creative soil for everything that has brought development to humanity—Phantasy not to be taken literally but hermeneutically—Hermeneutics adds analogies to those already given—Hermeneutical interpretation indicates the means of synthesis of the individual, provided as soon as the symbolic outlines of the path are understood they are followed up—Co-operation and honest endeavour essential to cure—The moral factor determines the cure—"Life-lines" have a short and ephemeral value—Dreams are compensatory to conscious thinking—Watch must be kept for dreams indicative of causes of error—Hence the patient must remain in contact with the unconscious—End of analysis reached when enough psychological insight and mastery of technique is acquired to enable individual to follow his ever-changing life-line, and to retain hold on the libido currents which give conscious support to his individuality.

ANALYTICAL PSYCHOLOGY

CHAPTER I

ON THE PSYCHOLOGY AND PATHOLOGY OF SO-CALLED OCCULT PHENOMENA^[1]

In that wide field of psychopathic deficiency where Science has demarcated the diseases of epilepsy, hysteria and neurasthenia, we meet scattered observations concerning certain rare states of consciousness as to whose meaning authors are not yet agreed. These observations spring up sporadically in the literature on narcolepsy, lethargy, *automatisme ambulatoire*, periodic amnesia, double consciousness, somnambulism, pathological dreamy states, pathological lying, etc.

These states are sometimes attributed to epilepsy, sometimes to hysteria, sometimes to exhaustion of the nervous system, or neurasthenia, sometimes they are allowed all the dignity of a disease *sui generis*. Patients occasionally work through a whole graduated scale of diagnoses, from epilepsy, through hysteria, up to simulation. In practice, on the one hand, these conditions can only be separated with great difficulty from the so-called neuroses, sometimes even are indistinguishable from them; on the other, certain features in the region of pathological deficiency present more than a mere analogical relationship not only with phenomena of normal psychology, but also with the psychology of the supernormal, of genius. Various as are the individual phenomena in this region, there is certainly no case that cannot be connected by some intermediate example with the other typical cases. This relationship in the pictures presented by hysteria and epilepsy is very close. Recently the view has even been maintained that there is no clean-cut frontier between epilepsy and hysteria, and that a difference is only to be noted in extreme cases. Steffens says, for example^[2] —"We are forced to the conclusion that in essence hysteria and epilepsy are not fundamentally different, that the cause of the disease is the same, but is manifest in a diverse form, in different intensity and permanence."

The demarcation of hysteria and certain borderline cases of epilepsy from congenital and acquired psychopathic mental deficiency likewise presents the greatest difficulties. The symptoms of one or other disease everywhere invade the neighbouring realm, so violence is done to the facts when they are split off and considered as belonging to one or other realm. The demarcation of psychopathic mental deficiency from the normal is an absolutely impossible task, the difference is everywhere only "more or less." The classification in the region of mental deficiency itself is confronted by the same difficulty. At best, certain classes can be separated off which crystallise round some well-marked nucleus through having peculiarly typical features. Turning away from the two large groups of intellectual and emotional deficiency, there remain those deficiencies coloured pre-eminently by hysteria or epilepsy (epileptoid) or neurasthenia, which are not notably deficiency of the intellect or of feeling. It is essentially in this region, insusceptible of any absolute classification, that the above-named conditions play their part. As is well known, they can appear as part manifestations of a typical epilepsy or hysteria, or can exist separately in the realm of psychopathic mental deficiency, where their qualifications of epileptic or hysterical are often due to the non-essential accessory features. It is thus the rule to place somnambulism among hysterical diseases, because it is occasionally a phenomenon of severe hysteria, or because mild so-called hysterical symptoms may accompany it. Binet says: "Il n'y a pas une somnambulisme, état nerveux toujours identique à lui-même, il y a des somnambulismes." As one of the manifestations of a severe hysteria, somnambulism is not an unknown phenomenon, but as a pathological entity, as a disease *sui generis*, it must be somewhat rare, to judge by its infrequency in German literature on the subject. So-called spontaneous somnambulism, resting upon a foundation of hysterically-tinged psychopathic deficiency, is not a very common occurrence and it is worth while to devote closer study to these cases, for they occasionally present a mass of interesting particulars.

Case of Miss Elise K., aged 40, single; book-keeper in a large business; no hereditary taint, except that it is alleged a brother became slightly nervous after family misfortune and illness. Well educated, of a cheerful, joyous nature, not of a saving disposition, always occupied with some big idea. She was very kind-hearted and gentle, did a great deal both for her parents, who were living in very modest circumstances, and for strangers. Nevertheless

she was not happy, because she thought she did not understand herself. She had always enjoyed good health till a few years ago, when she is said to have been treated for dilatation of the stomach and tapeworm. During this illness her hair became rapidly white, later she had typhoid fever. An engagement was terminated by the death of her fiancé from paralysis. She had been very nervous for a year and a half. In the summer of 1897 she went away for change of air and treatment by hydropathy. She herself says that for about a year she has had moments during work when her thoughts seem to stand still, but she does not fall asleep. Nevertheless she makes no mistakes in the accounts at such times. She has often been to the wrong street and then suddenly noticed that she was not in the right place. She has had no giddiness or attacks of fainting. Formerly menstruation occurred regularly every four weeks, and without any pain, but since she has been nervous and overworked it has come every fourteen days. For a long time she has suffered from constant headache. As accountant and book-keeper in a large establishment, the patient has had very strenuous work, which she performs well and conscientiously. In addition to the strenuous character of her work, in the last year she had various new worries. Her brother was suddenly divorced. In addition to her own work, she looked after his housekeeping, nursed him and his child in a serious illness, and so on. To recuperate, she took a journey on the 13th September to see a woman friend in South Germany. The great joy at seeing her friend from whom she had been long separated, and her participation in some festivities, deprived her of her rest. On the 15th, she and her friend drank half a bottle of claret. This was contrary to her usual habit. They then went for a walk in a cemetery, where she began to tear up flowers and to scratch at the graves. She remembered absolutely nothing of this afterwards. On the 16th she remained with her friend without anything of importance happening. On the 17th her friend brought her to Zürich. An acquaintance came with her to the Asylum; on the way she spoke quite sensibly, but was very tired. Outside the Asylum they met three boys, whom she described as the "three dead people she had dug up." She then wanted to go to the neighbouring cemetery, but was persuaded to come to the Asylum.

She is small, delicately formed, slightly anæmic. The heart is slightly enlarged to the left, there are no murmurs, but some reduplication of the sounds, the mitral being markedly accentuated. The liver dulness reaches to the border of the ribs. Patella-reflex is somewhat increased, but otherwise

no tendon-reflexes. There is neither anæsthesia, analgesia, nor paralysis. Rough examination of the field of vision with the hands shows no contraction. The patient's hair is a very light yellow-white colour; on the whole she looks her age. She gives her history and tells recent events quite clearly, but has no recollection of what took place in the cemetery at C. or outside the Asylum. During the night of the 17th-18th she spoke to the attendant and declared she saw the whole room full of dead people—looking like skeletons. She was not at all frightened, but was rather surprised that the attendant did not see them too. Once she ran to the window, but was otherwise quiet. The next morning, while still in bed, she saw skeletons, but not in the afternoon. The following night at four o'clock she awoke and heard the dead children in the neighbouring cemetery cry out that they had been buried alive. She wanted to go out to dig them up, but allowed herself to be restrained. Next morning at seven o'clock she was still delirious, but recalled accurately the events in the cemetery at C. and those on approaching the Asylum. She stated that at C. she wanted to dig up the dead children who were calling her. She had only torn up the flowers to free the graves and to be able to get at them. In this state Professor Bleuler explained to her that later on, when in a normal state again, she would remember everything. The patient slept in the morning, afterwards was quite clear, and felt herself relatively well. She did indeed remember the attacks, but maintained a remarkable indifference towards them. The following nights, with the exception of those of the 22nd and the 25th September, she again had slight attacks of delirium, when once more she had to deal with the dead. The details of the attacks differed, however. Twice she saw the dead in her bed, but she did not appear to be afraid of them, she got out of bed frequently, however, because she did not want "to inconvenience the dead"; several times she wanted to leave the room.

After a few nights free from attacks there was a slight one on the 30th Sept., when she called the dead from the window. During the day her mind was clear. On the 3rd of October she saw a whole crowd of skeletons in the drawingroom, as she afterwards related, during full consciousness. Although she doubted the reality of the skeletons, she could not convince herself that it was a hallucination. The following night, between twelve and one o'clock—the earlier attacks were usually about this time—she was obsessed with the idea of dead people for about ten minutes. She sat up in bed, stared at a corner and said: "Well, come!—but they're not all there.

Come along! Why don't you come? The room is big enough, there's room for all; when all are there, I'll come too." Then she lay down with the words: "Now they're all there," and fell asleep again. In the morning she had not the slightest recollection of any of these attacks. Very short attacks occurred in the nights of the 4th, 6th, 9th, 13th and 15th of October, between twelve and one o'clock. The last three occurred during the menstrual period. The attendant spoke to her several times, showed her the lighted street-lamps, and trees; but she did not react to this conversation. Since then the attacks have altogether ceased. The patient has complained about a number of troubles which she had had all along. She suffered much from headache the morning after the attacks. She said it was unbearable. Five grains of Sacch. lactis promptly alleviated this; then she complained of pains in both fore-arms, which she described as if it were a teno-synovitis. She regarded the bulging of the muscles in flexion as a swelling, and asked to be massaged. Nothing could be seen objectively, and no attention being paid to it, the trouble disappeared. She complained exceedingly and for a long time about the thickening of a toenail, even after the thickened part had been removed. Sleep was often disturbed. She would not give her consent to be hypnotised for the night-attacks. Finally on account of headache and disturbed sleep she agreed to hypnotic treatment. She proved a good subject, and at the first sitting fell into deep sleep with analgesia and amnesia.

In November she was again asked whether she could now remember the attack on the 19th September which it had been suggested that she would recall. It gave her great trouble to recollect it, and in the end she could only state the chief facts, she had forgotten the details.

It should be added that the patient was not superstitious, and in her healthy days had never particularly interested herself in the supernatural. During the whole course of treatment, which ended on the 14th November, great indifference was evinced both to the illness and the cure. Next spring the patient returned for out-patient treatment of the headache, which had come back during the very hard work of these months. Apart from this symptom her condition left nothing to be desired. It was demonstrated that she had no remembrance of the attacks of the previous autumn, not even of those of the 19th September and earlier. On the other hand, in hypnosis she could

recount the proceedings in the cemetery and during the nightly disturbances.

By the peculiar hallucination and by its appearance our case recalls the conditions which V. Kraft-Ebing has described as "protracted states of hysterical delirium." He says: "Such conditions of delirium occur in the slighter cases of hysteria. Protracted hysterical delirium is built upon a foundation of temporary exhaustion. Excitement seems to determine an outbreak, and it readily recurs. Most frequently there is persecution-delirium with very violent anxiety, sometimes of a religious or erotic character. Hallucinations of all the senses are not rare, but illusions of sight, smell and feeling are the commonest, and most important. The visual hallucinations are especially visions of animals, pictures of corpses, phantastic processions in which dead persons, devils and ghosts swarm. The illusions of hearing are simply sounds (shrieks, howlings, claps of thunder) or local hallucinations, frequently with a sexual content."

This patient's visions of corpses, occurring almost always in attacks, recall the states occasionally seen in hystero-epilepsy. There likewise occur specific visions which, in contrast with protracted delirium, are connected with single attacks.

(1) A lady 30 years of age with *grande hystérie* had twilight states in which as a rule she was troubled by terrible hallucinations; she saw her children carried away from her, wild beasts eating them up, and so on. She has amnesia for the content of the individual attacks.^[3]

(2) A girl of 17, likewise a semi-hysteric, saw in her attacks the corpse of her dead mother approaching her to draw her to her. Patient has amnesia for the attacks.^[4]

These are cases of severe hysteria wherein consciousness rests upon a profound stage of dreaming. The nature of the attack and the stability of the hallucination alone show a certain kinship with our case, which in this respect has numerous analogies with the corresponding states of hysteria. For instance, with those cases where a psychical shock (rape, etc.) was the occasion for the outbreak of hysterical attacks, and where at times the original incident is lived over again, stereotyped in the hallucination. But our case gets its specific mould from the identity of the consciousness in the

different attacks. It is an "Etat Second" with its own memory and separated from the waking state by complete amnesia. This differentiates it from the above-mentioned twilight states and links it to the so-called somnambolic conditions.

Charcot^[5] divides the somnambolic states into two chief classes:—

1. Delirium with well-marked incoordination of representation and action.
2. Delirium with co-ordinated action. This approaches the waking state.

Our case belongs to the latter class.

If by somnambulism be understood a state of systematised partial waking,^[6] any critical review of this affection must take account of those exceptional cases of recurrent amnesias which have been observed now and again. These, apart from nocturnal ambulism, are the simplest conditions of systematised partial waking. Naef's case is certainly the most remarkable in the literature. It deals with a gentleman of 32, with a very bad family history presenting numerous signs of degeneration, partly functional, partly organic. In consequence of over-work at the age of 17 he had a peculiar twilight state with delusions, which lasted some days and was cured with a sudden recovery of memory. Later he was subject to frequent attacks of giddiness and palpitation of the heart and vomiting; but these attacks were never attended by loss of consciousness. At the termination of some feverish illness he suddenly travelled from Australia to Zürich, where he lived for some weeks in careless cheerfulness, and only came to himself when he read in the paper of his sudden disappearance from Australia. He had a total and retrograde amnesia for the several months which included the journey to Australia, his sojourn there and the return journey.

Azam^[7] has published a case of periodic amnesia. Albert X., 12-1/2 years old, of hysterical disposition, was several times attacked in the course of a few years by conditions of amnesia in which he forgot reading, writing and arithmetic, even at times his own language, for several weeks at a stretch. The intervals were normal.

Proust^[8] has published a case of *Automatisme ambulatoire* with pronounced hysteria which differs from Naef's in the repeated occurrence of the attacks. An educated man, 30 years old, exhibits all the signs of *grande hystérie*; he

is very suggestible, has from time to time, under the influence of excitement, attacks of amnesia which last from two days to several weeks. During these states he wanders about, visits relatives, destroys various objects, incurs debts, and has even been convicted of "picking pockets."

Boileau describes a similar case^[9] of wandering-impulse. A widow of 22, highly hysterical, became terrified at the prospect of a necessary operation for salpingitis; she left the hospital and fell into a state of somnambulism, from which she awoke three days later with total amnesia. During these three days she had travelled a distance of about 60 kilometres to fetch her child.

William James has described a case of an "ambulatory sort."^[10]

The Rev. Ansel Bourne, an itinerant preacher, 30 years of age, psychopathic, had on a few occasions attacks of loss of consciousness lasting one hour. One day (January 17, 1887) he suddenly disappeared from Greene, after having taken 551 dollars out of the bank. He remained hidden for two months. During this time he had taken a little shop under the name of H. J. Browne in Norriston, Pa., and had carefully attended to all purchases, although he had never done this sort of work before. On March 14, 1887, he suddenly awoke and went back home, and had complete amnesia for the interval.

Mesnet^[11] publishes the following case:—

F., 27 years old, sergeant in the African regiment, was wounded in the parietal bone at Bazeilles. Suffered for a year from hemiplegia, which disappeared when the wound healed. During the course of his illness the patient had attacks of somnambulism, with marked limitation of consciousness; all the senses were paralysed, with the exception of taste and a small portion of the visual sense. The movements were co-ordinated, but obstacles in the way of their performance were overcome with difficulty. During the attacks he had an absurd collecting-mania. By various manipulations one could demonstrate a hallucinatory content in his consciousness; for instance, when a stick was put in his hand he would feel himself transported to a battle scene, would place himself on guard, see the enemy approaching, etc.

Guinon and Sophie Waltke^[12] made the following experiments on hysterics:

—

A blue glass was held in front of the eyes of a female patient during a hysterical attack; she regularly saw the picture of her mother in the blue sky. A red glass showed her a bleeding wound, a yellow one an orange-seller or a lady with a yellow dress.

Mesnet's case reminds one of the cases of occasional attacks of shrinkage of memory.

MacNish^[13] communicates a similar case.

An apparently healthy young lady suddenly fell into an abnormally long and deep sleep—it is said without prodromal symptoms. On awaking she had forgotten the words for and the knowledge of the simplest things. She had again to learn to read, write, and count; her progress was rapid in this re-learning. After a second attack she again woke in her normal state, but without recollection of the period when she had forgotten things. These states alternated for more than four years, during which consciousness showed continuity within the two states, but was separated by an amnesia from the consciousness of the normal state.

These selected cases of various forms of changes of consciousness all throw a certain light upon our case. Naef's case presents two hysteriform eclipses of memory, one of which is marked by the appearance of delusions, and the other by its long duration, contraction of the field of consciousness, and desire to wander. The peculiar associated impulses are specially clear in the cases of Proust and Mesnet. In our case the impulsive tearing up of the flowers, the digging up of the graves, form a parallel. The continuity of consciousness which the patient presents in the individual attacks recalls the behaviour of the consciousness in MacNish's case; hence our case may be regarded as a transient phenomenon of alternating consciousness. The dreamlike hallucinatory content of the limited consciousness in our case does not, however, justify an unqualified assignment to this group of *double consciousness*. The hallucinations in the second state show a certain creativeness which seems to be conditioned by the auto-suggestibility of this state. In Mesnet's case we noticed the appearance of hallucinatory processes from simple stimulation of touch. The patient's subconsciousness

employs simple perceptions for the automatic construction of complicated scenes which then take possession of the limited consciousness. A somewhat similar view must be taken about our patient's hallucinations; at least, the external conditions which gave rise to the appearance of the hallucinations seem to strengthen our supposition. The walk in the cemetery induces the vision of the skeletons; the meeting with the three boys arouses the hallucination of children buried alive whose voices the patient hears at night-time. She arrived at the cemetery in a somnambulant state, which on this occasion was specially intense in consequence of her having taken alcohol. She performed actions almost instinctively about which her subconsciousness nevertheless did receive certain impressions. (The part played here by alcohol must not be underestimated. We know from experience that it does not only act adversely upon these conditions, but, like every other narcotic, it gives rise to a certain increase of suggestibility.) The impressions received in somnambulism subconsciously form independent growths, and finally reach perception as hallucinations. Thus our case closely corresponds to those somnambulant dream-states which have recently been subjected to a penetrating study in England and France.

These lapses of memory, which at first seem without content, gain a content by means of accidental auto-suggestion, and this content builds itself up automatically to a certain extent. It achieves no further development, probably on account of the improvement now beginning, and finally it disappears altogether as recovery sets in. Binet and Féré have made numerous experiments on the implanting of suggestions in states of partial sleep. They have shown, for example, that when a pencil is put in the anæsthetic hand of a hysteric, letters of great length are written automatically whose contents are unknown to the patient's consciousness. Cutaneous stimuli in anæsthetic regions are sometimes perceived as visual images, or at least as vivid associated visual presentations. These independent transmutations of simple stimuli must be regarded as primary phenomena in the formation of somnambulant dream-pictures. Analogous manifestations occur in exceptional cases within the sphere of waking consciousness. Goethe,^[14] for instance, states that when he sat down, lowered his head and vividly conjured up the image of a flower, he saw it undergoing changes of its own accord, as if entering into new combinations.

In half-waking states these manifestations are relatively frequent in the so-called hypnagogic hallucinations. The automatism which the Goethe example illustrates are differentiated from the truly somnambulant, inasmuch as the primary presentation is a conscious one in this case; the further development of the automatism is maintained within the definite limits of the original presentation, that is, within the purely motor or visual region.

If the primary presentation disappears, or if it is never conscious at all, and if the automatic development overlaps neighbouring regions, we lose every possibility of a demarcation between waking automatism and those of the somnambulant state; this will occur, for instance, if the presentation of a hand plucking the flower gets joined to the perception of the flower or the presentation of the smell of the flower. We can then only differentiate it by the more or less. In one case we then speak of the "waking hallucinations of the normal," in the other, of the dream-vision of the somnambulists. The interpretation of our patient's attacks as hysterical becomes more certain by the demonstration of a probably psychogenic origin of the hallucination. This is confirmed by her troubles, headache and teno-synovitis, which have shown themselves amenable to suggestive treatment. The ætiological factor alone is not sufficient for the diagnosis of hysteria; it might really be expected *a priori* that in the course of a disease which is so suitably treated by rest, as in the treatment of an exhaustion-state, features would be observed here and there which could be interpreted as manifestations of exhaustion. The question arises whether the early lapses and later somnambulant attacks could not be conceived as states of exhaustion, so-called "neurasthenic crises." We know that in the realm of psychopathic mental deficiency there can arise the most diverse epileptoid accidents, whose classification under epilepsy or hysteria is at least doubtful. To quote C. Westphal: "On the basis of numerous observations, I maintain that the so-called epileptoid attacks form one of the most universal and commonest symptoms in the group of diseases which we reckon among the mental diseases and neuropathies; the mere appearance of one or more epileptic or epileptoid attacks is not decisive for its course and prognosis. As mentioned, I have used the concept of epileptoid in the widest sense for the attack itself."^[15]

The epileptoid moments of our case are not far to seek; the objection can, however, be raised that the colouring of the whole picture is hysterical in

the extreme. Against this, however, it must be stated that every somnambulism is not *eo ipso* hysterical. Occasionally states occur in typical epilepsy which to experts seem parallel with somnambulant states,^[16] or which can only be distinguished by the existence of genuine convulsions.^[17]

As Diehl shows,^[18] in neurasthenic mental deficiency crises also occur which often confuse the diagnosis. A definite presentation-content can even create a stereotyped repetition in the individual crisis. Lately Mörchen has published a case of epileptoid neurasthenic twilight state.^[19]

I am indebted to Professor Bleuler for the report of the following case:—

An educated gentleman of middle age—without epileptic antecedents—had exhausted himself by many years of over-strenuous mental work. Without other prodromal symptoms (such as depression, etc.) he attempted suicide during a holiday; in a peculiar twilight state he suddenly threw himself into the water from a bank, in sight of many persons. He was at once pulled out and retained but a fleeting remembrance of the occurrence.

Bearing these observations in mind, neurasthenia must be allowed to account for a considerable share in the attacks of our patient, Miss E. K. The headaches and the teno-synovitis point to the existence of a relatively mild hysteria, generally latent, but becoming manifest under the influence of exhaustion. The genesis of this peculiar illness explains the relationship which has been described between epilepsy, hysteria and neurasthenia.

Summary.—Miss Elise K. is a psychopathic defective with a tendency to hysteria. Under the influence of nervous exhaustion she suffers from attacks of epileptoid giddiness whose interpretation is uncertain at first sight. Under the influence of an unusually large dose of alcohol the attacks develop into definite somnambulism with hallucinations, which are limited in the same way as dreams to accidental external perceptions. When the nervous exhaustion is cured the hysterical manifestations disappear.

In the region of psychopathic deficiency with hysterical colouring, we encounter numerous phenomena which show, as in this case, symptoms of diverse defined diseases, which cannot be attributed with certainty to any one of them. These phenomena are partially recognised to be independent; for instance, pathological lying, pathological reveries, etc. Many of these

states, however, still await thorough scientific investigation; at present they belong more or less to the domain of scientific gossip. Persons with habitual hallucinations, and also the inspired, exhibit these states; they draw the attention of the crowd to themselves, now as poet or artist, now as saviour, prophet or founder of a new sect.

The genesis of the peculiar frame of mind of these persons is for the most part lost in obscurity, for it is only very rarely that one of these remarkable personalities can be subjected to exact observation. In view of the often great historical importance of these persons, it is much to be wished that we had some scientific material which would enable us to gain a closer insight into the psychological development of their peculiarities. Apart from the now practically useless productions of the pneumatological school at the beginning of the nineteenth century, German scientific literature is very poor in this respect; indeed, there seems to be real aversion from investigation in this field. For the facts so far gathered we are indebted almost exclusively to the labours of French and English workers. It seems at least desirable that our literature should be enlarged in this respect. These considerations have induced me to publish some observations which will perhaps help to further our knowledge concerning the relationship of hysterical twilight-states and enlarge the problems of normal psychology.

CASE OF SOMNAMBULISM IN A PERSON WITH NEUROPATHIC INHERITANCE (SPIRITUALISTIC MEDIUM).

The following case was under my observation in the years 1899 and 1900. As I was not in medical attendance upon Miss S. W., a physical examination for hysterical stigmata unfortunately could not be made. I kept a complete diary of the séances, which I filled up after each sitting. The following report is a condensed account from these notes. Out of regard for Miss S. W. and her family a few unimportant dates have been altered and a few details omitted from the story, which for the most part is composed of very intimate matters.

Miss S. W., 15½ years old. Reformed Church. The paternal grandfather was highly intelligent, a clergyman with frequent waking hallucinations (generally visions, often whole dramatic scenes with dialogues, etc.). A brother of the grandfather was an imbecile eccentric, who also saw visions.

A sister of the grandfather, a peculiar, odd character. The paternal grandmother after some fever in her 20th year (typhoid?) had a trance which lasted three days, from which she did not awake until the crown of her head had been burned by a red-hot iron. During states of excitement later on she had fainting fits which were nearly always followed by a brief somnambulism during which she uttered prophecies. Her father was likewise a peculiar, original personality with bizarre ideas. All three had waking hallucinations (second-sight, forebodings, etc.). A third brother was also eccentric and odd, talented but one-sided. The mother has an inherited mental defect often bordering on psychosis. The sister is a hysteric and visionary and a second sister suffers from "nervous heart attacks." Miss S. W. is slenderly built, skull somewhat rachitic, without pronounced hydrocephalus, face rather pale, eyes dark with a peculiar penetrating look. She has had no serious illnesses. At school she passed for average, showed little interest, was inattentive. As a rule her behaviour was rather reserved, sometimes giving place, however, to exuberant joy and exaltation. Of average intelligence, without special gifts, neither musical nor fond of books, her preference is for handwork—and day dreaming. She was often absent-minded, misread in a peculiar way when reading aloud, instead of the word *Ziege* (goat), for instance, said *Gais*, instead of *Treppe* (stair), *Stege*; this occurred so often that her brothers and sisters laughed at her. There were no other abnormalities; there were no serious hysterical manifestations. Her family were artisans and business people with very limited interests. Books of mystical content were never permitted in the family. Her education was faulty; there were numerous brothers and sisters and thus the education was given indiscriminately, and in addition the children had to suffer a great deal from the inconsequent and vulgar, indeed sometimes rough, treatment of their mother. The father, a very busy business man, could not pay much attention to his children, and died when S. W. was not yet grown up. Under these uncomfortable conditions it is no wonder that S. W. felt herself shut in and unhappy. She was often afraid to go home, and preferred to be anywhere rather than there. She was left a great deal with playmates and grew up in this way without much polish. The level of her education is relatively low and her interests correspondingly limited. Her knowledge of literature is also very limited. She knows the common school songs by heart, songs of Schiller and Goethe and a few other poets, as well as fragments from a song book and the

psalms. Newspaper stories represent her highest level in prose. Up to the time of her somnambulism she had never read any books of a serious nature. At home and from friends she heard about table-turning and began to take an interest in it. She asked to be allowed to take part in such experiments, and her desire was soon gratified. In July 1899, she took part a few times in table-turnings with some friends and her brothers and sisters, but in joke. It was then discovered that she was an excellent "medium." Some communications of a serious nature arrived which were received with general astonishment. Their pastoral tone was surprising. The spirit said he was the grandfather of the medium. As I was acquainted with the family I was able to take part in these experiments. At the beginning of August, 1899, the first attacks of somnambulism took place in my presence. They took the following course: S. W. became very pale, slowly sank to the ground, or into a chair, shut her eyes, became cataleptic, drew several deep breaths, and began to speak. In this stage she was generally quite relaxed; the reflexes of the lids remained, as did also tactile sensation. She was sensitive to unexpected noises and full of fear, especially in the initial stage.

She did not react when called by name. In somnambulic dialogues she copied in a remarkably clever way her dead relations and acquaintances, with all their peculiarities, so that she made a lasting impression upon unprejudiced persons. She also so closely imitated persons whom she only knew from descriptions that no one could deny her at least considerable talent as an actress. Gradually gestures were added to the simple speech, which finally led to "*attitudes passionelles*" and complete dramatic scenes. She took up postures of prayer and rapture, with staring eyes, and spoke with impassionate and glowing rhetoric. She then made use exclusively of a literary German which she spoke with an ease and assurance quite contrary to her usual uncertain and embarrassed manner in the waking state. Her movements were free and of a noble grace, depicting most beautifully her varying emotions. Her attitude during these states was always changing and diverse in the different attacks. Now she would lie for ten minutes to two hours on the sofa or the ground, motionless, with closed eyes; now she assumed a half-sitting posture and spoke with changed tone and speech; now she would stand up, going through every possible pantomimic gesture. Her speech was equally diversified and without rule. Now she spoke in the first person, but never for long, generally to prophesy her next attack; now she spoke of herself (and this was the most usual) in the third person. She

then acted as some other person, either some dead acquaintance or some chance person, whose part she consistently carried out according to the characteristics she herself conceived. At the end of the ecstasy there usually followed a cataleptic state with *flexibilitas cerea*, which gradually passed over into the waking state. The waxy anæmic pallor which was an almost constant feature of the attacks made one really anxious; it sometimes occurred at the beginning of the attack, but often in the second half only. The pulse was then small but regular and of normal frequency; the breathing gentle, shallow, or almost imperceptible. As already stated, S. W. often predicted her attacks beforehand; just before the attacks she had strange sensations, became excited, rather anxious, and occasionally expressed thoughts of death: "she will probably die in one of these attacks; during the attack her soul only hangs to her body by a thread, so that often the body could scarcely go on living." Once after the cataleptic attack tachypnœa lasting two minutes was observed, with a respiration rate of 100 per minute. At first the attacks occurred spontaneously, afterwards S. W. could provoke them by sitting in a dark corner and covering her face with her hands. Frequently the experiment did not succeed. She had so-called "good" and "bad" days. The question of amnesia after the attacks is unfortunately very obscure. This much is certain, that after each attack she was quite accurately orientated as to what she had gone through "during the rapture." It is, however, uncertain how much she remembered of the conversations in which she served as medium, and of changes in her surroundings during the attack. It often seemed that she did have a fleeting recollection, for directly after waking she would ask: "Who was here? Wasn't X or Y here? What did he say?" She also showed that she was superficially aware of the content of the conversations. She thus often remarked that the spirits had communicated to her before waking what they had said. But frequently this was not the case. If, at her request, the contents of the trance speeches were repeated to her she was often annoyed about them. She was then often sad and depressed for hours together, especially when any unpleasant indiscretions had occurred. She would then rail against the spirits and assert that next time she would beg her guides to keep such spirits far away. Her indignation was not feigned, for in the waking state she could but poorly control herself and her emotions, so that every mood was at once mirrored in her face. At times she seemed only slightly or not at all aware of the external proceedings during the attack.

She seldom noticed when any one left the room or came in. Once she forbade me to enter the room when she was awaiting special communications which she wished to keep secret from me. Nevertheless I went in, and sat down with the three other sitters and listened to everything. Her eyes were open and she spoke to those present without noticing me. She only noticed me when I began to speak, which gave rise to a storm of indignation. She remembered better, but still apparently only in indefinite outlines, the remarks of those taking part which referred to the trance speeches or directly to herself. I could never discover any definite rapport in this connection.

In addition to these great attacks which seemed to follow a certain law in their course, S. W. produced a great number of other automatisms. Premonitions, forebodings, unaccountable moods and rapidly changing fancies were all in the day's work. I never observed simple states of sleep. On the other hand, I soon noticed that in the middle of a lively conversation S. W. became quite confused and spoke without meaning in a peculiar monotonous way, and looked in front of her dreamily with half-closed eyes. These lapses usually lasted but a few minutes. Then she would suddenly proceed: "Yes, what did you say?" At first she would not give any particulars about these lapses, she would reply off-hand that she was a little giddy, had a headache, and so on. Later she simply said: "they were there again," meaning her spirits. She was subjected to the lapses much against her will; she often tried to defend herself: "I do not want to, not now, come some other time; you seem to think I only exist for you." She had these lapses in the streets, in business, in fact anywhere. If this happened to her in the street, she leaned against a house and waited till the attack was over. During these attacks, whose intensity was most variable, she had visions; frequently also, especially during the attacks where she turned extremely pale, she "wandered"; or as she expressed it, lost her body, and got away to distant places whither her spirits led her. Distant journeys during ecstasy strained her exceedingly; she was often exhausted for hours after, and many times complained that the spirits had again deprived her of much power, such overstrain was now too much for her; the spirits must get another medium, etc. Once she was hysterically blind for half an hour after one of these ecstasies. Her gait was hesitating, feeling her way; she had to be led; she did not see the candle which was on the table. The pupils reacted. Visions occurred in great numbers without proper "lapses" (designating by

this word only the higher grade of distraction of attention). At first the visions only occurred at the beginning of the sleep. Once after S. W. had gone to bed the room became lighted up, and out of the general foggy light there appeared white glittering figures. They were throughout concealed in white veil-like robes, the women had a head-covering like a turban, and a girdle. Afterwards (according to the statements of S. W.), "the spirits were already there" when she went to bed. Finally she also saw the figures in bright daylight, though still somewhat blurred and only for a short time, provided there were no proper lapses, in which case the figures became solid enough to take hold of. But S. W. always preferred darkness. According to her account the content of the vision was for the most part of a pleasant kind. Gazing at the beautiful figures she received a feeling of delicious blessedness. More rarely there were terrible visions of a dæmonic nature. These were entirely confined to the night or to dark rooms. Occasionally S. W. saw black figures in the neighbouring streets or in her room; once out in the dark courtyard she saw a terrible copper-red face which suddenly stared at her and frightened her. I could not learn anything satisfactory about the first occurrence of the vision. She states that once at night, in her fifth or sixth year, she saw her "guide," her grandfather (whom she had never known). I could not get any objective confirmation from her relatives of this early vision. Nothing of the kind is said to have happened until her first séance. With the exception of the hypnagogic brightness and the flashes, there were no rudimentary hallucinations, but from the beginning they were of a systematic nature, involving all the sense-organs equally. So far as concerns the intellectual reaction to these phenomena it is remarkable with what curious sincerity she regarded her dreams. Her entire somnambulic development, the innumerable puzzling events, seemed to her quite natural. She looked at her whole past in this light. Every striking event of earlier years stood to her in necessary and clear relationship to her present condition. She was happy in the consciousness of having found her real life-task. Naturally she was unswervingly convinced of the reality of her visions. I often tried to present her with some sceptical explanation, but she invariably turned this aside; in her usual condition she did not clearly grasp a reasoned explanation, and in the semi-somnambulic state she regarded it as senseless in view of the facts staring her in the face. She once said: "I do not know if what the spirits say and teach me is true, neither do I know if they are those by whose names they call themselves, but that my

spirits exist there is no question. I see them before me, I can touch them, I speak to them about everything I wish, as naturally as I'm now talking to you. They must be real." She absolutely would not listen to the idea that the manifestations were a kind of illness. Doubts about her health or about the reality of her dream would distress her deeply; she felt so hurt by my remarks that when I was present she became reserved, and for a long time refused to experiment if I was there; hence I took care not to express my doubts and thoughts aloud. From her immediate relatives and acquaintances she received undivided allegiance and admiration—they asked her advice about all kinds of things. In time she obtained such an influence upon her followers that three of her brothers and sisters likewise began to have hallucinations of a similar kind. Their hallucinations generally began as night-dreams of a very vivid and dramatic kind; these gradually extended into the waking time, partly hypnagogic, partly hypnopompic. A married sister had extraordinary vivid dreams which developed from night to night, and these appeared in the waking consciousness; at first as obscure illusions, next as real hallucinations, but they never reached the plastic clearness of S. W.'s visions. For instance, she once saw in a dream a black dæmonic figure at her bedside in animated conversation with a white, beautiful figure, which tried to restrain the black one; nevertheless the black one seized her and tried to choke her, then she awoke. Bending over her she then saw a black shadow with a human contour, and near by a white cloudy figure. The vision only disappeared when she lighted a candle. Similar visions were repeated dozens of times. The visions of the other two sisters were of a similar kind, but less intense.

This particular type of attack with the complete visions and ideas had developed in the course of less than a month, but never afterwards exceeded these limits. What was later added to these was but the extension of all those thoughts and cycles of visions which to a certain extent were already indicated quite at the beginning. As well as the "great" attacks and the lesser ones, there must also be noted a third kind of state comparable to "lapse" states. These are the *semi-somnambulic states*. They appeared at the beginning or at the end of the "great" attacks, but also appeared without any connection with them. They developed gradually in the course of the first month. It is not possible to give a more precise account of the time of their appearance. In this state a fixed gaze, brilliant eyes, and a certain dignity

and stateliness of movement are noticeable. In this phase S. W. is herself, her own somnambolic ego.

She is fully orientated to the external world, but seems to stand with one foot, as it were, in her dream-world. She sees and hears her spirits, sees how they walk about in the room among those who form the circle, and stand first by one person, then by another. She is in possession of a clear remembrance of her visions, her journeys and the instructions she receives. She speaks quietly, clearly and firmly and is always in a serious, almost religious frame of mind. Her bearing indicates a deeply religious mood, free from all pietistic flavour, her speech is singularly uninfluenced by her guide's jargon compounded of Bible and tract. Her solemn behaviour has a suffering, rather pitiful aspect. She is painfully conscious of the great differences between her ideal world at night and the rough reality of the day. This state stands in sharp contrast to her waking existence; there is here no trace of that unstable and inharmonious creature, that extravagant nervous temperament which is so characteristic for the rest of her relationships. Speaking with her, you get the impression of speaking with a much older person who has attained through numerous experiences to a sure harmonious footing. In this state she produced her best results, whilst her romances correspond more closely to the conditions of her waking interests. The semi-somnambulism usually appears spontaneously, mostly during the table experiments, which sometimes announced by this means that S. W. was beginning to know beforehand every automatic communication from the table. She then usually stopped the table-turning and after a short time passed more or less suddenly into an ecstatic state. S. W. showed herself to be very sensitive. She could divine and reply to simple questions thought of by a member of the circle who was not a "medium," if only the latter would lay a hand on the table or on her hand. Genuine thought-transference without direct or indirect contact could never be achieved. In juxtaposition with the obvious development of her whole personality the continued existence of her earlier ordinary character was all the more startling. She imparted with unconcealed pleasure all the little childish experiences, the flirtations and love-secrets, all the rudeness and lack of education of her parents and contemporaries. To every one who did not know her secret she was a girl of fifteen and a half, in no respect unlike a thousand other such girls. So much the greater was people's astonishment when they got to know her in her other aspect. Her near relatives could not

at first grasp this change: to some extent they never altogether understood it, so there was often bitter strife in the family, some of them taking sides for and others against S. W., either with enthusiastic over-valuation or with contemptuous censure of "superstition." Thus did S. W., during the time I watched her closely, lead a curious, contradictory life, a real "double life" with two personalities existing side by side or closely following upon one another and contending for the mastery. I now give some of the most interesting details of the sittings in chronological order.

First and second sittings, August, 1899. S. W. at once undertook to lead the "communications." The "psychograph," for which an upturned glass tumbler was used, on which two fingers of the right hand were laid, moved quick as lightning from letter to letter. (Slips of paper, marked with letter and numbers, had been arranged in a circle round the glass.) It was communicated that the "medium's" grandfather was present and would speak to us. There then followed many communications in quick sequence, of a most religious, edifying nature, in part in properly made words, partly in words with the letters transposed, and partly in a series of reversed letters. The last words and sentences were produced so quickly that it was not possible to follow without first inverting the letters. The communications were once interrupted in abrupt fashion by a new communication, which announced the presence of the writer's grandfather. On this occasion the jesting observation was made: "Evidently the two 'spirits' get on very badly together." During this attempt darkness came on. Suddenly S. W. became very disturbed, sprang up in terror, fell on her knees and cried "There, there, do you not see that light, that star there?" and pointed to a dark corner of the room. She became more and more disturbed, and called for a light in terror. She was pale, wept, "it was all so strange, she did not know in the least what was the matter with her." When a candle was brought she became calm again. The experiments were now stopped.

At the next sitting, which took place in the evening, two days later, similar communications from S. W.'s grandfather were obtained. When darkness fell S. W. suddenly leaned back on the sofa, grew pale, almost shut her eyes, and lay there motionless. The eyeballs were turned upwards, the lid-reflex was present as well as tactile sensation. The breathing was gentle, almost imperceptible. The pulse small and weak. This attack lasted about half an hour, when S. W. suddenly sighed and got up. The extreme pallor,

which had lasted throughout the whole attack, now gave place to her usual pale pink colour. She was somewhat confused and distraught, indicated that she had seen all sorts of things, but would tell nothing. Only after urgent questioning would she relate that in an extraordinary waking condition she had seen her grandfather arm-in-arm with the writer's grandfather. The two had gone rapidly by in an open carriage, side by side.

III. In the third séance, which took place some days later, there was a similar attack of more than half an hour's duration. S. W. afterwards told of many white, transfigured forms who each gave her a flower of special symbolic significance. Most of them were dead relatives. Concerning the exact content of their talk she maintained an obstinate silence.

IV. After S. W. had entered into the somnambulic state she began to make curious movements with her lips, and made swallowing gurgling noises. Then she whispered very softly and unintelligibly. When this had lasted some minutes she suddenly began to speak in an altered deep voice. She spoke of herself in the third person. "She is not here, she has gone away." There followed several communications of a religious kind. From the content and the way of speaking it was easy to conclude that she was imitating her grandfather, who had been a clergyman. The content of the talk did not rise above the mental level of the "communications." The tone of the voice was somewhat forced, and only became natural when, in the course of the talk, the voice approximated to the medium's own.

(In later sittings the voice was only altered for a few moments when a new spirit manifested itself.)

Afterwards there was amnesia for the trance-conversation. She gave hints about a sojourn in the other world, and she spoke of an undreamed-of blessedness which she felt. It must be further noted that her conversation in the attack occurred quite spontaneously, and was not in response to any suggestions.

Directly after this séance S. W. became acquainted with the book of Justinus Kerner, "Die Seherin von Prevorst." She began thereupon to magnetise herself towards the end of the attack, partly by means of regular passes, partly by curious circles and figures of eight, which she described symmetrically with both arms. She did this, she said, to disperse the severe

headaches which occurred after the attacks. In the August séances, not detailed here, there were in addition to the grandfather numerous spirits of other relatives who did not produce anything very remarkable. Each time when a new one came on the scene the movement of the glass was changed in a striking way; it generally ran along the rows of letters, touching one or other of them, but no sense could be made of it. The orthography was very uncertain and arbitrary, and the first sentences were frequently incomprehensible or broken up into a meaningless medley of letters. Generally automatic writing suddenly began at this point. Sometimes automatic writing was attempted during complete darkness. The movements began with violent backward jerks of the whole arm, so that the paper was pierced by the pencil. The first attempt at writing consisted of numerous strokes and zigzag lines about 8 cm. high. In later attempts there came first unreadable words, in large handwriting, which gradually became smaller and clearer. It was not essentially different from the medium's own. The grandfather was again the controlling spirit.

V. Somnambulic attacks in September, 1899. S. W. sits upon the sofa, leans back, shuts her eyes, breathes lightly and regularly. She gradually becomes cataleptic, the catalepsy disappears after about two minutes, when she lies in an apparently quiet sleep with complete muscular relaxation. She suddenly begins to speak in a subdued voice: "No! you take the red, I'll take the white, you can take the green, and you the blue. Are you ready? We will go now." (A pause of several minutes during which her face assumes a corpse-like pallor. Her hands feel cold and are very bloodless.) She suddenly calls out with a loud, solemn voice: "Albert, Albert, Albert," then whispering: "Now you speak," followed by a longer pause, when the pallor of the face attains the highest possible degree. Again, in a loud solemn voice, "Albert, Albert, do you not believe your father? I tell you many errors are contained in N.'s teaching. Think about it." Pause. The pallor of the face decreases. "He's very frightened. He could not speak any more." (These words in her usual conversational tone.) Pause. "He will certainly think about it," S. W. now speaks again in the same tone, in a strange idiom which sounds like French or Italian, now recalling the former, now the latter. She speaks fluently, rapidly, and with charm. It is possible to understand a few words but not to remember the whole, because the language is so strange. From time to time certain words recur, as *wena*, *wenes*, *wenai*, *wene*, etc. The absolute naturalness of the proceedings is

bewildering. From time to time she pauses as if some one were answering her. Suddenly she speaks in German, "Is time already up?" (In a troubled voice.) "Must I go already? Goodbye, goodbye." With the last words there passes over her face an indescribable expression of ecstatic blessedness. She raises her arms, opens her eyes,—hitherto closed,—looks radiantly upwards. She remains a moment thus, then her arms sink slackly, her eyes shut, the expression of her face is tired and exhausted. After a short cataleptic stage she awakes with a sigh. She looks around astonished: "I've slept again, haven't I?" She is told she has been talking during the sleep, whereupon she becomes much annoyed, and this increases when she learns she has spoken in a foreign tongue. "But didn't I tell the spirits I don't want it? It mustn't be. It exhausts me too much." Begins to cry. "Oh, God! Oh, God! must then everything, everything, come back again like last time? Is nothing spared me?" The next day at the same time there was another attack. When S. W. has fallen asleep Ulrich von Gerbenstein suddenly announces himself. He is an entertaining chatterer, speaks very fluently in high German with a North-German accent. Asked what S. W. is now doing, after much circumlocution he explains that she is far away, and he is meanwhile here to look after her body, the circulation of the blood, the respiration, etc. He must take care that meanwhile no black person takes possession of her and harms her. Upon urgent questioning he relates that S. W. has gone with the others to Japan, to appear to a distant relative and to restrain him from a stupid marriage. He then announces in a whisper the exact moment when the manifestation takes place. Forbidden any conversation for a few minutes, he points to the sudden pallor occurring in S. W., remarking that materialisation at such a great distance is at the cost of correspondingly great force. He then orders cold bandages to the head to alleviate the severe headache which would occur afterwards. As the colour of the face gradually becomes more natural the conversation grows livelier. All kinds of childish jokes and trivialities are uttered; suddenly U. von G. says, "I see them coming, but they are still very far off; I see them there like a star." S. W. points to the North. We are naturally astonished, and ask why they do not come from the East, whereto U. von G. laughingly retorts: "Oh, but they come the direct way over the North Pole. I am going now; farewell." Immediately after S. W. sighs, wakes up, is ill-tempered, complains of extremely bad headache. She saw U. von G. standing by her

body; what had he told us? She gets angry about the "silly chatter" from which he cannot refrain.

VI. Begins in the usual way. Extreme pallor; lies stretched out, scarcely breathing. Speaks suddenly, with loud, solemn voice: "Yes, be frightened; I am; I warn you against N.'s teaching. See, in hope is everything that belongs to faith. You would like to know who I am. God gives where one least expects it. Do you not know me?" Then unintelligible whispering; after a few minutes she awakes.

VII. S. W. soon falls asleep; lies stretched out on the sofa. Is very pale. Says nothing, sighs deeply from time to time. Casts up her eyes, rises, sits on the sofa, bends forward, speaks softly: "You have sinned grievously, have fallen far." Bends forward still, as if speaking to some one who kneels before her. She stands up, turns to the right, stretches out her hands, and points to the spot over which she has been bending. "Will you forgive her?" she asks, loudly. "Do not forgive men, but their spirits. Not she, but her human body has sinned." Then she kneels down, remains quite still for about ten minutes in the attitude of prayer. Then she gets up suddenly, looks to heaven with ecstatic expression, and then throws herself again on her knees, with her face bowed on her hands, whispering incomprehensible words. She remains rigid in this position several minutes. Then she gets up, looks again upwards with a radiant countenance, and lies down on the sofa; soon after she wakes.

DEVELOPMENT OF THE SOMNAMBULIC PERSONALITIES.

At the beginning of many séances the glass was allowed to move by itself, when occasionally the advice followed in stereotyped fashion: "You must ask."

Since convinced spiritualists took part in the séances, all kinds of spiritualistic wonders were of course demanded, and especially the "protecting spirits." In reply, sometimes names of well-known dead people were produced, sometimes unknown names, *e.g.* Berthe de Valours, Elizabeth von Thierfelsenburg, Ulrich von Gerbenstein, etc. The controlling spirit was almost without exception the medium's grandfather, who once explained: "he loved her more than any one in this world because he had

protected her from childhood up, and knew all her thoughts." This personality produced a flood of Biblical maxims, edifying observations, and song-book verses; the following is a specimen:—

In true believing,
To faith in God cling ever nigh,
Thy heavenly comfort never leaving,
Which having, man can never die.
Refuge in God is peace for ever,
When earthly cares oppress the mind;
Who from the heart can pray is never
Bowed down by fate, howe'er unkind.

Numerous similar elaborations betrayed by their banal, unctuous contents their origin in some tract or other. When S. W. had to speak in ecstasy, lively dialogues developed between the circle-members and the somnambulant personality. The content of the answers received is essentially just the same commonplace edifying stuff as that of the psychographic communications. The character of this personality is distinguished by its dry and tedious solemnity, rigorous conventionality and pietistic virtue (which is not consistent with the historic reality). The grandfather is the medium's guide and protector. During the ecstatic state he gives all kinds of advice, prophesies later attacks and the visions she will see on waking, etc. He orders cold bandages, gives directions concerning the medium's lying down or the date of the séances. His relationship to the medium is an extremely tender one. In liveliest contrast to this heavy dream-person stands a personality, appearing first sporadically, in the psychographic communications of the first séance. It soon disclosed itself as the dead brother of a Mr. R., who was then taking part in the séance. This dead brother, Mr. P. R., was full of commonplaces about brotherly love towards his living brother. He evaded particular questions in all manner of ways. But he developed a quite astonishing eloquence towards the ladies of the circle and in particular offered his allegiance to one whom Mr. P. R. had never known when alive. He affirmed that he had already cared very much for her in his lifetime, had often met her in the street without knowing who she was, and was now uncommonly delighted to become acquainted with her in this unusual manner. With such insipid compliments, scornful remarks to the men, harmless childish jokes, etc., he took up a large part of the séance. Several of the members found fault with the frivolity and banality of this "spirit," whereupon he disappeared for one or two séances, but soon reappeared, at first well-behaved, often indeed uttering Christian maxims, but soon dropping back into the old tone. Besides these two sharply differentiated personalities, others appeared who varied but little from the grandfather's type; they were mostly dead relatives of the medium. The general atmosphere of the first two months' séances was accordingly solemnly edifying, disturbed only from time to time by Mr. P. R.'s trivial chatter. Some weeks after the beginning of the séances, Mr. R. left our circle, whereupon a remarkable change took place in Mr. P. R.'s conversation. He became monosyllabic, came less often, and after a few séances vanished altogether, later on he reappeared but with great infrequency, and for the most part only when the medium was alone with the particular lady mentioned. Then a new personality forced himself into the foreground; in contrast to Mr. P. R., who always spoke the Swiss dialect, this gentleman adopted an affected North-German way of speaking. In all else he was an exact copy of Mr. P. R. His eloquence was somewhat remarkable, since S. W. had only a very scanty knowledge of high German, whilst this new personality, who called himself Ulrich von

Gerbenstein, spoke an almost faultless German, rich in charming phrases and compliments.
[20]

Ulrich von Gerbenstein was a witty chatterer, full of repartee, an idler, a great admirer of the ladies, frivolous, and most superficial.

During the winter of 1899-1900 he gradually came to dominate the situation more and more, and took over one by one all the above-mentioned functions of the grandfather, so that under his influence the serious character of the séances disappeared.

All suggestions to the contrary proved unavailing, and at last the séances had on this account to be suspended for longer and longer intervals. There is a peculiarity common to all these somnambulatory personalities which must be noted. They have access to the medium's memory, even to the unconscious portion, they are also *au courant* with the visions which she has in the ecstatic state, but they have only *the most superficial knowledge of her phantasies during the ecstasy*. Of the somnambulatory dreams they know only what they occasionally pick up from the members of the circle. On doubtful points they can give no information, or only such as contradicts the medium's explanations. The stereotyped answer to these questions runs: "Ask Ivenes."^[21] "Ivenes knows." From the examples given of different ecstatic moments it is clear that the medium's consciousness is by no means idle during the trance, but develops a striking and multiplex phantastic activity. For the reconstruction of S. W.'s somnambulatory self we have to depend altogether upon her several statements; for in the first place her spontaneous utterances connecting her with the waking self are few, and often irrelevant, and in the second very many of these ecstatic states go by without gesture, and without speech, so that no conclusions as to the inner happenings can afterwards be drawn from the external appearances. *S. W. is almost totally amnesic for the automatic phenomena during ecstasy as far as they come within the territory of the new personalities of her ego. Of all the other phenomena, such as loud talking, babbling, etc., which are directly connected with her own ego she usually has a clear remembrance.* But in every case there is complete amnesia only during the first few minutes after the ecstasy. Within the first half-hour, during which there usually prevails a kind of semi-somnambulism with a dreamlike manner, hallucinations, etc., the amnesia gradually disappears, whilst fragmentary memories emerge of what has occurred, but in a quite irregular and arbitrary fashion.

The later séances were usually begun by our hands being joined and laid on the table, whereon the table at once began to move. Meanwhile S. W. gradually became somnambulatory, took her hands from the table, lay back on the sofa, and fell into the ecstatic sleep. She sometimes related her experiences to us afterwards, but showed herself very reticent if strangers were present. After the very first ecstasy she indicated that she played a distinguished *rôle* among the spirits. She had a special name, as had each of the spirits; hers was *Ivenes*; her grandfather looked after her with particular care. In the ecstasy with the flower-vision we learnt her special secret, hidden till then beneath the deepest silence. During the séances in which her spirit spoke she made long journeys, mostly to relatives, to whom she said she appeared, or she found herself on the Other Side, in "That space between the stars which people think is empty, but in which there are really very many spirit-worlds." In the semi-somnambulatory state which frequently followed her attacks, she once described, in peculiar poetic fashion, a landscape on the Other Side, "a wondrous, moon-lit valley, set aside for the races not yet born." She represented her somnambulatory ego as being almost completely

released from the body. It is a fully-grown but small, black-haired woman, of pronounced Jewish type, clothed in white garments, her head covered with a turban. She understands and speaks the language of the spirits, "for spirits still, from old human custom, do speak to one another, although they do not really need to, since they mutually understand one another's thoughts." She "does not really always talk with the spirits, but just looks at them, and so understands their thoughts." She travels in the company of four or five spirits, dead relatives, and visits her living relatives and acquaintances in order to investigate their life and their way of thinking; she further visits all places which lie within the radius of these spectral inhabitants. From her acquaintanceship with Kerner's book, she discovered and improved upon the ideas of the black spirits who are kept enchanted in certain places, or exist partly beneath the earth's surface (compare the "Seherin von Prevorst"). This activity caused her much trouble and pain; in and after the ecstasy she complained of suffocating feelings, violent headache, etc. But every fortnight, on Wednesdays, she could pass the whole night in the garden on the Other Side in the company of holy spirits. There she was taught everything concerning the forces of the world, the endless complicated relationships and affinities of human beings, and all besides about the laws of reincarnation, the inhabitants of the stars, etc. Unfortunately only the system of the world-forces and reincarnation achieved any expression. As to the other matters she only let fall disconnected observations. For example, once she returned from a railway journey in an extremely disturbed state. It was thought at first something unpleasant had happened, till she managed to compose herself, and said, "A star-inhabitant had sat opposite to her in the train." From the description which she gave of this being, I recognised a well-known elderly merchant I happened to know, who has a rather unsympathetic face. In connection with this experience she related all kinds of peculiarities of these star-dwellers; they have no god-like souls, as men have, they pursue no science, no philosophy, but in technical arts they are far more advanced than men. Thus on Mars a flying-machine has long been in existence; the whole of Mars is covered with canals, these canals are cleverly excavated lakes and serve for irrigation. The canals are quite superficial; the water in them is very shallow. The excavating caused the inhabitants of Mars no particular trouble, for the soil there is lighter than the earth's. The canals are nowhere bridged, but that does not prevent communication, for everything travels by flying-machine. Wars no longer occur on the stars, for no differences of opinion exist. The star-dwellers have not human bodies, but the most laughable ones possible, such as one would never imagine. Human spirits who are allowed to travel on the Other Side may not set foot on the stars. Equally, wandering star-dwellers may not come to the earth, but must remain at a distance of twenty-five metres above the earth's surface. Should they transgress they remain in the power of the earth, and must assume human bodies, and are only set free again after their natural death. As men, they are cold, hard-hearted, cruel. S. W. recognises them by a singular expression in which the "Spiritual" is lacking, and by their hairless, eyebrowless, sharply-cut faces. Napoleon was a star-dweller.

In her journeys she does not see the places through which she hastens. She has a feeling of floating, and the spirits tell her when she is at the right spot. Then, as a rule, she only sees the face and upper part of the person to whom she is supposed to appear, or whom she wishes to see. She can seldom say in what kind of surroundings she sees this person. Occasionally she saw me, but only my head without any surroundings. She occupied herself much with the enchanting of spirits, and for this purpose she wrote oracular sayings in a foreign tongue, on

slips of paper which she concealed in all sorts of queer places. An Italian murderer, presumably living in my house, and whom she called Conventi, was specially displeasing to her. She tried several times to cast a spell upon him, and without my knowledge hid several papers about, on which messages were written; these were later found by chance. One such, written in red ink, was as follows:

Conventi
Marche. 4 govi
Ivenes.

Conventi, go
orden, Astaf
vent.

Gen palus, vent allis
ton prost afta ben genallis.

Unfortunately, I never obtained any interpretation of this. S. W. was quite inaccessible in this matter. Occasionally the somnambolic Ivenes speaks directly to the public. She does so in dignified fashion, rather precociously, but she is not wearisomely unctuous and impossibly twaddling as are her two guides; she is a serious, mature person, devout and pious, full of womanly tenderness and great modesty, always yielding to the judgments of others. This expression of plaintive emotion and melancholy resignation is peculiar to her. She looks beyond this world, and unwillingly returns to reality; she bemoans her hard lot, and her unsympathetic family surroundings. Associated with this there is something elevated about her; she commands her spirits, despises the twaddling chatter of Gerbenstein, consoles others, directs those in distress, warns and protects them from dangers to body and soul. She is the intermediary for the entire intellectual output of all manifestations, but she herself ascribes it to the direction of the spirits. It is Ivenes who entirely controls S. W.'s semi-somnambolic state.

In semi-somnambulism S. W. gave some of those taking part in the séances the opportunity to compare her with the "Seherin von Prevorst" (Prophetess of Prevorst). This suggestion was not without results. S. W. gave hints of earlier existences which she had already lived through, and after a few weeks she suddenly disclosed a whole system of reincarnations, although she had never before mentioned anything of the kind. Ivenes is a spiritual being who is something more than the spirits of other human beings. Every human spirit must incorporate himself twice in the course of the centuries. But Ivenes must incorporate herself at least once every two hundred years; besides herself only two other persons have participated in this fate, namely, Swedenborg and Miss Florence Cook (Crookes's famous medium). S. W. calls these two personages her brother and sister. She gave no information

about their pre-existences. In the beginning of the nineteenth century Ivenes was Frau Hauffe, the Prophetess of Prevorst; at the end of the eighteenth century, a clergyman's wife in central Germany (locality unknown). As the latter she was seduced by Goethe and bore him a child. In the fifteenth century she was a Saxon countess, and had the poetic name of Thierfelsenburg. Ulrich von Gerbenstein is a relative from that line. The interval of 300 years, and her adventure with Goethe, must be atoned for by the sorrows of the Prophetess of Prevorst. In the thirteenth century she was a noblewoman of Southern France, called de Valours, and was burnt as a witch. From the thirteenth century to the Christian persecution under Nero there were numerous reincarnations of which S. W. could give no detailed account. In the Christian persecution under Nero she played a martyr's part. Then comes a period of obscurity till the time of David, when Ivenes was an ordinary Jewess. After her death she received from Astaf, an angel from a high heaven, the mandate for her future wonderful career. In all her pre-existences she was a medium and an intermediary in the intercourse between this side and the other. Her brothers and sisters are equally old and have the like vocation. In her various pre-existences she was sometimes married, and in this way gradually founded a whole system of relationships with whose endless complicated inter-relations she occupied herself in many ecstasies. Thus, for example, about the eighth century she was the mother of her earthly father and, moreover, of her grandfather, and mine. Hence the striking friendship of these two old gentlemen, otherwise strangers. As Mme. de Valours she was the present writer's mother. When she was burnt as a witch the writer took it much to heart, and went into a cloister at Rouen, wore a grey habit, became Prior, wrote a work on Botany and died at over eighty years of age. In the refectory of the cloister there hung a picture of Mme. de Valours, in which she was depicted in a half-reclining position. (S. W. in the semi-somnambule state often took this position on the sofa. It corresponds exactly to that of Mme. Recamier in David's well-known picture.) A gentleman who often took part in the séances, who had some slight resemblance to the writer, was also one of her sons from that period. Around this core of relationship there grouped themselves, more or less intimately connected, all the persons in any way related or known to her. One came from the fifteenth century, another—a cousin—from the eighteenth century, and so on.

From the three great family stocks grew by far the greater part of the present European peoples. She and her brothers and sisters are descended from Adam, who arose by materialisation; the other then-existing families, from whom Cain took his wife, were descended from apes. S. W. produced from this circle of relationship an extensive family-gossip, a very flood of romantic stories, piquant adventures, etc. Sometimes the target of her romances was a lady acquaintance of the writer's who for some undiscoverable reason was peculiarly antipathetic to her. She declared that this lady was an incarnation of a celebrated Parisian poisoner, who had achieved great notoriety in the eighteenth century. She maintained that this lady still continued her dangerous work, but in a much more ingenious way than formerly; through the inspiration of the wicked spirits who accompany her she had discovered a liquid which when merely exposed to the air attracted tubercle bacilli and formed a splendid developing medium for them. By means of this liquid, which she was wont to mix with the food, the lady had brought about the death of her husband (who had indeed died of tuberculosis); also one of her lovers, and of her own brother, for the sake of his inheritance. Her eldest son was an illegitimate child by her lover. As a widow she had secretly borne to another lover an illegitimate child, and finally she had had an unnatural relationship with her

own brother (who was later on poisoned). In this way S. W. spun innumerable stories, in which she believed quite implicitly. The persons of these stories appeared in the drama of her visions, as did the lady before referred to, going through the pantomime of making confession and receiving absolution of sins. Everything interesting occurring in her surroundings was incorporated in this system of romances, and given an order in the network of relationships with a more or less exact statement as to their pre-existences and the spirits influencing them. It fared thus with all who made S. W.'s acquaintance: they were valued at a second or first incarnation, according as they possessed a marked or indefinite character. They were generally described as relatives, and always exactly in the same definite way. Only subsequently, often several weeks later, after an ecstasy, there would make its appearance a new complicated romance which explained the striking relationship through pre-existences or through illegitimate relations. Persons sympathetic to S. W. were usually very near relatives. Most of these family romances were very carefully made up, so that to contradict them was impossible. They were always worked out with a quite bewildering certainty, and surprised one by an extremely clever evaluation of certain details which she had noticed or taken from somewhere. For the most part the romances had a ghastly character, murder by poison and dagger, seduction and divorce, forgery of wills, played the chief rôle.

Mystic Science.—In reference to scientific questions S. W. put forward numerous suggestions. Generally towards the end of the séances there was talk and debate about various subjects of scientific and spiritistic nature. S. W. never took part in the discussion, but generally sat dreamily in a corner in a semi-somnambolic state. She listened to one and another, taking hold of the talk in a half-dream, but she could never relate anything connectedly; if asked about it only partial explanations were given. In the course of the winter hints emerged in various séances: "The spirits taught her about the world-forces and the strange revelations from the other side, yet she would not tell anything now." Once she tried to give a description, but only said: "On one side was the light, on the other the power of attraction." Finally, in March 1900, when for some time nothing had been heard of the teachings at the séances, she announced suddenly with a joyful face that she had now received everything from the spirits. She drew out a long narrow strip of paper upon which were numerous names. Although I asked for it she would not let it leave her hands, but dictated the following scheme to me.

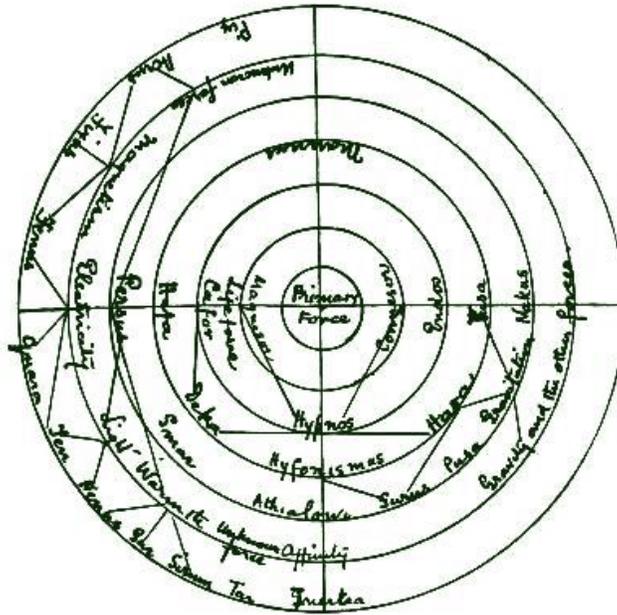

FIG. 1.

I can remember clearly that in the course of the winter of 1895 we spoke several times in S. W.'s presence of the forces of attraction and repulsion in connection with Kant's "Natural History of the Heavens"; we spoke also of the "Law of the Conservation of Energy," of the different forces of energy, and of the question whether the force of gravity was perhaps a form of movement. From this talk S. W. had plainly created the foundation of her mystic system. She gave the following explanation: The natural forces are arranged in seven circles. Outside these circles are three more, in which unknown forces intermediate between energy and matter are found. Matter is found in seven circles which surround ten inner ones. In the centre stands the primary force, which is the original cause of creation and is a spiritual force. The first circle which surrounds the primary force is matter which is not really a force and does not arise from the primary force, but it unites with the primary force and from this union the first descendants are the spiritual forces; on the one hand the Good or Light Powers, on the other the Dark Powers. The Power Magnesor consists most of primary force; the Power Connesor, in which the dark might of matter is greatest, contains the least. The further outwards the primary force streams forth, the weaker it becomes, but weaker too becomes the power of matter, since its power is greatest where the collision with the primary power is most violent, *i.e.* in the Power Connesor. Within the circles there are fresh analogous forces of equal strength but making in the opposite direction. The system can also be described in a single series beginning with primary force, Magnesor, Cafor, etc., proceeding from left to right on the scheme and ascending with Tusa, Endos, ending with Connesor; only then the survey of the grade of intensity is made more difficult. Every force in the outer circle is combined from the nearest adjacent forces of the inner circle.

1. *The Magnesor Group.*—The so-called powers of Light descend in direct line from Magnesor, but slightly influenced by the dark side. The powers Magnesor and Cafor form together the so-called Life Force, which is no single power but is differently combined in animals and plants. Between Magnesor and Cafor there exists the Life Force of Man. Morally

good men and those mediums who bring about interviews of good spirits on the earth have most Magnesor. Somewhere about the middle there stand the life forces of animals, and in Cafor that of plants. Nothing is known about Hefa, or rather S. W. can give no information. Persus is the fundamental power which comes to light in the phenomenon of the forces of locomotion. Its recognisable forces are Warmth, Light, Electricity, Magnetism, and two unknown forces, one of which only exists in comets. Of the powers of the seventh circle S. W. could only point out north and south magnetism and positive and negative electricity. *Deka* is unknown. *Smar* is of peculiar significance, to be indicated below; it leads to—

2. *Hypnos Group*.—*Hypnos* and *Hyfonismus* are powers which only dwell within certain beings, in those who are in a position to exert a magnetic influence upon others. *Athialowi* is the sexual instinct. Chemical affinity is directly derived from it. In the ninth circle under it arises indolence (that is the line of *Smar*). *Svens* and *Kara* are of unknown significance. *Pusa* corresponds to *Smar* in the opposite sense.

3. *The Connesor Group*.—Connesor is the opposite pole of Magnesor. It is the dark and wicked power equal in intensity to the good power of light. While the good power creates, this one turns into the opposite. Endos is an elemental power of minerals. From these (significance unknown) gravitation proceeds, which on its side is designated as the elemental force of the forces of resistance that occur in phenomena (gravity, capillarity, adhesion and cohesion). Nakus is the secret power of a rare stone which controls the effect of snake poison. The two powers *Smar* and *Pusa* have a special importance. According to S. W., *Smar* develops in the bodies of morally good men at the moment of death. This power enables the soul to rise to the powers of light. *Pusa* behaves in the opposite way, for it is the power which conducts morally bad people to the dark side in the state of Connesor.

In the sixth circle the visible world begins, which only appears to be so sharply divided from the other side in consequence of the fickleness of our organs of sense. In reality the transition is a very gradual one, and there are people who live on a higher stage of knowledge because their perceptions and sensations are more delicate than those of others. Great seers are enabled to see manifestations of force where ordinary people can perceive nothing. S. W. sees Magnesor as a white or bluish vapour, which chiefly develops when good spirits are near. Connesor is a dark vapour-like fluid, which, like Magnesor, develops on the appearance of "black" spirits. For instance, the night before the beginning of great visions the shiny vapour of Magnesor spreads in thick layers, out of which, the good spirits grow to visible white forces. It is just the same with Connesor. But these powers have their different mediums. S. W. is a Magnesor medium, as were the Prophetess of Prevorst and Swedenborg. The materialisation mediums of the spiritualists are mostly Connesor mediums, because materialisation takes place much more easily through Connesor on account of its close connection with the properties of matter. In the summer of 1900 S. W. tried several times to produce the circles of matter, but she never arrived at other than vague and incomprehensible hints and afterwards spoke no more about this.

Conclusion.—The really interesting and valuable séances came to an end with the production of the system of powers. Before this a gradual decline in the vividness of the ecstasies was noticeable. Ulrich von Gerbenstein came increasingly to the front, and filled up the séances with his childish chatter. The visions which S. W. had in the meantime likewise seem to have lost vividness and plasticity of formation, for S. W. was afterwards only able to feel pleasant

sensations in the presence of good spirits, and disagreeableness in that of bad spirits. Nothing new was produced. There was something of uncertainty in the trance talks, as if feeling and seeking for the impression which she was making upon the audience, together with an increasing staleness in the content. In the outward behaviour of S. W. there arose also a marked shyness and uncertainty, so that the impression of wilful deception became ever stronger. The writer therefore soon withdrew from the séances. S. W. experimented afterwards in other circles, and six months after my leaving was caught cheating *in flagranti delicto*. She wanted to arouse again by spiritualistic experiments the lost belief in her supernatural powers; she concealed small objects in her dress, throwing them up in the air during the dark séance. With this her part was played out. Since then, eighteen months have passed during which I have not seen S. W. I have learnt from an observer who knew her in the earlier days, that she has now and again strange states of short duration during which she is very pale and silent, and has a fixed glittering look. I did not hear any more of visions. She is said not to take part any longer in spiritualistic séances. S. W. is now in a large business, and according to all accounts is an industrious and responsible person who does her work eagerly and cleverly, giving entire satisfaction. According to the account of trustworthy persons, her character has much improved; she has become quieter, more regular and sympathetic. No other abnormalities have appeared in her. This case, in spite of its incompleteness, contains a mass of psychological problems whose exposition goes far beyond the limits of this little work. We must therefore be satisfied with a mere sketch of the various striking manifestations. For the sake of a more lucid exposition it seems better to review the various states separately.

1. The *Waking State*.—Here the patient shows various peculiarities. As we have seen, at school she was often distracted, lost herself in a peculiar way, was moody; her behaviour changes inconsequently, now quiet, shy, reserved, now lively, noisy and talkative. She cannot be called unintelligent, but she strikes one sometimes as narrow-minded, sometimes as having isolated intelligent moments. Her memory is good on the whole, but owing to her distraction it is much impaired. Thus, despite much discussion and reading of Kerner's "Seherin von Prevorst," for many weeks, she does not know, if directly asked, whether the author's name is *Koerner* or *Kerner*, nor the name of the Prophetess. All the same, when it occasionally comes up, the name *Kerner* is correctly written in the automatic communications. In general it may be said that her character has something extremely impulsive, incomprehensible, protean. Deducting the want of balance due to puberty, there remains a pathological residue which expresses itself in reactions which follow no rule and a bizarre unaccountable character. This character may be called *déséquilibré*, or unstable. Its specific mould is derived from traits which can certainly be regarded as hysterical. This is decidedly so in the conditions of distraction. As Janet^[22] maintains, the foundation of hysterical anæsthesia is the loss of attention. He was able to prove in youthful hysterics "a striking indifference and distracted attention in the whole region of the emotional life." Misreading is a notable instance, which beautifully illustrates hysterical dispersion of attention. The psychology of this process may perhaps be viewed as follows: during reading aloud attention becomes paralysed for this act and is directed towards some other object. Meanwhile the reading is continued mechanically, the sense impressions are received as before, but in consequence of the dispersion the excitability of the perceptive centre is lowered, so that the strength of the sense impression is no longer adequate to fix the attention in such a way that perception as such is conducted

along the motor speech route; thus all the inflowing associations which at once unite with any new sense impression are repressed. The further psychological mechanism permits of only two possible explanations: (1) The admission of the sense impression is received unconsciously (because of the increase of threshold stimulus), in the perceptive centre just below the threshold of consciousness, and consequently is not incorporated in the attention and conducted back to the speech route. It only reaches verbal expression through the intervention of the nearest associations, in our case through the dialect expression^[23] for the object. (2) The sense impression is perceived consciously, but at the moment of its entrance into the speech route it reaches a territory whose excitability is diminished by the dispersion of attention. At this place the dialect word is substituted by association for the motor speech image, and it is uttered as such. In either case it is certain that it is the acoustic dispersed attention which fails to correct the error. Which of the two explanations is correct cannot be proved in this case; probably both approach the truth, for the dispersion of attention seems to be general, and in each case concerns more than one of the centres engaged in the act of reading aloud. In our case this phenomenon has a special value, for we have here a quite elementary automatic phenomenon. It may be called hysterical in so far as in this concrete case a state of exhaustion and intoxication, with its parallel manifestations, can be excluded. A healthy person only exceptionally allows himself to be so engaged by an object that he fails to correct the errors of a dispersed attention—those of the kind described. The frequency of these occurrences in the patient point to a considerable limitation of the field of consciousness, in so far as she can only master a relative minimum of elementary sensations flowing in at the same time. If we wish to describe more exactly the psychological state of the "psychic shady side," we might call it either a sleeping or a dream-state, according as passivity or activity predominated. There is, at all events, a pathological dream-state of very rudimentary extension and intensity and its genesis is spontaneous; dream-states arising spontaneously, with the production of automatisms, are generally regarded as hysterical on the whole. It must be pointed out that these instances of misreading occurred frequently in our subject, and that the term hysterical is employed in this sense; so far as we know, it is only on a foundation of hysterical constitution that spontaneous states of partial sleep or dreams occur frequently.

Binet^[24] has studied experimentally the automatic substitution of some adjacent association in his hysterics. If he pricked the anæsthetic hand of the patient without his noticing the prick, he thought of "points"; if the anæsthetic finger was moved, he thought of "sticks" or "columns." When the anæsthetic hand, concealed from the patient's sight by a screen, writes "Salpêtrière," she sees in front of her the word "Salpêtrière" in white writing on a black ground. This recalls the experiments above referred to of Guinon and Sophie Waltke.

We thus find in our subject, at a time when there was nothing to indicate the later phenomena, rudimentary automatisms, fragments of dream manifestations, which imply in themselves the possibility that some day more than one association would creep in between the perception of the dispersed attention and consciousness. The misreading shows us, moreover, a certain automatic independence of the psychical elements. This occasionally expands to a more or less fleeting dispersion of attention, although with very slight results which are never in any way striking or suspicious; this dispersedness approximates to that of the physiological dream. The misreading can be thus conceived as a prodromal symptom of the later events;

especially as its psychology is prototypical for the mechanism of somnambolic dreams, which are indeed nothing but a many-sided multiplication and manifold variation of the elementary processes reviewed above. I never succeeded in demonstrating during my observations similar rudimentary automatisms. It would seem that in course of time the states of dispersed attention, to a certain extent beneath the surface of consciousness, at first of low degree have grown into these remarkable somnambolic attacks; hence they disappeared during the waking state, which was free from attacks. So far as concerns the development of the patient's character, beyond a certain not very extensive ripening, no remarkable change could be demonstrated during the observations lasting nearly two years. More remarkable is the fact that in the two years since the cessation (complete?) of the somnambolic attacks, a considerable change in character has taken place. We shall have occasion later on to speak of the importance of this observation.

Semi-Somnambulism.—In S. W.'s case the following condition was indicated by the term semi-somnambulism. For some time after and before the actual somnambolic attack the patient finds herself in a state whose most salient feature can best be described as "preoccupation." She only lends half an ear to the conversation around her, answers at random, often gets absorbed in all manner of hallucinations; her face is solemn, her look ecstatic, visionary, ardent. Closer observation discloses a far-reaching alteration of the entire character. She is now serious, dignified; when she speaks her subject is always an extremely serious one. In this condition she can talk so seriously, forcibly and convincingly, that one is tempted to ask oneself if this is really a girl of fifteen and a half. One has the impression of a mature woman possessed of considerable dramatic talent. The reason for this seriousness, this solemnity of behaviour, is given in her explanation that at these times she stands at the frontier of this world and the other, and associates just as truly with the spirits of the dead as with living people. And, indeed, her conversation is usually divided between answers to real objective questions and hallucinatory ones. I call this state semi-somnambulism because it coincides with Richet's own definition. He^[25] says: "La conscience de cet individu persiste dans son intégrité apparente, toutefois des opérations très compliquées vont s'accomplir en dehors de la conscience sans que le moi volontaire et conscient paraisse ressentir une modification quelconque. Une autre personne sera en lui qui agira, pensera, voudra, sans que la conscience, c'est à dire le moi réfléchi conscient, aît la moindre notion."

Binet^[26] says of this term: "Le terme indique la parenté de cet état avec le somnambulisme véritable, et en suite il laisse comprendre que la vie somnambulique qui se manifeste durant la veille est réduite, déprimée, par la conscience normale qui la recouvre."

AUTOMATISMS.

Semi-somnambulism is characterised by the continuity of consciousness with that of the waking state and by the appearance of various automatisms which give evidence of an activity of the subconscious self, independent of that of consciousness.

Our case shows the following automatic phenomena:

- (1) Automatic movements of the table.

(2) Automatic writing.

(3) Hallucinations.

1. *Automatic Movements of the Table.*—Before the patient came under my observation she had been influenced by the suggestion of "table-turning," which she had first come across as a game. As soon as she entered the circle there appeared communications from members of her family which showed her to be a medium. I could only find out that, as soon as ever her hand was placed on the table, the typical movements began. The resulting communications have no interest for us. But the automatic character of the act itself deserves some discussion, for we may, without more ado, set aside the imputation that there was any question of intentional and voluntary pushing or pulling on the part of the patient.

As we know from the investigations of Chevreul,^[27] Gley, Lehmann and others, unconscious motor phenomena are not only of frequent occurrence among hysterical persons, and those pathologically inclined in other directions, but they are also relatively easily produced in normal persons who show no other spontaneous automatism. I have made many experiments on these lines, and can confirm this observation. In the great majority of instances all that is required is enough patience to put up with an hour of quiet waiting. In most subjects, motor automatism will be obtained in a more or less high degree if contra-suggestions do not intervene as obstacles. In a relatively small percentage the phenomena arise spontaneously, *i.e.* directly under the influence of verbal suggestion or of some earlier auto-suggestion. In this instance the case is powerfully affected by suggestion. In general, the particular predisposition is subject to all those laws which also hold good for normal hypnosis. Nevertheless, certain special circumstances are to be taken into account, conditioned by the peculiarity of the case. It is not a question of a total hypnosis, but of a partial one, limited entirely to the motor area of the arm, like the cerebral anæsthesia produced by "magnetic passes" for a painful spot in the body. We touch the spot in question employing verbal suggestion or making use of some existing auto-suggestion, using the tactile stimulus which we know acts suggestively, to bring about the desired partial hypnosis. In accordance with this procedure, refractory subjects can be brought easily enough to an exhibition of automatism. The experimenter intentionally gives the table a slight push, or, better, a series of rhythmic but very slight taps. After a short time he notices that the oscillations become stronger, that they continue although he has interrupted his own intentional movements. The experiment has succeeded, the subject has unsuspectingly taken up the suggestion. By this procedure much more is obtained than by verbal suggestion. In very receptive persons and in all those cases where movement seems to arise spontaneously, the purposeful tremulous movements,^[28] not perceptible by the subject, assume the *rôle* of *agent provocateur*.

In this way persons who, by themselves, have never obtained automatic movements of a coarse calibre, sometimes assume the unconscious guidance of the table-movements, provided that the tremors are strong and that the medium understands their meaning. In this case the medium takes control of the slight oscillations and returns them considerably strengthened, but rarely at exactly the same instant, generally a few seconds later, in this way revealing the agent's conscious or unconscious thought. By means of this simple mechanism there may arise those cases of thought-reading so bewildering at first sight. A very simple experiment, that succeeds in many cases even with unpractised persons, will serve to illustrate

this. The experimenter thinks, say, of the number *four*, and then waits, his hands quietly resting on the table, until he feels that the table makes the first inclination to announce the number thought of. He lifts his hands off the table immediately, and the number *four* will be correctly tilted out. It is advisable in this experiment to place the table upon a soft thick carpet. By close attention the experimenter will occasionally notice a movement of the table which is thus represented.

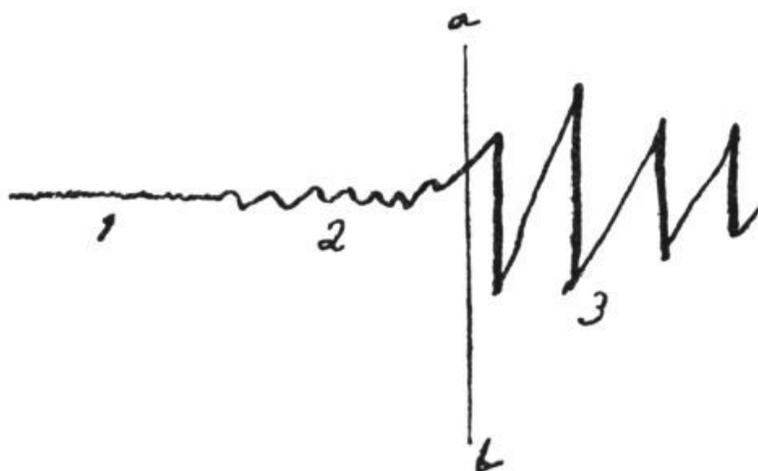

FIG. 2.

- (1) Purposeful tremors too slight to be perceived by the subject.
- (2) Several very small but perceptible oscillations of the table which indicate that the subject is responding to them.
- (3) The big movements (tilts) of the table, giving the number four that was thought of.
- (ab) Denotes the moment when the operator's hands are removed.

This experiment succeeds excellently with well-disposed but inexperienced subjects. After a little practice the phenomenon indicated is wont to disappear, since by practice the number is read and reproduced directly from the purposeful movements.^[29]

In a responsive medium these purposeful tremors of the experimenter act just as the intentional taps in the experiment cited above; they are received, strengthened and reproduced, although slightly wavering. Still they are perceptible and hence act suggestively as slight tactile stimuli, and by the increase of partial hypnosis give rise to great automatic movements. This experiment illustrates in the clearest way the increase step by step of auto-suggestion. Along the path of this auto-suggestion are developed all the automatic phenomena of a motor nature. How the intellectual content gradually mingles in with the purely motor need scarcely be elucidated after this discussion. There is no need of a special suggestion for the evoking of intellectual phenomena. From the outset it is a question of word-presentation, at least from the side of the experimenter. After the first aimless motor irrelevancies of the unpractised subject, some word-products or the intentions of the experimenter are soon reproduced. Objectively the occurrence of an intellectual content must be understood as follows:—

By the gradual increase of auto-suggestion the motor-range of the arm becomes isolated from consciousness, that is to say, the perception of the slight movement-impulse is concealed from consciousness.^[30]

By the knowledge gained from consciousness that some intellectual content is possible, there results a collateral excitation in the speech-area as the means immediately at hand for intellectual notification. The motor part of word-presentation is necessarily chiefly concerned with this aiming at notification.^[31] In this way we understand the unconscious flowing over of speech-impulse to the motor-area^[32] and conversely the gradual penetration of partial hypnosis into the speech-area.

In numerous experiments with beginners, as a rule I have observed at the beginning of intellectual phenomena a relatively large number of completely meaningless words, also often a series of meaningless single letters. Later on, all kinds of absurdities are produced, *e.g.* words or entire sentences with the letters irregularly misplaced or with the order of the letters all reversed—a kind of mirror-writing. The appearance of the letter or word indicates a new suggestion; some sort of association is involuntarily joined to it, which is then realised. Remarkably enough, these are not generally the conscious associations, but quite unexpected ones, a circumstance showing that a considerable part of the speech-area is already hypnotically isolated. The recognition of this automatism again forms a fruitful suggestion, since invariably at this moment the feeling of strangeness arises, if it is not already present in the pure motor-automatism. The question, "Who is doing this?" "Who is speaking?", is the suggestion for the synthesis of the unconscious personality which as a rule does not like being kept waiting too long. Any name is introduced, generally one charged with emotion, and the automatic splitting of the personality is accomplished. How accidental and how vacillating this synthesis is at its beginning, the following reports from the literature show. Myers^[33] communicates the following interesting observation on a Mr. A., a member of the Society for Psychical Research, who was making experiments on himself in automatic writing.

THIRD DAY.

Question: What is man?

Answer: TEFI H HASL ESBLE LIES.

Is that an anagram? Yes.

How many words does it contain? Five.

What is the first word? SEE.

What is the second word? SEEEE.

See? Shall I interpret it myself? Try to.

Mr. A. found this solution: "Life is less able." He was astonished at this intellectual information, which seemed to him to prove the existence of an intelligence independent of his own. Therefore he went on to ask:

Who are you? Clelia.
Are you a woman? Yes.
Have you ever lived upon the earth? No.
Will you come to life? Yes.
When? In six years.
Why are you conversing with me? E if Clelia el.
Mr. A. interpreted this answer as: I Clelia feel.

FOURTH DAY.

Question: Am I the one who asks the questions? Yes.
Is Clelia there? No.
Who is here then? Nobody.
Does Clelia exist at all? No.
With whom then was I speaking yesterday? With no one.

Janet^[34] conducted the following conversation with the subconsciousness of Lucie, who, meanwhile, was engaged in conversation with another observer. "M'entendez-vous?" asks Janet. Lucie answers by automatic writing, "Non." "Mais pour répondre il faut entendre?" "Oui, absolument." "Alors comment faites-vous?" "Je ne sais." "Il faut bien qu'il y ait quelqu'un qui m'entend?" "Oui." "Qui cela! Autre que Lucie. Eh bien! Une autre personne. Voulez-vous que nous lui donnions un nom?" "Non." "Si, ce sera plus commode," "Eh bien, Adrienne!" "Alors, Adrienne, m'entendez-vous?" "Oui."

From these quotations it will be seen in what way the subconscious personality is constructed. It owes its origin purely to suggestive questions meeting a certain disposition of the medium. The explanation is the result of the disintegration of the psychical complex; the feeling of the strangeness of such automatism then comes in to help, as soon as conscious attention is directed to the automatic act. Binet^[35] remarks on this experiment of Janet's: "Il faut bien remarquer que si la personnalité d'Adrienne a pu se créer, c'est qu'elle a rencontré une possibilité psychologique; en d'autres termes, il y avait là des phénomènes désagrégés vivant séparés de la conscience normale du sujet." The individualisation of the subconsciousness always denotes a considerable further step of great suggestive influence upon the further formation of automatism.^[36] So, too, we must regard the origin of the unconscious personalities in our case.

The objection that there is simulation in automatic table-turning may well be given up, when one considers the phenomenon of thought-reading from the purposeful tremors which the patient offered in such plenitude. Rapid, conscious thought-reading demands at the least an extraordinary degree of practice, which it has been shown the patient did not possess. By

means of the purposeful tremors whole conversations can be carried on, as in our case. In the same way the suggestibility of the subconscious can be proved objectively if, for instance, the experimenter with his hand on the table desires that the hand of the medium should no longer be able to move the table or the glass; contrary to all expectation and to the liveliest astonishment of the subject, the table will immediately remain immovable. Naturally any other desired suggestions can be realised, provided they do not overstep by their innervations the region of partial hypnosis; this proves at the same time the limited nature of the hypnosis. Suggestions for the legs and the other arm will thus not be obeyed. Table-turning was not an automatism which belonged exclusively to the patient's semi-somnambulism: on the contrary, it occurred in the most pronounced form in the waking state, and in most cases then passed over into semi-somnambulism, the appearance of this being generally announced by hallucinations, as it was at the first sitting.

2. *Automatic Writing*.—A second automatic phenomenon, which at the outset corresponds to a higher degree of partial hypnosis, is automatic writing. It is, according to my experience, much rarer and more difficult to produce than table-turning. As in table-turning, it is again a matter of a primary suggestion, to the conscious when sensibility is retained, to the unconscious when it is obliterated. The suggestion is, however, not a simple one, for it already bears in itself an intellectual element. "To write" means "to write something." This special element of the suggestion, which extends beyond the merely motor, often conditions a certain perplexity on the part of the subject, giving rise to slight contrary suggestions which hinder the appearance of the automatisms. I have observed in a few cases that the suggestion is realised, despite its relative venturesomeness (*e.g.* one directed towards the waking consciousness of a so-called normal person). However, it takes place in a peculiar way; it first displaces the purely motor part of the central system concerned in hypnosis, and the deeper hypnosis is then reached by auto-suggestion from the motor phenomenon, analogous to the procedure in table-turning described above. The subject,^[37] who has a pencil in his hand, is purposely engaged in conversation whilst his attention is diverted from the writing. The hand begins to make movements, beginning with many upward strokes and zigzag lines, or a simple line is made. Occasionally it happens that the pencil does not touch the paper, but writes in the air. These movements must be conceived as purely motor phenomena, which correspond to the expression of the motor element in the presentation "write." This phenomenon is somewhat rare; generally single letters are first written, and what was said above of table-turning holds true of their combination into words and sentences. True mirror-writing is also observed here and there. In the majority of cases, and perhaps in all experiments with beginners who are not under some very special suggestion, the automatic writing is that of the subject. Occasionally its character may be greatly changed,^[38] but this is secondary, and is always to be regarded as a symptom of the intruding synthesis of a subconscious personality.

FIG. 3.

As stated, the patient's automatic writing never came to any very great development. In these experiments, generally carried out in darkness, she passed over into semi-somnambulism, or into ecstasy. The automatic writing had thus the same effect as the preliminary table-turning.

3. *The Hallucinations.*—The nature of the passing into somnambulism in the second séance is of psychological importance. As stated, the automatic phenomena were progressing favourably when darkness came on. The most interesting event of this séance, so far, was the brusque interruption of the communication from the grandfather, which was the starting-point of various debates amongst the members of the circle. These two momentous occurrences, the darkness and the striking event, seem to have been the foundation for a rapid deepening of hypnosis, in consequence of which the hallucinations could be developed. The psychological mechanism of this process seems to be as follows. The influence of darkness upon the suggestibility of the sense-organs is well known.^[39] Binet^[40] states that it has a special influence on hysterics, producing a state of sleepiness. As is clear from the foregoing, the patient was in a state of partial hypnosis and had constituted herself one with the unconscious personality in closest relationship to her in the domain of speech. The automatic expression of this personality is interrupted most unexpectedly by a new person, of whose existence no one had any suspicion. Whence came this cleavage? Obviously the eager expectation of this first séance had very much occupied the patient. Her reminiscences of me and my family had probably grouped themselves around this expectation; hence these suddenly come to light at the climax of the automatic expression. That it was just my grandfather and no one else—not, *e.g.*, my deceased father, who, as she knew, was much closer to me than the grandfather whom I had never known—perhaps suggests where the origin of this new person is to be sought. It is probably a

dissociation of the personality already present which seized upon the material next at hand for its expression, namely, upon the associations concerning myself. How far this is parallel to the experiences revealed by dream investigation (Freud's^[41]) must remain undecided, for we have no means of judging how far the effect mentioned can be considered a "repressed" one. From the brusque interruption of the new personality, we may conclude that the presentations concerned were very vivid, with corresponding intensity of expectation. This perhaps was an attempt to overcome a certain maidenly shyness and embarrassment. This event reminds us vividly of the manner in which the dream presents to consciousness, by a more or less transparent symbolism, things one has never said to oneself clearly and openly. We do not know when this dissociation of the new personality occurred, whether it had been slowly prepared in the unconscious, or whether it first occurred in the séance. In any case, this event meant a considerable increase in the extension of the unconscious sphere rendered accessible through the hypnosis. At the same time this event must be regarded as powerfully suggestive in regard to the impression which it made upon the waking consciousness of the patient. For the perception of this unexpected intervention of a new power must inevitably excite a feeling of the strangeness of the automatisms, and would easily suggest the thought that an independent spirit is here making itself known. Hence the intelligible association that she would finally be able to see this spirit. The situation that ensued at the second séance is to be explained by the coincidence of this energising suggestion with the heightened suggestibility conditioned by the darkness. The hypnosis, and with it the series of dissociated presentations, break through to the visual area, and the expression of the unconscious, hitherto purely motor, is made objective, according to the measure of the specific energy of the new system, in the shape of visual images with the character of hallucinations; not as a mere accompanying phenomenon of the word-automatism, but as a substituted function. The explanation of the situation that arose in the first séance, at that time unexpected and inexplicable, is no longer presented in words, but as a descriptive allegorical vision. The sentence "they do not hate one another, but are friends," is expressed in a picture. We often encounter events of this kind in somnambulism. The thinking of somnambulists is given in plastic images which constantly break into this or that sense-sphere and are made objective in hallucinations. The process of

reflection sinks into the subconscious; only its end-results arise to consciousness either as presentations vividly tinged by the senses, or directly as hallucinations. In our case the same thing occurred as in the patient whose anæsthetic hand Binet pricked nine times, making her think of the figure 9; or as in Flournoy's^[42] Helen Smith, who, when asked during business-hours about certain patterns, suddenly saw the number of days (18) for which they had been lent, at a length of 20 mm. in front of her. The further question arises, why does the automatism appear in the visual and not in the acoustic sphere? There are several grounds for this choice of the visual sphere.

- (1) The patient is not gifted acoustically; she is, for instance, very unmusical.
- (2) There was no stillness corresponding to the darkness which might have favoured the appearance of sounds; there was a lively conversation.
- (3) The increased conviction of the near presence of spirits, because the automatism felt so strange, could easily have aroused the idea that a spirit might be seen, thus causing a slight excitation of the visual sphere.
- (4) The entoptic phenomena in darkness favoured the occurrence of hallucinations.

The reasons (3) and (4)—the entoptic phenomena in the darkness and the probable excitation of the visual sphere—are of decisive importance for the appearance of hallucinations. The entoptic phenomena in this case play the same rôle in the auto-suggestion, the production of the automatism, as the slight tactile stimuli in hypnosis of the motor centre. As stated, flashes preceded the first hallucinatory twilight-state. Obviously attention was already at a high pitch, and directed to visual perceptions, so that the retina's own light, usually very weak, was seen with great intensity. The part played by entoptic perceptions of light in the origin of hallucinations deserves further consideration. Schüle^[43] says: "The swarming of light and colour which stimulates and animates the field of vision, although in the dark, supplies the material for phantastic figures in the air before falling asleep. As we know, absolute darkness is never seen; a few particles of the dark field of vision are always illumined; flecks of light move here and there, and combine into all kinds of figures; it only needs a moderately active

imagination to create out of them, as one does out of clouds, certain known figures. The power of reasoning, fading as one falls asleep, leaves phantasy free play to construct very vivid figures. In the place of the light spots, haziness and changing colours of the dark visual field, there arise definite outlines of objects."^[44]

In this way hypnagogic hallucinations arise. The chief *rôle* naturally belongs to the imagination, hence imaginative people in particular are subject to hypnagogic hallucinations.^[45] The hypnopompic hallucinations described by Myers arise in the same way.

It is highly probable that hypnagogic pictures are identical with the dream-pictures of normal sleep—forming their visual foundation. Maury^[46] has proved from self-observation that the pictures which hovered around him hypnagogically were also the objects of the dreams that followed. G. Trumbull Ladd^[47] has shown this even more convincingly. By practice he succeeded in waking himself suddenly two to five minutes after falling asleep. He then observed that the figures dancing before the retina at times represented the same contours as the pictures just dreamed of. He even states that nearly every visual dream is shaped by the retina's own light-figures. In our case the fantastic rendering of these pictures was favoured by the situation. We must not underrate the influence of the over-excited expectation which allowed the dull retina-light to appear with increased intensity.^[48] The further formation of the retinal appearances follows in accordance with the predominating presentations. That hallucinations appear in this way has been also observed in other visionaries. Jeanne d'Arc^[49] first saw a cloud of light, and only after some time there stepped forth St. Michael, St. Catherine and St. Margaret. For a whole hour Swedenborg^[50] saw nothing but illuminated spheres and fiery flames. He felt a mighty change in the brain, which seemed to him "release of light." After the space of one hour he suddenly saw red figures which he regarded as angels and spirits. The sun visions of Benvenuto Cellini^[51] in Engelsburg are probably of the same nature. A student who frequently saw apparitions stated: "When these apparitions come, at first I only see single masses of light and at the same time am conscious of a dull noise in the ears. Gradually these contours become clear figures."

The appearance of hallucinations occurred in a quite classical way in Flournoy's Helen Smith. I quote the cases in question from his article.^[52]

"18 Mars. Tentative d'expérience dans l'obscurité. Mlle. Smith voit un ballon tantôt lumineux, tantôt s'obscurcissant.

"25 Mars. Mlle. Smith commence à distinguer de vagues lueurs, de longs rubans blancs, s'agitant du plancher au plafond, puis enfin une magnifique étoile qui dans l'obscurité s'est montrée à elle seule pendant toute la séance.

"1 Avril. Mlle. Smith se sent très agitée, elle a des frissons, est partiellement glacée. Elle est très inquiète et voit tout à coup se balançant au-dessus de la table une figure grimaçante et très laide avec de longs cheveux rouges. Elle voit alors un magnifique bouquet de roses de nuances diverses; tout à coup elle voit sortir de dessous le bouquet un petit serpent, qui, rampant doucement, vient sentir les fleurs, les regarde," etc.

Helen Smith^[53] says in regard to the origin of her vision of March:

"La lueur rouge persista autour de moi et je me suis trouvée entourée de fleurs extraordinaires."

At all times the complex hallucinations of visionaries have occupied a peculiar place in scientific criticism. Macario^[54] early separated these so-called intuition-hallucinations from others, since he maintains that they occur in persons of an eager mind, deep understanding and high nervous excitability. Hecker^[55] expresses himself similarly but more enthusiastically.

His view is that their condition is "the congenital high development of the spiritual organ which calls into active, free and mobile play the life of the imagination, bringing it spontaneous activity." These hallucinations are "precursors or signs of mighty spiritual power." The vision is "an increased excitation which is harmoniously adapted to the most complete health of mind and body." The complex hallucinations do not belong to the waking state, but prefer as a rule a partial waking state. The visionary is buried in his vision even to complete annihilation. Flournoy was also always able to prove in the visions of H.S. "un certain degré d'obnubilation." In our case the vision is complicated by a state of sleep whose peculiarities we shall review later.

THE CHANGE IN CHARACTER.

The most striking characteristic of the second stage in our case is the change in character. We meet many cases in the literature which have offered the symptom of spontaneous character-change. The first case in a scientific publication is Weir-Mitchell's^[56] case of Mary Reynolds.

This was the case of a young woman living in Pennsylvania in 1811. After a deep sleep of about twenty hours she had totally forgotten her entire past and everything she had learnt; even the words she spoke had lost their meaning. She no longer knew her relatives. Slowly she re-learnt to read and write, but her writing was from right to left. More striking still was the change in her character. Instead of being melancholy, she was now cheerful in the extreme. Instead of being reserved, she was buoyant and sociable. Formerly taciturn and retiring, she was now merry and jocose. Her disposition was totally changed.^[57]

In this state she renounced her former retired life and liked to undertake adventurous excursions unarmed, through wood and mountain, on foot and horseback. In one of these excursions she encountered a large black bear, which she took for a pig. The bear raised himself on his hind legs and gnashed his teeth at her. As she could not drive her horse on any further, she took an ordinary stick and hit the bear until it took to flight. Five weeks later, after a deep sleep, she returned to her earlier state with amnesia for the interval. These states alternated for about sixteen years. *But her last twenty-five years Mary Reynolds passed exclusively in her second state.*

Schroeder von der Kalk^[58] reports on the following case: The patient became ill at the age of sixteen with periodic amnesia, after a previous tedious illness of three years. Sometimes in the morning after waking she passed through a peculiar choreic state, during which she made rhythmical movements with her arms. Throughout the whole day she would then exhibit a childish, silly behaviour and lost all her educated capabilities. (When normal she is very intelligent, well-read, speaks French well.) In the second state she begins to speak faulty French. On the second day she is again at times normal. The two states are completely separated by amnesia.^[59]

Hoefelt^[60] reports on a case of spontaneous somnambulism in a girl who, in her normal state, was submissive and modest, but in somnambulism was impertinent, rude and violent. Azam's^[61] Felida was, in her normal state, depressed, inhibited, timid; and in the second state lively, confident, enterprising to recklessness. *The second state gradually became the chief one, and finally so far suppressed the first state that the patient called her normal states, lasting now but a short time, "crises."* The amnesic attacks had begun at 14½. In time the second state became milder and there was a certain approximation between the character of the two states. A very striking example of change in character is that worked out by Camuset, Ribot, Legrand du Saulle, Richer, Voisin, and put together by Bourru and Burot.^[62] It is that of Louis V., a severe male hysteric with amnesic alternating character. In the first stage he is rude, cheeky, querulous, greedy, thievish, inconsiderate. In the second state he is an agreeable, sympathetic character, industrious, docile and obedient. This amnesic change of character has been used by Paul Lindau^[63] in his drama "Der Andere" (The Other One).

Rieger^[64] reports on a case parallel to Lindau's criminal lawyer. The unconscious personalities of Janet's Lucie and Léonie (Janet, *l.c.*) and Morton Prince's^[65] may also be regarded as parallel with our case. There are, however, therapeutic artificial products whose importance lies in the domain of the dissociation of consciousness and of memory.

In the above cases, the second state is always separated from the first by an amnesic dissociation, and the change in character is, at times, accompanied by a break in the continuity of consciousness. In our case there is no amnesic disturbance; the passage from the first to the second stage follows quite gradually and the continuity of consciousness remains. The patient carries out in her waking state everything, otherwise unknown to her, from the field of the unconscious that she has experienced during hallucinations in the second stage.

Periodic changes in personality without amnesic dissociation are found in the region of *folie circulaire*, but are rarely seen in hysterics, as Renaudin's^[66] case shows. A young man, whose behaviour had always been excellent, suddenly began to display the worst tendencies. There were no symptoms of insanity, but, on the other hand, the whole surface of the body

was anæsthetic. This state showed periodic intervals, and in the same way the patient's character was subject to vacillations. As soon as the anæsthesia disappeared he was manageable and friendly. When the anæsthesia returned he was overcome by the worst instincts, which, it was observed, even included the wish to murder.

Remembering that our patient's age at the beginning of the disturbances was 14-1/2, that is, the age of puberty had just been reached, one must suppose that there was some connection between the disturbances and the physiological character-changes at puberty. "There appears in the consciousness of the individual during this period of life a new group of sensations, together with the feelings and ideas arising therefrom; this continuous pressure of unaccustomed mental states makes itself constantly felt because the cause is always at work; the states are co-ordinated because they arise from one and the same source, and must little by little bring about deep-seated changes in the ego."^[67] Vacillating moods are easily recognisable; the confused new, strong feelings, the inclination towards idealism, to exalted religiosity and mysticism, side by side with the falling back into childishness, all this gives to adolescence its prevailing character. At this epoch the human being first makes clumsy attempts at independence in every direction; for the first time uses for his own purposes all that family and school have contributed hitherto; he conceives ideals, constructs far-reaching plans for the future, lives in dreams whose content is ambitious and egotistic. This is all physiological. The puberty of a psychopathic is a crisis of more serious import. Not only do the psychophysical changes run a stormy course, but features of a hereditary degenerate character become fixed. In the child these do not appear at all, or but sporadically. For the explanation of our case we are bound to consider a specific disturbance of puberty. The reasons for this view will appear from a further study of the second personality. (For the sake of brevity we shall call the second personality IVENES—as the patient baptised her higher ego).

Ivenes is the exact continuation of the everyday ego. She includes the whole of her conscious content. In the semi-somnambulant state her intercourse with the real external world is analogous to that of the waking state, that is, she is influenced by recurrent hallucinations, but no more than persons who are subject to non-confusional psychotic hallucinations. The continuity of Ivenes obviously extends to the hysterical attack with its dramatic scenes,

visionary events, etc. During the attack itself she is generally isolated from the external world; she does not notice what is going on around her, does not know that she is talking loudly, etc. But she has no amnesia for the dream-content of her attack. Amnesia for her motor expressions and for the changes in her surroundings is not always present. That this is dependent upon the degree of intensity of her somnambulant state and that there is sometimes partial paralysis of individual sense organs is proved by the occasion when she did not notice me; her eyes were then open, and most probably she saw the others, although she only perceived me when I spoke to her. This is a case of so-called *systematised anæsthesia* (negative hallucination) which is often observed in hysterics.

Flournoy,^[68] for instance, reports of Helen Smith that during the séances she suddenly ceased to see those taking part, although she still heard their voices and felt their touch; sometimes she no longer heard, although she saw the movements of the lips of the speakers, etc.

Ivenes is just the continuation of the waking self. She contains the entire consciousness of S. W.'s waking state. Her remarkable behaviour tells decidedly against any analogy with cases of *double consciousness*. The characteristics of Ivenes contrast favourably with the patient's ordinary self. She is a calmer, more composed personality; her pleasing modesty and accuracy, her uniform intelligence, her confident way of talking must be regarded as an improvement of the whole being; thus far there is analogy with Janet's Léonie. But this is the extent of the similarity. Apart from the amnesia, they are divided by a deep psychological difference. Léonie II. is the healthier, the more normal; she has regained her natural capabilities, she shows remarkable improvement upon her chronic condition of hysteria. Ivenes rather gives the impression of a more artificial product; there is something thought out; despite all her excellences she gives the impression of playing a part excellently; her world-sorrow, her yearning for the other side of things, are not merely piety but the attributes of saintliness. Ivenes is no mere human, but a mystic being who only partly belongs to reality. The mournful features, the attachment to sorrow, her mysterious fate, lead us to the historic prototype of Ivenes—Justinus Kerner's "Prophetess of Prevorst." Kerner's book must be taken as known, and therefore I omit any references to these common traits. But Ivenes is no copy of the prophetess; she lacks the resignation and the saintly piety of the latter. The prophetess is

merely used by her as a study for her own original conception. The patient pours her own soul into the *rôle* of the prophetess, thus seeking to create an ideal of virtue and perfection. She anticipates her future. She incarnates in Ivenes what she wishes to be in twenty years—the assured, influential, wise, gracious, pious lady. It is in the construction of the second person that there lies the far-reaching difference between Léonie II. and Ivenes. Both are psychogenic. But Léonie I. receives in Léonie II. what really belongs to her, while S. W. builds up a person beyond herself. It cannot be said "she deceives herself" into, but that "she dreams herself" into the higher ideal state.^[69]

The realisation of this dream recalls vividly the psychology of the pathological cheat. Delbruck^[70] and Forel^[71] have indicated the importance of auto-suggestion in the formation of pathological cheating and reverie. Pick^[72] regards intense auto-suggestibility as the first symptom of the hysterical dreamer, making possible the realisation of the "day-dream." One of Pick's patients dreamt that she was in a morally dangerous situation, and finally carried out an attempt at rape on herself; she lay on the floor naked and fastened herself to a table and chairs. Or some dramatic person will be created with whom the patient enters into correspondence by letter, as in Bohn's case.^[73] The patient dreamt herself into an engagement with a totally imaginary lawyer in Nice, from whom she received letters which she had herself written in disguised handwriting. This pathological dreaming, with auto-suggestive deceptions of memory amounting to real delusions and hallucinations, is pre-eminently to be found in the lives of many saints.^[74]

It is only a step from the dreamlike images strongly stamped by the senses to the true complex hallucinations.^[75] In Pick's case, for instance, one sees that the patient, who persuades herself that she is the Empress Elizabeth, gradually loses herself in her dreams to such an extent that her condition must be regarded as a true "twilight" state. Later it passes over into hysterical delirium, when her dream-phantasies become typical hallucinations. The pathological liar, who becomes involved through his phantasies, behaves exactly like a child who loses himself in his play, or like the actor who loses himself in his part.^[76] There is here no fundamental distinction from somnambule dissociation of personality, but only a difference of degree, which rests upon the intensity of the primary auto-

suggestibility or disintegration of the psychic elements. *The more consciousness becomes dissociated, the greater becomes the plasticity of the dream situation, the less becomes the amount of conscious lying and of consciousness in general.* This being carried away by interest in the object is what Freud calls *hysterical identification*. For instance, to Erler's^[77] acutely hysterical patient there appeared hypnagogically little riders made of paper, who so took possession of her imagination that she had the feeling of being herself one of them. Similar phenomena normally occur to us in dreams in general, in which we think like "hysterics."^[78]

The complete abandonment to the interesting image explains also the wonderful naturalness of pseudological or somnambulic representation—a degree unattainable in conscious acting. The less waking consciousness intervenes by reflection and reasoning, the more certain and convincing becomes the objectivation of the dream, e.g. the roof-climbing of somnambulists.

Our case has another analogy with *pseudologia phantastica*: *The development of the phantasies during the attacks.* Many cases are known in the literature where the pathological lying comes on in attacks and during serious hysterical trouble.^[79]

Our patient develops her systems exclusively in the attack. In her normal state she is quite incapable of giving any new ideas or explanations; she must either transpose herself into somnambulism or await its spontaneous appearance. This exhausts the affinity to *pseudologia phantastica* and to pathological dream-states.

Our patient's state is even differentiated from pathological dreaming, since it could never be proved that her dream-weavings had at any time previously been the objects of her interest during the day. Her dreams occur explosively, break forth with bewildering completeness from the darkness of the unconscious. Exactly the same was the case in Flournoy's Helen Smith. In many cases (see below), however, links with the perceptions of the normal states can be demonstrated: it seems therefore probable that the roots of every dream were originally images with an emotional accentuation, which, however, only occupied waking consciousness for a short time.^[80] We must allow that in the origin of such dreams hysterical forgetfulness^[81] plays a *part not to be underestimated*.

Many images are buried which would be sufficient to put the consciousness on guard; associated classes of ideas are lost and go on spinning their web in the unconscious, thanks to the psychic dissociation; this is a process which we meet again in the genesis of our dreams.

"Our conscious reflection teaches us that when exercising attention we pursue a definite course. But if that course leads us to an idea which does not meet with our approval, we discontinue and cease to apply our attention. Now, apparently, the chain of thought thus started and abandoned, may go on without regaining attention unless it reaches a spot of especially marked intensity, which compels renewed attention. An initial rejection, perhaps consciously brought about by the judgment on the ground of incorrectness or unfitness for the actual purpose of the mental act, may therefore account for the fact that a mental process continues unnoticed by consciousness until the onset of sleep."^[82]

In this way we may explain the apparently sudden and direct appearance of dream-states. The entire carrying over of the conscious personality into the dream-*rôle* involves indirectly the development of simultaneous automatisms. "Une seconde condition peut amener la division de conscience; ce n'est pas une altération de la sensibilité, c'est une attitude particulière de l'esprit, la concentration de l'attention pour un point unique; il résulte de cet état de concentration que l'esprit devient distrait pour la reste et en quelque sorte insensible, ce qui ouvre la carrière aux actions automatiques, et ces actions peuvent prendre un caractère psychique et constituer des intelligences parasites, vivant côte à côte avec la personnalité normale qui ne les connaît pas."^[83]

Our subject's romances throw a most significant light on the subjective roots of her dreams. They swarm with secret and open love-affairs, with illegitimate births and other sexual insinuations. The central point of all these ambiguous stories is a lady whom she dislikes, who is gradually made to assume the form of her polar opposite, and whilst Ivenes becomes the pinnacle of virtue, this lady is a sink of iniquity. *But her reincarnation doctrines, in which she appears as the mother of countless thousands, arises in its naïve nakedness from an exuberant phantasy which is, of course, very characteristic of the period of puberty. It is the woman's premonition of the sexual feeling, the dream of fruitfulness, which the*

patient has turned into these monstrous ideas. We shall not go wrong if we seek for the curious form of the disease in the teeming sexuality of this too-rich soil. Viewed from this standpoint, the whole creation of Ivenes, with her enormous family, is nothing but a dream of sexual wish-fulfilment, differentiated from the dream of a night only in that it persists for months and years.

RELATION TO THE HYSTERICAL ATTACK.

So far one point in S. W.'s history has remained unexplained, and that is her attack. In the second séance she was suddenly seized with a sort of fainting fit, from which she awoke with a recollection of various hallucinations. According to her own statement, she had not lost consciousness for a moment. Judging from the external symptoms and the course of the attack, one is inclined to regard it as a *narcolepsy*, or rather a *lethargy*; such, for example, as Loewenfeld has described, and the more readily as we know that previously one member of her family (her grandmother) has had an attack of lethargy. It is possible to imagine that the *lethargic disposition* (Loewenfeld) had descended to our subject. In spiritualistic séances it is not usual to see hysterical convulsions. Our subject showed no sort of convulsive symptoms, but in their place, perhaps, the peculiar sleeping-states. Ætiologically, at the outset, two moments must be taken into consideration:

1. The irruption of hypnosis.
2. The psychic stimulation.

1. *Irruption of Partial Hypnosis.*—Janet observes that the subconscious automatisms have a hypnotic influence and can bring about complete somnambulism. ^[84]

He made the following experiment: While the patient, who was in the completely waking state, was engaged in conversation by a second observer, Janet stationed himself behind her and by means of whispered suggestions made her unconsciously move her hand and by written signs give an answer to questions. Suddenly the patient broke off the conversation, turned round and with her supraliminal consciousness

continued the previously subconscious talk with Janet. She had fallen into hypnotic somnambulism.^[85]

There is here a state of affairs similar to our patient's. But it must be noted that, for certain reasons discussed later, the sleeping state is not to be regarded as hypnotic. We therefore come to the question of—

2. *The Psychic Stimulation.*—It is told of Bettina Brentano that the first time she met Goethe she suddenly fell asleep on his knee.^[86]

This ecstatic sleep in the midst of extremest torture, the so-called "witch-sleep," is well known in the history of trials for witchcraft.^[87]

With susceptible subjects relatively insignificant stimuli suffice to bring about the somnambulant state. Thus a sensitive lady had to have a splinter cut out of her finger. Without any kind of bodily change she suddenly saw herself sitting by the side of a brook in a beautiful meadow, plucking flowers. This condition lasted as long as the slight operation and then disappeared spontaneously.^[88]

Loewenfeld^[89] has noticed unintentional inducement of hysterical lethargy through hypnosis.

Our case has certain resemblances to hysterical lethargy^[90] as described by Loewenfeld, viz. the shallow breathing, the diminution of the pulse, the corpse-like pallor of the face, and further the peculiar feeling of dying and the thoughts of death.^[91]

The retention of one sense is not inconsistent with lethargy: thus in certain cases of trance the sense of hearing remains.^[92]

In Bonamaison's^[93] case not only was the sense of touch retained, but the senses of hearing and smell were quickened. The hallucinatory content and loud speaking is also met with in persons with hallucinations in lethargy.^[94] Usually there prevails total amnesia for the lethargic interval. Loewenfeld's^[95] case D. had, however, a fleeting recollection; in Bonamaison's case there was no amnesia. Lethargic patients do not prove susceptible to the usual waking stimuli, but Loewenfeld succeeded with his patient St. in turning the lethargy into hypnosis by means of mesmeric passes, thus combining it with the rest of consciousness during the attack.

[96] Our patient showed herself absolutely unsusceptible in the beginning of the lethargy, but later on she began to speak spontaneously, was incapable of giving any attention when her somnambolic ego was speaking, but could attend when it was one of her automatic personalities. In this last case it is probable that the hypnotic effect of the automatism succeeded in achieving a partial transformation of the lethargy into hypnosis. When we consider that, according to Loewenfeld's view, the lethargic disposition must not be "too readily identified with the peculiar condition of the nervous apparatus in hysteria," then the idea of the family heredity of this disposition in our case becomes not a little probable. The disease is much complicated by these attacks.

So far we have seen that the patient's consciousness of her ego is identical in all the states. We have discussed two secondary complexes of consciousness and have followed them into the somnambolic attack, where they appear as the patient's vision when she had lost her motor activity during the attack. During the next attacks she was impervious to any external incidents, but on the other hand developed, within the twilight state, all the more intense activity, in the form of visions. It seems that many secondary series of ideas must have split off quite early from the primary unconscious personality, for already, after the first two séances, "spirits" appeared by the dozen. The names were inexhaustible in variety, but the differences between the personalities were soon exhausted and it became apparent that they could all be subsumed under two types, the *serio-religious* type and the *gay-hilarious*. So far it was really only a matter of *two different unconscious personalities*, which appeared under different names but had no essential differences. The older type, the grandfather, who had initiated the automatism, also first began to make use of the twilight state. I am not able to remember any suggestion which might have given rise to the automatic speaking. According to the preceding view, the attack in such circumstances might be regarded as a partial auto-hypnosis. The ego-consciousness which remains and, as a result of its isolation from the external world, occupies itself entirely with its hallucinations, is what is left over of the waking consciousness. Thus the automatism has a wide field for its activity. The independence of the individual central spheres which we have proved at the beginning to be present in the patient, makes the automatic act of speaking appear intelligible. Just as the dreamer on

occasion speaks in his sleep, so, too, a man in his waking hours may accompany intensive thought with an unconscious whisper.^[97] The peculiar movements of the speech-musculature are to be noted. They have also been observed in other somnambulists.^[98]

These clumsy attempts must be directly paralleled with the unintelligent and clumsy movements of the table or glass, and most probably correspond to the *preliminary activity* of the motor portion of the presentation; that is to say, a stimulus limited to the motor-centre which has not previously been subordinated to any higher system. Whether the like occurs in persons who talk in their dreams, I do not know. But it has been observed in hypnotised persons.^[99]

Since the convenient medium of speech was used as the means of communication, the study of the subconscious personalities was considerably lightened. Their intellectual compass is a relatively mediocre one. Their knowledge is greater than that of the waking patient, including also a few occasional details, such as the birthdays of dead strangers and the like. The source of these is more or less obscure, since the patient does not know whence in the ordinary way she could have procured the knowledge of these facts. These are cases of so-called cryptomnesia, which are too unimportant to deserve more extended notice. The intelligence of the two subconscious persons is very slight; they produce banalities almost exclusively, but their relation to the conscious ego of the patient when in the somnambulant state is interesting. They are invariably aware of everything that takes place during ecstasy and occasionally they render an exact report from minute to minute.^[100]

The subconscious persons only know the patient's phantastic changes of thought very superficially; they do not understand these and cannot answer a single question concerning the situation. Their stereotyped reference to Ivenes is: "Ask Ivenes." This observation reveals a dualism in the character of the subconscious personalities difficult to explain; for the grandfather, who gives information by automatic speech, also appears to Ivenes and, according to her account, teaches her about the objects in question. How is it that, when the grandfather speaks through the patient's mouth, he knows nothing of the very things which he himself teaches her in the ecstasies?

We must again return to the discussion of the first appearance of the hallucinations. We picture the vision, then, as an irruption of hypnosis into the visual sphere. That irruption does not lead to a "normal" hypnosis, but to a "hystero-hypnosis," that is, the simple hypnosis is complicated by a hysterical attack.

It is not a rare occurrence in the domain of hypnotism for normal hypnosis to be disturbed, or rather to be replaced by the unexpected appearance of hysterical somnambulism; the hypnotist in many cases then loses rapport with the patient. In our case the automatism arising in the motor area plays the part of hypnotist; the suggestions proceeding from it (called objective auto-suggestions) hypnotise the neighbouring areas in which a certain susceptibility has arisen. At the moment when the hypnotism flows over into the visual sphere, the hysterical attack occurs which, as remarked, effects a very deep-reaching change in a large portion of the psychical region. We must now suppose that the automatism stands in the same relationship to the attack as the hypnotist to a pathological hypnosis; its influence upon the further structure of the situation is lost. The hallucinatory appearance of the hypnotised personality, or rather of the suggested idea, may be regarded as the last effect upon the somnambulant personality. Thenceforward the hypnotist becomes only a figure with whom the somnambulant personality occupies itself independently: he can only state what is going on and is no longer the *conditio sine qua non* of the content of the somnambulant attack. The independent ego-complex of the attack, in our case Ivenes, has now the upper hand. She groups her own mental products around the personality of the hypnotiser, that is, of the grandfather, now degraded to a mere image. In this way we are enabled to understand the dualism in the character of the grandfather. *The grandfather I. who speaks directly to those present, is a totally different person and a mere spectator of his double, grandfather II., who appears as Ivenes' teacher.* Grandfather I. maintains energetically that both are one and the same person, and that I. has all the knowledge which II. possesses, and is only prevented from giving information by the difficulties of speech. (The dissociation was of course not realized by the patient, who took both to be one person.) Grandfather I., if closely examined, however, is not altogether wrong, judging from one fact which seems to make for the identity of I. and II., viz. that they are never both present together. When I. speaks automatically, II. is not present; Ivenes remarks on his absence. Similarly,

during the ecstasy, when she is with II., she cannot say where I. is, or she may learn only on returning from an imaginary journey that meanwhile I. has been guarding her body. Conversely I. never says that he is going on a journey with Ivenes and never explains anything to her. This behaviour should be noted, for if I. is really separate from II., there seems no reason why he should not speak automatically at the same time that II. appears, and be present with II. in the ecstasy. Although this might have been supposed possible, as a matter of fact it was never observed. How is this dilemma to be resolved? At all events there exists an identity of I. and II., but it does not lie in the region of the personality under discussion; it lies in the basis common to both; that is, in the personality of the subject which in deepest essence is one and indivisible. Here we come across the characteristic of all hysterical dissociations of consciousness. *They are disturbances which only belong to the superficial, and none reaches so deep as to attack the strong-knit foundation of the ego-complex.*

In many such cases we can find the bridge which, although often well-concealed, spans the apparently impassable abyss. For instance, by suggestion, one of four cards is made invisible to a hypnotised person; he thereupon names the other three. A pencil is placed in his hand with the instruction to write down all the cards lying there; he correctly adds the fourth one.^[101]

In the aura of his hystero-epileptic attacks a patient of Janet's^[102] invariably had a vision of a conflagration, and whenever he saw an open fire he had an attack; indeed, the sight of a lighted match was sufficient to bring about an attack. The patient's visual field on the left side was limited to 30°, the right eye was shut. The left eye was fixed in the middle of a perimeter whilst a lighted match was held at 80°. The hystero-epileptic attack took place immediately. Despite the extensive amnesia in many cases of double consciousness, the patients' behaviour does not correspond to the degree of their ignorance, but it seems rather as if a deeper instinct guided their actions in accordance with their former knowledge. Not only this relatively slight amnesic dissociation, but the severe amnesia of the epileptic twilight-state, formerly regarded as *irreparabile damnum*, does not suffice to cut the inmost threads which bind the ego-complex in the twilight-state to the normal ego. In one case the content of the twilight-state could be grafted on to the waking ego-complex.^[103]

Making use of these experiments for our case, we obtain the helpful hypothesis that those layers of the unconscious beyond reach of the dissociation endeavour to present the unity of automatic personality. This endeavour is shattered in the deeper-seated and more elemental disturbance of the hysterical attack,^[104] which prevents a more complete synthesis by the tacking on of associations which are to a certain extent the most original individual property of supraliminal personality. *As the Ivenes dream emerged it was fitted on to the figures accidentally in the field of vision, and henceforth remains associated with them.*

RELATIONSHIP TO THE UNCONSCIOUS PERSONALITY.

As we have seen, the numerous personalities become grouped round two types, the grandfather and Ulrich von Gerbenstein. The first produces exclusively sanctimonious religiosity and gives edifying moral precepts. The latter is, in one word, a "flapper," in whom there is nothing male except the name. We must here add from the anamnesis that at fifteen the patient was confirmed by a very bigoted clergyman, and at home she is occasionally the recipient of sanctimonious moral talks. The grandfather represents this side of her past, Gerbenstein the other half; hence the curious contrast. Here we have personified the chief characteristics of her past. On the one hand the sanctimonious person with a narrow education, on the other the boisterousness of a lively girl of fifteen who often overshoots the mark.^[105] We find both sets of traits mixed in the patient in sharp contrast. At times she is anxious, shy, and extremely reserved; at others boisterous to a degree. She is herself often most painfully aware of these contradictions. This circumstance gives us the key to the source of the two unconscious personalities. The patient is obviously seeking a middle path between the two extremes; she endeavours to repress them and strains after some ideal condition. These strainings bring her to the puberty dream of the ideal Ivenes, beside whose figure the unacknowledged trends of her character recede into the background. They are not lost, however, but as repressed ideas, analogous to the Ivenes idea, begin an independent existence as automatic personalities.

S. W.'s behaviour recalls vividly Freud's^[106] investigations into dreams which disclose the independent growth of repressed thoughts. We can now

comprehend why the hallucinatory persons are separated from those who write and speak automatically. The former teach Ivenes the secrets of the Other Side, they relate all those phantastic tales about the extraordinariness of her personality, they create scenes where Ivenes can appear dramatically with the attributes of power, wisdom and virtue. These are nothing but dramatic dissociations of her dream-self. The latter, the automatic persons, are the ones to be overcome, they must have no part in Ivenes. With the spirit-companions of Ivenes they have only the name in common. *A priori*, it is not to be expected that in a case like ours, where these divisions are never clearly defined, that two such characteristic individualities should disappear entirely from a somnambulic ego-complex having so close a relation with the waking consciousness. And in fact, we do meet them in part in those ecstatic penitential scenes and in part in the romances crammed with more or less banal, mischievous gossip.

COURSE.

It only remains to say a few words about the course of this strange affection. The process reached its maximum in four to eight weeks. The descriptions given of Ivenes and of the unconscious personalities belong generally to this period. Thenceforth a gradual decline was noticeable; the ecstasies grew meaningless and the influence of Gerbenstein became more powerful. The phenomena gradually lost their distinctive features, the characters which were at first well demarcated became by degrees inextricably mixed. The psychological contribution grew smaller and smaller until finally the whole story assumed a marked effect of fabrication. Ivenes herself was much concerned about this decline; she became painfully uncertain, spoke cautiously, feeling her way, and allowed her character to appear undisguised. The somnambulic attacks decreased in frequency and intensity. All degrees from somnambulism to conscious lying were observable. Thus the curtain fell. The patient has since gone abroad. We should not underestimate the importance of the fact that her character has become pleasanter and more stable. Here we may recall the cases cited in which the second state gradually replaced the first state. Perhaps this is a similar phenomenon.

It is well known that somnambulant manifestations sometimes begin at puberty.^[107] The attacks of somnambulism in Dyce's case^[108] began immediately before puberty and lasted just till its termination. The somnambulism of H. Smith is likewise closely connected with puberty.^[109]

Schroeder von der Kalk's patient was 16 years old at the time of her illness; Felida 14-1/2, etc. We know also that at this period the future character is formed and fixed. In the case of Felida and of Mary Reynolds we saw that the character in state II. replaced that of state I. *It is not therefore unthinkable that these phenomena of double consciousness are nothing but character-formations for the future personality, or their attempts to burst forth.* In consequence of special difficulties (unfavourable external conditions, psychopathic disposition of the nervous system, etc.), *these new formations, or attempts thereat, become bound up with peculiar disturbances of consciousness.* Occasionally the somnambulism, in view of the difficulties that oppose the future character, takes on a marked teleological meaning, for it gives the individual, who might otherwise be defeated, the means of victory. Here I am thinking first of all of Jeanne d'Arc, whose extraordinary courage recalls the deeds of Mary Reynolds' II. This is perhaps the place to point out the similar function of the "hallucination téléologique" of which the public reads occasionally, although it has not yet been submitted to a scientific study.

THE UNCONSCIOUS ADDITIONAL CREATIVE WORK.

We have now discussed all the essential manifestations offered by our case which are of significance for its inner structure. Certain accompanying manifestations may be briefly considered: *the unconscious additional creative work.* Here we shall encounter a not altogether unjustifiable scepticism on the part of the representative of science. Dessoir's conception of a second ego met with much opposition, and was rejected, as too impossible in many directions. As is known, occultism has proclaimed a pre-eminent right to this field and has drawn premature conclusions from doubtful observations. We are indeed very far from being in a position to state anything conclusive, since we have at present only most inadequate material. Therefore if we touch on the field of the unconscious additional creative work, it is only that we may do justice to all sides of our case. *By*

unconscious addition we understand that automatic process whose result does not penetrate to the conscious psychic activity of the individual. To this region above all belongs thought-reading through table movements. I do not know whether there are people who can divine a whole long train of thought by means of inductions from the intentional tremulous movements. It is, however, certain that, assuming this to be possible, such persons must be availing themselves of a routine achieved after endless practice. But in our case long practice can be excluded without more ado, and there is nothing left but to accept a primary susceptibility of the unconscious, far exceeding that of the conscious.

This supposition is supported by numerous observations on somnambulists. I will mention only Binet's^[110] experiments, where little letters or some such thing, or little complicated figures in relief were laid on the anæsthetic skin of the back of the hand or the neck, and the unconscious perceptions were then recorded by means of signs. On the basis of these experiments he came to the following conclusion: "D'après les calculs que j'ai pu faire, la sensibilité inconsciente d'une hystérique est à certains moments *cinquante fois* plus fine que celle d'une personne normale." A second additional creation coming under consideration in our case and in numerous other somnambulists, is that condition which French investigators call "cryptomnesia."^[111] By this term is meant the becoming conscious of a memory-picture which cannot be regarded as in itself primary, but at most is secondary, by means of subsequent recalling or abstract reasoning. It is characteristic of cryptomnesia that the picture which emerges does not bear the obvious mark of the memory-picture, is not, that is to say, bound up with the idiosyncratic super-conscious ego-complex.

Three ways may be distinguished in which the cryptomnesic picture is brought to consciousness.

1. *The picture enters consciousness without any intervention of the sense-spheres (intra-psychically).* It is an intruding idea whose causal sequence is hidden within the individual. In so far cryptomnesia is quite an everyday occurrence, concerned with the deepest normal psychic events. How often it misleads the investigator, the author or the composer into believing his ideas original, whilst the critic quite well recognises their source! Generally the individuality of the representation protects the author from the

accusation of plagiarism and proves his good faith; still, cases do occur of unconscious verbal reproduction. Should the passage in question contain some remarkable idea, the accusation of plagiarism, more or less conscious, is justified. After all, a valuable idea is linked by numerous associations with the ego-complex; at different times, in different situations, it has already been meditated upon and thus leads by innumerable links in all directions. It can therefore never so disappear from consciousness that its continuity could be entirely lost from the sphere of conscious memory. We have, however, a criterion by which we can always recognise objectively intra-psychic cryptomnesia. The cryptomnesic presentation is linked to the ego-complex by the minimum of associations. The reason for this lies in the relation of the individual to the particular object, in the disproportion of interest to object. Two possibilities occur: (1) The object is worthy of interest but the interest is slight in consequence of dispersion or want of understanding; (2) The object is not worthy of interest, consequently the interest is slight. In both cases an extremely labile connection with consciousness arises which leads to a rapid forgetting. The slight bridge is soon destroyed and the acquired presentation sinks into the unconscious, where it is no longer accessible to consciousness. Should it enter consciousness by means of cryptomnesia, the feeling of strangeness, of its being an original creation, will cling to it because the path by which it entered the subconscious has become undiscoverable. Strangeness and original creation are, moreover, closely allied to one another if one recalls the numerous witnesses in *belles-lettres* to the nature of genius ("possession" by genius).^[112]

Apart from certain striking cases of this kind, where it is doubtful whether it is a cryptomnesia or an original creation, there are some cases in which a passage of no essential content is reproduced, and that almost verbally, as in the following example:—

About that time when Zarathustra lived on the blissful islands, it came to pass that a ship cast anchor at that island on which the smoking mountain standeth; and the sailors of that ship went ashore in order to shoot rabbits! But about the hour of noon, when the captain and his men had mustered again, they suddenly saw a man come through the air unto them, and a voice said distinctly: "It is time! It is high time!" But when that person was nighest unto them (he passed by them flying

quickly like a shadow, in the direction in which the volcano was situated) they recognised with the greatest confusion that it was Zarathustra. For all of them, except the captain, had seen him before, and they loved him, as the folk love, blending love and awe in equal parts. "Lo! there," said the old steersman, "Zarathustra goeth unto hell!"

An extract of awe-inspiring import from the log of the ship "Sphinx" in the year 1686, in the Mediterranean.

Just. Kerner, "Blätter aus Prevorst," vol. IV., p, 57.

The four captains and a merchant, Mr. Bell, went ashore on the island of Mount Stromboli to shoot rabbits. At three o'clock they called the crew together to go aboard, when, to their inexpressible astonishment, they saw two men flying rapidly over them through the air. One was dressed in black, the other in grey. They approached them very closely, in the greatest haste; to their greatest dismay they descended amid the burning flames into the crater of the terrible volcano, Mount Stromboli. They recognised the pair as acquaintances from London.

Frau E. Förster-Nietzsche, the poet's sister, told me, in reply to my inquiry, that Nietzsche took up Just. Kerner between the age of twelve and fifteen, when stopping with his grandfather, Pastor Oehler, in Pobler, but certainly never afterwards. It could never have been the poet's intention to commit a plagiarism from a ship's log; if this had been the case, he would certainly have omitted the very prosaic "to shoot rabbits," which was, moreover, quite unessential to the situation. In the poetical sketch of Zarathustra's journey into Hell there was obviously interpolated, half or wholly unconsciously, that forgotten impression from his youth.

This is an instance which shows all the peculiarities of cryptomnesia. A quite unessential detail, which deserves nothing but speedy forgetting, is reproduced with almost verbal fidelity, whilst the chief part of the narrative is, one cannot say altered, but recreated quite distinctively. To the distinctive core, the idea of the journey to Hell, there is added a detail, the old, forgotten impression of a similar situation. The original is so absurd that the youth, who read everything, probably skipped through it, and certainly had no deep interest in it. Here we get the required minimum of

associated links, for we cannot easily conceive a greater jump, than from that old, absurd story to Nietzsche's consciousness in the year 1883. If we picture to ourselves Nietzsche's mood at the time when "Zarathustra" was composed,^[113] and think of the ecstasy that at more than one point approached the pathological, we shall comprehend the abnormal reminiscence. The second of the two possibilities mentioned, the acceptance of some object, not itself uninteresting, in a state of dispersion or half interest from lack of understanding, and its cryptomnesic reproduction we find chiefly in somnambulists; it is also found in the literary chronicles dealing with dying celebrities.^[114]

Amid the exhaustive selection of these phenomena we are chiefly concerned with *talking in a foreign tongue, the so-called glossolalia*. This phenomenon is mentioned everywhere when it is a question of similar ecstatic conditions. In the New Testament, in the *Acta Sanctorum*,^[115] in the Witchcraft Trials, more recently in the Prophetess of Prevorst, in Judge Edmond's daughter Laura, in Flournoy's Helen Smith. The last is unique from the point of view of investigation; it is found also in Bresler's^[116] case, which is probably identical with Blumhardt's^[117] Gottlieben Dittus. As Flournoy shows, glossolalia is, so far as it really is independent speech, a cryptomnesic phenomenon, [Greek: Kat' exochên]. The reader should consult Flournoy's most interesting exposition.

In our case glossolalia was only once observed, when the only understandable words were the scattered variations on the word "vena." The source of this word is clear. A few days previously the patient had dipped into an anatomical atlas for the study of the veins of the face, which were given in Latin. She had used the word "vena" in her dreams, as happens occasionally to normal persons. The remaining words and sentences in a foreign language betray, at the first glance, their derivation from French, in which the patient was somewhat fluent. Unfortunately I am without the more accurate translations of the various sentences, because the patient would not give them; but we may hold that it was a phenomenon similar to Helen Smith's Martian language. Flournoy found that the Martian language was nothing but a childish translation from French; the words were changed but the syntax remained the same. Even more probable is the view that the patient simply ranged next to each other meaningless words that rang strangely, without any true word-formation,^[118] she borrowed certain

characteristic sounds from French and Italian and combined them into a kind of language, just as Helen Smith completed the *lacunæ* in the real Sanscrit words by products of her own resembling that language. The curious names of the mystical system can be reduced, for the most part, to known roots. The writer vividly recalls the botanical schemes found in every school atlas; the internal resemblance of the relationship of the planets to the sun is also pretty clear; we shall not be going astray if we see in the names reminiscences from popular astronomy. Thus can be explained the names Persus, Fenus, Nenus, Sirum, Surus, Fixus, and Pix, as the childlike distortions of Perseus, Venus, Sirius and Fixed Star, analogous to the Vena variations. Magnesor vividly recalls Magnetism, whose mystic significance the patient knew from the Prophetess of Prevorst. In Connesor, the contrary to Magnesor, the prefix "con" is probably the French "contre." Hypnos and Hyfonismus recall hypnosis and hypnotism (German *hypnotismus*), about which there are the most superstitious ideas circulating in lay circles. The most used suffixes in "us" and "os" are the signs by which as a rule people decide the difference between Latin and Greek. The other names probably spring from similar accidents to which we have no clues. The rudimentary glossolalia of our case has not any title to be a classical instance of cryptomnesia, for it only consisted in the unconscious use of various impressions, partly optical, party acoustic, and all very close at hand.

2. *The cryptomnesic image arrives at consciousness through the senses (as a hallucination)*. Helen Smith is the classic example of this kind. I refer to the case mentioned on the date "18 Mars."^[119]

3. *The image arrives at consciousness by motor automatism.* H. Smith had lost her valuable brooch, which she was anxiously looking for everywhere. Ten days later her guide Leopold informed her by means of the table where the brooch was. Thus informed, she found it at night-time in the open field, covered by sand.^[120] Strictly speaking, in cryptomnesia there is not any additional creation in the true sense of the word, since the conscious memory experiences no increase of its function, but only an enrichment of its content. By the automatism certain regions are merely made accessible to consciousness in an indirect way, which were formerly sealed against it. But the unconscious does not thereby accomplish any creation which exceeds the capacity of consciousness qualitatively or quantitatively. Cryptomnesia is only an apparent additional creation, in contrast to hypermnesia, which actually represents an increase of function.^[121]

We have spoken above of a receptivity of the unconscious greater than that of the consciousness, chiefly in regard to the simple attempts at thought-reading of numbers. As mentioned, not only our somnambulist but a relatively large number of normal persons are able to guess from the tremors lengthy thought-sequences, if they are not too complicated. These experiments are, so to speak, the prototype of those rarer and incomparably more astonishing cases of intuitive knowledge displayed at times by somnambulists.^[122] Zschokke^[123] in his "Introspection" has shown us that these phenomena do not belong only to the domain of somnambulism, but occur among non-somnambulic persons. The formation of such knowledge seems to be arrived at in various ways: first and foremost there is the fineness, already noted, of unconscious perceptions; then must be emphasised the importance of the enormous suggestibility of somnambulists. *The somnambulist not only incorporates every suggestive idea to some extent, but actually lives in the suggestion, in the person of his doctor or observer, with that abandonment characteristic of the suggestible hysteric.* The relation of Frau Hauffe to Kerner is a striking example of this. That in such cases there is a high degree of *association-concordance* can cause no astonishment; a condition which Richet might have taken more account of in his experiments in thought-transference. Finally there are cases of somnambulic additional creative work which are not to be explained solely by hyperæsthesia of the unconscious activity of the senses and association-concordance, but presuppose a highly developed

intellectual activity of the unconscious. The deciphering of the purposive tremors demand an extreme sensitiveness and delicacy of feeling, both psychological and physiological, to combine the individual perceptions into a complete unity of thought, if it is at all permissible to make an analogy between the processes of cognition in the realm of the unconscious and the conscious. The possibility must always be considered that *in the unconscious, feeling and concept are not clearly separated*, perhaps even are one. The intellectual elevation which certain somnambulists display in ecstasy, though a rare thing, is none the less one that has sometimes been observed.^[124] I would designate the scheme composed by our patient as just one of those pieces of creative work that exceed the normal intelligence. We have already seen whence one portion of this scheme probably came. A second source is no doubt the life-crisis of Frau Hauffe, portrayed in Kerner's book. The external form seems to be determined by these adventitious facts. As already observed in the presentation of the case, the idea of dualism arises from the conversations picked up piecemeal by the patient during those dreamy states occurring after her ecstasies. This exhausts my knowledge of the sources of S. W.'s creations. Whence arose the root-idea the patient is unable to say. I naturally examined occultistic literature pertinent to the subject, and discovered a store of parallels with her gnostic system from different centuries scattered through all kinds of work mostly quite inaccessible to the patient. Moreover, at her youthful age, and with her surroundings, the possibility of any such study is quite excluded. A brief survey of the system in the light of her own explanations shows how much intelligence was used in its construction. How highly the intellectual work is to be estimated is a matter of opinion. In any case, considering her youth, her mentality must be regarded as quite extraordinary.

CHAPTER II

THE ASSOCIATION METHOD

LECTURE I^[125]

When you honoured me with an invitation to lecture at Clark University, a wish was expressed that I should speak about my methods of work, and especially about the psychology of childhood. I hope to accomplish this task in the following manner:—

In my first lecture I will give to you the view points of my association methods; in my second I will discuss the significance of the familiar constellations; while in my third lecture I shall enter more fully into the psychology of the child.

I might confine myself exclusively to my theoretical views, but I believe it will be better to illustrate my lectures with as many practical examples as possible. We will therefore occupy ourselves first with the association test which has been of great value to me both practically and theoretically. The history of the association method in vogue in psychology, as well as the method itself, is, of course, so familiar to you that there is no need to enlarge upon it. For practical purposes I make use of the following formula:

1. head
2. green
3. water
4. to sing
5. dead
6. long
7. ship
8. to pay
9. window

10. friendly
11. to cook
12. to ask
13. cold
14. stem
15. to dance
16. village
17. lake
18. sick
19. pride
20. to cook
21. ink
22. angry
23. needle
24. to swim
25. voyage
26. blue
27. lamp
28. to sin
29. bread
30. rich
31. tree
32. to prick
33. pity

34. yellow
35. mountain
36. to die
37. salt
38. new
39. custom
40. to pray
41. money
42. foolish
43. pamphlet
44. despise
45. finger

46. expensive
47. bird
48. to fall
49. book
50. unjust
51. frog
52. to part
53. hunger
54. white
55. child
56. to take care
57. lead pencil
58. sad
59. plum
60. to marry
61. house
62. dear
63. glass
64. to quarrel
65. fur
66. big

67. carrot

96. to sleep
97. month
98. nice
99. woman
100. to abuse

This formula has been constructed after many years of experience. The words are chosen and partially arranged in such a manner as to strike easily almost all complexes which occur in practice. As shown above, there is a regulated mixing of the grammatical qualities of the words. For this there are definite reasons. ^[126]

Before the experiment begins the test person receives the following instruction: "Answer as quickly as possible with the first word that occurs to your mind." This instruction is so simple that it can easily be followed. The work itself, moreover, appears extremely easy, so that it might be expected any one could accomplish it with the greatest facility and promptitude. But, contrary to expectation, the behaviour is quite otherwise.

I.—AN EXAMPLE OF A NORMAL REACTION TYPE.

Stimulus word.	Reaction Time. Unit 0·2 second.	Reaction.	Reproduction.

head	9	foot	part of the body
green	11	blouse	
water	14	clear	light
to sing	6	children	
dead	11	do not like	
long	6	short	I, tall

plum	16	to eat a plum, pluck what do you mean by it? Is that symbolic?	fruit
to marry	27	how can you? reunion, union union, alliance	

The following diagrams illustrate the reaction times in an association experiment in four normal test-persons. The height of each column denotes the length of the reaction time.

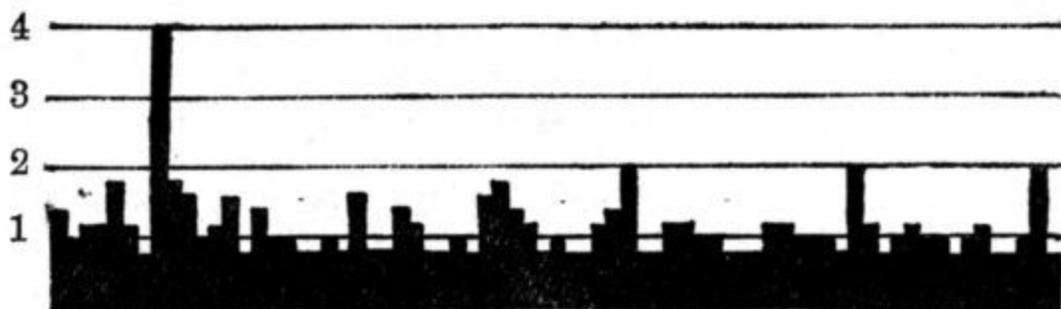

FIG. 4.

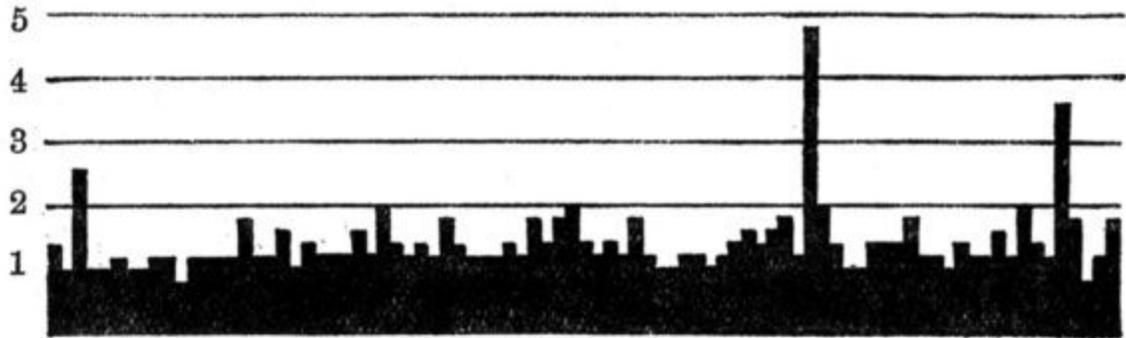

FIG. 5.

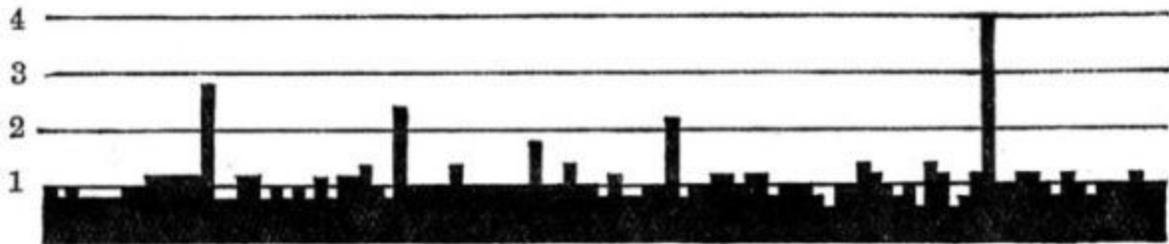

FIG. 6.

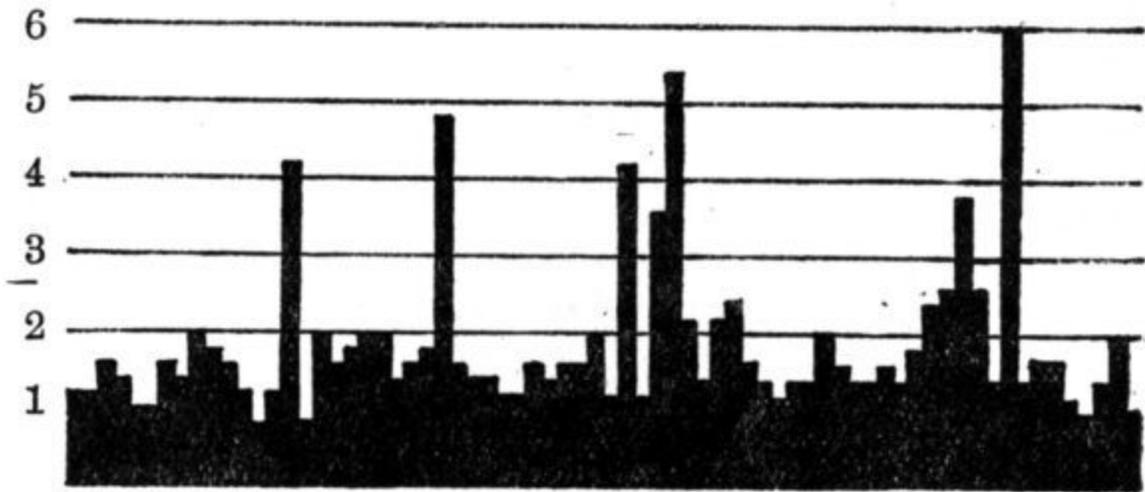

FIG. 7.

The succeeding diagram shows the course of the reaction time in hysterical individuals. The light cross-hatched columns denote the places where the test-person was unable to react (so-called failures to react).

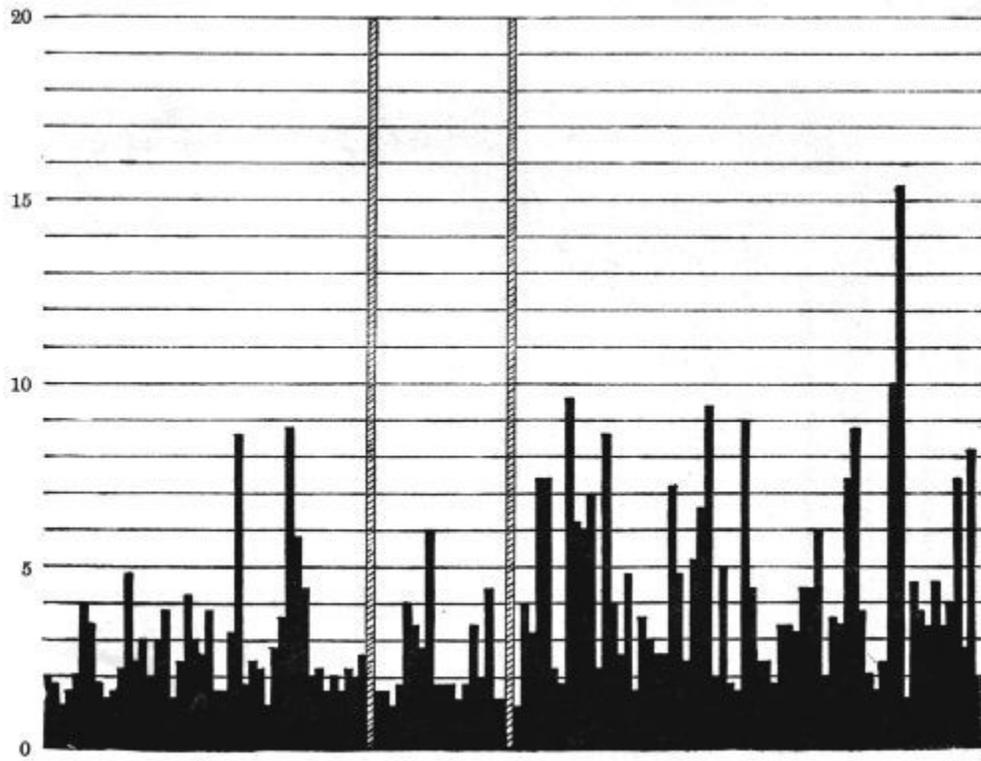

FIG. 8.

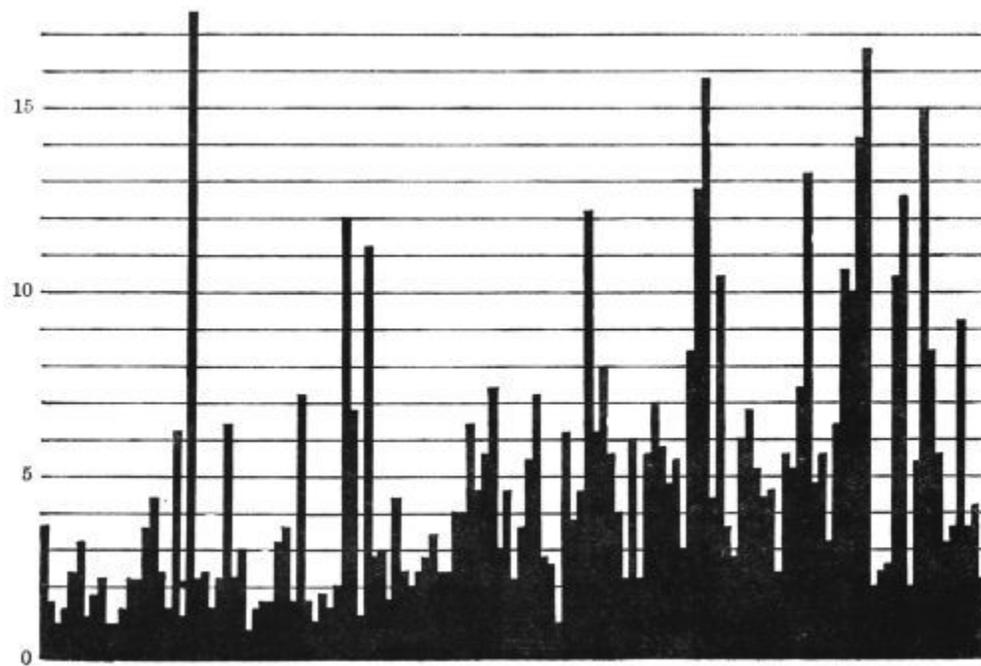

FIG. 9.

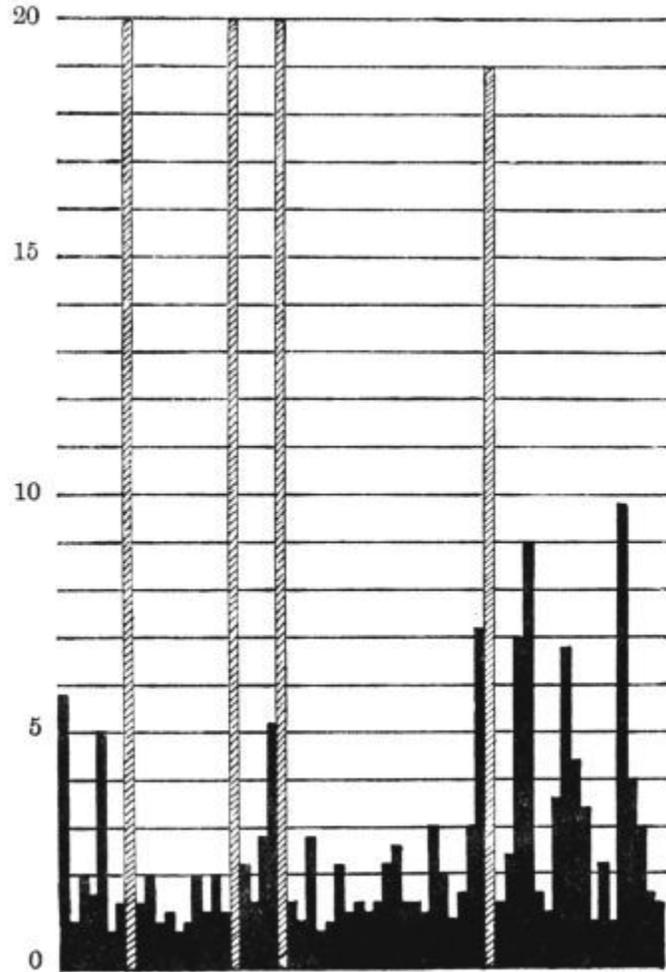

FIG. 10.

The first thing that strikes us is the fact that many test-persons show a marked prolongation of the reaction time. This would seem to be suggestive of intellectual difficulties,—wrongly however, for we are often dealing with very intelligent persons of fluent speech. The explanation lies rather in the emotions. In order to understand the matter, comprehensively, we must bear in mind that the association experiments cannot deal with a separated psychic function, for any psychic occurrence is never a thing in itself, but is always the resultant of the entire psychological past. The association experiment, too, is not merely a method for the reproduction of separated word couplets, but it is a kind of pastime, a conversation between experimenter and test-person. In a certain sense it is still more than that. Words really represent condensed actions, situations, and things. When I give a stimulus word to the test-person, which denotes an action, it is as if I represented to him the action itself, and asked him, "How do you behave

towards it? What do you think of it? What would you do in this situation?" If I were a magician, I should cause the situation corresponding to the stimulus word to appear in reality, and placing the test-person in its midst, I should then study his manner of reaction. The result of my stimulus words would thus undoubtedly approach infinitely nearer perfection. But as we are not magicians, we must be contented with the linguistic substitutes for reality; at the same time we must not forget that the stimulus word will almost without exception conjure up its corresponding situation. All depends on how the test-person reacts to this situation. The word "bride" or "bridegroom" will not evoke a simple reaction in a young lady; but the reaction will be deeply influenced by the strong feeling tones evoked, the more so if the experimenter be a man. It thus happens that the test-person is often unable to react quickly and smoothly to all stimulus words. There are certain stimulus words which denote actions, situations, or things, about which the test-person cannot think quickly and surely, and this fact is demonstrated in the association experiments. The examples which I have just given show an abundance of long reaction times and other disturbances. In this case the reaction to the stimulus word is in some way impeded, that is, the adaptation to the stimulus word is disturbed. The stimulus words therefore act upon us just as reality acts; indeed, a person who shows such great disturbances to the stimulus words, is in a certain sense but imperfectly adapted to reality. Disease itself is an imperfect adaptation; hence in this case we are dealing with something morbid in the psyche,—with something which is either temporarily or persistently pathological in character, that is, we are dealing with a psychoneurosis, with a functional disturbance of the mind. This rule, however, as we shall see later, is not without its exceptions.

Let us, in the first place, continue the discussion concerning the prolonged reaction time. It often happens that the test-person actually does *not* know what to answer to the stimulus word. He waives any reaction, and for the moment he totally fails to obey the original instructions, and shows himself incapable of adapting himself to the experimenter. If this phenomenon occurs frequently in an experiment, it signifies a high degree of disturbance in adjustment. I would call attention to the fact that it is quite indifferent what reason the test-person gives for the refusal. Some find that too many ideas suddenly occur to them; others, that they suffer from a deficiency of ideas. In most cases, however, the difficulties first perceived are so

deterrent that they actually give up the whole reaction. The following example shows a case of hysteria with many failures of reaction:—

Stimulus word.	Reaction Time. Unit 0·2 second.	Reaction.	Reproduction.
to sing	9	nice	+ ^[130]
dead	15	awful	?
long ^[131]	40	the time, the journey	?
ship ^[132]			+
to pay	11	money	
window	10	big	high
friendly	50	a man	human
to cook	10	soup	+
ink	9	black or blue	+
angry			bad
needle	9	to sew	+
lamp	14	light	+
to sin			
bread	15	to eat	+
rich ^{[133][134]}	40	good, convenient	+
yellow	18	paper	colour
mountain	10	high	+
to die	15	awful	+
salt ^[135]	25	salty	+
new			good, nice
custom ^[136]			
to pray			
money ^[137]	35	to buy, one is able	+
pamphlet	16	to write	+
to despise ^[138]	22	people	+
finger			
dear	12	thing	+
bird	12	sings or flies	+

In example II. we find a characteristic phenomenon. The test-person is not content with the requirements of the instruction, that is, she is not satisfied with *one* word, but reacts with many words. She apparently does more and better than the instruction requires, but in so doing she does not fulfil the requirements of the instruction. Thus she reacts:—custom—good—barbaric; foolish—narrow minded—restricted; family—big—small—everything possible.

These examples show in the first place that many other words connect themselves with the reaction word. The test person is unable to suppress the ideas which subsequently occur to her. She also pursues a certain tendency which perhaps is more exactly expressed in the following reaction: new—old—as an opposite. The addition of "as an opposite" denotes that the test-person has the desire to add something explanatory or supplementary. This tendency is also shown in the following reaction: finger—not only hand, also foot—a limb—member—extremity.

Here we have a whole series of supplements. It seems as if the reaction were not sufficient for the test-person, something else must always be added, as if what has already been said were incorrect or in some way imperfect. This feeling is what Janet designates the "*sentiment d'incomplétude*," but this by no means explains everything. I go somewhat deeply into this phenomenon because it is very frequently met with in neurotic individuals. It is not merely a small and unimportant subsidiary manifestation demonstrable in an insignificant experiment, but rather an elemental and universal manifestation which plays a *rôle* in other ways in the psychic life of neurotics.

By his desire to supplement, the test-person betrays a tendency to give the experimenter more than he wants, he actually makes great efforts to find further mental occurrences in order finally to discover something quite satisfactory. If we translate this observation into the psychology of everyday life, it signifies that the test-person has a constant tendency to give to others more feeling than is required and expected. According to Freud, this is a sign of a reinforced object-libido, that is, it is a compensation for an inner want of satisfaction and voidness of feeling. This elementary observation therefore displays one of the characteristics of hysterics, namely, the tendency to allow themselves to be carried away by everything, to attach themselves enthusiastically to everything, and always to promise too much

and hence perform too little. Patients with this symptom are, in my experience, always hard to deal with; at first they are enthusiastically enamoured of the physician, for a time going so far as to accept everything he says blindly; but they soon merge into an equally blind resistance against him, thus rendering any educative influence absolutely impossible.

We see therefore in this type of reaction an expression of a tendency to give more than is asked or expected. This tendency betrays itself also in other failures to follow the instruction:—

to quarrel—angry—different things—I always quarrel at home;
to marry—how can you marry?—reunion—union;
plum—to eat—to pluck—what do you mean by it?—is it symbolic?
to sin—this idea is quite strange to me, I do not recognise it.

These reactions show that the test-person gets away altogether from the situation of the experiment. For the instruction was, that he should answer only with the first word which occurs to him. But here we note that the stimulus words act with excessive strength, that they are taken as if they were direct personal questions. The test-person entirely forgets that we deal with mere words which stand in print before us, but finds a personal meaning in them; he tries to divine their intention and defend himself against them, thus altogether forgetting the original instructions.

This elementary observation discloses another common peculiarity of hysterics, namely, that of taking everything personally, of never being able to remain objective, and of allowing themselves to be carried away by momentary impressions; this again shows the characteristics of the enhanced object-libido.

Yet another sign of impeded adaptation is the often occurring *repetition of the stimulus words*. The test-persons repeat the stimulus word as if they had not heard or understood it distinctly. They repeat it just as we repeat a difficult question in order to grasp it better before answering. This same tendency is shown in the experiment. The questions are repeated because the stimulus words act on hysterical individuals in much the same way as difficult personal questions. In principle it is the same phenomenon as the subsequent completion of the reaction.

In many experiments we observe that the same reaction constantly reappears to the most varied stimulus words. These words seem to possess a special reproduction tendency, and it is very interesting to examine their relationship to the test-person. For example, I have observed a case in which the patient repeated the word "short" a great many times and often in places where it had no meaning. The test-person could not directly state the reason for the repetition of the word "short." From experience I knew that such predicates always relate either to the test-person himself or to the person nearest to him. I assumed that in this word "short" he designated himself, and that in this way he helped to express something very painful to him. The test-person is of very small stature. He is the youngest of four brothers, who, in contrast to himself, are all tall. He was always the "*child*" in the family; he was nicknamed "Short" and was treated by all as the "little one." This resulted in a total loss of self-confidence. Although he was intelligent, and despite long study, he could not decide to present himself for examination; he finally became impotent, and merged into a psychosis in which, whenever he was alone, he took delight in walking about in his room on his toes in order to appear taller. The word "short," therefore, stood to him for a great many painful experiences. This is usually the case with the perseverated words; they always contain something of importance for the individual psychology of the test-person.

The signs thus far discussed are not found spread about in an arbitrary way through the whole experiment, but are seen in very definite places, namely, where the stimulus words strike against emotionally accentuated complexes. This observation is the foundation of the so-called "diagnosis of facts" (*Tatbestandsdiagnostik*). This method is employed to discover, by means of an association experiment, which is the culprit among a number of persons suspected of a crime. That this is possible I will demonstrate by the brief recital of a concrete case.

On the 6th of February, 1908, our supervisor reported to me that a nurse complained to her of having been robbed during the forenoon of the previous day. The facts were as follows: The nurse kept her money, amounting to 70 francs, in a pocket-book which she had placed in her cupboard where she also kept her clothes. The cupboard contained two compartments, of which one belonged to the nurse who was robbed, and the other to the head nurse. These two nurses and a third one, who was an

intimate friend of the head nurse, slept in the room where the cupboard was. This room was in a section which was occupied in common by six nurses who had at all times free access to the room. Given such a state of affairs it is not to be wondered that the supervisor shrugged her shoulders when I asked her whom she most suspected.

Further investigation showed that on the day of the theft, the above-mentioned friend of the head nurse was slightly indisposed and remained the whole morning in the room in bed. Hence, unless she herself was the thief, the theft could have taken place only in the afternoon. Of four other nurses upon whom suspicion could possibly fall, there was one who attended regularly to the cleaning of the room in question, while the remaining three had nothing to do in it, nor was it shown that any of them had spent any time there on the previous day.

It was therefore natural that the last three nurses should be regarded for the time being as less implicated, so I began by subjecting the first three to the experiment.

From the information I had obtained of the case, I knew that the cupboard was locked but that the key was kept near by in a very conspicuous place, that on opening the cupboard the first thing which would strike the eye was a fur boa, and, moreover, that the pocket-book was between some linen in an inconspicuous place. The pocket-book was of dark reddish leather, and contained the following objects: a 50-franc banknote, a 20-franc piece, some centimes, a small silver watch-chain, a stencil used in the lunatic asylum to mark the kitchen utensils, and a small receipt from Dosenbach's shoeshop in Zürich.

Besides the plaintiff, only the head nurse knew the exact particulars of the deed, for as soon as the former missed her money she immediately asked the head nurse to help her find it, thus the head nurse had been able to learn the smallest details, which naturally rendered the experiment still more difficult, for she was precisely the one most suspected. The conditions for the experiment were better for the others, since they knew nothing concerning the particulars of the deed, and some not even that a theft had been committed. As critical stimulus words I selected the name of the robbed nurse, plus the following words: cupboard, door, open, key, yesterday, banknote, gold, 70, 50, 20, money, watch, pocket-book, chain,

silver, to hide, fur, dark reddish, leather, centimes, stencil, receipt, Dosenbach. Besides these words which referred directly to the deed, I took also the following, which had a special effective value: theft, to take, to steal, suspicion, blame, court, police, to lie, to fear, to discover, to arrest, innocent.

The objection is often made to the last species of words that they may produce a strong affective resentment even in innocent persons, and for that reason one cannot attribute to them any comparative value. Nevertheless, it may always be questioned whether the affective resentment of an innocent person will have the same effect on the association as that of a guilty one, and that question can only be authoritatively answered by experience. Until the contrary is demonstrated, I maintain that words of the above-mentioned type may profitably be used.

I distributed these critical words among twice as many indifferent stimulus words in such a manner that each critical word was followed by two indifferent ones. As a rule it is well to follow up the critical words by indifferent words in order that the action of the first may be clearly distinguished. But one may also follow up one critical word by another, especially if one wishes to bring into relief the action of the second. Thus I placed together "darkish red" and "leather," and "chain" and "silver."

After this preparatory work I undertook the experiment with the three above-mentioned nurses. Following the order of the experiment, I shall denote the friend of the head nurse by the letter A, the head nurse by B, and the nurse who attended to the cleaning of the room by C. As examinations of this kind can be rendered into a foreign tongue only with the greatest difficulty, I will content myself with presenting the general results, and with giving some examples. I first undertook the experiment with A, and judging by the circumstances she appeared only slightly moved. B was next examined; she showed marked excitement, her pulse being 120 per minute immediately after the experiment. The last to be examined was C. She was the most tranquil of the three; she displayed but little embarrassment, and only in the course of the experiment did it occur to her that she was suspected of stealing, a fact which manifestly disturbed her towards the end of the experiment.

The general impression from the examination spoke strongly against the head nurse B. It seemed to me that she evinced a very "suspicious," or I might almost say, "impudent" countenance. With the definite idea of finding in her the guilty one I set about adding up the results. You will see that I was wrong in my surmise and that the test proved my error.

One can make use of many special methods of computing, but they are not all equally good and equally exact. (One must always resort to calculation, as appearances are enormously deceptive.) The method which is most to be recommended is that of the probable average of the reaction time. It shows at a glance the difficulties which the person in the experiment had to overcome in the reaction.

The technique of this calculation is very simple. The probable average is the middle number of the various reaction times arranged in a series. The reaction times are, for example,^[139] placed in the following manner: 5, 5, 5, 7, 7, 7, 7, 8, 9, 9, 9, 12, 13, 14. The number found in the middle (8) is the probable average of this series.

The probable averages of the reaction are:

A	B	C
10.0	12.0	13.5.

No conclusions can be drawn from this result. But the average reaction times calculated separately for the indifferent reactions, for the critical, and for those immediately following the critical (post-critical) are more interesting.

From this example we see that whereas A has the shortest reaction time for the indifferent reactions, she shows in comparison to the other two persons of the experiment, the longest time for the critical reactions.

THE PROBABLE AVERAGE OF THE REACTION TIME.

for	A	B	C
Indifferent reactions	10·0	11·0	12·0
Critical reactions	16·0	13·0	15·0
Post-critical reactions	10·0	11·0	13·0

The difference between the reaction times, let us say between the indifferent and the critical, is 6 for A, 2 for B, and 3 for C, that is, it is more than double for A when compared with the other two persons.

In the same way we can calculate how many complex indicators there are on an average for the indifferent, critical, etc., reactions.

THE AVERAGE COMPLEX-INDICATORS FOR EACH REACTION.

for	A	B	C
Indifferent reactions	0·6	0·9	0·8
Critical reactions	1·3	0·9	1·2
Post-critical reactions	0·6	1·0	0·8

The difference between the indifferent and critical reactions for A = 0·7, for B = 0, for C = 0·4. A is again the highest.

Another question to consider is, the proportion of imperfect reactions in each case.

The result for A = 34%, for B = 28%, and for C = 30%.

Here, too, A reaches the highest value, and in this, I believe, we see the characteristic moment of the guilt-complex in A. I am, however, unable to explain here circumstantially the reasons why I maintain that memory errors are related to an emotional complex, as this would lead me beyond the limits of the present work. I therefore refer the reader to my work "*Ueber die Reproduktionsstörungen im Associationsexperiment*" (IX Beitrag der Diagnost. Associat. Studien).^[140]

As it often happens that an association of strong feeling tone produces in the experiment a perseveration, with the result that not only the critical association, but also two or three successive associations are imperfectly reproduced, it will be very interesting to see how many imperfect

reproductions are so arranged in the series in our cases. The result of computation shows that the imperfect reproductions thus arranged in series are for A 64.7%, for B 55.5%, and for C 30.0%.

Again we find that A has the greatest percentage. To be sure, this may partially depend on the fact that A also possesses the greatest number of imperfect reproductions. Given a small number of reactions, it is usual that the greater the total number of the same, the more the imperfect reactions will occur in groups. But this cannot account for the high proportion in our case, where, on the other hand, B and C have not a much smaller number of imperfect reactions when compared to A. It is significant that C with her slight emotions during the experiment shows the minimum of imperfect reproductions arranged in series.

As imperfect reproductions are also complex indicators, it is necessary to see how they distribute themselves in respect to the indifferent, critical, etc., reactions.

It is hardly necessary to bring into prominence the differences between the indifferent and the critical reactions of the various subjects as shown by the resulting numbers of the table. In this respect, too, A occupies first place.

IMPERFECT REPRODUCTIONS WHICH OCCUR.

in	A	B	C
Indifferent reactions	10	12	11
Critical reactions	19	9	12
Post-critical reactions	5	7	7

Naturally, here, too, there is a probability that the greater the number of the imperfect reproductions the greater is their number in the critical reactions. If we suppose that the imperfect reproductions are distributed regularly and without choice, among all the reactions, there will be a greater number of them for A (in comparison with B and C) even as reactions to critical words, since A has the greater number of imperfect reproductions. Admitting such a uniform distribution of the imperfect reproductions, it is easy to calculate how many we ought to expect to belong to each individual kind of reaction.

From this calculation it appears that the disturbances of reproductions which concern the critical reactions for A greatly surpass the number expected, for C they are 0·9 higher, while for B they are lower.

IMPERFECT REPRODUCTIONS.

For	Which may be expected			Which really occur		
	Indifferent Reactions.	Critical Reactions.	Post-critical Reactions.	Indifferent Reactions.	Critical Reactions.	Post-critical Reactions.
A	11·2	12·5	10·2	10	19	5
B	9·2	10·3	8·4	12	9	7
C	9·9	11·1	9·0	11	12	7

All this points to the fact that in the subject A the critical stimulus words acted with the greatest intensity, and hence the greatest suspicion falls on A. Practically relying on the test one may assume the probability of this person's guilt. The same evening A made a complete confession of the theft, and thus the success of the experiment was confirmed.

Such a result is undoubtedly of scientific interest and worthy of serious consideration. There is much in experimental psychology which is of less use than the material exemplified in this test. Putting the theoretical interest altogether aside, we have here something that is not to be despised from a practical point of view, to wit, a culprit has been brought to light in a much easier and shorter way than is customary. What has been possible once or twice ought to be possible again, and it is well worth while to investigate some means of rendering the method increasingly capable of rapid and sure results.

This application of the experiment shows that it is possible to strike a concealed, indeed an unconscious complex by means of a stimulus word; and conversely we may assume with great certainty that behind a reaction which shows a complex indicator there is a hidden complex, even though the test-person strongly denies it. One must get rid of the idea that educated and intelligent test-persons are able to see and admit their own complexes. Every human mind contains much that is unacknowledged and hence unconscious as such; and no one can boast that he stands completely above

his complexes. Those who persist in maintaining that they can, are not aware of the spectacles upon their noses.

It has long been thought that the association experiment enables one to distinguish certain *intellectual* types. That is not the case. The experiment does not give us any particular insight into the purely intellectual, but rather into the emotional processes. To be sure we can erect certain types of reaction; they are not, however, based on intellectual peculiarities, but depend entirely on the *proportionate emotional states*. Educated test-persons usually show superficial and linguistically deep-rooted associations, whereas the uneducated form more valuable associations and often of ingenious significance. This behaviour would be paradoxical from an intellectual view-point. The meaningful associations of the uneducated are not really the product of intellectual thinking, but are simply the results of a special emotional state. The whole thing is more important to the uneducated, his emotion is greater, and for that reason he pays more attention to the experiment than the educated person, and his associations are therefore more significant. Apart from those determined by education, we have to consider three principal individual types:

1. An objective type with undisturbed reactions.
2. A so-called complex-type with many disturbances in the experiment occasioned by the constellation of a complex.
3. A so-called definition-type. The peculiarity of this type consists in the fact that the reaction always gives an explanation or a definition of the content of the stimulus word; *e.g.*:

apple,—a tree-fruit;
table,—a piece of household furniture;
to promenade,—an activity;
father,—chief of the family.

This type is chiefly found in stupid persons, and it is therefore quite usual in imbecility. But it can also be found in persons who are not really stupid, but who do not wish *to be taken as stupid*. Thus a young student from whom associations were taken by an older intelligent woman student reacted

altogether with definitions. The test-person was of the opinion that it was an examination in intelligence, and therefore directed most of his attention to the significance of the stimulus words; his associations, therefore, looked like those of an idiot. All idiots, however, do not react with definitions; probably only those react in this way who would like to appear smarter than they are, that is, those to whom their stupidity is painful. I call this widespread complex the "intelligence-complex." A normal test-person reacts in a most overdrawn manner as follows:

anxiety—heart anguish;
to kiss—love's unfolding;
to kiss—perception of friendship.

This type gives a constrained and unnatural impression. The test-persons wish to be more than they are, they wish to exert more influence than they really have. Hence we see that persons with an intelligence-complex are usually unnatural and constrained; that they are always somewhat stilted, or flowery; they show a predilection for complicated foreign words, high-sounding quotations, and other intellectual ornaments. In this way they wish to influence their fellow-beings, they wish to impress others with their apparent education and intelligence, and thus to compensate for their painful feeling of stupidity. The definition-type is closely related to the predicate-type, or, to express it more precisely, to the predicate-type expressing personal judgment (*Wertprädikattypus*). For example:

flower—pretty;
money—convenient;
animal—ugly;
knife—dangerous;
death—ghastly.

In the definition type the *intellectual* significance of the stimulus word is rendered prominent, but in the predicate type its *emotional* significance. There are predicate-types which show great exaggeration where reactions such as the following appear:

piano—horrible;
to sing—heavenly;

mother—ardently loved;
father—something good, nice, holy.

In the definition-type an absolutely *intellectual* make-up is manifested or rather simulated, but here there is a very *emotional* one. Yet, just as the definition-type really conceals a lack of intelligence, so the excessive *emotional* expression conceals or overcompensates an emotional deficiency. This conclusion is very interestingly illustrated by the following discovery:—On investigating the influence of the familiar milieus on the association-type it was found that young people seldom possess a predicate-type, but that, on the other hand, the predicate-type increases in frequency with advancing age. In women the increase of the predicate-type begins a little after the 40th year, and in men after the 60th. That is the precise time when, owing to the deficiency of sexuality, there actually occurs considerable emotional loss. If a test-person evinces a distinct predicate-type, it may always be inferred that a marked internal emotional deficiency is thereby compensated. Still, one cannot reason conversely, namely, that an inner emotional deficiency must produce a predicate-type, no more than that idiocy directly produces a definition-type. A predicate-type can also betray itself through the external behaviour, as, for example, through a particular affectation, enthusiastic exclamations, an embellished behaviour, and the constrained sounding language so often observed in society.

The complex-type shows no particular tendency except the *concealment* of a complex, whereas the definition and predicate types betray a positive tendency to exert in some way a *definite* influence on the experimenter. But whereas the definition-type tends to bring to light its intelligence, the predicate-type displays its emotion. I need hardly add of what importance such determinations are for the diagnosis of character.

After finishing an association experiment I usually add another of a different kind, the so-called *reproduction* experiment. I repeat the same stimulus words and ask the test-persons whether they still remember their former reactions. In many instances the memory fails, and as experience shows, these locations are stimulus words which touched an emotionally accentuated complex, or stimulus words immediately following such critical words.

This phenomenon has been designated as paradoxical and contrary to all experience. For it is known that emotionally accentuated things are better retained in memory than indifferent things. This is quite true, but it does not hold for the *linguistic* expression of an emotionally accentuated content. On the contrary, one very easily forgets what he has said under emotion, one is even apt to contradict himself about it. Indeed, the efficacy of cross-examinations in court depends on this fact. The reproduction method therefore serves to render still more prominent the complex stimulus. In normal persons we usually find a limited number of false reproductions, seldom more than 19-20 per cent., while in abnormal persons, especially in hysterics, we often find from 20-40 per cent. of false reproductions. The reproduction certainty is therefore in certain cases a measure for the emotivity of the test-person.

By far the larger number of neurotics show a pronounced tendency to cover up their intimate affairs in impenetrable darkness, even from the doctor, so that he finds it very difficult to form a proper picture of the patient's psychology. In such cases I am greatly assisted by the association experiment. When the experiment is finished, I first look over the general course of the reaction times. I see a great many very prolonged intervals; this means that the patient can only adjust himself with difficulty, that his psychological functions proceed with marked internal frictions with *resistances*. The greater number of neurotics react only under great and very definite resistances; there are, however, others in whom the average reaction times are as short as in the normal, and in whom the other complex indicators are lacking, but, despite that fact, they undoubtedly present neurotic symptoms. These rare cases are especially found among very intelligent and educated persons, chronic patients who, after many years of practice, have learned to control their outward behaviour and therefore outwardly display very little if any trace of their neuroses. The superficial observer would take them for normal, yet in some places they show disturbances which betray the repressed complex.

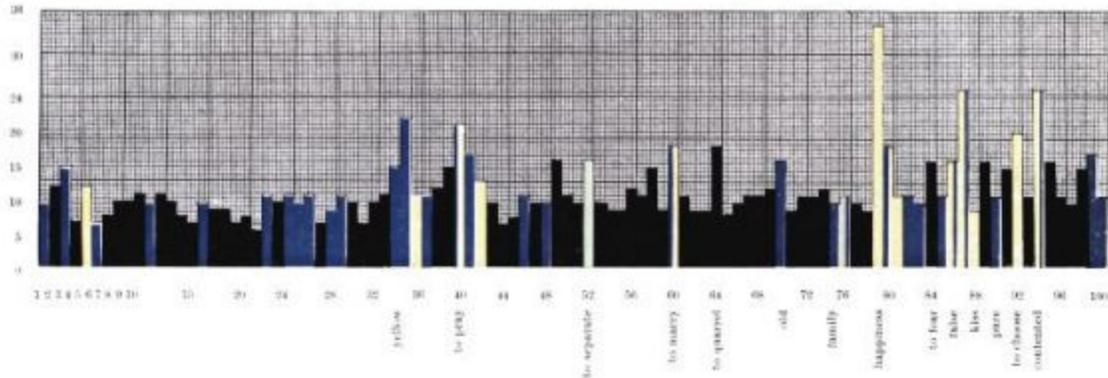

After examining the reaction times I turn my attention to the type of the association to ascertain with what type I am dealing. If it is a predicate-type I draw the conclusions which I have detailed above; if it is a complex type I try to ascertain the nature of the complex. With the necessary experience

one can readily emancipate one's judgment from the test-person's statements and almost without any previous knowledge of the test-persons it is possible under certain circumstances to read the most intimate complexes from the results of the experiment. I look at first for the reproduction words and put them together, and then I look for the stimulus words which show the greatest disturbances. In many cases merely assorting these words suffices to unearth the complex. In some cases it is necessary to put a question here and there. The matter is well illustrated by the following concrete example:

It concerns an educated woman of 30 years of age, married three years previously. Since her marriage she has suffered from episodic excitement in which she is violently jealous of her husband. The marriage is a happy one in every other respect, and it should be noted that the husband gives no cause for the jealousy. The patient is sure that she loves him and that her excited states are groundless. She cannot imagine whence these excited states originate, and feels quite perplexed over them. It is to be noted that she is a catholic and has been brought up religiously, while her husband is a protestant. This difference of religion did not admittedly play any part. A more thorough anamnesis showed the existence of an extreme prudishness. Thus, for example, no one was allowed to talk in the patient's presence about her sister's childbirth, because the sexual moment suggested therein caused her the greatest excitement. She always undressed in the adjoining room and never in her husband's presence, etc. At the age of 27 she was supposed to have had no idea how children were born. The associations gave the results shown in the accompanying chart.

The stimulus words characterised by marked disturbances are the following: yellow, to pray, to separate, to marry, to quarrel, old, family, happiness, false, fear, to kiss, bride, to choose, contented. The strongest disturbances are found in the following stimulus words: *to pray*, *to marry*, *happiness*, *false*, *fear*, and *contented*. These words, therefore, more than any others, seem to strike the complex. The conclusions that can be drawn from this is that she is not indifferent to the fact that her husband is a protestant, that she again thinks of praying, believes there is something wrong with marriage, that she is false, entertains fancies of faithlessness, is afraid (of the husband? of the future?), she is not contented with her choice (to choose) and she thinks of separation. The patient therefore has a separation

complex, for she is very discontented with her married life. When I told her this result she was affected and at first attempted to deny it, then to mince over it, but finally she admitted everything I said and added more. She reproduced a large number of fancies of faithlessness, reproaches against her husband, etc. *Her prudishness and jealousy were merely a projection of her own sexual wishes on her husband.* Because she was faithless in her fancies and did not admit it to herself she was jealous of her husband.

For the stimulus words corresponding to the numbers, see the list on pages [94](#) and [95](#).

The blue columns represent failures of reproductions, the green ones represent repetitions of stimulus words, and the yellow columns show those associations in which the patient either laughed or made mistakes, using many words instead of one. The height of the columns represent the length of the reaction time.

[To face p. 118.

It is impossible in a lecture to give a review of all the manifold uses of the association experiment. I must content myself with having demonstrated to you a few of its chief uses.

LECTURE II

THE FAMILIAL CONSTELLATIONS

Ladies and Gentlemen: As you have seen, there are manifold ways in which the association experiment may be employed in practical psychology. I

should like to speak to you to-day about another use of this experiment which is primarily of theoretical significance. My pupil, Miss Fürst, M.D., made the following researches: she applied the association experiment to 24 families, consisting altogether of 100 test-persons; the resulting material amounted to 22,200 associations. This material was elaborated in the following manner: Fifteen separate groups were formed according to logical-linguistic standards, and the associations were arranged as follows:

	Husband	Wife	Difference
I. Co-ordination	6·5	0·5	6
II. Sub and supraordination	7	—	7
III. Contrast	—	—	—
IV. Predicate expressing a personal judgment	8·5	95·0	86·5
V. Simple predicate	21·0	3·5	17·5
VI. Relations of the verb to the subject or complement	15·5	0·5	15·0
VII. Designation of time, etc.	11·0	—	11·0
VIII. Definition	11·0	—	11·0
IX. Coexistence	1·5	—	1·5
X. Identity	0·5	0·5	—
XI. Motor-speech combination	12·0	—	12·0
XII. Composition of words	—	—	—
XIII. Completion of words	—	—	—
XIV. Clang associations	—	—	—
XV. Defective reactions	—	—	—
Total	—	—	173·5
	173·5		
Average difference	—	=	11·5
	15		

As can be seen from this example, I utilise the difference to demonstrate the degree of the analogy. In order to find a basis for the sum of the resemblance I have calculated the differences among all Dr. Fürst's test-persons, not related among themselves, by comparing every female test-person with all the other unrelated females; the same has been done for the male test-persons.

The most marked difference is found in those cases where the two test-persons compared have no associative quality in common. All the groups are calculated in percentages, the greatest difference possible being $200/15 = 13.3$ per cent.

I. The average difference of male unrelated test-persons is 5.9 per cent., and that of females of the same group is 6 per cent.

II. The average difference between male related test-persons is 4.1 per cent., and that between female related tests-persons is 3.8 per cent. From these numbers we see that relatives show a tendency to agreement in the reaction type.

III. Difference between fathers and children = 4.2.

" " mothers " " = 3.5.

The reaction types of children come nearer to the type of the mother than to the father.

IV. Difference between fathers and their sons = 3.1.

" " " " " daughters = 4.9.

" " mothers " " sons = 4.7.

" " " " " daughters = 3.0.

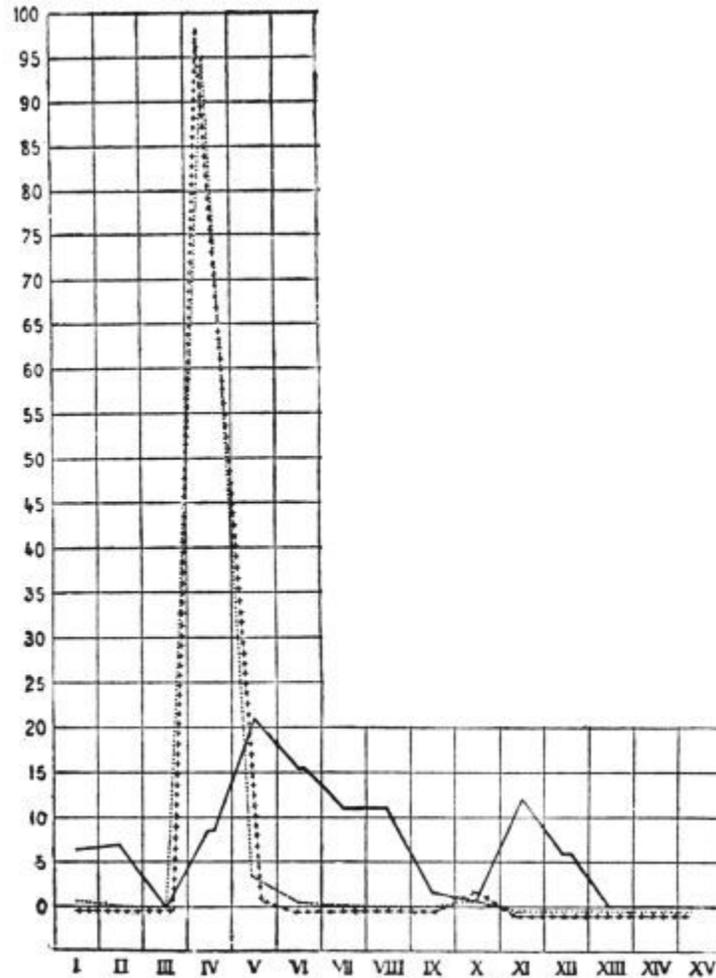

FIG. 11.

Tracing A. — father; mother; ++++ daughter.

I. Assoc. by co-ordination; II. sub and supraordination; III. contrast, etc. (see previous page).

V. Difference between brothers = 4.7.
 " " sisters = 5.1.

If the married sisters are omitted from the comparison we get the following result:

Difference of unmarried sisters = 3.8. These observations show distinctly that marriage destroys more or less the original agreement, as the husband belongs to a different type.

Difference between unmarried brothers = 4.8.

Marriage seems to exert no influence on the association forms in men. Nevertheless, the material which we have at our disposal is not as yet enough to allow us to draw definite conclusions.

VI. Difference between husband and wife = 4.7.

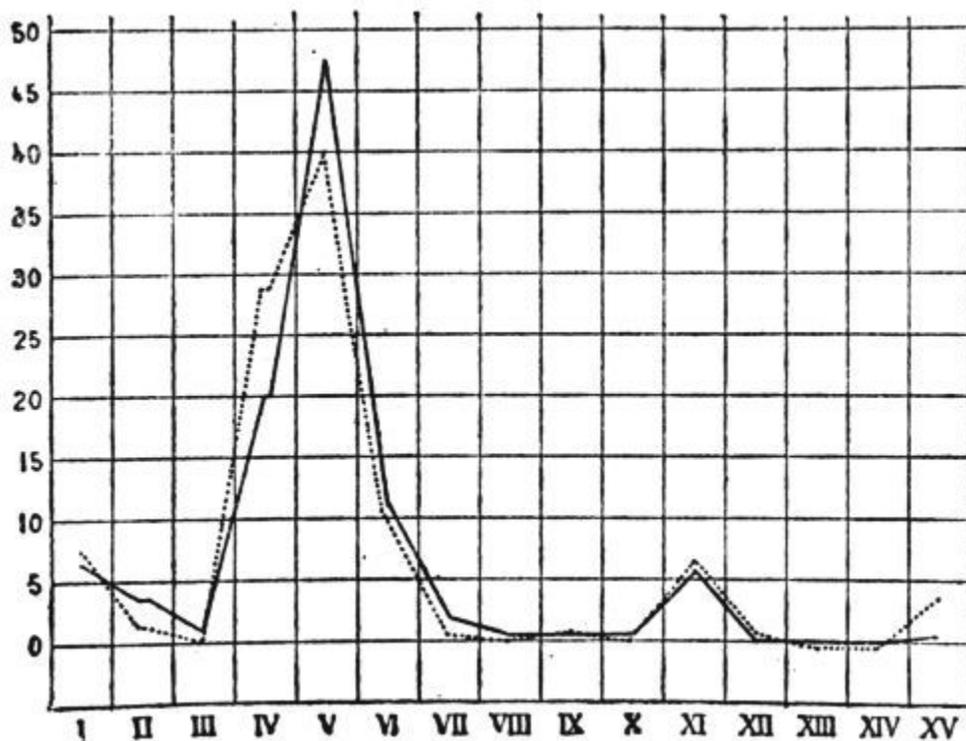

FIG. 12.

Tracing B. — husband; wife.

This number sums up inadequately the different and very unequal values; that is to say, there are some cases which show extreme difference and some which show marked concordance.

The different results are shown in the tracings (Figs. 11-15).

In the tracings I have marked the number of associations of each quality perpendicularly in percentages. The Roman letters written horizontally represent the forms of association indicated in the above tables.

Tracing A. The father (black line) shows an objective type, while the mother and daughter show the pure predicate type with a pronounced subjective tendency.

Tracing B. The husband and wife agree well in the predicate objective type, the predicate subjective being somewhat more numerous in the wife.

Tracing C. A very nice agreement between a father and his two daughters.

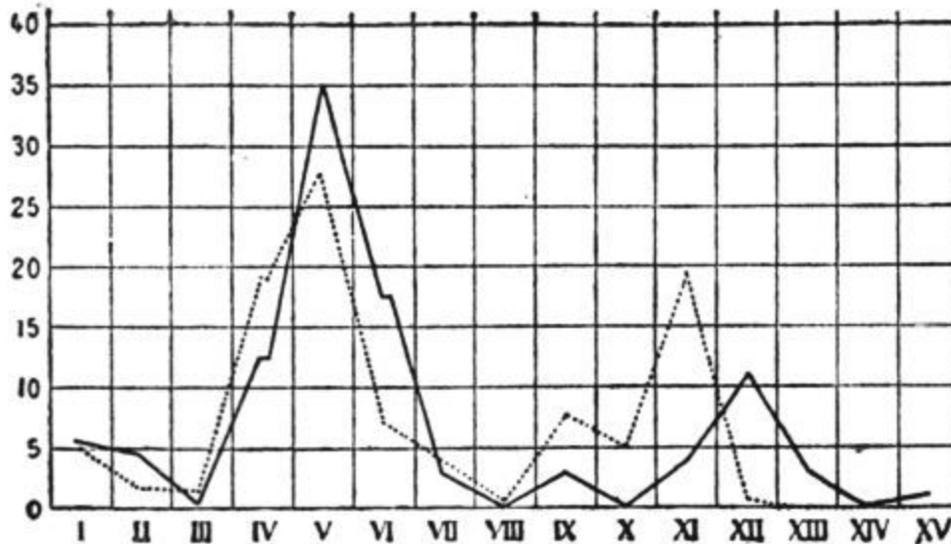

FIG. 13.

Tracing C. — father; 1st daughter; ++++ 2nd daughter.

Tracing D. Two sisters living together. The dotted line represents the married sister.

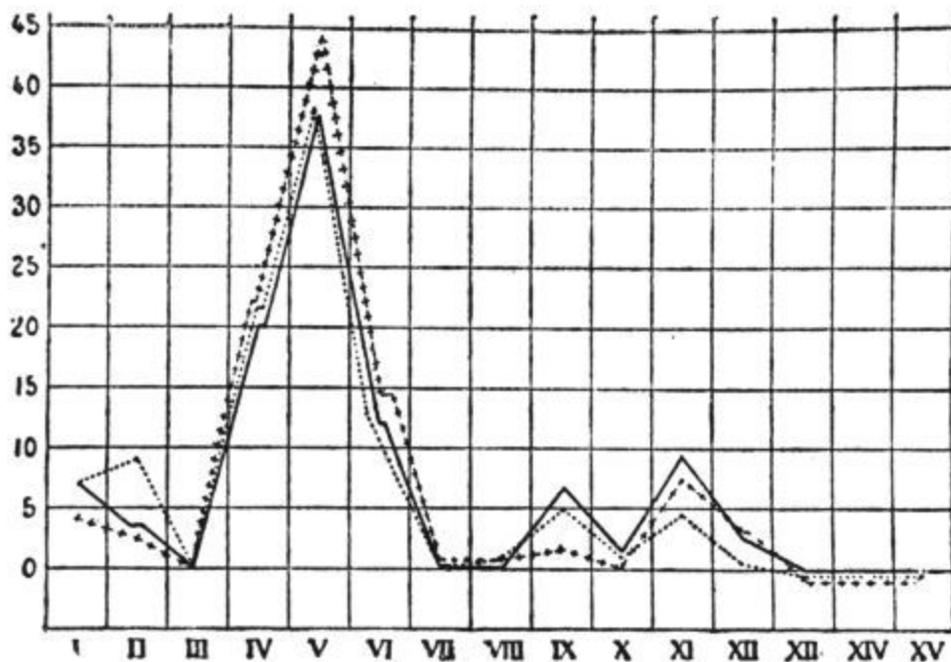

FIG. 14.

Tracing D. — single sister; married sister.

Tracing E. Husband and wife. The wife is a sister of the two women of tracing D. She approaches very closely to the type of her husband. Her tracing is the direct opposite of that of her sisters.

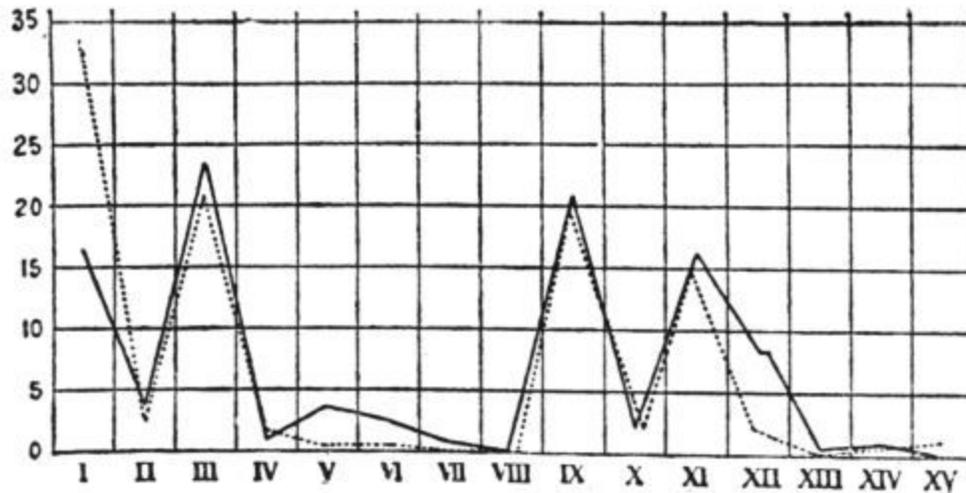

FIG. 15.

Tracing E. — husband; wife.

The similarity of the associations is often very extraordinary. I will reproduce here the associations of a mother and daughter.

Stimulus Word.	Mother.	Daughter.
to pay attention	diligent pupil	pupil
law	command of God	Moses
dear	child	father and mother
great	God	father
potato	bulbous root	bulbous root
family	many persons	5 persons
strange	traveller	traveller
brother	dear to me	dear
to kiss	mother	mother
burn	great pain	painful
door	wide	big
hay	dry	dry

month	many days	31 days
air	cool	moist
coal	sooty	black
fruit	sweet	sweet
merry	happy child	child

One might indeed think that in this experiment, where full scope is given to chance, individuality would become a factor of the utmost importance, and that therefore one might expect a very great diversity and lawlessness of associations. But as we see the opposite is the case. Thus the daughter lives contentedly in the same circle of ideas as her mother, not only in her thought but in her form of expression; indeed, she even uses the same words. What could be regarded as more inconsequent, inconstant, and lawless than a fancy, a rapidly passing thought? It is not lawless, however, neither is it free, but closely determined within the limits of the milieu. If, therefore, even the superficial and manifestly most inconsequent formations of the intellect are altogether subject to the milieu-constellation, what must we not expect for the more important conditions of the mind, for the emotions, wishes, hopes, and intentions? Let us consider a concrete example, illustrated by tracing A.

The mother is 45 years old and the daughter 16 years. Both have a very distinct predicate-type expressing personal judgment, both differ from the father in the most striking manner. The father is a drunkard and a demoralised creature. We can thus readily understand that his wife experiences an emotional voidness which she naturally betrays by her enhanced predicate-type. The same causes cannot, however, operate in the case of the daughter, for, in the first place, she is not married to a drunkard, and, in the second, life with all its hopes and promises still lies before her. It is distinctly unnatural for the daughter to show an extreme predicate-type expressing personal judgment. She responds to the stimuli of the environment just like her mother. But whereas in the mother the type is in a way a natural consequence of her unhappy condition of life, this condition is entirely lacking in the daughter. The daughter simply imitates the mother; she merely appears like the mother. Let us consider what this can signify for a young girl. If a young girl reacts to the world like an old woman, disappointed in life, this at once shows unnaturalness and constraint. But more serious consequences are possible. As you know the predicate-type is

a manifestation of intensive emotions; the emotions are always involved. Thus we cannot prevent ourselves from responding inwardly, at least, to the feelings and passions of our immediate environment; we allow ourselves to be infected and carried away by it. Originally the effects and their physical manifestations had a biological significance; *i.e.* they were a protective mechanism for the individual and the whole herd. If we manifest emotions, we can with certainty expect to receive emotions in return. That is the feeling of the predicate-type. What the 45-year-old woman lacks in emotions, *i.e.* in love in her marriage relations she seeks to obtain in the outside world, and for that reason she is an ardent participant in the Christian Science movement. If the daughter imitates this situation she copies her mother, she seeks to obtain emotions from the outside. But for a girl of sixteen such an emotional state is, to say the least, quite dangerous; like her mother, she reacts to her environment as a sufferer soliciting sympathy. Such an emotional state is no longer dangerous in the mother, but for obvious reasons it is quite dangerous in the daughter. Once freed from her father and mother she will be like her mother, *i.e.* she will be a suffering woman craving for inner gratification. She will thus be exposed to the great danger of falling a victim to brutality and of marrying a brute and inebriate like her father.

This conception is of importance in the consideration of the influence of environment and education. The example shows what passes over from the mother to the child. It is not the good and pious precepts, nor is it any other inculcation of pedagogic truths that have a moulding influence upon the character of the developing child, but what most influences him is the peculiarly affective state which is totally unknown to his parents and educators. The concealed discord between the parents, the secret worry, the repressed hidden wishes, all these produce in the individual a certain affective state with its objective signs which slowly but surely, though unconsciously, works its way into the child's mind, producing therein the same conditions and hence the same reactions to external stimuli. We know the depressing effect mournful and melancholic persons have upon us. A restless and nervous individual infects his surroundings with unrest and dissatisfaction, a grumbler with his discontent, etc. Since grown-up persons are so sensitive to surrounding influences, we should certainly expect this to be even more noticeable among children, whose minds are as soft and plastic as wax. The father and mother impress deeply into the child's mind

the seal of their personality; the more sensitive and mouldable the child the deeper is the impression. Thus things that are never even spoken about are reflected in the child. The child imitates the gesture, and just as the gesture of the parent is the expression of an emotional state, so in turn the gesture gradually produces in the child a similar feeling, as it feels itself, so to speak, into the gesture. Just as the parents adapt themselves to the world, so does the child. At the age of puberty when it begins to free itself from the spell of the family, it enters into life with, so to say, a surface adaptation entirely in keeping with that of the father and mother. The frequent and often very deep *depressions of puberty* emanate from this; they are symptoms which are rooted in the difficulty of new adjustment. The youthful person at first tries to separate himself as much as possible from his family; he may even estrange himself from it, but inwardly this only ties him the more firmly to the parental image. I cite the case of a young neurotic who ran away from his parents; he was estranged from, and almost hostile to them, but he admitted to me that he possessed a special sanctum; it was a strong box containing his old childhood books, old dried flowers, stones, and even small bottles of water from the well at his home and from a river along which he walked with his parents, etc.

The first attempts to assume friendship and love are constellated in the strongest manner possible by the relation to parents, and here one can usually observe how powerful are the influences of the familiar constellations. It is not rare, for instance, for a healthy man whose mother was hysterical to marry a hysteric, or for the daughter of an alcoholic to choose an alcoholic for her husband. I was once consulted by an intelligent and educated young woman of twenty-six who suffered from a peculiar symptom. She thought that her eyes now and then took on a strange expression which exerted a disagreeable influence on men. If she then looked at a man he became self-conscious, turned away and said something rapidly to his neighbour, at which both were either embarrassed or inclined to laugh. The patient was convinced that her look excited indecent thoughts in the men. It was impossible to convince her of the falsity of her conviction. This symptom immediately aroused in me the suspicion that I dealt with a case of paranoia rather than with a neurosis. But as was shown only three days later by the further course of the treatment, I was mistaken, for the symptom promptly disappeared after it had been explained by analysis. It originated in the following manner: The lady had a lover who

deserted her in a very marked manner. She felt utterly forsaken; she withdrew from all society and pleasure, and entertained suicidal ideas. In her seclusion there accumulated unadmitted and repressed erotic wishes which she unconsciously projected on men whenever she was in their company. This gave rise to the conviction that her look excited erotic wishes in men. Further investigation showed that her deserting lover was a lunatic, which she had not apparently observed. I expressed my surprise at her unsuitable choice, and added that she must have had a certain predilection for loving mentally abnormal persons. This she denied, stating that she had once before been engaged to be married to a normal man. He, too, deserted her; and on further investigation it was found that he, too, had been in an insane asylum shortly before,—another lunatic! This seemed to me to confirm with sufficient certainty my belief that she had an unconscious tendency to choose insane persons. Whence originated this strange taste? Her father was an eccentric character, and in later years entirely estranged from his family. Her whole love had therefore been turned away from her father to a brother eight years her senior; him she loved and honoured as a father, and this brother became hopelessly insane at the age of fourteen. That was apparently the model from which the patient could never free herself, after which she chose her lovers, and through which she had to become unhappy. Her neurosis which gave the impression of insanity, probably originated from this infantile model. We must take into consideration that we are dealing in this case with a highly educated and intelligent lady, who did not pass carelessly over her mental experiences, who indeed reflected much over her unhappiness, without, however, having any idea whence her misfortune originated.

There are things which unconsciously appear to us as a matter of course, and it is for this reason that we do not see them truly, but attribute everything to the so-called congenital character. I could cite any number of examples of this kind. Every patient furnishes contributions to this subject of the determination of destiny through the influence of the familiar milieu. In every neurotic we see how the constellation of the infantile milieu influences not only the character of the neurosis, but also life's destiny, even in its minute details. The unhappy choice of a profession, and innumerable matrimonial failures can be traced to this constellation. There are, however, cases where the profession has been well chosen, where the husband or wife leaves nothing to be desired, and where still the person does not feel well

but works and lives under constant difficulties. Such cases often appear under the guise of chronic neurasthenia. Here the difficulty is due to the fact that the mind is unconsciously split into two parts of divergent tendencies which are impeding each other; one part lives with the husband or with the profession, while the other lives unconsciously in the past with the father or mother. I have treated a lady who, after suffering many years from a severe neurosis, merged into a dementia præcox. The neurotic affection began with her marriage. This lady's husband was kind, educated, well to do, and in every respect suitable for her; his character showed nothing that would in any way interfere with a happy marriage. The marriage was nevertheless unhappy, all congenial companionship being excluded because the wife was neurotic.

The important heuristic axiom of every psychoanalysis reads as follows: *If a person develops a neurosis this neurosis contains the counter-argument against the relation of the patient to the individual with whom he is most intimately connected.* A neurosis in the husband loudly proclaims that he has intensive resistances and contrary tendencies against his wife; if the wife has a neurosis she has a tendency which diverges from her husband. If the person is unmarried the neurosis is then directed against the lover or the sweetheart or against the parents. Every neurotic naturally strives against this relentless formulation of the content of his neurosis, and he often refuses to recognise it at any cost, but still it is always justified. To be sure, the conflict is not on the surface, but must generally be revealed through a painstaking psychoanalysis.

The history of our patient reads as follows:

The father had a powerful personality. She was his favourite daughter, and entertained for him a boundless veneration. At the age of seventeen she for the first time fell in love with a young man. At that time she twice dreamt the same dream, the impression of which never left her in all her later years; she even imputed a mystic significance to it, and often recalled it with religious dread. In the dream she saw a tall, masculine figure with a very beautiful white beard; at this sight she was permeated with a feeling of awe and delight as if she experienced the presence of God Himself. This dream made the deepest impression on her, and she was constrained to think of it again and again. The love affair of that period proved to be one of little warmth, and was soon given up. Later the patient married her present

husband. Though she loved her husband she was led continually to compare him with her deceased father; this comparison always proved unfavourable to her husband. Whatever the husband said, intended, or did, was subjected to this standard and always with the same result: "My father would have done all this better and differently." Our patient's life with her husband was not happy, she could neither respect nor love him sufficiently; she was inwardly dissatisfied. She gradually developed a fervent piety, and at the same time violent hysterical symptoms supervened. She began by going into raptures now over this and now over that clergyman; she was looking everywhere for a spiritual friend, and estranged herself more and more from her husband. The mental trouble manifested itself about ten years after marriage. In her diseased state she refused to have anything to do with her husband and child; she imagined herself pregnant by another man. In brief, the resistances against her husband, which hitherto had been laboriously repressed, came out quite openly, and among other things manifested themselves in insults of the gravest kind directed against him.

In this case we see how a neurosis appeared, as it were, at the moment of marriage, *i.e. this neurosis expresses the counter-argument against the husband*. What is the counter-argument? The counter-argument is the father of the patient, for she verified her belief daily that her husband was not the equal of her father. When the patient first fell in love there had appeared a symptom in the form of an extremely impressive dream or vision. She saw the man with the very beautiful white beard. Who was this man? On directing her attention to the beautiful white beard she immediately recognised the phantom. It was of course her father. Thus every time the patient merged into a love affair the picture of her father inopportunately appeared and prevented her from adjusting herself psychologically to her husband.

I purposely chose this case as an illustration because it is simple, obvious, and quite typical of many marriages which are crippled through the neurosis of the wife. The cause of the unhappiness always lies in a too firm attachment to the parents. The infantile relationship has not been given up. We find here one of the most important tasks of pedagogy, namely, the solution of the problem how to free the growing individual from his unconscious attachments to the influences of the infantile milieu, in such a manner that he may retain whatever there is in it that is suitable and reject

whatever is unsuitable. To solve this difficult question on the part of the child seems to me impossible at present. We know as yet too little about the child's emotional processes. The first and only real contribution to the literature on this subject has in fact appeared during the present year. It is the analysis of a five-year-old boy published by Freud.

The difficulties on the part of the child are very great. They should not, however, be so great on the part of the parents. In many ways the parents could manage the love of children more carefully, more indulgently, and more intelligently. The sins committed against favourite children by the undue love of the parents could perhaps be avoided through a wider knowledge of the child's mind. For many reasons I find it impossible to say anything of general validity concerning the bringing up of children as it is affected by this problem. We are as yet very far from general prescriptions and rules; indeed we are still in the realm of casuistry. Unfortunately, our knowledge of the finer mental processes in the child is so meagre that we are not yet in any position to say where the greatest trouble lies, whether in the parents, in the child, or in the conception of the milieu. Only psychoanalyses of the kind that Professor Freud has published in the *Jahrbuch*, 1909,^[141] will help us out of this difficulty. Such comprehensive and profound observations should act as a strong inducement to all teachers to occupy themselves with Freud's psychology. This psychology offers more values for practical pedagogy than the physiological psychology of the present.

LECTURE III

EXPERIENCES CONCERNING THE PSYCHIC LIFE OF THE CHILD^[142]

Ladies and Gentlemen: In our last lecture we saw how important the emotional processes of childhood are for later life. In to-day's lecture I should like to give you some insight into the psychic life of the child through the analysis of a four-year-old girl. It is much to be regretted that there are few among you who have had the opportunity of reading the

analysis of "Little Hans" (*Kleiner Hans*), which was published by Freud during the current year.^[143] I ought to begin by giving you the content of that analysis, so that you might be in a position to compare Freud's results with those obtained by me, and observe the marked, and astonishing similarity between the unconscious creations of the two children. Without a knowledge of the fundamental analysis of Freud, much in the report of the following case will appear strange, incomprehensible, and perhaps unacceptable to you. I beg you, however, to defer your final judgment and to enter upon the consideration of these new subjects with a kindly disposition, for such pioneer work in virgin soil requires not only the greatest patience on the part of the investigator, but also the unprejudiced attention of his audience. Because the Freudian investigations apparently involve a discussion of the most intimate secrets of sexuality many people have had a feeling of repulsion against them, and have therefore rejected everything as a matter of course without any real disproof. This, unfortunately, has almost always been the fate of Freud's doctrines up to the present. One must not come to the consideration of these matters with the firm conviction that they do not exist, for it may easily happen that for the prejudiced they really do not exist. One should perhaps assume the author's point of view for the moment and investigate these phenomena under his guidance. Only in this way can the correctness or otherwise of our observations be affirmed. We may err, as all human beings err. But the continual holding up to us of our mistakes—perhaps they are worse than mistakes—does not help us to see things more distinctly. We should prefer to see *wherein* we err. That should be demonstrated to us in our own sphere of experience. Thus far, however, no one has succeeded in meeting us on our own ground, nor in giving us a different conception of the things which we ourselves see. We still have to complain that our critics persist in maintaining complete ignorance about the matters in question. The only reason for this is that they have never taken the trouble to become thoroughly acquainted with our method; had they done this they would have understood us.

The little girl to whose sagacity and intellectual vivacity we are indebted for the following observations is a healthy, lively child of emotional temperament. She has never been seriously ill, and never, even in the realm of the nervous system, had there been observed any symptoms prior to this

investigation. In the report which follows we shall have to waive any connected description, for it is made up of anecdotes which treat of one experience out of a whole cycle of similar ones, and which cannot, therefore, be arranged scientifically and systematically, but must rather be described somewhat in the form of a story. We cannot as yet dispense with this manner of description in our analytical psychology, for we are still far from being able in all cases to separate with unerring certainty what is curious from what is typical.

When the little daughter, whom we will call Anna, was about three years old, she once had the following conversation with her grandmother:

Anna: "Grandma, why are your eyes so dim?"

Grandma: "Because I am old."

A.: "But you will become young again."

G.: "No, do you know, I shall become older and older, and then I shall die."

A.: "Well, and then?"

G.: "Then I shall be an angel."

A.: "And then will you be a little baby again?"

The child found here a welcome opportunity for the provisional solution of a problem. For some time before she had been in the habit of asking her mother whether she would ever have a living doll, a little child, a little brother. This naturally included the question as to the origin of children. As such questions appeared only spontaneously and indirectly, the parents attached no significance to them, but responded to them as lightly and in appearance as carelessly as the child seemed to ask them. Thus she once received from her father the pretty story that children are brought by the stork. Anna had already heard somewhere a more serious version, namely, that children, are little angels living in heaven, and are brought from heaven by the stork. This theory seems to have become the starting point for the investigating activity of the little one. From the conversation with the

grandmother it could be seen that this theory was capable of wide application, namely, it not only solved in a comforting manner the painful idea of parting and dying, but at the same time also the riddle of the origin of children. Such solutions which kill at least two birds with one stone were formerly tenaciously adhered to in science, and cannot be removed from the mind of the child without a certain amount of shock.

Just as the birth of a little sister was the turning point in the history of "Little Hans," so in this case it was the birth of a brother, which happened when Anna had reached the age of four years. The pregnancy of the mother apparently remained unnoticed; *i.e.* the child never expressed herself on this subject. On the evening before the birth, when labour pains were beginning, the child was in her father's room. He took her on his knee and said, "Tell me, what would you say if you should get a little brother to-night?" "I would kill him" was the prompt answer. The expression "to kill" looks very serious, but in reality it is quite harmless, for "to kill" and "to die" in child language signify only to remove, either in the active or in the passive sense, as has already been pointed out a number of times by Freud. "To kill" as used by the child is a harmless word, especially so when we know that the child uses the word "kill" quite promiscuously for all possible kinds of destruction, removal, demolition, etc. It is, nevertheless, worth while to note this tendency (see the analysis of *Kleiner Hans*, p. 5).

The birth occurred early in the morning, and later the father entered the room where Anna slept. She awoke as he came in. He imparted to her the news of the advent of a little brother, which she took with surprise and strained facial expression. The father took her in his arms and carried her into the lying-in room. She first threw a rapid glance at her somewhat pale mother and then displayed something like a mixture of embarrassment and suspicion as if thinking, "Now what else is going to happen?" (Father's impression.) She displayed hardly any pleasure at the sight of the new arrival, so that the cool reception she gave it caused general disappointment. During the forenoon she kept very noticeably away from her mother; this was the more striking as she was usually much attached to her. But once when her mother was alone she ran into the room, embraced her and said, "Well, aren't you going to die now?" Now a part of the conflict in the child's psyche is revealed to us. Though the stork theory was never really taken seriously, she accepted the fruitful re-birth hypothesis, according to which a

person by dying helps a child into life. Accordingly the mother, too, must die; why, then, should the newborn child, against whom she already felt childish jealousy, cause her pleasure? It was for this reason that she had to seek a favourable opportunity of reassuring herself as to whether the mother was to die, or rather was moved to express the hope that she would not die.

With this happy issue, however, the re-birth theory sustained a severe shock. How was it possible now to explain the birth of her little brother and the origin of children in general? There still remained the stork theory which, though never expressly rejected, had been implicitly waived through the assumption of the re-birth theory. The explanations next attempted unfortunately remained hidden from the parents as the child went to stay with her grandmother for a few weeks. From the latter's report the stork theory was often discussed, and was naturally reinforced by the concurrence of those about her.

When Anna returned to her parents, she again, on meeting her mother, evinced the same mixture of embarrassment and suspicion which she had displayed after the birth. The impression, though inexplicable, was quite unmistakable to both parents. Her behaviour towards the baby was very nice. During her absence a nurse had come into the house who, on account of her uniform, made a deep impression on Anna; to be sure, the impression at first was quite unfavourable as she evinced the greatest hostility to her. Thus nothing could induce her to allow herself to be undressed and put to sleep by this nurse. Whence this resistance originated was soon shown in an angry scene near the cradle of the little brother in which Anna shouted at the nurse, "This is not your little brother, he is mine!" Gradually, however, she became reconciled to the nurse, and began to play nurse herself; she had to have her white cap and apron, and "nursed" now her little brother, and now her doll.

In contrast to her former mood she became unmistakably mournful and dreamy. She often sat for a long time under the table singing stories and making rhymes, which were partially incomprehensible but sometimes contained the "nurse" theme ("I am a nurse of the green cross"). Some of the stories, however, distinctly showed a painful feeling striving for expression.

Here we meet with a new and important feature in the little one's life: that is, we meet with reveries, even a tendency towards poetic fancies and melancholic attacks. All of them things which we are wont first to encounter at a later period of life, at a time when the youth or maiden is preparing to sever the family tie and to enter independently upon life, but is still held back by an inward, painful feeling of homesickness for the warmth of the parental hearth. At such a time the youth begins to replace what is lacking with poetic fancies in order to compensate for the deficiency. To approximate the psychology of a four-year-old child to that of the youth approaching puberty will at first sight seem paradoxical; the relationship lies, however, not in the age but rather in the mechanism. The elegiac reveries express the fact that a part of that love which formerly belonged, and should belong, to a real object, is now *introverted*, that is, it is turned inward into the subject and there produces an increased imaginative activity. What is the origin of this *introversion*? Is it a psychological manifestation peculiar to this age, or does it owe its origin to a conflict?

This is explained in the following occurrence. It often happened that Anna was disobedient to her mother, she was insolent, saying, "I am going back to grandma."

Mother: "But I shall be sad when you leave me."

Anna: "Oh, but you have my little brother."

This reaction towards the mother shows what the little one was really aiming at with her threats to go away again; she apparently wished to hear what her mother would say to her proposal, that is, to see what attitude her mother would actually assume to her, whether her little brother had not ousted her altogether from her mother's regard. One must, however, give no credence to this little trickster. For the child could readily see and feel that, despite the existence of the little brother, there was nothing essentially lacking to her in her mother's love. The reproach to which she subjects her mother is therefore unjustified, and to the trained ear this is betrayed by a slightly affected tone. Such an unmistakable tone does not expect to be taken seriously and hence it obtrudes itself more vehemently. The reproach as such cannot be taken seriously by the mother, for it was only the forerunner of other and this time more serious resistances. Not long after the conversation narrated above, the following scene took place:

Mother: "Come, we are going into the garden now!"

Anna: "You are telling lies, take care if you are not telling the truth."

M.: "What are you thinking of? I *am* telling the truth."

A.: "No, you are not telling the truth."

M.: "You will soon see that I am telling the truth: we are going into the garden now."

A.: "Indeed, is that true? Is that really true? Are you not lying?"

Scenes of this kind were repeated a number of times. This time the tone was more rude and more vehement, and at the same time the accent on the word "lie" betrayed something special which the parents did not understand; indeed, at first they attributed too little significance to the spontaneous utterances of the child. In this they merely did what education usually does in general, *ex officio*. We usually pay little heed to children in every stage of life; in all essential matters, they are treated as not responsible, and in all unessential matters, they are trained with an automatic precision.

Under resistances there always lies a question, a conflict, of which we hear later and on other occasions. But usually one forgets to connect the thing heard with the resistances. Thus, on another occasion, Anna put to her mother the following questions:—

Anna: "I should like to become a nurse when I grow big—why did you not become a nurse?"

Mother: "Why, as I have become a mother I have children to nurse anyway."

A. (Reflecting): "Indeed, shall I be a lady like you, and shall I talk to you then?"

The mother's answer again shows whither the child's question was really directed. Apparently Anna, too, would like to have a child to "nurse" just as the nurse has. Where the nurse got the little child is quite clear. Anna, too, could get a child in the same way if she were big. Why did not the mother become such a nurse, that is to say, how did she get a child if not in the

same way as the nurse? Like the nurse, Anna, too, could get a child, but how that fact might be changed in the future or how she might come to resemble her mother in the matter of getting children is not clear to her. From this resulted the thoughtful question, "Indeed, shall I be a lady like you? Shall I be quite different?" The stork theory evidently had come to naught, the dying theory met a similar fate; hence she now thinks one may get a child in the same way, as, for example, the nurse got hers. She, too, could get one in this natural way, but how about the mother who is no nurse and still has children? Looking at the matter from this point of view, Anna asks: "Why did you not become a nurse?" namely, "why have you not got your child in the natural way?" This peculiar indirect manner of questioning is typical, and evidently corresponds with the child's hazy grasp of the problem, unless we assume a certain diplomatic uncertainty prompted by a desire to evade direct questioning. We shall later find an illustration of this possibility. Anna is evidently confronted with the question "Where does the child come from?" The stork did not bring it; mother did not die; nor did mother get it in the same way as the nurse. She has, however, asked this question before and received the information from her father that the stork brings children; this is positively untrue, she can never be deceived on this point. Accordingly, papa and mama and all the others lie. This readily explains her suspicion at the childbirth and her discrediting of her mother. But it also explains another point, namely, the elegiac reveries which we have attributed to a partial introversion. We know now what was the real object from which love was removed and uselessly introverted, namely, it had to be taken *from the parents* who deceived her and refused to tell her the truth. (What can this be which must not be uttered? What is going on here?) Such were the parenthetic questions of the child, and the answer was: Evidently this must be something to be concealed, perhaps something dangerous. Attempts to make her talk and to draw out the truth by means of artful questions were futile, so *resistance is placed against resistance*, and the introversion of love begins. It is evident that the capacity for sublimation in a four-year-old child is still too slightly developed to be capable of performing more than symptomatic services. The mind, therefore, depends on another compensation, namely, it resorts to one of the relinquished infantile devices for securing love by force, preferably that of crying and calling the mother at night. This had been diligently practised and exhausted during her first year. It now returns, and corresponding to the

period of life has become well determined and equipped with recent impressions. It was just after the earthquakes in Messina, and this event was discussed at the table. Anna was extremely interested in everything, she repeatedly asked her grandmother to tell her how the earth shook, how the houses fell in and many people lost their lives. After this she had nocturnal fears, she could not be alone, her mother had to go to her and stay with her; otherwise she feared that an earthquake would happen, that the house would fall and kill her. During the day, too, she was much occupied with such thoughts. While walking with her mother she annoyed her with such questions as, "Will the house be standing when we return home? Are you sure there is no earthquake at home? Will papa still be living?" About every stone lying in the road she asked whether it was from an earthquake. A building in course of erection was a house destroyed by the earthquake, etc. Finally, she began to cry out frequently at night that the earthquake was coming and that she heard the thunder. Each evening she had to be solemnly assured that there was no earthquake coming.

Many means of calming her were tried, thus she was told, for example, that earthquakes only occur where there are volcanoes. But then she had to be satisfied that the mountains surrounding the city were not volcanoes. This reasoning led the child by degrees to a desire for learning, as strong as it was unnatural at her age, which showed itself in a demand that all the geological atlases and text-books should be brought to her from her father's library. For hours she rummaged through these works looking for pictures of volcanoes and earthquakes, and asking questions continually. Here we are confronted by an energetic effort to sublimate the fear into an eager desire for knowledge, which at this age made a decidedly premature exaction. But how many a gifted child suffering in exactly the same way with such problems, is "cosseted" through this untimely sublimation, by no means to its advantage. For, by favouring sublimation at this age one is merely strengthening manifestation of neurosis. The root of the eager desire for knowledge is *fear*, and *fear is the expression of converted libido*; that is, it is the expression of *an introversion which has become neurotic*, which at this age is neither necessary nor favourable for the development of the child.

Whither this eager desire for knowledge was ultimately directed is explained by a series of questions which arose almost daily. "Why is Sophie

(a younger sister) younger than I?" "Where was Freddie (the little brother) before? Was he in heaven? What was he doing there? Why did he come down just now, why not before?"

This state of affairs led the father to decide that the mother should tell the child when occasion offered *the truth concerning the origin of the little brother*. This having been done, Anna soon thereafter asked about the stork. Her mother told her that the story of the stork was not true, but that Freddie grew inside his mother like the flowers in a plant. At first he was very little, and then he became bigger and bigger as a plant does. She listened attentively without the slightest surprise, and then asked, "But did he come out all by himself?"

Mother: "Yes."

Anna: "But he cannot walk!"

Sophie: "Then he crawled out."

Anna, overhearing her little sister's answer: "Is there a hole here? (pointing to the breast) or did he come out of the mouth? Who came out of the nurse?" She then interrupted herself and exclaimed, "No, no, the stork brought baby brother down from heaven." She soon left the subject and again wished to see pictures of volcanoes. During the evening following this conversation she was calm. The sudden explanation produced in the child a whole series of ideas, which manifested themselves in certain questions. New unexpected perspectives were opened; she rapidly approached the main problem, namely, the question, "*Where did the baby come out?*" *Was it from a hole in the breast or from the mouth?* Both suppositions are entirely qualified to form acceptable theories. We even meet with recently married women who still entertain the theory of the hole in the abdominal wall or of the Cæsarean section; this is supposed to betray a very unusual degree of innocence. But as a matter of fact it is not innocence; we are always dealing in such cases with infantile sexual activities, which in later life have brought the *vias naturales* into ill repute.

It may be asked where the child got the absurd idea that there is a hole in the breast, or that the birth takes place through the mouth. Why did she not select one of the natural openings existing in the pelvis from which things

come out daily? The explanation is simple. Very shortly before, our little one had invoked some educational criticism from her mother by a heightened interest in both openings with their remarkable excretions,—an interest not always in accord with the requirements of cleanliness and decorum. Then for the first time she became acquainted with the exceptional laws relating to these bodily regions and, being a sensitive child, she soon learned that there was something here to be tabooed. This region, therefore, must not be referred to. Anna had simply shown herself docile and had so adjusted herself to the cultural demands that she thought (at least spoke) of the simplest things last. The incorrect theories substituted for correct laws sometimes persist for years until brusque explanations come from without. It is, therefore, no wonder that such theories, the forming of and adherence to which are favoured even by parents and educationalists should later become determinants for important symptoms in a neurosis, or of delusions in a psychosis, just as I have shown that in dementia præcox^[144] what has existed in the mind for years always remains somewhere, though it may be hidden under compensations of a seemingly different kind.

But even before this question was settled as to where the child really comes out a new problem obtruded itself, viz. the children came out of the mother, but how is it with the nurse? Did some one come out of her too? This question was followed by the remark, "No, no, the stork brought down baby brother from heaven." What is there peculiar about the fact that nobody came out of the nurse? We recall that Anna identified herself with the nurse, and planned to become a nurse later, for she, too, would like to have a child, and she could have one as well as the nurse. But now when it is known that the little brother grew in mama, how is it now?

This disquieting question is averted by a quick return to the stork-angel theory which has never been really believed and which after a few trials is at last definitely abandoned. Two questions, however, remain in the air. The first reads as follows: Where does the child come out? The second, a considerably more difficult one, reads: How does it happen that mama has children while the nurse and the servants do not? All these questions did not at first manifest themselves.

On the day following the explanation, while at dinner, Anna spontaneously remarked: "My brother is in Italy, and has a house of cloth and glass, but it does not tumble down."

In this case, as in the others, it was impossible to ask for an explanation; the resistances were too great and Anna could not be drawn into conversation. This former officious and pretty explanation is very significant. For some three months the two sisters had been building a stereotyped fanciful conception of a "big brother." This brother knows everything, he can do and has everything, he has been and is in every place where the children are not; he is owner of great cows, oxen, horses, dogs; everything is his, etc. Every one has such a "big brother." We must not look far for the origin of this fancy; the model for it is the *father* who seems to correspond to this conception; he seems to be like a brother to mama. The children, too, have their similar powerful "brother." This brother is very brave; he is at present in dangerous Italy and inhabits an impossible fragile house, and *it does not tumble down*. For the child this realises an important wish: *the earthquake is no longer to be dangerous*; in consequence *the child's fear disappeared and did not return*. The fear of earthquakes now entirely vanished. Instead

of calling her father to her bed to conjure away the fear, she now became very affectionate and begged him every night to kiss her.

In order to test this new state of affairs the father showed her pictures illustrating volcanoes and earthquake devastations. Anna remained unaffected, she examined the pictures with indifference, remarking, "These people are dead; I have already seen that quite often." The picture of a volcanic eruption no longer had any attraction for her. Thus all her scientific interest collapsed and vanished as suddenly as it came. During the days following the explanation Anna had quite important matters to occupy herself with; she disseminated her newly acquired knowledge among those about her in the following manner: She began by again circumstantially affirming what had been told her, viz. that Freddy, her younger sister, and herself had grown in her mother, that papa and mama grew in their mothers, and that the servants likewise grew in their respective mothers. By frequent questions she tested the true basis of her knowledge, for her suspicion was aroused in no small measure, so that it needed many confirmations to remove all her uncertainties.

On one occasion the trustworthiness of the theory threatened to go to pieces. About a week after the explanation, the father was taken ill with influenza and had to remain in bed during the forenoon. The children knew nothing about this, and Anna, coming into the parents' bedroom, saw what was quite unusual, namely, that her father was remaining in bed. She again took on a peculiar surprised expression; she remained at a distance from the bed and would not come nearer; she was apparently again reserved and suspicious. But suddenly she burst out with the question, "Why are you in bed; have you a plant in your inside too?"

The father naturally had to laugh. He calmed her, however, by assuring her that children never grow in the father, that only women can have children, and not men; thereupon the child again became friendly. But though the surface was calm the problems continued to work in the dark. A few days later, while at dinner, Anna related the following dream: "I dreamed last night of Noah's ark." The father then asked her what she had dreamed about it, but Anna's answer was sheer nonsense. In such cases it is necessary only to wait and pay attention. A few minutes later she said to her mother, "I dreamed last night about Noah's ark, and there were a lot of little animals in it." Another pause. She then began her story for the third time. "*I dreamed*

last night about Noah's ark, and there were a lot of baby animals in it, and underneath there was a lid and that opened and all the baby animals fell out."

The children really had a Noah's ark, but its opening, a lid, was on the roof and not underneath. In this way she delicately intimated that the story of the birth from mouth or breast is incorrect, and that she had some inkling where the children came out.

A few weeks then passed without any noteworthy occurrences. On one occasion she related the following dream: *"I dreamed about papa and mama; they had been sitting late in the study, and we children were there too."* On the face of this we find a wish of the children to be allowed to sit up as long as the parents. This wish is here realised, or rather it is utilised to express a more important wish, namely, *to be present in the evening when the parents are alone*; of course, quite innocently, it was in the *study* where she has seen all the interesting books, and where she has satiated her thirst for knowledge; *i.e.* she was really seeking an answer to the burning question, whence the little brother came. If the children were there they would find out.^[145] A few days later Anna had a terrifying dream from which she awoke crying, "The earthquake is coming, the house has begun to shake." Her mother went to her and calmed her by saying that the earthquake was not coming, that everything was quiet, and that everybody was asleep. Whereupon Anna said: *"I would like to see the spring, when all the little flowers are coming out and the whole lawn is full of flowers; I would like to see Freddy, he has such a dear little face. What is papa doing? What is he saying?"* The mother said, "He is asleep, and isn't saying anything now." Little Anna then remarked with a sarcastic smile: *"He will surely be sick again to-morrow."*

This text should be read backwards. The last sentence was not meant seriously, as it was uttered in a mocking tone. When the father was sick the last time, Anna suspected that he had a "plant in his inside." The sarcasm signifies: "To-morrow papa is surely going to have a child." But this also is not meant seriously. Papa is not going to have a child; mama alone has children; perhaps she will have another child to-morrow; but where from? "What does papa do?" The formulation of the difficult problem seems here to come to the surface. It reads: What does papa really do if he does not

bear children? The little one is very anxious to have a solution for all these problems; she would like to know how Freddy came into the world, she would like to see how the little flowers come out of the earth in the spring, and these wishes are hidden behind the fear of earthquakes.

After this intermezzo Anna slept quietly until morning. In the morning her mother asked her what she had dreamed. She did not at first recall anything, and then said: "*I dreamed that I could make the summer, and then some one threw a Punch*^[146] *down into the closet.*"

This peculiar dream apparently has two different scenes which are separated by "then." The second part draws its material from the recent wish to possess a Punch, that is, to have a boy doll just as mama has a little boy. Some one threw Punch down into the closet; one often lets other things fall down into the water closet. *It is just like this that the children, too, come out.* We have here an analogy to the "Lumpf-theory" of little Hans.^[147] Whenever several scenes are found in one dream, each scene ordinarily represents a particular variation of the complex elaboration. Here accordingly the first part is only a variation of the theme found in the second part. The meaning of "to see the spring" or "to see the little flowers come out" we have already remarked. Anna now dreams that she *can make the summer*, that is she can bring it about that the little flowers shall come out. She herself can make a little child, and the second part of the dream represents this just as one makes a motion in the w.c. Here we find the egoistic wish which is behind the seemingly objective interest of the previous night's conversation.

A few days later the mother was visited by a lady who expected soon to become a mother. The children seemed to take no interest in the matter, but the next day they amused themselves with the following play which was directed by the elder girl; they took all the newspapers they could find in their father's paper-basket and stuffed them under their clothes, so that the imitation was unmistakable. During the night little Anna had another dream: "*I dreamed about a woman in the city; she had a very big stomach.*" The chief actor in a dream is always the dreamer himself under some definite aspect; thus the childish play of the day before is fully solved.

Not long after, Anna surprised her mother with the following performance: She stuck her doll under her clothes, then pulled it out slowly head

downwards, and at the same time remarked, "*Look, the baby is coming out, now it is all out.*" By this means Anna tells her mother, "You see, thus I apprehend the problem of birth. What do you think of it? Is that right?" The play is really meant to be a question, for, as we shall see later, this idea had to be officially confirmed. That rumination on this problem by no means ended here, is shown by the occasional ideas conceived during the following weeks. Thus she repeated the same play a few days later with her Teddy Bear, who stands in the relation of an especially beloved doll. One day, looking at a rose, she said to her grandmother, "See, the rose is getting a baby." As her grandmother did not quite understand her, she pointed to the enlarged calyx and said, "Don't you see it is quite fat here?"

Anna once quarrelled with her younger sister, and the latter exclaimed angrily, "I will kill you." Whereupon Anna answered, "When I am dead you will be all alone; then you will have to pray to God for a live baby." But the scene soon changed: Anna was the angel, and the younger sister was forced to kneel before her and pray to her that she should present to her a living child. In this way Anna became the child-dispensing mother.

Oranges were once served at table. Anna impatiently asked for one and said, "*I am going to take an orange and swallow it all down into my stomach, and then I shall get a baby.*" Who does not think here of fairy tales in which childless women become pregnant by swallowing fruit, fish, and similar things?^[148] In this way Anna sought to solve the problem *how the children actually come into the mother*. She thus enters into a formulation which hitherto had not been defined with so much clearness. The solution follows in the form of an *analogy*, which is quite characteristic of the archaic thinking of the child. (In the adult, too, there is a kind of thinking by metaphor which belongs to the stratum lying immediately below consciousness; dreams bring the analogies to the surface; the same may be observed also in dementia præcox.) In German as well as in numerous foreign fairy tales one frequently finds such characteristic childish comparisons. Fairy tales seem to be the myths of the child, and therefore contain among other things the mythology which the child weaves concerning the sexual processes. The spell of the fairy tale poetry, which is felt even by the adult, is explained by the fact that some of the old theories are still alive in our unconscious minds. We experience a strange, peculiar and familiar feeling when a conception of our remotest youth is again

stimulated. Without becoming conscious it merely sends into consciousness a feeble copy of its original emotional strength.

The problem how the child gets into the mother was difficult to solve. As the only way of taking things into the body is through the mouth, it could evidently be assumed that the mother ate something like a fruit, which then grows inside her. But then comes another difficulty, namely, it is clear enough what the mother produces, but it is not yet clear what the father is good for.

What does the father do? Anna now occupied herself exclusively with this question. One morning she ran into the parents' bedroom while they were dressing, she jumped into her father's bed, lay face downwards, kicked with her legs and called at the same time, "*Look! does papa do that?*" The analogy to the horse of "little Hans" which raised such disturbance with its legs, is very surprising.

With this last performance the problem seemed to be at rest entirely, at least the parents found no opportunity to make any pertinent observations. That the problem should come to a standstill just here is not at all surprising, for this is really its most difficult part. Moreover, we know from experience that not many children go beyond these limits during the period of childhood. The problem is almost too difficult for the childish mind, which still lacks much knowledge necessary to its solution.

This standstill lasted about five months, during which no phobias or other signs of complex-elaboration appeared. After this lapse of time there appeared premonitory signs of some new incidents. Anna's family lived at that time in the country near a lake where the mother and children could bathe. As Anna was afraid to wade farther into the water than knee-deep, her father once put her into the water, which led to an outburst of crying. In the evening while going to bed Anna asked her mother, "Do you not believe that father wanted to drown me?" A few days later there was another outburst of crying. She continued to stand in the gardener's way until he finally placed her in a newly dug hole. Anna cried bitterly, and afterwards maintained that the gardener wished to bury her. Finally she awoke during the night with fearful crying. Her mother went to her in the adjoining room and quieted her. She had dreamed that "a train passed and then fell in a heap."

This tallies with the "stage coach" of "little Hans." These incidents showed clearly enough that fear was again in the air, *i.e.* that a resistance had again arisen preventing transference to the parents, and that therefore a great part of her love was converted into fear. This time suspicion was not directed against the mother, but against the father, who she was sure must know the secret, but would never let anything out. What could the father be doing or keeping secret? To the child this secret appeared as something dangerous, so that she felt the worst might be expected from the father. (This feeling of childish anxiety with the father as object we see again most distinctly in adults, especially in dementia præcox, which lifts the veil of obscurity from many unconscious processes, as though it were following psychoanalytic principles.) It was for this reason that Anna came to the apparently absurd conclusion that her father wanted to drown her. At the same time her fear contained the thought that the *object of the father had some relation to a dangerous action*. This stream of thought is no arbitrary interpretation. Anna meanwhile grew a little older and her interest in her father took on a special colouring which is hard to describe. Language has no words to describe the quite unique kind of tender curiosity which shone in the child's eyes.

Anna once took marked delight in assisting the gardener while he was sowing grass, without apparently divulging the profound significance of her play. About a fortnight later she began to observe with great pleasure the young grass sprouting. On one of these occasions she asked her mother the following question: "Tell me, how did the eyes grow into the head?" The mother told her that she did not know. Anna, however, continued to ask whether God or her papa could tell this? The mother then referred her to her father, who might tell her how the eyes grew into the head. A few days later there was a family reunion at tea. When the guests had departed, the father remained at the table reading the paper and Anna also remained. Suddenly approaching her father she said, "Tell me, how did the eyes grow into the head?"

Father: "They did not grow into the head; they were there from the beginning and grew with the head."

A.: "Were not the eyes planted?"

F.: "No, they grew in the head like the nose."

A.: "Did the mouth and the ears grow in the same way? and the hair, too?"

F.: "Yes, they all grew in the same way."

A.: "And the hair, too? But the mousies came into the world naked. Where was the hair before? Aren't there little seeds for it?"

F.: "No; you see, the hair really came out of little grains which are like seeds, but these were already in the skin long before and nobody sowed them." The father was now getting concerned; he knew whither the little one's thoughts were directed, but he did not wish to overthrow, for the sake of a former false application, the opportunely established seed-theory which she had most fortunately gathered from nature; but the child spoke with an unwonted seriousness which demanded consideration.

Anna (evidently disappointed, and in a distressed tone): "But how did Freddy get into mama? Who stuck him in? and who stuck you into your mama? Where did he come out from?"

From this sudden storm of questions the father chose the last for his first answer. "Just think, you know well enough that Freddy is a boy; boys become men and girls women. Only women and not men can have children; now just think, where could Freddy come out from?"

A. (Laughs joyfully and points to her genitals): "Did he come out here?"

Father: "Yes, of course, you certainly must have thought of this before?"

A. (Overlooking the question): "But how did Freddy get into mama? Did anybody plant him? Was the seed planted?"

This very precise question could no longer be evaded by the father. He explained to the child, who listened with the greatest attention, that the mother is like the soil and the father like the gardener; that the father provides the seed which grows in the mother, and thus gives origin to a baby. This answer gave extraordinary satisfaction; she immediately ran to her mother and said, "Papa has told me everything, now I know it all." She did not, however, tell what she knew.

The new knowledge was, however, put into play the following day. Anna went to her mother and said, "Think, mama, papa told me how Freddy was a little angel and was brought from heaven by a stork." The mother was

naturally surprised and said, "No, you are mistaken, papa surely never told you such a thing!" whereupon the little one laughed and ran away.

This was apparently a mode of revenge. Her mother did not wish or was not able to tell her how the eyes grew into the head, hence she did not know how Freddy got into her. It was for this reason that she again tried her with the old story.

I wish to impress firmly upon parents and educationists this instructive example of child psychology. In the learned psychological discussions on the child's psyche we hear nothing about those parts which are so important for the health and naturalness of our children, nor do we hear more about the child's emotions and conflicts; and yet they play a most important rôle.

It very often happens that children are erroneously treated as quite imprudent and irrational beings. Thus on indulgently remarking to an intelligent father, whose four-year-old daughter masturbated excessively, that care should be exercised in the presence of the child who slept in the same room as the parents, I received the indignant reply, "I can absolutely assure you that the child knows nothing about sexual matters." This recalls that distinguished old neurologist who wished to deny the attribute "sexual" to a childbirth phantasy which was represented in a dreamy state.

On the other hand, a child evincing neurotic talent exaggerated by neurosis may be urged on by solicitous parents. How easy and tempting it would have been, *e.g.* in the present case, to admire, excite, and develop prematurely the child's eager desire for learning, and thereby develop an unnatural *blasé* state and a precociousness masking a neurosis! In such cases the parents must look after their own complexes and complex tendencies and not make capital out of them at the expense of the child. The idea should be dismissed once for all that children are to be held in bondage by their parents or that they are their toys. They are characteristic and new beings. In the matter of enlightenment on sexual things it can be affirmed that they suffer from the preconceived opinion that the truth is harmful. Many neurologists are of opinion that even in grown-ups enlightenment on their own psychosexual processes is harmful and even immoral. Would not the same persons perhaps refuse to admit the existence of the genitals themselves?

One should not, however, go from this extreme of prudishness to the opposite one, namely that of enlightenment *à tout prix*, which may turn out as foolish as it is disagreeable. In this matter I believe much discretion is advisable; still if children come upon an idea, they should be deceived no more than adults.

I hope, ladies and gentlemen, that I have shown you what complicated psychic processes psychoanalytic investigation reveals in the child, and how great is the significance of these processes for the mental health as well as for the general psychic development of the child. What I have been unable to show is the universal validity of these observations. Unfortunately, I am not in a position to demonstrate this, for I do not know myself how much of it is universally valid. Only by accumulation of such observations and further penetration into the problems broached shall we gain a complete insight into the laws of psychical development. It is to be regretted that we are at present still far from this goal. But I confidently hope that educators and practical psychologists, whether physicians or deep-thinking parents, will not leave us too long unassisted in this immensely important and interesting field.

CHAPTER III

THE SIGNIFICANCE OF THE FATHER IN THE DESTINY OF THE INDIVIDUAL^[149]

Ducunt volentem fata, nolentem trahunt.

Freud has pointed out in many places^[150] with unmistakable clearness that the psychosexual relationship of the child towards his parents, particularly towards the father, possesses an overwhelming importance in the content of any later neurosis. This relationship is in fact the infantile channel *par excellence* in which the libido flows back^[151] when it encounters any obstacles in later years, thus revivifying long-forgotten dreams of childhood. It is ever so in life when we draw back before too great an obstacle—the menace of some severe disappointment or the risk of some too far-reaching decision—the energy stored up for the solution of the task flows back impotent; the by-streams once relinquished as inadequate are again filled up. He who has missed the happiness of woman's love falls back, as a substitute, upon some gushing friendship, upon masturbation, upon religiosity; should he be a neurotic he plunges still further back into the conditions of childhood which have never been quite forsaken, to which even the normal is fettered by more than one link—he returns to the relationship to father and mother. Every psychoanalysis carried out at all thoroughly shows this regression more or less plainly. One peculiarity which stands out in the works and views of Freud is that the relationship to the father is seen to possess an overwhelming importance. This importance of the father in the moulding of the child's psycho-sexuality may also be discovered in a quite other and remote field, in the investigation of the family.^[152] The most recent thorough investigations demonstrate the predominating influence of the father often lasting for centuries. The mother seems of less importance in the family.^[153] If this is true for heredity on the physical side how much more should we expect from the psychological influences emanating from the father? These experiences, and those gained more particularly in an analysis carried out conjointly with

Dr. Otto Gross, have impressed upon me the soundness of this view. The problem has been considerably advanced and deepened by the investigations of my pupil, Dr. Emma Fürst, into familial resemblances in the reaction-type.^[154] Fürst made association experiments on one hundred persons belonging to twenty-four families. Of this extensive material, only the results in nine families and thirty-seven persons (all uneducated) have been worked out and published. But the painstaking calculations do already permit some valuable conclusions. The associations are classified on the KRÆPELIN-ASCHAFFENBURG scheme as simplified and modified by myself; the difference is then calculated between each group of qualities of the subjects experimented upon and the corresponding group of every other subject experimented upon. Thus we finally get the differentiation of the mean in reaction-type. The following is the result:—

Non-related men differ among themselves by 5·9.

Non-related women differ among themselves by 6·0.

Related men differ among themselves by 4·1.

Related women differ among themselves by 3·8.

Relatives, and especially related women, have therefore, on the average, resemblance in reaction-type. This fact means that the psychological adaptation of relatives differs but slightly.

An investigation into the various relationships gave the following:—

The mean difference of the husband and wife amounts to 4·7. The mean deviation of this mean is, however, 3·7, a very high figure, which signifies that the mean figure 4·7 is composed of very heterogeneous figures; there are married couples in whom the reaction type is very close and others in whom it is very slight. On the whole, however, father and son, mother and daughter stand remarkably close.

The difference between father and son amounts to 3·1.

The difference between mother and daughter amounts to 3·0.

With the exception of a few cases of married couples (where the difference fell to 1·4) these are the lowest differences. In Fürst's work there was a case where the difference between the forty-five year old mother and her sixteen year old daughter was only 0·5. But it was just in this case that the mother

and daughter differed from the father's type by 11·8. The father is a coarse, stupid man, an alcoholic; the mother goes in for Christian Science. This corresponds with the fact that mother and daughter exhibit an extreme word-predicate type,^[155] which is, in my experience, important semeiotically for the diagnosis of insufficiency in the sexual object. The word-predicate type transparently applies an excessive amount of emotion externally and displays emotions with the unconscious, but nevertheless obvious, endeavour to awaken echoing emotions in the experimenter. This view closely corresponds with the fact that in Fürst's material the number of word-predicates increases with the age of the subjects experimented upon.

The fact of the extreme similarity between the reaction-type of the offspring and the parents is matter for thought. The association experiment is nothing but a small section from the psychological life of a man. At bottom daily life is nothing but an extensive and many-varied association experiment; in essence we react in life just as we do in the experiments. Although this truth is evident, still it requires a certain consideration and limitation. Let us take as an instance the case of the unhappy mother of forty-five years and her unmarried daughter of sixteen. The extreme word-predicate type of the mother is, without doubt, the precipitate of a whole life of disappointed hopes and wishes. One is not in the least surprised at the word-predicate type here. But the daughter of sixteen has really not yet lived at all; her real sexual object has not yet been found, and yet she reacts as if she were her mother with endless disillusion behind her. She has *the mother's adaptation*, and in so far she is identified with the mother. There is ample evidence that the mother's adaptation must be attributed to her relationship to the father. But the daughter is not married to the father and therefore does not need this adaptation. She has taken it over from the influence of her milieu, and later on will try to adapt herself to the world with this *familial disharmony*. In so far as an ill-assorted marriage is unsuitable, the adaptation resulting from it is unsuitable.

Clearly such a fate has many possibilities. To adapt herself to life, this girl either will have to surmount the obstacles of her familial milieu, or, unable to free herself from them, she *will succumb to the fate to which such an adaptation predisposes* her. Deep within, unnoticed by any one, there may go on a glossing over of the infantile disharmony, or a development of the negative of the parents' character, accompanied by hindrances and conflicts

to which she herself has no clue. Or, growing up, she will come into painful conflict with that world of actualities to which she is so ill-adapted till one stroke of fate after another gradually opens her eyes to the fact that it is herself, infantile and maladjusted, that is amiss. The source of infantile adaptation to the parents is naturally the affective condition on both sides; the psycho-sexuality of the parents on one side and that of the child on the other. It is a kind of psychical infection; we know that it is not logical truth, but affects and their psychical expressions^[156] which are here the effective forces. It is these that, with the power of the herd-instinct, press into the mind of the child, there fashioning and moulding it. In the plastic years between one and five there have to be worked out all the essential formative lines which fit exactly into the parental mould. Psychoanalytic experience teaches us that, as a rule, the first signs of the later conflict between the parental constellation and individual independence, of the struggle between repression and libido (Freud), occur before the fifth year.

The few following histories will show how this parental constellation obstructs the adaptation of the offspring. It must suffice to present only the chief events of these, that is the events of sexuality.

Case 1.—A well-preserved woman of 55; dressed poorly but carefully in black with a certain elegance, the hair carefully dressed; a polite, obviously affected manner, precise in speech, a devotee. The patient might be the wife of a minor official or shopkeeper. She informs me, blushing and dropping her eyes, that she is the divorced wife of a common peasant. She has come to the hospital on account of depression, night terrors, palpitations, slight nervous twitchings in the arms, thus presenting the typical features of a slight climacteric neurosis. To complete the picture, she adds that she suffers from severe anxiety-dreams; in her dreams some man seems to be pursuing her, wild animals attack her, and so on.

Her anamnesis begins with the family history. (So far as possible I give her own words.) Her father was a fine, stately, rather corpulent man of imposing appearance. He was very happy in his marriage, for her mother *worshipped* him. He was a clever man, a master-mechanic, and held a dignified and honourable position. There were only two children, the patient and an elder sister. The sister was the mother's, and the patient her father's favourite. When the patient was five years old the father died

suddenly from a stroke, at the age of forty-two. The patient felt herself very isolated and was from that time treated by the mother and the elder sister as the Cinderella. She noticed clearly enough that her mother preferred her sister to herself. Her mother remained a widow, her respect for her husband being too great to allow her to marry a second time. She preserved his memory "like a religious cult" and brought up her children in this way.

Later on the sister married, relatively young; the patient did not marry till twenty-four. She never cared for young men, they all seemed insipid; her mind turned always to more mature men. When about twenty she became acquainted with a stately gentleman rather over forty, to whom she was much drawn. For various reasons the friendship was broken off. At twenty-four she became acquainted with a widower who had two children. He was a fine, stately, somewhat corpulent man, and had an imposing presence, like her father; he was forty-four. She married him and respected him enormously. The marriage was childless; the children by the first marriage died from an infectious disease. After four years of married life her husband also died. For eighteen years she remained his faithful widow. But at forty-six (just before the menopause) she experienced a great need of love. As she had no acquaintances she went to a matrimonial agency and married the first comer, a peasant of some sixty years who had been already twice divorced on account of brutality and perverseness; the patient knew this before marriage. She remained five unbearable years with him, when she also obtained a divorce. The neurosis set in a little later.

No further discussion will be required for those with psychoanalytic experience; the case is too obvious. For those unversed in psychoanalysis let me point out that up to her forty-sixth year the patient did but reproduce most faithfully the milieu of her earliest youth. The sexuality which announced itself so late and so drastically, even here only led to a deteriorated edition of the father-surrogate; to this she is brought by this late-blossoming sexuality. Despite repression, the neurosis betrays the ever-fluctuating eroticism of the aging woman who still wants to please (affectation) but dares not acknowledge her sexuality.

Case 2.—A man of thirty-four of small build and with a sensible, kindly expression. He is easily embarrassed, blushes often. He came for treatment on account of "nervousness." He says he is very irritable, readily fatigued,

has nervous indigestion, is often deeply depressed so that he has thought of suicide.

Before coming to me for treatment he sent me a circumstantial autobiography, or rather a history of his illness, in order to prepare me for his visit. His story began: "My father was a very big and strong man." This sentence awakened my curiosity; I turned over a page and there read: "When I was fifteen a big lad of nineteen took me into the wood and indecently assaulted me."

The numerous gaps in the patient's story induced me to obtain a more exact anamnesis from him, which produced the following remarkable facts.

The patient is the youngest of three brothers. His father, a big, red-haired man, was formerly a soldier in the Papal Swiss Guard, and then became a policeman. He was a strict, gruff old soldier, who brought up his sons with military precision; he commanded them, did not call them by name, but whistled to them. He had spent his youth in Rome, where he acquired syphilis, from the consequences of which he still suffered in old age. He was fond of talking about his adventures in early life. His eldest son (considerably older than the patient) was exactly like him, he was big, strong and had reddish hair. The mother was a feeble woman, prematurely aged; exhausted and tired of life, she died at forty when the patient was eight years old. He preserved a tender and beautiful memory of his mother.

When he went to school he was always the whipping-boy and always the object of his schoolfellows' mockery. The patient considers that his peculiar dialect was to blame for this. Later he was apprenticed to a severe and unkind master, under most trying conditions, from which all the other apprentices had run away, finding them intolerable. Here he held out for over two years. At fifteen the assault already mentioned took place, in addition to some other slighter homosexual experiences. Then fate sent him to France. There he made the acquaintance of a man from the South of France, a great boaster and Don Juan. He dragged the patient into a brothel; he went unwilling and out of fear. He was impotent there. Later he went to Paris, where his brother, a master-mason, the replica of his father, was leading a dissolute life. There the patient remained a long time, badly paid and helping his sister-in-law out of pity. The brother often took him along to a brothel, where the patient was always impotent. Here the brother asked

him to make over to him his inheritance, 6000 francs. He first consulted his second brother, who was also in Paris, who urgently tried to dissuade him from giving the money to his brother, because it would only be squandered. Nevertheless the patient gave his all to his brother, who indeed soon squandered it. And the second brother, who would have dissuaded him, was also let in for 500 francs. To my astonished question why he had so lightly given the money to his brother without any guarantee, he replied: he had asked for it, he was not a bit sorry about the money; he would give him another 6000 francs if he had it. The eldest brother came to grief altogether and his wife divorced him. The patient returned to Switzerland and remained for a year without regular employment, often suffering from hunger. During this time he made the acquaintance of a family where he became a frequent visitor. The husband belonged to some peculiar sect; he was a hypocrite and neglected his family. The wife was elderly, ill and weak, and moreover pregnant. There were six children and great poverty. The patient developed warm affection for this woman and divided with her the little he possessed. She brought him her troubles, and said she felt sure she would die in childbed. Then he promised her (he who possessed nothing) to take charge of the children himself and bring them up. The wife did die in childbed. The orphanage-board interfered, however, and allowed him only one child. So he had a child but no family, and naturally could not bring it up by himself. He thus came to think of marrying. But as he had never been in love with any woman he was in great perplexity. It then occurred to him that his elder brother was divorced from his wife, and he resolved to marry her. He wrote his intention to her in Paris. She was seventeen years older than he, but not disinclined to the plan. She invited him to come to Paris to talk matters over. On the eve of this journey fate, however, willed that he should run a big iron nail into his foot so that he could not travel. After a little while, when the wound was healed, he went to Paris, and found that he had imagined his sister-in-law, and now his *fiancée*, to be younger and prettier than she really was. The wedding took place, and three months later the first coitus, at his wife's initiative. He himself had no desire for it. They brought up the child together, he in the Swiss and she in the French way, for she was a French woman. At the age of nine the child was run over and killed by a cyclist. The patient then felt very lonely and dismal at home. He proposed to his wife that she should adopt a young girl, whereupon she broke out into a fury of jealousy. Then

for the first time he fell in love with a young girl, whilst at the same time the neurosis started, with deep depression and nervous exhaustion, for meanwhile his life at home had become a hell.

My proposition to separate from his wife was refused out of hand, because he could not take upon himself to make the old woman unhappy on his account. He clearly prefers to be tormented still further; for it would seem that the recollection of his youth is more precious to him than any present joys.

In this case also the whole movement of a life takes place in the magic circle of the familial constellation. The relation to the father is the strongest and most momentous issue; its masochistic homosexual colouring stands out clearly everywhere. Even the unhappy marriage is determined in every way through the father, for the patient marries the divorced wife of his eldest brother, which *is as if* he married his mother. His wife is also the representative of the mother-surrogate, of the friend who died in childbed.

The neurosis started at the moment when the libido had obviously withdrawn from this relationship of infantile constellation, and approached, for the first time, the sexual end determined by the individual. In this, as in the previous case, the familial constellation proves to be by far the stronger; the narrow field vouchsafed by a neurosis is all that remains for the display of individuality.

Case 3.—A thirty-six year old peasant woman, of average intelligence, healthy appearance and robust build, mother of three healthy children. Comfortable family circumstances. Patient comes to the hospital for treatment for the following reasons: for some weeks she has been terribly wretched and anxious, has been sleeping badly, has terrifying dreams, and suffers also during the day from anxiety and depression. All these things are admittedly without foundation, she herself is surprised at them, and must admit her husband is perfectly right when he insists they are all "stuff and nonsense." All the same she cannot get away from them. Strange ideas come to her too; she is going to die and is going to hell. She gets on very well with her husband.

The psychoanalytic examination of the case immediately brought the following: some weeks before, she happened to take up some religious

tracts which had long lain about the house unread. There she read that *swearers* would go to hell. She took this very much to heart, and has since thought it incumbent on her to prevent people swearing or she herself will go to hell. About a fortnight before she read these tracts, her father, who lived with her, suddenly died from a stroke. She was not actually present at his death, but arrived when he was already dead. Her terror and grief were very great.

In the days following the death she thought much about it all, wondering why her father had to meet his end so abruptly. In the midst of such meditations it suddenly occurred to her that the last words she had heard her father say were: "I also am one of those who have fallen from the cart into the devil's clutches." The remembrance filled her with grief, and she recalled how often her father had sworn savagely. She wondered then whether there really were a life after death, and whether her father were in heaven or hell. During these musings she came across the tracts and began to read them, getting to the place where it said that swearers go to hell. Then came upon her great fear and terror; she overwhelmed herself with reproaches, she ought to have stopped her father's swearing, deserved punishment for her neglect. She would die and would be condemned to hell. Henceforth she was full of sorrow, moody, tormented her husband with this obsessive idea, and renounced all joy and happiness.

The patient's life-history (reproduced partly in her own words) is as follows:

She is the youngest of five brothers and sisters and was always her *father's favourite*. The father gave her everything she wanted if he possibly could. For instance, if she wanted a new dress and her mother refused it, she could be sure her father would bring her one next time he went to town. The mother died rather early. At twenty-four the patient married the man of her choice, *against her father's wishes*. The father simply disapproved of her choice although he had nothing particular against the man. After the wedding she made her father come and live with them. That seemed a matter of course, she said, since the other relations had never suggested having him with them. The father was a quarrelsome swearer and drunkard. Husband and father-in-law, as may easily be imagined, got on extremely badly together. The patient would always meekly fetch her father spirits from the inn, although this gave rise perpetually to anger and altercations.

But she finds her husband "all right." He is a good, patient fellow with only one failing: he does not obey her father enough; she finds that incomprehensible, and would rather have her husband knuckle under to her father. All said and done, father is still father. In the frequent quarrels she always took her father's part. But she has nothing to say against her husband and he is usually right in his protests, but *one must help one's father*.

Soon it began to seem to her that she had sinned against her father by marrying against his will, and she often felt, after one of these incessant wrangles, that her love for her husband had quite vanished. And since her father's death it is impossible to love her husband any longer, for his disobedience was the most frequent occasion of her father's fits of raging and swearing. At one time the quarrelling became too painful for the husband, and he induced his wife to find rooms for her father elsewhere, where he lived for two years. During this time husband and wife lived together peaceably and happily. But by degrees the patient began to reproach herself for letting her father live alone; in spite of everything he was her father. And in the end, despite the husband's protests, she fetched him home again because, as she said, in truth she did love her father better than her husband. Scarcely was the old man back in the house before strife was renewed. And so it went on till the father's sudden death.

After this recital she broke out into a whole series of lamentations: she must separate from her husband: she would have done it long ago if it were not for the children. She had indeed done an ill-deed, committed a very great sin when she married her husband against her father's wish. She ought to have taken the man whom her father had wanted her to have. He certainly would have obeyed her father and then everything would have been right. Oh, her husband was not by a long way so kind as her father, she could do anything with her father, but not with her husband. Her father had given her everything she wanted. *Now she would best of all like to die, so that she might be with her father*.

When this outburst was over, I inquired eagerly on what grounds she had refused the husband her father had suggested to her.

The father, a small peasant on a lean little farm, had taken as a servant, just at the time when his youngest daughter came into the world, a miserable little boy, a foundling. The boy developed in most unpleasant fashion: he

was so stupid that he could not learn to read or write or even speak quite properly. He was an absolute idiot. As he approached manhood there developed on his neck a series of ulcers, some of which opened and continually discharged pus, giving such a dirty, ugly creature a horrible appearance. His intelligence did not grow with his years, so he stayed on as servant in the peasant's house without any recognised wage.

To this youth the father wanted to marry his favourite daughter.

The girl, fortunately, had not been disposed to yield, but now she regretted it, since this idiot would unquestionably have been more obedient to her father than her good man had been.

Here, as in the foregoing case, it must be clearly understood that the patient is not at all weak-minded. Both possess normal intelligence, which unfortunately the blinkers of the infantile constellation prevent their using. That appears with quite remarkable clearness in this patient's life-story. The father's authority is never questioned! It makes not the least difference that he is a quarrelsome drunkard, the obvious cause of all the quarrels and disturbances; on the contrary, the lawful husband must give way to the bogey, and at last our patient even comes to regret that her father did not succeed in completely destroying her life's happiness. So now she sets about doing that herself through her neurosis, which compels in her the wish to die, that she may go to hell, whither, be it noted, the father has already betaken himself.

If we are ever disposed to see some demonic power at work controlling mortal destiny, surely we can see it here in these melancholy silent tragedies working themselves out slowly, torturingly, in the sick souls of our neurotics. Some, step by step, continually struggling against the unseen powers, do free themselves from the clutches of the demon who forces his unsuspecting victims from one savage mischance to another: others rise up and win to freedom, only to be dragged back later to the old paths, caught in the noose of the neurosis. You cannot even maintain that these unhappy people are neurotic or "degenerates." If we normal people examine our lives from the psychoanalytic standpoint, we too perceive how a mighty hand guides us insensibly to our destiny and not always is this hand a kindly one.

[157] We often call it the hand of God or of the Devil, for the power of the

infantile constellation has become mighty during the course of the centuries in affording support and proof to all the religions.

But all this does not go so far as to say that we must cast the blame of inherited sins upon our parents. A sensitive child whose intuition is only too quick in reflecting in his own soul all the excesses of his parents must lay the blame for his fate on his own characteristics. But, as our last case shows, this is not always so, for the parents can (and unfortunately only too often do) fortify the evil in the child's soul, preying upon the child's ignorance to make him the slave of their complexes. In our case this attempt on the part of the father is quite obvious. It is perfectly clear why he wanted to marry his daughter to this brutish creature: *he wanted to keep her and make her his slave for ever*. What he did is but a crass exaggeration of what is done by thousands of so-called respectable, educated people, who have their own share in this educational dust-heap of enforced discipline. The fathers who allow their children no independent possession of their own emotions, who fondle their daughters with ill-concealed eroticism and tyrannical passion, who keep their sons in leading-strings, force them into callings and finally marry them off "suitably," and the mothers who even in the cradle excite their children with unhealthy tenderness, later on make them into slavish puppets, and then at last, out of jealousy, destroy their children's love-life fundamentally, they all act not otherwise than this stupid and brutal boor.

It will be asked, wherein lies the parents' magic power to bind their children to themselves, as with iron fetters, often for the whole of their lives? The psychoanalyst knows that it is nothing but the sexuality on both sides.

We are always trying not to admit the child's sexuality. That view only comes from wilful ignorance, which happens to be very prevalent again just now.^[158]

I have not given any real analysis of these cases. We therefore do not know what happened within the hearts of these puppets of fate when they were children. A profound insight into a child's mind as it grows and lives, hitherto unattainable, is given in Freud's contribution to the first half-yearly volume of *Jahrbuch für Psychoanalytische u. Psychopathologische Forschungen*. If I venture, after Freud's masterly presentation, to offer

another small contribution to the study of the child-mind it is because the psychoanalytic records of cases seem to me always valuable.

Case 4.—An eight year old boy, intelligent, rather delicate-looking, is brought to me by his mother, on account of enuresis. During the consultation the child always hangs on to his mother, a pretty, youthful woman. The parents' marriage is a happy one, but the father is strict, and the boy (the eldest child) is rather afraid of him. The mother compensates for the father's strictness by corresponding tenderness, to which the boy responds so much that he never gets away from his mother's apron-strings. He never plays with his schoolfellows, never goes alone into the street unless he has to go to school. He fears the boys' roughness and violence and plays thoughtful games at home or helps his mother with housework. He is extremely jealous of his father. He cannot bear it when the father shows tenderness to the mother.

I took the boy aside and asked him about his dreams.

He dreams very often of a *black snake which wants to bite his face*. Then he cries out, and his mother has to come from the next room to his bedside.

In the evening he goes quietly to bed. But when he falls asleep it seems to him that a wicked *black man with a sabre or gun lies on his bed—a tall, thin man who wants to kill him*.

His parents sleep in the adjoining room. It often seems to him that something dreadful is going on there, as if there are great *black snakes or wicked men who want to kill his Mamma*. Then he has to cry out and his mother comes to comfort him.

Every time he wets his bed he calls his mother, who has to settle him down again in dry things.

The father is a tall thin man. Every morning he stands at the washstand naked in full view of the child, to perform a thorough ablution. The child also tells me that at night he is often suddenly waked from sleep by a strange sound in the next room; then he is always horribly afraid as if something dreadful were going on in there, some struggle—but his mother quiets him, says there's nothing to be afraid of.

It is not difficult to see whence comes the black snake and who the wicked man is, and what is happening in the next room. It is equally easy to understand the boy's aim when he calls out for his mother: he is jealous and separates her from the father. This he does also in the daytime whenever he sees his father caressing her. So far the boy is simply his father's rival for his mother's love.

But now comes the circumstance that the snake and the bad man also threaten him, there happens to him the same thing as to his mother in the next room. Thus he identifies himself with his mother and proposes a similar relationship for himself with his father. That is owing to his homosexual component which feels like a woman towards the father. What enuresis signifies in this case is, from the Freudian standpoint, not difficult to understand. The micturition dream throws light upon it. Let me refer to an analysis of the same kind in my article: "L'analyse des rêves, Année psychologique" (1909). Enuresis must be regarded as an infantile sex-surrogate; in the dream-life of adults too it is easily used as a cloak for the urge of sexual desire.

This little example shows what goes on in the mind of an eight year old boy, when he is in a position of too much dependence upon his parents, but the blame is also partly due to the too strict father and the too indulgent mother.

The infantile attitude here, it is evident, is nothing but infantile sexuality. If now we survey all the far-reaching possibilities of the infantile constellation, we are forced to say that *in essence our life's fate is identical with the fate of our sexuality*. If Freud and his school devote themselves first and foremost to tracing out the individual's sexuality it is certainly not in order to excite piquant sensations, but to gain a deeper insight into the driving forces that determine that individual's fate. In this we are not saying too much, rather understating the case. If we can strip off the veils shrouding the problems of individual destiny, we can afterwards widen our view from the history of the individual to the history of nations. And first of all we can look at the history of religions, at the history of the phantasy-systems of whole peoples and epochs. The religion of the Old Testament elevated the *paterfamilias* to the Jehovah of the Jews whom the people had to obey in fear and dread. The Patriarchs are an intermediate stage towards the deity. The neurotic fear and dread of the Jewish religion, the imperfect,

not to say unsuccessful attempt at the sublimation of a still too barbarous people, gave rise to the excessive severity of the Mosaic Law, the ceremonial constraint of the neurotic.^[159]

Only the prophets succeeded in freeing themselves from this constraint; in them the identification with Jehovah, the complete sublimation, is successful. They became the fathers of the people. Christ, the fulfilment of prophecy, put an end to this fear of God and taught mankind that the true relation to the Godhead is "love." Thus he destroyed the ceremonial constraint of the Law and gave the example of a personal loving relationship to God. The later imperfect sublimation of the Christian Mass leads again to the ceremonial of the Church from which occasionally the minds capable of sublimation among the saints and reformers have been able to free themselves. Not without cause therefore does modern theology speak of "inner" or "personal" experiences as having great enfranchising power, for always the ardour of love transmutes the dread and constraint into a higher, freer type of feeling.

What we see in the development of the world-process, the original source of the changes in the Godhead, we see also in the individual. Parental power guides the child like a higher controlling fate. But when he begins to grow up, there begins also the conflict between the infantile constellation and the individuality, the parental influence dating from the prehistoric (infantile) period is repressed, sinks into the unconscious but is not thereby eliminated; by invisible threads it directs the individual creations of the ripening mind as they appear. Like everything that has passed into the unconscious, the infantile constellation sends up into consciousness dim, foreboding feelings, feelings of mysterious guidance and opposing influences. Here are the roots of the first religious sublimations. In the place of the father, with his constellating virtues and faults, there appears, on the one hand, an altogether sublime deity, on the other the devil, in modern times for the most part largely whittled away by the perception of one's own moral responsibility. Elevated love is attributed to the former, a lower sexuality to the latter. As soon as we approach the territory of the neurosis, the antithesis is stretched to the utmost limit. God becomes the symbol of the most complete sexual repression, the Devil the symbol of sexual lust. Thus it is that the conscious expression of the father-constellation, like every expression of an unconscious complex when it appears in consciousness,

gets its Janus-face, its positive and its negative components. A curious, beautiful example of this crafty play of the unconscious is seen in the love-episode in the Book of Tobias. Sarah, the daughter of Raguel in Ecbatana, desires to marry; but her evil fate wills it that seven times, one after another, she chooses a husband who dies on the marriage-night. The evil spirit Asmodi, by whom she is persecuted, kills these husbands. She prays to Jehovah to let her die rather than suffer this shame again. She is despised even by her father's maid-servants. The eighth bridegroom, Tobias, is sent to her by God. He too is led into the bridal-chamber. Then the old Raguel, who has only pretended to go to bed, gets up again and goes out and digs his son-in-law's grave beforehand, and in the morning sends a maid to the bridal-chamber to make sure of the expected death. But this time Asmodi's part is played out, Tobias is alive.

Unfortunately medical etiquette forbids me to give a case of hysteria which fits in exactly with the above instance, except that there were not seven husbands, but only three, ominously chosen under all the signs of the infantile constellation. Our first case too comes under this category and in our third we see the old peasant at work preparing to dedicate his daughter to a like fate.

As a pious and obedient daughter (compare her beautiful prayer in chapter iii.) Sarah has brought about the usual sublimation and cleavage of the father-complex and on the one side has elevated her childish love to the adoration of God, on the other has turned the obsessive force of her father's attraction into the persecuting demon Asmodi. The legend is so beautifully worked out that it displays the father in his twofold aspect, on the one hand as the inconsolable father of the bride, on the other as the secret digger of his son-in-law's grave, whose fate he foresees. This beautiful fable has become a cherished paradigm for my analysis, for by no means infrequent are such cases where the father-demon has laid his hand upon his daughter, so that her whole life long, even when she does marry, there is never a true union, because her husband's image never succeeds in obliterating the unconscious and eternally operative infantile father-ideal. This is valid not only for daughters, but equally for sons. A fine instance of such a father-constellation is given in Dr. Brill's recently published: "Psychological factors in dementia præcox. An analysis."^[160]

In my experience the father is usually the decisive and dangerous object of the child's phantasy, and if ever it happens to be the mother, I have been able to discover behind her a grandfather to whom she belonged in her heart.

I must leave this question open: my experience does not go far enough to warrant a decision. It is to be hoped that the experience of the coming years will sink deeper shafts into this still dark land which I have been able but momentarily to light up, and will discover to us more of the secret workshop of that fate-deciding demon of whom Horace says:

"Scit Genius natale comes qui temperat astrum,
Naturæ deus humanæ, mortalis in unum,
Quodque caput, vultu mutabilis, albus et ater."

CHAPTER IV

A CONTRIBUTION TO THE PSYCHOLOGY OF RUMOUR^[161]

About a year ago the school authorities in N. asked me to give a professional opinion as to the mental condition of Marie X., a thirteen year old schoolgirl. Marie had been expelled from school because she had been instrumental in originating an ugly rumour, spreading gossip about her class-teacher. The punishment hit the child, and especially her parents, very hard, so that the school authorities were inclined to readmit her if protected by a medical opinion. The facts were as follows:—

The teacher had heard indirectly that the girls were attributing some equivocal sexual story to him. On investigation it was found that Marie X. had one day related a dream to three girlfriends which ran somewhat as follows:—

"The class was going to the swimming-baths. I had to go to the boys' because there was no more room. Then we swam a long way out in the lake (asked 'who did so': 'Lina P., the teacher, and myself'). A steamer came along. The teacher asked us if we wished to get into it. We came to K. A wedding was just going on there (asked 'whose': 'a friend of the teacher's'). We were also to take part in it. Then we went for a journey (who? 'I, Lina P., and the teacher'). It was like a honeymoon journey. We came to Andermatt, and there was no more room in the hotel, so we were obliged to pass the night in a barn. The woman got a child there, and the teacher became the godfather."

When I examined the child she told this dream. The teacher had likewise related the dream in writing. In this earlier version the obvious blanks after the word "steamer" in the above text were filled up as follows: "We got up. Soon we felt cold. An old man gave us a blouse which the teacher put on." On the other hand, there was an omission of the passage about finding no room in the hotel and being obliged to pass the night in the barn.

The child told the dream immediately, not only to her three friends but also to her mother. The mother repeated it to me with only trifling differences from the two versions given above. The teacher, in his further investigations, carried out with deepest misgivings, failed, like myself, to get indications of any more dangerous material. There is therefore a strong probability that the original recital could not have run very differently. (The passage about the cold and the blouse seems to be an early interpolation, for it is an attempt to supply a logical relationship. Coming out of the water one is wet, has on only a bathing dress, and is therefore unable to take part in a wedding before putting on some clothes.) At first, of course, the teacher would not allow that the whole affair had arisen only out of a dream. He rather suspected it to be an invention. He was, however, obliged to admit that the innocent telling of the dream was apparently a fact, and that it was unnatural to regard the child as capable of such guile as to indicate some sexual equivocation in this disguised form. For a time he wavered between the view that it was a question of cunning invention, and the view that it was really a question of a dream, innocent in itself, which had been understood by the other

children in a sexual way. When his first indignation wore off he concluded that Marie X.'s guilt could not be so great, and that her phantasies and those of her companions had contributed to the rumour. He then did something really valuable. He placed Marie's companions under supervision, and made them all write out what they had heard of the dream.

Before turning our attention to this, let us cast a glance at the dream analytically. In the first place, we must accept the facts and agree with the teacher that we have to do with a dream and not with an invention; for the latter the ambiguity is too great. Conscious invention tries to create unbroken transitions; the dream takes no account of this, but sets to work regardless of gaps, which, as we have seen, here give occasion for interpolations during the conscious revision. The gaps are very significant. In the swimming-bath there is no picture of undressing, being unclothed, nor any detailed description of their being together in the water. The omission of being dressed on the ship is compensated for by the above-mentioned interpolation, but only for the teacher, thus indicating that his nakedness was in most urgent need of cover. The detailed description of the wedding is wanting, and the transition from the steamer to the wedding is abrupt. The reason for stopping overnight in the barn at Andermatt is not to be found at first. The parallel to this is, however, the want of room in the swimming-bath, which made it necessary to go into the men's department; in the hotel the want of room again emphasises the separation of the sexes. The picture of the barn is most insufficiently filled out. The birth suddenly follows and quite without sequence. The teacher as godfather is extremely equivocal. Marie's rôle in the whole story is throughout of secondary importance, indeed she is only a spectator.

All this has the appearance of a genuine dream, and those of my readers who have a wide experience of the dreams of girls of this age will assuredly confirm this view. Hence the meaning of the dream is so simple that we may quietly leave its interpretation to her school-companions, whose declarations are as follows:

AURAL WITNESSES.

Witness I.—"M. dreamed that she and Lina P. had gone swimming with our teacher. After they had swum out in the lake pretty far, M. said she could not swim any further as her foot hurt her so much. The teacher said she might sit on my^[162] back. M. got up and they swam out. After a time a steamer came along and they got up on it. Our teacher seems to have had a rope by which he tied M. and L. together and dragged them out into the lake. They travelled thus as far as Z., where they stepped out. But now they had no clothes on. The teacher bought a jacket whilst M. and L. got a long, thick veil, and all three walked up the street along the lake. This was when the wedding was going on. Presently they met the party. The bride had on a blue silk dress but no veil. She asked M. and L. if they would be kind enough to give her their veil. M. and L. gave it, and in return they were allowed to go to the wedding. They went into the Sun Inn. Afterwards they went a honeymoon journey to Andermatt; I do not know now whether they went to the Inn at A. or at Z. There they got coffee, potatoes, honey, and butter."

"I must not say any more, only the teacher finally was made godfather."

Remarks.—The roundabout story concerning the want of room in the swimming-bath is absent; Marie goes direct with her teacher to the bath. Their persons are more closely bound together in the water by means of the rope fastening the teacher and the two girls together. The ambiguity of the "getting up" in the first story has other consequences here, for the part about the steamer in the first story now occurs in two places; in the first the teacher takes Marie on his back. The delightful little slip "she could sit on my back" (instead of *his*), shows the real part taken by the narrator herself in this scene. This makes it clear why the dream brings the steamer somewhat abruptly into action, in order to give an innocent, harmless turn to the equivocal "getting up" instead of another which is common, for instance, in music-hall songs. The passage about the want of clothing, the uncertainty of which has been already noticed, arouses the special interest of the narrator. The teacher buys a jacket, the girls get a long veil (such as one only wears in case of death or at weddings). That the latter is meant is shown by the remark that the bride had none (it is the bride who wears the veil). The narrator, a girl-friend of Marie, here helps the dreamer to dream further: the possession of the veil designates the bride or the brides, Marie and Lina. Whatever is shocking or immoral in this situation is relieved by the girls giving up the veil; it then takes an innocent turn. The narrator follows the same mechanism in the cloaking of the equivocal scene at Andermatt; there is nothing but nice food, coffee, potatoes, honey, butter, a turning back to the infantile life according to the well-known method. The conclusion is apparently very abrupt: the teacher becomes a godfather.

Witness II.—M. dreamt she had gone bathing with L. P. and the teacher. Far out in the lake M. said to the teacher that her leg was hurting her very much. Then the teacher said she could get up on him. I don't know now whether the last sentence was really so told, but I think so. As there was just then a ship on the lake the teacher said she should swim as far as the ship and then get in. I don't remember exactly how it went on. Then the teacher or M., I don't really remember which, said they would get out at Z. and run home. Then the teacher called out to two gentlemen who had just been bathing there, that they might carry the children to land. Then L. P. sat up on one man, and M. on the other fat man, and the teacher held on to the fat man's leg and swam after them. Arrived on land they ran home. On the way the teacher met his friend who had a wedding. M. said: "It was then the fashion to go on foot, not in a carriage." Then the bride said she must now go along also. Then the teacher said it would be nice if the two girls gave the bride their black veils, which they had got on the way. I can't now remember how. The children gave it her, and the bride said they were really dear generous children. Then they went on further and put up at the Sun Hotel. There they got something to eat, I don't know exactly what. Then they went to a barn and danced. All the men had taken off their coats except the teacher. Then the bride said he ought to take off his coat also. Then the teacher hesitated but finally did so. Then the teacher was.... Then the teacher said he was cold. I must not tell any more; it is improper. That's all I heard of the dream.

Remarks.—The narrator pays special attention to the getting up, but is uncertain whether in the original it referred to getting up on the teacher or the steamer. This uncertainty is, however, amply compensated for by the elaborate invention of the two strangers who take the girls upon their backs. The getting up is too valuable a thought for the narrator to surrender, but she is troubled by the idea of the teacher seeing the object. The want of clothing likewise arouses much interest. The bride's veil has, it is true, become the black veil of mourning

(naturally in order to conceal anything indelicate). There is not only no innocent twisting, but it is conspicuously virtuous ("dear, generous children"); the amoral wish has become changed into virtue which receives special emphasis, arousing suspicion as does every accentuated virtue.

This narrator exuberantly fills in the blanks in the scene of the barn: the men take off their coats; the teacher also, and is therefore ... *i.e.* naked and hence cold. Whereupon it becomes too improper.

The narrator has correctly recognised the parallels which were suspected in the criticisms of the original dream; she has filled in the scene about the undressing which belongs to the bathing, for it must finally come out that the girls are together with the naked teacher.

Witness III.—M. told me she had dreamt: Once I went to the baths but there was no room for me. The teacher took me into his dressing-room. I undressed and went bathing. I swam until I reached the bank. Then I met the teacher. He said would I not like to swim across the lake with him. I went, and L. P. also. We swam out and were soon in the middle of the lake. I did not want to swim any further. Now I can't remember it exactly. Soon a ship came up, and we got up on the ship. The teacher said, "I am cold," and a sailor gave us an old shirt. The three of us each tore a piece of the shirt away. I fastened it round the neck. Then we left the ship and swam away towards K.

L. P. and I did not want to go further, and two fat men took us upon their backs. In K. we got a veil which we put on. In K. we went into the street. The teacher met his friend who invited us to the wedding. We went to the Sun and played games. We also danced the polonaise; now I don't remember exactly. Then we went for a honeymoon journey to Andermatt. The teacher had no money with him, and stole some chestnuts in Andermatt. The teacher said, "I am so glad that I can travel with my two pupils." Then there is something improper which I will not write. The dream is now finished.

Remarks.—The undressing together now takes place in the narrow space of the dressing-room at the baths. The want of dress on the ship gives occasion to a further variant. (The old shirt torn in three.) In consequence of great uncertainty the getting up on the teacher is not mentioned. Instead, the two girls get up on two fat men. As "fat" becomes so prominent it should be noted that the teacher is more than a little plump. The setting is thoroughly typical; each one has a teacher. The duplication or multiplication of the persons is an expression of their significance, *i.e.* of the stored-up libido.^[163] (Compare the duplication of the attribute in dementia præcox in my "Psychology of Dementia Præcox.") In cults and mythologies the significance of this duplication is very striking. (Cp. the Trinity and the two mystical formulas of confession: "Isis una quæ es omnia. Hermes omnia solus et ter unus.") Proverbially we say he eats, drinks, or sleeps "for two." The multiplication of the personality expresses also an analogy or comparison—*my friend* has the same "ætiological value" (Freud) as *myself*. In dementia præcox, or schizophrenia, to use Bleuler's wider and better term, the multiplication of the personality is mainly the expression of the stored-up libido, for it is invariably the person to whom the patient has transference who is subjected to this multiplication. ("There are two professors N." "Oh, you are also Dr. J.; this morning another came to see me who called himself Dr. J.") It seems that, corresponding to the general tendency in schizophrenia, this splitting is an analytic degradation whose motive is to prevent the arousing of too violent

impressions. A final significance of the multiplication of personality which, however, does not come exactly under this concept is the raising of some attribute of the person to a living figure. A simple instance is Dionysos and his companion Phales, wherein Phales is the equivalent of Phallos, the personification of the penis of Dionysos. The so-called attendants of Dionysos (Satyri, Sileni, Mænades, Mimallones, etc.) consist of the personification of the attributes of Dionysos.

The scene in Andermatt is portrayed with a nice wit, or more properly speaking, dreamt further: "The teacher steals chestnuts," that is equivalent to saying he does what is prohibited. By chestnuts is meant roasted chestnuts, which on account of the incision are known as a female sexual symbol. Thus the remark of the teacher, that he was especially glad to travel with his pupils, following directly upon the theft of the chestnuts, becomes intelligible. This theft of the chestnuts is certainly a personal interpolation, for it does not occur in any of the other accounts. It shows how intensive was the inner participation of the school companions of Marie X. in the dream, resting upon similar ætiological requirements.

This is the last of the aural witnesses. The story of the veil, the pain in the feet, are items which we may perhaps suspect to have been suggested in the original narrative. Other interpolations are, however, absolutely personal, and are due to independent inner participation in the meaning of the dream.

HEARSAY EVIDENCE.

(I.) The whole school had to go bathing with the teacher. M. X. had no place in the bath in which to undress. Then the teacher said: "You can come into my room and undress with me." She must have felt very uncomfortable. When both were undressed they went into the lake. The teacher took a long rope and wound it round M. Then they both swam far out. But M. got tired, and then the teacher took her upon his back. Then M. saw Lina P.; she called out to her, Come along with me, and Lina came. Then they all swam out still farther. They met a ship. Then the teacher asked, "May we get in? these girls are tired." The boat stopped, and they could all get up. I do not know exactly how they came ashore again at K. Then the teacher got an old night-shirt. He put it on. Then he met an old friend who was celebrating his wedding. The teacher, M. and L. were invited. The wedding was celebrated at the Crown in K. They wanted to play the polonaise. The teacher said he would not accompany them. Then the others said he might as well. He did it with M. The teacher said: "I shall not go home again to my wife and children. I love you best, M." She was greatly pleased. After the wedding there was the honeymoon journey. The teacher, M. and L. had to accompany the others also. The journey was to Milan. Afterwards they went to Andermatt, where they could find no place to sleep. They went to a barn, where they could stop the night all together. I must not say any more because it becomes highly improper.

Remarks.—The undressing in the swimming-bath is properly detailed. The union in the water receives a further simplification for which the story of the rope led the way; the teacher fastens himself to Marie. Lina P. is not mentioned at all; she only comes later when Marie is already sitting upon the teacher. The dress is here a jacket. The wedding ceremony contains a very direct meaning. "The teacher will not go home any more to wife and child." Marie is the darling. In the barn they all found a place together, and then it becomes highly improper.

(II.) It was said that she had gone with the school to the swimming-baths to bathe. But as the baths were over-full the teacher had called her to come to him. We swam out to the lake, and L. P. followed us. Then the teacher took a string and bound us to one another. I do not know now exactly how they again got separated. But after a long time they suddenly arrived at Z. There a scene is said to have taken place which I would rather not tell, for if it were true it would be too disgraceful; also now I don't know exactly how it is said to have been, for I was very tired, only I also heard that M. X. is said to have told how she was always to remain with our teacher, and he again and again caressed her as his favourite pupil. If I knew exactly I would also say the other thing, but my sister only said something about a little child which was born there, and of which the teacher was said to have been the godfather.

Remarks.—Note that in this story the improper scene is inserted in the place of the wedding ceremony, where it is as apposite as at the end, for the attentive reader will certainly have already observed that the improper scene could have taken place in the swimming-bath dressing-room. The procedure has been adopted which is so frequent in dreams as a whole; the final thoughts of a long series of dream images contain exactly what the first image of the series was trying to represent. The censor pushes the complex away as long as possible through ever-renewed disguises, displacements, innocent renderings, etc. It does not take place in the bathing-room, in the water the "getting up" does not occur, on landing it is not on the teacher's back that the girls are sitting, it is another pair who are married in the barn, another girl has the child, and the teacher is only—godfather. All these images and situations are, however, directed to pick out the complex, the desire for coitus. Nevertheless the action still occurs at the back of all these metamorphoses, and the result is the birth placed at the end of the scene.

(III.) Marie said: the teacher had a wedding with his wife, and they went to the "Crown" and danced with one another. M. said a lot of wild things which I cannot repeat or write about, for it is too embarrassing.

Remarks.—Here everything is too improper to be told. Note that the marriage takes place with the wife.

(IV.) ... that the teacher and M. once went bathing, and he asked M. whether she wanted to come along too. She said "yes." When they had gone out together they met L. P., and the teacher asked whether she wished to come along. And they went out farther. Then I also heard that she said that the teacher said L. P. and she were the favourite pupils. She also told us that the teacher was in his swimming drawers. Then they went to a wedding, and the bride got a little child.

Remarks.—The personal relationship to the teacher is strongly emphasised (the "favourite pupils"), likewise the want of clothing ("swimming drawers").

(V.) M. and L. P. went bathing with the teacher. When M. and L. P. and the teacher had swum a little way, M. said: "I cannot go any further, teacher, my foot hurts me." Then the teacher said she should sit on his back, which M. did. Then a small steamer came along, and the teacher got into the ship. The teacher had also two ropes, and he fastened both children to the ship. Then they went together to Z. and got out there. Then the teacher bought himself a dressing jacket and put it on, and the children had put a cloth over themselves. The teacher

had a bride, and they were in a barn. Both children were with the teacher and the bride in the barn, and danced. I must not write the other thing, for it is too awful.

Remarks.—Here Marie sits upon the teacher's back. The teacher fastens the two children by ropes to the ship, from which it can be seen how easily ship is put for teacher. The jacket again emerges as the piece of clothing. It was the teacher's own wedding, and what is improper comes after the dance.

(VI.) The teacher is said to have gone bathing with the whole school. M. could not find any room, and she cried. The teacher is said to have told M. she could come into his dressing-room.

"I must leave out something here and there," said my sister, "for it is a long story." But she told me something more which I must tell in order to speak the truth. When they were in the bath the teacher asked M. if she wished to swim out into the lake with him. To which she replied, "If I go along, you come also." Then we swam until about half-way. Then M. got tired, and then the teacher pulled her by a cord. At K. they went on land, and from there to Z. (The teacher was all the time dressed as in the bath.) There we met a friend, whose wedding it was. We were invited by this friend. After the ceremony there was a honeymoon journey, and we came to Milan. We had to pass one night in a barn where something occurred which I cannot say. The teacher said we were his favourite pupils, and he also kissed M.

Remarks.—The excuse "I must leave out something here and there" replaces the undressing. The teacher's want of clothing is emphasised. The journey to Milan is a typical honeymoon. This passage also seems to be an independent fancy, due to some personal participation. Marie clearly figures as the loved one.

(VII.) The whole school and the teacher went bathing. They all went into one room. The teacher also. M. alone had no place, and the teacher said to her, "I have still room," she went. Then the teacher said, "Lie on my back, I will swim out into the lake with you." I must not write any more, for it is improper; I can hardly say it at all. Beyond the improper part which followed I do not know any more of the dream.

Remarks.—The narrator approaches the basis. Marie is to lie upon the teacher's back in the bathing compartment. Beyond the improper part she cannot give any more of the dream.

(VIII.) The whole school went bathing. M. had no room and was invited by the teacher into his compartment. The teacher swam out with her and told her that she was his darling or something like that. When they got ashore at Z. a friend was just having a wedding and he invited them both in their swimming costumes. The teacher found an old dressing jacket and put it over the swimming drawers. He (the teacher) also kissed M. and said he would not return home to his wife any more. They were also both invited on the honeymoon journey. On the journey they passed Andermatt, where they could not find any place to sleep, and so had to sleep in the hay. There was a woman; the dreadful part now comes, it is not at all right to make something serious into mockery and laughter. This woman got a small child. I will not say any more now, for it becomes too dreadful.

Remarks.—The narrator is thoroughgoing. (He told her simply she was his darling. He kissed her and said he would not go home to his wife.) The vexation about the silly tattling which breaks through at the end suggests some peculiarity in the narrator. From subsequent

investigation it was found that this girl was the only one of the witnesses who had been early and intentionally given an explanation about sex by her mother.

EPICRISIS.

So far as the interpretation of the dream is concerned, there is nothing for me to add; the children have taken care of all the essentials, leaving practically nothing over for psychoanalytic interpretation. *Rumour has analysed and interpreted the dream.* So far as I know rumour has not hitherto been investigated in this new capacity. This case certainly makes it appear worth while to fathom the psychology of rumour. In the presentation of the material I have purposely restricted myself to the psychoanalytic point of view, although I do not deny that my material offers numerous openings for the invaluable researches of the followers of Stern, Claparède, and others.

The material enables us to understand the structure of the rumour, but psychoanalysis cannot rest satisfied with that. The why and wherefore of the whole manifestation demands further knowledge. As we have seen, the teacher, astonished by this rumour, was left puzzled by the problem, wondering as to its cause and effect. How can a dream which is notoriously incorrect and meaningless (for teachers are, as is well known, grounded in psychology) produce such effects, such malicious gossip? Faced by this, the teacher seems to have instinctively hit upon the correct answer. The effect of the dream can only be explained by its being "le vrai mot de la situation," *i.e.* that the dream formed the fit expression for something that was already in the air. It was the spark which fell into the powder magazine. The material contains all the proofs essential for this view. I have repeatedly drawn attention to their own unrecognised participation in the dream by Marie's school-companions, and the special points of interest where any of them have added their own phantasies or dreams. The class consists of girls between twelve and thirteen years of age, who therefore are in the midst of the prodromata of puberty. The dreamer Marie X. is herself physically almost completely developed sexually, and in this respect ahead of her class; she is therefore a leader who has given the watchword for the unconscious, and thus brought to expression the sexual complexes of her companions which were lying there ready prepared.

As can be easily understood, the occasion was most painful to the teacher. The supposition that therein lay some secret motive of the schoolgirls is justified by the psychoanalytic axiom—judge actions by their results rather than by their conscious motives.^[164] Consequently it would be probable that Marie X. had been especially troublesome to her teacher. Marie at first liked this teacher most of all. In the course of the latter half-year her position had, however, changed. She had become dreamy and inattentive, and towards the dusk of evening was afraid to go into the streets for fear of bad men. She talked several times to her companions about sexual things in a somewhat obscene way; her mother asked me anxiously how she should explain the approaching menstruation to her daughter. On account of this alteration in conduct Marie had forfeited the good opinion of her teacher, as was clearly evidenced for the first time by a school report, which she and some of her friends had received a few days before the outbreak of the rumour. The disappointment was so great that the girls had imagined all kinds of fancied acts of revenge against the teacher; for instance, they might push him on to the lines so that the train would run over him, etc. Marie was especially to the fore in these

murderous phantasies. On the night of this great outburst of anger, when her former liking for her teacher seemed quite forgotten, that repressed part of herself announced itself in the dream, and fulfilled its desire for sexual union with the teacher—as a compensation for the hate which had filled the day.

On waking, the dream became a subtle instrument of her hatred, because the wish-idea was also that of her school companions, as it always is in rumours of this kind. Revenge certainly had its triumph, but the recoil upon Marie herself was still more severe. Such is the rule when our impulses are given over to the unconscious. Marie X. was expelled from school, but upon my report she was allowed to return to it.

I am well aware that this little communication is inadequate and unsatisfactory from the point of view of exact science. Had the original story been accurately verified we should have clearly demonstrated what we have now been only able to suggest. This case therefore only posits a question, and it remains for happier observers to collect convincing experiences in this field.

CHAPTER V

ON THE SIGNIFICANCE OF NUMBER-DREAMS^[165]

The symbolism of numbers which greatly engaged the imaginative philosophy of earlier centuries has again acquired a fresh interest from the analytic investigations of Freud and his school. But in the material of number-dreams we no longer discover conscious puzzles of symbolic concatenations of numbers but the unconscious roots of the symbolism of numbers. There is scarcely anything quite fundamentally new to offer in this sphere since the presentations of Freud, Adler and Stekel. It must here suffice to corroborate their experiences by recording parallel cases. I have had under observation a few cases of this kind which are worth reporting for their general interest.

The first three instances are from a middle-aged married man whose conflict of the moment was an extra-conjugal love affair. The piece of the dream from which I take the symbolised number is: *in front of the manager his general subscription. The manager comments on the high number of the subscription. It reads 2477.*

The analysis of the dream brings out a rather ungentlemanly reckoning up of the expense of the affair, which is foreign to the generous nature of the dreamer, and which the unconscious makes use of as a resistance to this affair. The preliminary interpretation is, therefore, that the number has some financial importance and origin. A rough estimate of the expenses so far leads to a number which in fact approaches 2477 francs; a more exact reckoning, however, gives 2387 francs, which could be only arbitrarily translated into 2477. I then left the numbers to the free association of the patient; it occurs to him that the figure in the dream should be divided as 24-77. Perhaps it is a telephone number; this supposition proves incorrect. The next association is that it is the total of some numbers. A reminiscence then occurs to him that he once told me that he had celebrated the 100th birthday of his mother and himself when his mother was 65 and he was 35 years old. (Their birthdays are on the same day.)

In this way the patient arrived at the following series of associations:—

He is born on	26 II.
His mistress	28 VIII.
His wife	1 III.
His mother (his father is long dead)	26 II.
His two children	29 IV.
	and 13 VII.
The patient is born	II. 75.
His mistress	VIII. 85.

He is now 36 years old, his mistress 25.

If this series of associations is written in the usual figures, the following addition is arrived at:

$$\begin{array}{r} 26. \text{ II.} = 262 \\ 28. \text{ VIII.} = 288 \\ 1. \text{ III.} = 13 \\ 26. \text{ II.} = 262 \\ 29. \text{ IV.} = 294 \\ 13. \text{ VII.} = 137 \\ \text{ II. } 75. = 275 \\ \text{ VIII. } 85 = 885 \\ 25 = 25 \\ 36 = 36 \\ \hline 2477 \end{array}$$

This series, which includes all the members of his family, gives the number 2477.

This construction led to a deeper layer of the dream's meaning. The patient is most closely united to his family, but on the other hand very much in love. This situation provokes a severe conflict. The detailed description of the manager's appearance (which I leave out for the sake of brevity) pointed to the analyst, from whom the patient rightly fears and desires firm control and criticism of his condition of dependence and bondage.

The dream which followed soon afterwards, reported in brief, runs: *The analyst asks the patient what he actually does at his mistress'? to which the patient replied he plays there, and that indeed on a very high number, on 152. The analyst remarks: "You are sadly cheated."*

The analysis displayed again a repressed tendency to reckon up the expense of the affair. The amount spent monthly was close on 152 francs, it was from 148-158 francs. The remark that he was being cheated alludes to the point at issue in the difficulties of the patient with his mistress. She maintains that he had deflowered her; he, on the contrary, is firmly convinced that she was not a virgin, and that she had already been seduced by some one else at the time when he was seeking her favours and she was refusing him. The expression "number" leads to the associations: number of the gloves, calibre-number. From there the next step was to the fact that he recognized, at the first coitus, a noticeable width of the opening instead of the expected resistance of the hymen. To him, this is proof of the deception. The unconscious naturally makes use of this opportunity as an effective means of opposition to the relationship. 152 proves at first refractory to further analysis. The number on a subsequent occasion aroused the really not remote association, "house-number." Then came this series of associations. When the patient first knew her the lady lived at X Street No. 17, then Y Street No. 129, then Z Street No. 48.

Here the patient thought that he had clearly gone far beyond 152, the total being 194. It then occurred to him that the lady had removed from No. 48 Z Street at his instigation for certain reasons; it must therefore run $194 - 48 = 146$. She now lives in A Street No. 6, therefore $146 + 6 = 152$.

The following dream was obtained during a later part of the analysis. The patient dreamt that *he had received an account from the analyst in which he was charged interest for delay in payment from the period September 3rd to 29th. The interest on the total of 315 francs was 1 franc.*

Under this reproach of meanness and avariciousness levelled at the analyst, the patient covered, as analysis proved, a violent unconscious envy. Diverse things in the life of the analyst can arouse the patient's envy; one fact here in particular had recently made a marked impression. His physician had received an addition to the family. The disturbed relations between the patient and his wife unfortunately does not permit such an expectation in his case. Hence his ground for envy and invidious comparisons.

As before, the analysis of 315 produces a separation into 3—1—5. To three he associates—his doctor has three children, just lately there is one in addition. He himself would have five children were all living; as it is he has $3 - 1 = 2$ living; for three of the children were stillborn. The symbolism of the numbers is not exhausted by these associations.

The patient remarks that the period from 3rd to 29th September contains twenty-six days. His next thought is to add this and the other figures of the dream:

$$\begin{array}{r} 26 \\ 315 \\ 1 \\ \hline 342 \\ \hline \end{array}$$

With 342 he carries out the same operation as on 315, splitting it into 3—4—2. Whereas before it came out that his doctor had three children, and then had another, and the patient had five, now it runs: the doctor had three children, and now has four, patient has only two. He remarks on this that the second figure sounds like a rectification in contrast with the wish-fulfilment of the first.

The patient, who had discovered this explanation for himself without my help, declared himself satisfied. His physician, however, was not; to him it seemed that the above disclosures did not exhaust the rich possibilities that determined the unconscious images. The patient had, for instance, added to the figure five that of the stillborn children; one was born in the 9th month and two in the 7th. He also emphasised the fact that his wife had had two miscarriages, one in the 5th week and the other in the 7th. Adding these figures together we get the determination of the number 26.

$$\begin{array}{r} \text{Child of 7 months} \\ \text{" " 7 " } \\ \text{" " 9 " } \\ \hline \text{23 " } \\ \text{2 miscarriages (5 + 7 weeks) 3 " } \\ \hline \end{array}$$

It seems as if the number twenty-six were determined by the number of the lost times of pregnancy. This time (twenty-six days) denotes, in the dream, a delay for which the patient was charged one franc interest. He has, in fact, suffered a delay through the lost pregnancies, for his doctor has, during the time the patient has known him, surpassed him with one child. One franc must be one child. We have already seen the tendency of the patient to add together all his children, even the dead ones, in order to outdo his rival. The thought that his physician had outdone him by one child could easily react immediately upon the determination of 1. We will therefore follow up this tendency of the patient and carry on his play with figures, by adding to the figure 26 the two complete pregnancies of nine months each.

$$26 + 9 + 9 = 44$$

If we follow the tendency to split up the numbers we get $2 + 6$ and $4 + 4$, two groups of figures which have only this in common, that each group gives 8 by addition. These numbers are, as we must notice, composed entirely of the months of pregnancy given by the patient. Compare with them those groups of figures which contain the information as to the doctor's fecundity, viz. 315 and 342; it is to be noted that the resemblance lies in their sum-total giving $9 : 9 - 8 = 1$. It looks as if here likewise the notion about the differentiation of 1 were carried out. As the patient remarked, 315 seems thus a wish-fulfilment, 342 on the other hand a rectification. An ingenious fancy playing round will discover the following difference between the two numbers:

$$3 \times 1 \times 5 = 15. \quad 3 \times 4 \times 2 = 24. \quad 24 - 15 = 9$$

Here again we come upon the important figure 9, which neatly combines the reckoning of the pregnancies and births.

It is difficult to say where the borderline of play begins; necessarily so, for the unconscious product is the creation of a sportive fancy, of that psychic impulse out of which play itself arises. It is repugnant to the scientific mind to have serious dealings with this element of play, which on all sides loses itself in the vague. But it must be never forgotten that the human mind has for thousands of years amused itself with just this kind of game; it were therefore nothing wonderful if this historic past again compelled admission in dream to similar tendencies. The patient pursues in his waking life similar phantastic tendencies about figures, as is seen in the fact already mentioned of the celebration of the 100th birthday. Their presence in the dream therefore need not surprise us. In a single example of unconscious determination exact proofs are often lacking, but the sum of our experiences entitles us to rely upon the accuracy of the individual discoveries. In the investigation of free creative phantasy we are in the region, almost more than anywhere else, of broad empiricism; a high measure of discretion as to the accuracy of individual results is consequently required, but this in nowise obliges us to pass over in silence what is active and living, for fear of being execrated as unscientific. There must be no parleying with the superstition-phobia of the modern mind; for this itself is a means by which the secrets of the unconscious are kept veiled.

It is of special interest to see how the problems of the patient are mirrored in the unconscious of his wife. His wife had the following dream: She dreamt, and this is the whole dream: "*Luke*

137." The analysis of the number gives the following. To 1 she associates: The doctor has another child. He had three. If all her children were living she would have 7; now she has only $3 - 1 = 2$. But she desires $1 + 3 + 7 = 11$ (a twin number, 1 and 1), which expresses her wish that her two children had been pairs of twins, for then she would have reached the same number of children as the doctor. Her mother once had twins. The hope of getting a child by her husband is very precarious; this had for a long time turned her ideas in the unconscious towards a second marriage. Other phantasies pictured her as "done with," *i.e.* having reached the climacteric at 44. She is now 33 years old, therefore in 11 years she will have reached her 44th year. This is an important period as her father died in his 44th year. Her phantasy of the 44th year contains the idea of the death of her father. The emphasis on the death of her father corresponds to the repressed phantasy of the death of her husband, who is the obstacle to a second marriage. At this place the material belonging to the dream "Luke 137" comes in to solve the conflict. The dreamer is, one soon discovers, in no wise well up in her Bible, she has not read it for an incredible time, she is not at all religious. It would be therefore quite purposeless to have recourse to associations here. The dreamer's ignorance of her Bible is so great that she did not even know that the citation "Luke 137" could only refer to the Gospel of St. Luke. When she turned up the New Testament she came to the Acts of the Apostles. As chapter i. has only 26 verses and not 37, she took the 7th verse, "It is not for you to know the times or the seasons, which the Father hath put in his own power."

But if we turn to Luke i. 37, we find the Annunciation of the Virgin.

Verse 35. The Holy Ghost shall come upon thee, and the power of the Highest shall overshadow thee: therefore also that holy thing which shall be born of thee shall be called the Son of God.

Verse 36. And, behold, thy cousin Elisabeth, she hath also conceived a son in her old age: and this is the sixth month with her, who was called barren.

Verse 37. For with God nothing shall be impossible.

The necessary continuation of the analysis of "Luke 137" demanded the looking up of Luke xiii. 7, where it says:

Verse 6. A certain man had a fig tree planted in his vineyard; and he came and sought fruit thereon, and found none.

Verse 7. Then said he unto the dresser of his vineyard, Behold, these three years I come seeking fruit on this fig tree, and find none: cut it down; why cumbereth it the ground?

The fig-tree, which from antiquity has been a symbol of the male genital, is to be cut down on account of its unfruitfulness. This passage is in complete accord with innumerable sadistic phantasies of the dreamer, concerned with the cutting or biting off of the penis. The relation to her husband's unfruitful organ is obvious. That she withdraws her libido from her husband is clear for he is impotent as regard herself; it is equally clear that she undergoes regression to the father ("which the father hath put in his own power") and identifies herself with her mother who had twins.^[166] By thus advancing her age the dreamer places her husband in regard to herself in the position of a son or boy, of an age at which impotency is normal. Furthermore, the desire to overcome her husband is easily understood from, and amply

evidenced in her earlier analysis. It is therefore only a confirmation of what has been already said, if, following up the matter of "*Luke 137*," we find in Luke vii. verse 12, Now when he came nigh to the gate of the city, behold, there was a dead man carried out, the only son of his mother, and she was a widow. (13) And when the Lord saw her, he had compassion on her, and said unto her, Weep not. (14) And he came and touched the bier: and they that bare him stood still. And he said, Young man, I say unto thee, Arise.

In the particular psychological situation of the dreamer, the allusion to the resurrection presents a delightful meaning as the cure of her husband's impotency. Then the whole problem would be solved. There is no need for me to point out in so many words the numerous wish-fulfillments contained in this material; they are obvious to the reader.

The important combination of the symbol "*Luke 137*" must be conceived as cryptomnesia, since the dreamer is quite unversed in the Bible. Both Flournoy^[167] and myself^[168] have already drawn attention to the important effects of this phenomenon. So far as one can be humanly certain, the question of any manipulation of the material with intent to deceive does not come into consideration in this case. Those well posted in psychoanalysis will be able to allay any such suspicion simply from the disposition and setting of the material as a whole.

CHAPTER VI

A CRITICISM OF BLEULER'S "THEORY OF SCHIZOPHRENIC NEGATIVISM"^[169]

Bleuler's work contains a noteworthy clinical analysis of "Negativism." Besides giving a very precise and discerning summary of the various manifestations of negativism, the author presents us with a new psychological conception well worthy of attention, viz. the concept of *ambivalency* and of *ambitendency*, thus formulating the psychological axiom that every tendency is balanced by its opposite tendency (to this must be added that positive action is produced by *a comparatively small leaning to one side of the scale*). Similarly all other tendencies, under the stress of emotions, are balanced by their opposites—thus giving an *ambivalent* character to their expression. This theory rests on clinical observation of katatonic negativism, which more than proves the existence of contrasting tendencies and values. These facts are well known to psychoanalysis, where they are summed up under the concept of resistance. But this must not be taken as meaning that every positive psychic action simply calls up its opposite. One may easily gain the impression from Bleuler's work that his standpoint is that, *cum grano salis*, the conception or the tendency of the Schizophrenic is always accompanied by its opposite. For instance, Bleuler says:—

1. "Disposing causes of negativistic phenomena are: the *ambitendency* by which every impulse is accompanied by its opposite."
2. "*Ambivalency*, which gives two opposed emotional expressions to the same idea, and would regard that idea as positive and negative at the same time."
3. "*The schizophrenic splitting* of the psyche prevents any final summing up of the conflicting and corresponding psychisms, so that the unsuitable impulse can be realised just as much as the right one, and the negative thought substituted for the right one." "On this theory, negative manifestations may directly arise, since non-selected positive and negative psychisms may stand for one another," and so on.

If we investigate psychoanalytically a case of obvious ambivalency, *i.e.* of a more or less unexpected negative reaction instead of a positive one, we find that there is a strict sequence of psychological causes conditioning negative reaction. The tendency of this sequence is to disturb the intention of the contrasting or opposite series, that is to say, *it is resistance set up by a complex*. This fact, which has not yet been refuted by any other observations, seems to me to contradict the above-mentioned formulæ. (For confirmation, see my "Psychology of Dementia Præcox," p. 103.) Psychoanalysis has proved conclusively that a resistance always has an intention and a meaning; that there is no such thing as a capricious playing with contrasts. The systematic character of resistance holds good, as I believe I have proved, even in schizophrenia. So long as this position, founded upon a great variety of experience, is not disproved by any other observations, the theory of negativism must adapt itself to it. Bleuler in a sense supports this when he says: "For the most part the negative reaction does not

simply appear as accidental, *but is actually preferred to the right one.*" This is an admission that negativism is of the nature of resistance. Once admit this, and the primary importance of ambivalency disappears so far as negativism is concerned. The tendency to resistance remains as the only fundamental principle. Ambivalency can in no sense be put on all fours with the "schizophrenic splitting of the psyche," but must be regarded as a concept which gives expression to the universal and ever-present inner association of pairs of opposites. (One of the most remarkable examples of this is the "contrary meaning of root-words." See Freud's "Essay on Dreams," Jahrbuch, vol. II., p. 179.) The same thing applies to ambitendency. Neither is specific of schizophrenia, but applies equally to the neuroses and the normal. All that is specific to katatonic negativism is *the intentional contrast, i.e. the resistance.* From this explanation we see that resistance is something different from ambivalency; it is the dynamic factor which makes manifest the everywhere latent ambivalency. What is characteristic of the diseased mind is not ambivalency but resistance. This implies the existence of a conflict between two opposite tendencies which has succeeded in raising the normally present ambivalency into a struggle of opposing components. (Freud has very aptly called this, "The separation of pairs of opposites.") In other words it is a conflict of wills, bringing about the neurotic condition of "disharmony within the self." This condition is the only "splitting of the psyche" known to us, and is not so much to be regarded as a predisposing cause, but rather as a manifestation resulting from the inner conflict—the "incompatibility of the complex" (Riklin).

Resistance, as the fundamental fact of schizophrenic dissociation, thus becomes something which, in contra-distinction to ambivalency, is not *eo ipso* identical with the concept of the state of feeling, but is a secondary and supplementary one, with its own special and *quasi* independent psychological development; and this is identical with the necessary previous history of the complex in every case. It follows that the theory of negativism coincides with the theory of the complex, as the complex is the cause of the resistance.

Bleuler summarises the causes of negativism as follows:

- (a) The autistic retirement of the patient into his own phantasies.
- (b) The existence of a life-wound (complex) which must be protected from injury.
- (c) The misconception of the environment and of its meaning.
- (d) The directly hostile relation to environment.
- (e) The pathological irritability of schizophrenics.
- (f) The "press of ideas," and other aggravations of action and thought.
- (g) Sexuality with its ambivalency on the emotional plane is often one of the roots of negative reaction.

(a) Autistic withdrawal into one's own phantasies^[170] is what I formerly designated as the obvious overgrowth of the phantasies of the complex. The strengthening of the complex is coincident with the increase of the resistance.

(b) The life-wound (*Lebenswund*) is the complex which, as a matter of course, is present in every case of schizophrenia, and of necessity always carries with it the phenomena of autism or auto-erotism (introversion), for complexes and involuntary egocentricity are inseparable reciprocities. Points (a) and (b) are therefore identical. (Cf. "Psychology of Dementia Præcox," chapters ii. and iii.)

(c) It is proved that the misconception of environment is an assimilation of the complex.

(d) The hostile relation to environment is the maximum of resistance as psychoanalysis clearly shows. (d) goes with (a).

(e) "Irritability" proves itself psychoanalytically to be one of the commonest results of the complex. I designated it *complex-sensibility*. Its generalised form (if one may use such an expression) manifests itself as a damming up of the affect (= damming of the *libido*), consequent on increased resistance. So-called neurasthenia is a classical example of this.

(f) Under the term "press of ideas," and similar intellectual troubles, may be classified the "want of clearness and logic of the schizophrenic thinking," which Bleuler considers a predisposing cause. I have, as I may presume is known, expressed myself with much reserve on what he regards as the premeditation of the schizophrenic adjustment. Further and wider experience has taught me that the laws of the Freudian psychology of dreams and the theory of the neuroses must be turned towards the obscurities of schizophrenic thinking. *The painfulness of the elaborated complex necessitates a censorship of its expression.*^[171] This principle has to be applied to schizophrenic disturbance in thinking; and until it has been proved that this principle is not applicable to schizophrenia, there is no justification for setting up a new principle; *i.e.* to postulate that schizophrenic disturbance of ideas is something primary. Investigations of hypnagogic activity, as well as association reactions in states of concentrated attention, give psychical results which up to now are indistinguishable from the mental conditions in schizophrenia. For example excessive relaxation of attention suffices to conjure up images as like as two peas to the phantasies and expressions of schizophrenia. It will be remembered that I have attributed the notorious disturbances of attention in schizophrenia to the special character of the complex; an idea which my experience since 1906 have further confirmed. There are good reasons for believing specific schizophrenic thought-disturbance to be the *result of a complex*.

Now as regards the symptoms of thought-pressure, it is first and foremost a thought-compulsion, which, as Freud has shown, is first a thought-complex and secondly a *sexualisation of the thought*. Then to the symptom of thought-pressure there is superadded at least a *demoniac* impulse such as *may be observed in every vigorous release or production of libido*.

Thought-pressure, on closer examination, is seen to be a result of schizophrenic introversion, which necessarily leads to a sexualisation of the thought; *i.e.* to an autonomy of the complex.
^[172]

(g) *The transition to sexuality* appears from the psychoanalytical standpoint difficult to understand. If we consider that the development of resistance coincides in every case with the history of the complex we must ask ourselves: Is the complex sexual or not? (It goes without saying that we must understand sexuality in its proper sense of psycho-sexuality.) To this

question psychoanalysis gives the invariable answer: *Resistance always springs from a peculiar sexual development*. The latter leads in the well-known manner to conflict, *i.e.* to the complex. Every case of schizophrenia which has so far been analysed confirms this. It can therefore claim at least to be a working hypothesis, and one to be followed up. In the present state of our knowledge, it is therefore not easy to see why Bleuler only allows to sexuality a *quasi-determining* influence on the phenomena of negativism; for psychoanalysis demonstrates that the cause of negativism is resistance; and that with schizophrenia, as with all other neuroses, this arises from the peculiar sexual development.

It can scarcely be doubted to-day that schizophrenia, with its preponderance of the mechanisms of introversion, possesses the same mechanism as any other "psycho-neurosis." In my opinion, at any rate, its peculiar symptoms (apart from the clinical and anatomical standpoints) are only to be studied by psychoanalysis, *i.e.* when the investigation is mainly directed to the genetic impetus. I have, therefore, endeavoured to indicate how Bleuler's hypothesis stands in the light of the theory of complexes; I feel myself bound to emphasise the complex-theory in this relation, and am not disposed to surrender this conception, which is as illuminating as it was difficult to evolve.

CHAPTER VII

PSYCHOANALYSIS^[173]

Psychoanalysis is not only scientific, but also technical in character; and from results technical in their nature, has been developed a new psychological science which might be called "analytical psychology."

Psychologists and doctors in general are by no means conversant with this particular branch of psychology, owing to the fact that its technical foundations are as yet comparatively unknown to them. Reason for this may be found in that the new method is exquisitely psychological, and therefore belongs neither to the realm of medicine nor to that of experimental psychology. The medical man has, as a rule, but little knowledge of psychology; and the psychologist has no medical knowledge. There is therefore a lack of suitable soil in which to plant the spirit of this new method. Furthermore, the method itself appears to many persons so arbitrary that they cannot reconcile it with their scientific conscience. The conceptions of Freud, the founder of this method, laid particular stress upon the sexual factor; this fact has aroused strong prejudice, and many scientific men are repelled merely by this feeling. I need hardly remark that such an antipathy is not a logical ground for rejecting a new method. The facts being so, it is obvious that the psychoanalyst should discuss the principles rather than the results of his method, when he speaks in public; for he who does not acknowledge the scientific character of the method cannot acknowledge the scientific character of its results.

Before I enter into the principles of the psychoanalytic method, I must mention two common prejudices against it.

The first of these is that psychoanalysis is nothing but a somewhat deep and complicated form of anamnesis. Now it is well known that the anamnesis is based upon the evidence supplied by the patient's family, and upon his own conscious self-knowledge, revealed in reply to direct questions. The psychoanalyst naturally develops his anamnestic data as carefully as any other specialist; but this is merely the patient's history, and must not be confused with analysis. Analysis is the reduction of an actual conscious content of a so-called accidental nature, into its psychological determinants. This process has nothing to do with the anamnestic reconstruction of the history of the illness.

The second prejudice, which is based, as a rule, upon a superficial knowledge of psychoanalytic literature, is that psychoanalysis is a method of suggestion, by which a faith or doctrine of living is imposed upon the patient, thereby effecting a cure in the manner of mental healing or Christian Science. Many analysts, especially those who have worked in psychoanalysis for a long time, previously used therapeutic suggestion, and are therefore familiar with its workings. They know that the psychoanalyst's method of working is diametrically opposed to that of the hypnotist. In direct contrast with therapeutic suggestion, the psychoanalyst does not attempt to force anything upon his patient which the latter does

not see himself, and find reasonable with his own understanding. Faced with the constant desire on the part of the neurotic patient to receive suggestions and advice, the analyst just as constantly endeavours to lead him away from this passive receptive attitude, and make him use his common sense and powers of criticism, that equipped with these he may become fitted to meet the problems of life independently. We have often been accused of forcing interpretations upon patients, interpretations that were frequently quite arbitrary in character. I wish that one of these critics would make the attempt to force such arbitrary interpretations upon my patients, who are often persons of great intelligence and high culture, and who are, indeed, not infrequently my own colleagues. The impossibility of such an undertaking would soon be laid bare. In psychoanalysis we are dependent upon the patient and his judgment, for the reason that the very nature of analysis consists in leading him to a knowledge of his own self. The principles of psychoanalysis are so entirely different from those of therapeutic suggestion that they are not comparable.

An attempt has also been made to compare analysis with the reasoning method of Dubois, which is in itself a rational process. This comparison does not however hold good, for the psychoanalyst strictly avoids argument and persuasion with his patients. He must naturally listen to and take note of the conscious problems and conflicts of his patient, but not for the purpose of fulfilling his desire to obtain advice or direction with regard to his conduct. The problems of a neurotic patient cannot be solved by advice and conscious argument. I do not doubt that good advice at the right time can produce good results; but I do not know whence one can obtain the belief that the psychoanalyst can always give the right advice at the right time. The neurotic conflict is frequently, indeed as a rule, of such a character that advice cannot possibly be given. Furthermore, it is well known that the patient only desires authoritative advice in order that he may cast aside the burden of responsibility, referring himself and others to the opinion of the higher authority.

In direct contrast to all previous methods, psychoanalysis endeavours to overcome the disorders of the neurotic psyche through the subconscious, not through the conscious self. In this work we naturally have need of the patient's conscious content, for his subconsciousness can only be reached *viâ* the conscious. The material furnished by the anamnesis is the source from which our work starts. The detailed recital usually furnishes many valuable clues which make the psychogenic origin of the symptoms clear to the patient. This work is naturally only necessary where the patient is convinced that his neurosis is organic in its origin. But even in those cases where the patient is convinced from the very first of the psychic nature of his illness, a critical survey of the history is very advantageous, since it discloses to him a psychological concatenation of ideas of which he was unaware. In this manner those problems which need special discussion are frequently brought to the surface. Work of this kind may occupy many sittings. Finally the explanation of the conscious material reaches an end, in so far as neither the patient nor the doctor can add anything to it that is decisive in character. Under the most favourable circumstances the end comes with the formulation of the problem which proved itself to be impossible of solution. Let us take, for instance, the case of a man who was once well, but who became a neurotic between the age of 35 and 40. His position in life is assured, and he has a wife and children. Parallel with his neurosis he developed an intense resistance towards his professional work. He observed that the first symptoms of neurosis became noticeable when he had to overcome a certain difficulty in regard to it. Later on his symptoms became aggravated with each successive difficulty that

arose. An amelioration in his neurosis occurred whenever fortune favoured him in his professional work. The problem that results from a critical discussion of the anamnesis is as follows:—

The patient is aware that if he could improve his work, the mere satisfaction that would result could bring about the much-desired improvement in his neurotic condition. He cannot, however, make his work more efficient because of his great resistance against it. This problem cannot be solved by any reasoning process.

Let us take another case. A woman of 40, the mother of four children, became neurotic four years ago after the death of one of her children. A new period of pregnancy, followed by the birth of another child, produced a great improvement in her condition. The patient now lived in the thought that it would be a great help to her if she could have yet another child. Believing, however, that this could not happen, she attempted to devote her energies to philanthropic interests. But she failed to obtain the least satisfaction from this work. She observed a distinct alleviation of her complaint whenever she succeeded in giving real, living interest to any matter, but she felt entirely incapable of discovering anything that could bring her lasting interest and satisfaction. It is clear that no process of reasoning can solve this problem.

Here psychoanalysis must begin with the endeavour to solve the problem as to what prevents the patient from developing interests above and beyond her longing for a child.

Since we cannot assume that we know from the very beginning what the solution of such problems is, we must at this point trust to the clues furnished us by the individuality of the patient. Neither conscious questioning nor rational advice can aid us in the discovery of these clues, for the causes which prevent us from finding them are hidden from her consciousness. There is, therefore, no clearly indicated path by which to reach these subconscious inhibitions. The only rule that psychoanalysis lays down for our guidance in this respect, is to let the patient speak of that which occurs to him at the moment. The analyst must observe carefully what the patient says and, in the first instance, take due note thereof without attempting to force his own opinions upon him. Thus we observe that the patient whom I first mentioned begins by talking about his marriage, which we hitherto had reason to regard as normal. We now learn that he constantly has difficulties with his wife, and that he does not understand her in the least. This knowledge causes the physician to remark that the patient's professional work is clearly not his only problem; but that his conjugal relations are also in need of revision. This starts a train of thought in which many further ideas occur to the patient, concerning his married life. Hereupon follow ideas about the love affairs he had before his marriage. These experiences, related in detail, show that the patient was always somewhat peculiar in his more intimate relations with women, and that this peculiarity took the form of a certain childish egoism. This is a new and surprising point of view for him, and explains to him many of his misfortunes with women.

We cannot in every case get so far as this on the simple principle of letting the patient talk; few patients have their psychic material so much on the surface. Furthermore, many persons have a positive resistance against speaking freely about what occurs to them on the spur of the moment; it is often too painful to tell the doctor whom perhaps they do not entirely trust; in other cases because apparently nothing occurs to them, they force themselves to speak of

matters about which they are more or less indifferent. This habit of not talking to the point by no means proves that patients consciously conceal their unpleasant contents, for such irrelevant speaking can occur quite unconsciously. In such cases it sometimes helps the patient if he is told that he must not force himself, that he must only seize upon the very first thoughts that present themselves, no matter how unimportant or ridiculous they may seem. In certain cases even these instructions are of no use, and then the doctor is obliged to have recourse to other expedients. One of these is the employment of the association test, which usually gives excellent information as to the chief momentary tendencies of the individual.

A second expedient is dream analysis; this is *the real instrument* of psychoanalysis. We have already experienced so much opposition to dream analysis that a brief exposition of its principles is necessary. The interpretation of dreams, as well as the meaning given to them, is, as we know, in bad odour. It is not long since that oneirocritics were practised and believed in; nor is the time long past when even the most enlightened human beings were entirely under the ban of superstition. It is therefore comprehensible that our age should still retain a certain lively fear of those superstitions which have but recently been partially overcome. To this timidity in regard to superstition, the opposition to dream analysis is in a large measure due; but analysis is in no wise to blame for this. We do not select the dream as our object because we pay it the homage of superstitious admiration, but because it is a psychic product that is independent of the patient's consciousness. We ask for the patient's free thoughts, but he gives us little, or nothing; or at best something forced or irrelevant. Dreams are free thoughts, free phantasies, they are not forced, and they are psychic phenomena just as much as thoughts are.

It may be said of the dream that it enters into the consciousness as a complex structure, the connection between the elements of which is not conscious. Only by afterwards joining associations to the separate pictures of the dream, can the origin of these pictures, in certain recollections of the near and more remote past, be proved. One asks oneself: "Where have I seen or heard that?" And by the same process of free association comes the memory that one has actually experienced certain parts of the dream, some of them yesterday, some at an earlier date. This is well known, and every one will probably agree to it. Thus far the dream presents itself, as a rule, as an incomprehensible composition of certain elements which are not in the first instance conscious, but which are later recognised by the process of free association. This might be disputed on the ground that it is an *a priori* statement. I must remark, however, that this conception conforms to the only generally recognised working hypothesis as to the genesis of dreams, namely, the derivation of the dream from experiences and thoughts of the recent past. We are, therefore, upon known ground. Not that certain dream parts have under all circumstances been known to the individual, so that one might ascribe to them the character of being conscious; on the contrary, they are frequently, even generally, unrecognisable. Not until later do we

remember having consciously experienced this or that dream part. We may therefore regard the dream from this point of view as a product that comes from a subconscious origin. The technical unfolding of these subconscious sources is a mode of procedure that has always been instinctively employed. One simply tries to remember whence the dream parts come. Upon this most simple principle the psychoanalytic method of solving dreams is based. It is a fact that certain dream parts are derived from our waking life and, indeed, from experiences which, owing to their notorious lack of importance, would frequently have been consigned to certain oblivion, and were therefore well on their way towards becoming definitely subconscious. Such dream parts are the results of subconscious representations (images).

The principles according to which psychoanalysis solves dreams are therefore exceedingly simple, and have really been known for a long time. The further procedure follows the same path logically and consistently. If one spends considerable time over a dream, which really never happens outside psychoanalysis, one can succeed in finding more and more recollections for the separate dream parts. It is, however, not always possible to discover recollections for certain other parts; and then one must leave them for the time being, whether one likes it or not. When I speak of "recollections" I naturally do not mean merely memories of certain concrete experiences, but also of their inter-related meanings. The collected recollections are known as the dream material. With this material one proceeds according to a scientific method that is universally valid. If one has any experimental material to work up, one compares its separate parts and arranges them according to their similarities. Exactly the same course is pursued in dealing with the dream material; one gathers together its common characteristics, whether these be formal or material. In doing this one must absolutely get rid of certain prejudices. I have always observed that the beginner expects to find some tendency or other according to which he endeavours to mould his material. I have noticed this particularly in the cases of colleagues who were previously more or less violent opponents of psychoanalysis, owing to their well-known prejudices and misunderstandings. When fate willed that I should analyse them, and they consequently gained at last an insight into the method of analysis, it was demonstrated that the first mistake which they had been apt to make in their own psychoanalytic practice was that they forced the material into accord

with their own preconceived opinions; that is, they allowed their former attitude towards psychoanalysis, which they were not able to appreciate objectively, but only according to subjective phantasies, to have its influence upon their material. If one goes so far as to venture upon the task of examining the dream material, one must permit no comparison to frighten one away. The material consists, as a general rule, of very unequal images, from which it is under some circumstances most difficult to obtain the "tertium comparationis." I must forego giving you detailed examples of this, since it is quite impossible to introduce such extensive material into a lecture.

One pursues, then, the same method in classifying the unconscious content, as is used everywhere in comparing materials for the purpose of drawing conclusions from them. One objection has often been made, namely: why should the dream have a subconscious content at all? This objection is unscientific in my opinion. Every psychological moment has its own history. Every sentence that I utter has, besides the meaning consciously intended by me, a meaning that is historical; and this last may be entirely different from the conscious meaning. I am purposely expressing myself somewhat paradoxically. I certainly should not take it upon myself to explain each sentence according to its individual-historical meaning. That is easier in the case of larger and more complex formations. Every one is certainly convinced of the fact that a poem—in addition to its manifest contents—is also particularly characteristic of its author, in its form, subject-matter, and the history of its origin. Whereas the poet gave skilful expression to a fleeting mood in his song, the historian of literature sees in it and beyond it, things which the poet would never have suspected. The analysis which the literary critic makes of the subject-matter furnished by the poet may be compared with psychoanalysis in its method, even to the very errors which occur therein. The psychoanalytic method may be aptly compared with historical analysis and synthesis. Let us assume, for instance, that we do not understand the meaning of the rite of baptism as it is practised in our churches to-day. The priest tells us that baptism means the reception of the child into the Christian community. But we are not satisfied with this. Why should the child be sprinkled with water, etc.? In order that we may understand this rite we must gather together materials for comparison from the history of the rite, that is, from the memories of

mankind appertaining to it; and this must be done from various points of view.

Firstly—Baptism is clearly a rite of initiation, a consecration. Therefore those memories, above all, must be assembled which preserve the rites of initiation.

Secondly—The act of baptism is performed with water. This especial form of procedure proves the necessity of welding together another chain of memories concerning rites in which water was used.

Thirdly—The child is sprinkled with water when it is christened. In this case we must gather together all the forms of the rite, where the neophyte is sprinkled or where the child is submerged, etc.

Fourthly—We must recollect all the reminiscences in mythology and all the superstitious customs which are in any respect similar to the symbolic act of baptism.

In this manner we obtain a comparative study of the act of baptism. Thus we ascertain the elements from which baptism is derived; we further ascertain its original meaning, and at the same time make the acquaintance of a world rich in religious mythology, which makes clear to us all the multifarious and derived meanings of the act of baptism. Thus the analyst deals with the dream. He gathers together historical parallels for each dream part, even though they be very remote and attempts to construct the psychological history of the dream and the meanings that underlie it. By this monographic elaboration of the dream one gains, exactly as in the analysis of the act of baptism, a deep insight into the wonderfully subtle and significant network of subconscious determinations; an insight which, as I have said, can only be compared with the historical understanding of an act that we used only to consider from a very one-sided and superficial point of view.

I cannot disguise the fact that in practice, especially at the beginning of an analysis, we do not in all cases make complete and ideal analyses of dreams, but that we more generally continue to gather together the dream associations until the problem which the patient hides from us becomes so clear that even he can recognize it. This problem is then subjected to

conscious elaboration until it is cleared up as far as possible, and once again we stand before a question that cannot be answered.

You will now ask what course is to be pursued when the patient does not dream at all; I can assure you that hitherto all patients, even those who claimed never to have dreamed before, began to dream when they went through analysis. But on the other hand it frequently occurs that patients who began by dreaming vividly are suddenly no longer able to remember their dreams. The empirical and practical rule, which I have hitherto regarded as binding, is that the patient, if he does not dream, has sufficient conscious material, which he keeps back for certain reasons. A common reason is: "I am in the doctor's hands and am quite willing to be treated by him. But the doctor must do the work, I shall remain passive in the matter."

Sometimes the resistances are of a more serious character. For instance, persons who cannot admit certain morally grave sides to their characters, project their deficiencies upon the doctor by calmly presuming that he is more or less deficient morally, and that for this reason they cannot communicate certain unpleasant things to him. If, then a patient does not dream from the beginning or ceases to dream he retains material which is susceptible of conscious elaboration. Here the personal relation between the doctor and his patient may be regarded as the chief hindrance. It can prevent them both, the doctor as well as the patient, from seeing the situation clearly. We must not forget that, as the doctor shows, and must show, a searching interest in the psychology of his patient, so, too, the patient, if he has an active mind, gains some familiarity with the psychology of the doctor and assumes a corresponding attitude towards him. Thus the doctor is blind to the mental attitude of the patient to the exact extent that he does not see himself and his own subconscious problems. Therefore I maintain that a doctor must be analysed before he practises analysis. Otherwise the practice of analysis can easily be a great disappointment to him, because he can, under certain circumstances, reach a point where further progress is impossible, a situation which may make him lose his head. He is then readily inclined to assume that psychoanalysis is nonsense, so as to avoid the admission that he has run his vessel ashore. If you are sure of your own psychology you can confidently tell your patient that he does not dream because there is still conscious material to be disposed of. I say that one must be sure of one's self in such cases, for the

opinions and unsparing criticisms to which one sometimes has to submit, can be excessively disturbing to one who is unprepared to meet them. The immediate consequence of such a loss of personal balance on the part of the doctor is that he begins to argue with his patient, in order to maintain his influence over him; and this, of course, renders all further analysis impossible.

I have told you that, in the first instance, dreams need only be used as sources of material for analysis. At the beginning of an analysis it is not only unnecessary, but also unwise, to make a so-called complete interpretation of a dream; for it is very difficult indeed to make a complete and really exhaustive interpretation. The interpretations of dreams that one sometimes reads in psychoanalytic publications are often one-sided, and not infrequently contestable formulations. I include among these certain one-sided sexual reductions of the Viennese school. In view of the comprehensive many-sidedness of the dream material one must beware, above all, of one-sided formulations. The many-sidedness of the meaning of a dream, not its singleness of meaning, is of the utmost value, especially at the beginning of the psychoanalytic treatment. Thus, for instance, a patient had the following dream not long after her treatment had begun: "*She was in a hotel in a strange city. Suddenly a fire broke out; and her husband and her father, who were with her, helped her in the work of saving others.*" The patient was intelligent, extraordinarily sceptical, and absolutely convinced that dream analysis was nonsense. I had difficulty in inducing her to give dream analysis even one trial. Indeed I saw at once that I could not inform my patient of the real content of the dream under these circumstances because her resistances were much too great. I selected the fire, the most conspicuous occurrence of the dream, as the starting point for obtaining her free associations. The patient told me that she had recently read in a newspaper that a certain hotel in Z. had been burnt down; that she remembered the hotel because she had once lived in it. At the hotel she had made the acquaintance of a man, and from this acquaintance a somewhat questionable love affair developed. In connection with this story the fact came out that she had already had quite a number of similar adventures, all of which had a certain frivolous character. This important bit of past history was brought out by the first free association with a dream-part. It would have been impossible in this case to make clear to the patient the very striking meaning of the dream. With her frivolous mental attitude, of which

her scepticism was only a special instance, she could have calmly repelled any attempt of this kind. But after the frivolity of her mental attitude was recognised and proved to her, by the material that she herself had furnished, it was possible to analyse the dreams which followed much more thoroughly.

It is, therefore, advisable in the beginning to make use of dreams for the purpose of reaching the important subconscious material by means of the patient's free associations in connection with them. This is the best and most cautious method, especially for those who are just beginning to practise analysis. An arbitrary translation of the dreams is absolutely inadvisable. That would be a superstitious practice based on the acceptance of well-established symbolic meanings. But there are no fixed symbolic meanings. There are certain symbols that recur frequently, but we are not able to get beyond general statements. For instance, it is quite incorrect to assume that the snake, when it appears in dreams, has a merely phallic meaning; just as incorrect as it is to deny that it may have a phallic meaning in some cases. Every symbol has more than one meaning. I can therefore not admit the correctness of exclusively sexual interpretations, such as appear in some psychoanalytic publications, for my experience has made me regard them as one-sided and therefore insufficient. As an example of this I will tell you a very simple dream of a young patient of mine. It was as follows: *"I was going up a flight of stairs with my mother and sister. When we reached the top I was told that my sister was soon to have a child."*

I shall now show you how, on the strength of the hitherto prevailing point of view, this dream may be translated so that it receives a sexual meaning. We know that the incest phantasy plays a prominent part in the life of a neurotic. Hence the picture "with my mother and sister" might be regarded as an allusion in this direction. The "stairs" have a sexual meaning that is supposedly well established; they represent the sexual act because of the rhythmic climbing of steps. The child that my patient's sister is expecting is nothing but the logical result of these premises. The dream, translated thus, would be a clear fulfilment of infantile desires which as we know play an important part in Freud's theory of dreams.

Now I have analysed this with the aid of the following process of reasoning: If I say that the stairs are a symbol for the sexual act, whence do I obtain the right to regard the mother, the sister, and the child as concrete; that is, as not

symbolic? If, on the strength of the claim that dream pictures are symbolic, I give to certain of these pictures the value of symbols, what right have I to exempt certain other dream parts from this process? If, therefore, I attach symbolic value to the ascent of the stairs, I must also attach a symbolic value to the pictures that represent the mother, the sister, and the child. Therefore I did not translate the dream, but really analysed it. The result was surprising. I will give you the free associations with the separate dream-parts, word for word, so that you can form your own opinions concerning the material. I should state in advance that the young man had finished his studies at the university a few months previously; that he found the choice of a profession too difficult to make; and that he thereupon became a neurotic. In consequence of this he gave up his work. His neurosis took, among other things, a decidedly homosexual form.

The patient's associations with his mother are as follows: "I have not seen her for a long time, a very long time. I really ought to reproach myself for this. It is wrong of me to neglect her so." "Mother," then, stands here for something which is neglected in an inexcusable manner. I said to the patient: "What is that?" And he replied, with considerable embarrassment, "My work."

With his sister he associated as follows: "It is years since I have seen her. I long to see her again. Whenever I think of her I recall the time when I took leave of her. I kissed her with real affection; and at that moment I understood for the first time what love for a woman can mean." It is at once clear to the patient that his sister represents "love for woman."

With the stairs he has this association: "Climbing upwards; getting to the top; making a success of life; being grown up; being great." The child brings him the ideas: "New born; a revival; a regeneration; to become a new man."

One only has to hear this material in order to understand at once that the patient's dream is not so much the fulfilment of infantile desires, as it is the expression of biological duties which he has hitherto neglected because of his infantilism. Biological justice, which is inexorable, sometimes compels the human being to atone in his dreams for the duties which he has neglected in real life.

This dream is a typical example of the prospective and teleological function of dreams in general, a function that has been especially emphasised by my colleague Dr. Maeder. If we adhered to the one-sidedness of sexual interpretation, the real meaning of the dream would escape us. Sexuality in dreams is, in the first instance, a means of expression, and by no means always the meaning and the object of the dream. The unfolding of the prospective or teleological meaning of dreams is of particular importance as soon as analysis is so far advanced that the eyes of the patient are more easily turned upon the future, than upon his inner life and upon the past.

In connection with the application of symbolism, we can also learn from the example furnished us by this dream, that there can be no fixed and unalterable dream symbols, but at best a frequent repetition of fairly general meanings. So far as the so-called sexual meaning of dreams, in particular, is concerned, my experience has led me to lay down the following practical rules:

If dream analysis at the beginning of the treatment shows that the dream has an undoubted sexual meaning, this meaning is to be taken realistically; that is, it is proved thereby that the sexual problem itself must be subjected to a careful revision. If, for instance, an incest phantasy is clearly shown to be a latent content of the dream, one must subject the patient's infantile relations towards his parents and his brothers and sisters, as well as his relations towards other persons who are fitted to play the part of his father or mother in his mind, to a careful examination on this basis. But if a dream that comes in a later stage of the analysis has, let us say, an incest phantasy as its essential content, a phantasy that we have reason to consider disposed of, concrete value must not be attached to it under all circumstances; it must be regarded as symbolic. In this case symbolic value, not concrete value, must be attached to the sexual phantasy. If we did not go beyond the concrete value in this case, we should keep reducing the patient to sexuality, and this would arrest the progress of the development of his personality. The patient's salvation is not to be found by thrusting him back again into primitive sexuality; this would leave him on a low plane of civilisation whence he could never obtain freedom and complete restoration to health. Retrogression to a state of barbarism is no advantage at all for a civilised human being.

The above-mentioned formula, according to which the sexuality of a dream is a symbolic or analogous expression, naturally also holds good in the case of dreams occurring in the beginning of an analysis. But the practical reasons that have induced us not to take into consideration the symbolic value of this sexual phantasy, owe their existence to the fact that a genuine realistic value must be given to the abnormal sexual phantasies of a neurotic, in so far as the latter suffers himself to be influenced in his actions by these phantasies. Experience teaches us that these phantasies not only hinder him from adapting himself suitably to his situation, but that they also lead him to all manner of really sexual acts, and occasionally even to incest. Under these circumstances, it would be of little use to consider the symbolic content of the dream only; the concrete content must first be disposed of.

These arguments are based upon a different conception of the dream from that put forward by Freud; for, indeed, my experience has forced me to a different conception. According to Freud, the dream is in its essence a symbolic veil for repressed desires which are in conflict with the ideals of the personality. I am obliged to regard the dream structure from a different point of view. The dream for me is, in the first instance, the subliminal picture of the psychological condition of the individual in his waking state. It presents a *résumé* of the subliminal association material which is brought together by the momentary psychological situation. The volitional meaning of the dream which Freud calls the repressed desire, is, for me, essentially a means of expression. The activity of the consciousness, speaking biologically, represents the psychological effort which the individual makes in adapting himself to the conditions of life. His consciousness endeavours to adjust itself to the necessities of the moment, or, to put it differently: there are tasks ahead of the individual, which he must overcome. In many cases the solution is unknown; and for this reason the consciousness always tries to find the solution by the way of analogous experience. We always try to grasp what is unknown and in the future, according to our mental understanding of what has gone before. Now we have no reasons for assuming that the unconscious follows other laws than those which apply to conscious thought. The unconscious, like the conscious, gathers itself about the biological problems and endeavours to find solutions for these by analogy with what has gone before, just as much as the conscious does. Whenever we wish to assimilate something that is unknown, we arrive at it by a process of comparison. A simple example of this is the well-known

fact that, when America was discovered by the Spaniards, the Indians took the horses of the conquerors, which were strange to them, for large pigs, because pigs were familiar to their experience. This is the mental process which we always employ in recognising unknown things; and this is the essential reason for the existence of symbolism. It is a process of comprehension by means of analogy. The apparently repressed desires, contained in the dream, are volitional tendencies which serve as language-material for subconscious expression. So far as this particular point is concerned, I am in full accord with the views of Adler, another member of Freud's school. With reference to the fact that subconscious materials of expression are volitional elements or tendencies, I may say that this is dependent upon the archaic nature of dream thinking, a problem with which I have already dealt in previous researches.^[174]

Owing to our different conception of the structure of the dream, the further course of analysis also gains a different complexion from that which it had until now. The symbolic valuation given to sexual phantasies in the later stages of analysis necessarily leads less to the reduction of the patient's personality into primitive tendencies, than to the extension and further development of his mental attitude; that is, it tends to make his thinking richer and deeper, thus giving him what has always been one of the most powerful weapons that a human being can have in his struggle to adapt himself to life. By following this new course logically, I have come to the conclusion that these religious and philosophical motive forces—the so-called metaphysical needs of the human being—must receive positive consideration at the hands of the analyst. Though he must not destroy the motive forces that underlie them, by reducing them to their primitive, sexual roots, he must make them serve biological ends as psychologically valuable factors. Thus these instincts assume once more those functions that have been theirs from time immemorial.

Just as primitive man was able, with the aid of religious and philosophical symbol, to free himself from his original state, so, too, the neurotic can shake off his illness in a similar way. It is hardly necessary for me to say, that I do not mean by this, that the belief in a religious or philosophical dogma should be thrust upon the patient; I mean simply that he has to reassume that psychological attitude which, in an earlier civilisation, was characterised by the living belief in a religious or philosophical dogma. But

the religious-philosophical attitude does not necessarily correspond to the belief in a dogma. A dogma is a transitory intellectual formulation; it is the result of the religious-philosophical attitude, and is dependent upon time and circumstances. This attitude is itself an achievement of civilization; it is a function that is exceedingly valuable from a biological point of view, for it gives rise to the incentives that force human beings to do creative work for the benefit of a future age, and, if necessary, to sacrifice themselves for the welfare of the species.

Thus the human being attains the same sense of unity and totality, the same confidence, the same capacity for self-sacrifice in his conscious existence that belongs unconsciously and instinctively to wild animals. Every reduction, every digression from the course that has been laid down for the development of civilisation does nothing more than turn the human being into a crippled animal; it never makes a so-called natural man of him. My numerous successes and failures in the course of my analytic practice have convinced me of the invariable correctness of this psychological orientation. We do not help the neurotic patient by freeing him from the demand made by civilisation; we can only help him by inducing him to take an active part in the strenuous task of carrying on the development of civilisation. The suffering which he undergoes in performing this duty takes the place of his neurosis. But, whereas the neurosis and the complaints that accompany it are never followed by the delicious feeling of good work well done, of duty fearlessly performed, the suffering that comes from useful work, and from victory over real difficulties, brings with it those moments of peace and satisfaction which give the human being the priceless feeling that he has really lived his life.

CHAPTER VIII

ON PSYCHOANALYSIS^[175]

After many years' experience I now know that it is extremely difficult to discuss psychoanalysis at public meetings and at congresses. There are so many misconceptions of the matter, so many prejudices against certain psychoanalytic views, that it becomes an almost impossible task to reach mutual understanding in public discussion. I have always found a quiet conversation on the subject much more useful and fruitful than heated discussions *coram publico*. However, having been honoured by an invitation from the Committee of this Congress as a representative of the psychoanalytic movement, I will do my best to discuss some of the fundamental theoretical conceptions of psychoanalysis. I must limit myself to this part of the subject because I am quite unable to place before my audience all that psychoanalysis means and strives for, all its various applications, its psychology, its theoretical tendencies, its importance for the realm of the so-called "Geisteswissenschaften," e.g. Mythology, Comparative Religion, Philosophy, &c. But if I am to discuss certain theoretical problems fundamental to psychoanalysis, I must presuppose my audience to be well acquainted with the development and main results of psychoanalytic researches. Unfortunately, it often happens that people believe themselves entitled to judge psychoanalysis who have not even read the literature. It is my firm conviction that no one is competent to form a judgment concerning the subject until he has studied the fundamental works on psychoanalysis.

In spite of the fact that Freud's theory of neurosis has been worked out in great detail, it cannot be said to be, on the whole, very clear or easily accessible. This justifies my giving you a very short abstract of his fundamental views concerning the theory of neurosis.

You are aware that the original theory that hysteria and the related neuroses take their origin in a trauma or shock of sexual character in early childhood, was given up about fifteen years ago. It soon became obvious that the

sexual trauma could not be the real cause of a neurosis, since trauma is found so universally; there is scarcely a human being who has not had some sexual shock in early youth, and yet comparatively few have incurred a neurosis in later life. Freud himself soon became aware that several of the patients who related an early traumatic event, had only invented the story of a so-called trauma; it had never taken place in reality, and was a mere creation of phantasy. Moreover, on further investigation it became quite obvious that even a trauma which had actually occurred was not always responsible for the whole of the neurosis, although it does sometimes look as if the structure of the neurosis depended entirely upon the trauma. If a neurosis were the inevitable consequence of a trauma it would be quite incomprehensible why neurotics are not incomparably more numerous.

This apparently heightened shock-effect was clearly based upon the *exaggerated and morbid phantasy* of the patient. Freud also saw that this same phantasy manifested itself in relatively early bad habits, which he called infantile perversities. His new conception of the ætiology of a neurosis was based upon this further understanding and traced the neurosis back to some sexual activity in early infancy; this conception led on to his recent view that the neurotic is "fixed" to a certain period of his early infancy, because he still seems to preserve some trace of it, direct or indirect, in his mental attitude. Freud also makes the attempt to classify or to differentiate the neuroses, including dementia præcox, according to the stage of the infantile development in which the fixation took place.

From the standpoint of this theory, the neurotic appears to be entirely dependent upon his infantile past, and all his troubles in later life, his moral conflicts, and deficiencies, seem to be derived from the powerful influence of that period. The therapy and its main preoccupation are in full accord with this view, and are chiefly concerned with the unravelling of this infantile fixation, which is understood as an unconscious attachment of the sexual libido to certain infantile phantasies and habits.

This is, so far as I can see, the essence of Freud's theory. But this conception neglects the following important question: What is the cause of this fixation of the libido to the old infantile phantasies and habits? We have to remember that almost all persons have at some time had infantile phantasies and habits exactly corresponding to those of a neurotic, but they do not become fixed to them; consequently, they do not become neurotic

later on. The ætiological secret of the neurosis, therefore, does not consist in the mere *existence* of infantile phantasies, but lies in the so-called *fixation*. The manifold statements of the existence of infantile sexual phantasies in neurotic cases are worthless, in so far as they attribute an ætiological value to them, for the same phantasies can be found in normal individuals as well, a fact which I have often proved. It is only the fixation which seems to be characteristic. It is important to demand the nature of the proofs of the real existence of this infantile fixation. Freud, an absolutely sincere and thorough empiricist, would never have evolved this hypothesis had he not had sufficient grounds for it. The grounds are found in the results of the psychoanalytic investigations of the unconscious. Psychoanalysis discloses the unconscious existence of manifold phantasies, which have their end root in the infantile past and turn around the so-called "*Kern-complex*," or nucleus-complex, which may be designated in male individuals as the Œdipus-complex and in females as the Electra-complex. These terms convey their own meaning exactly. The whole tragic fate of Œdipus and Electra took place within the narrow confines of the family, just as the child's fate lies wholly within the family boundaries. Hence the Œdipus conflict is very characteristic of an infantile conflict, so also is the Electra conflict. The existence of these conflicts in infancy is largely proven by means of psychoanalytic experience. It is in the realm of this complex that the fixation is supposed to have taken place. Through the highly potent and effective existence of the nucleus-complex in the unconscious of neurotics, Freud was led to the hypothesis, that the neurotic has a peculiar fixation or attachment to it. Not the mere existence of this complex—for everybody has it in the unconscious—but the very strong attachment to it is what is typical of the neurotic. He is far more influenced by this complex than the normal person; many examples in confirmation of this statement will be found in every one of the recent psychoanalytic histories of neurotic cases.

We must admit that this conception is a very plausible one, because the hypothesis of fixation is based upon the well-known fact, that certain periods of human life, and particularly infancy, do sometimes leave determining traces for ever. The only question is whether this principle is a sufficient explanation or not. If we examine persons who have been neurotic from infancy it seems to be confirmed, for we see the nucleus-complex as a permanent and powerful activity throughout the whole life. But if we take cases which never show any considerable traces of neurosis

except at the particular time when they break down, and there are many such, this principle becomes doubtful. If there is such a thing as fixation, it is not permissible to base upon it a new hypothesis, claiming that at times during certain epochs of life the fixation becomes loosened and ineffective, while at others it suddenly becomes strengthened and effective. In such cases we find the nucleus-complex as active and as potent as in those which apparently support the theory of fixation. Here a critical attitude is peculiarly justifiable, when we consider the often-repeated observation that the moment of the outbreak of the disease is by no means indifferent; as a rule it is most critical. It usually occurs *at the moment when a new psychological adjustment, that is, a new adaptation, is demanded*. Such moments facilitate the outbreak of a neurosis, as every experienced neurologist knows. This fact seems to me extremely significant. If the fixation were indeed real we should expect to find its influence constant, *i.e.* a neurosis continuous throughout life. This is obviously not the case. The psychological determination of a neurosis is only partially due to an early infantile predisposition; it is due to a certain actual cause as well. And if we carefully examine the kind of infantile phantasies and events to which the neurotic individual is attached, we shall be obliged to agree that there is nothing in them specific for neurosis. Normal individuals have pretty much the same kind of internal and external experiences, and are attached to them to an even astonishing degree, without developing a neurosis. You will find primitive people, especially, very much bound to their infantility. It now begins to look as if this so-called fixation were a normal phenomenon, and that the importance of infancy for the later mental attitude is natural and prevails everywhere. The fact that the neurotic seems to be markedly influenced by his infantile conflicts, shows that it is less a matter of fixation than of a peculiar use which he makes of his infantile past. It looks as if he exaggerated its importance, and attributed a very great artificial value to it (Adler, a pupil of Freud's, expresses a very similar view). It would be unjust to say that Freud confined himself to the hypothesis of fixation; he also was conscious of the impression I have just discussed. He called this phenomenon of reactivation or secondary exaggeration of infantile reminiscences "regression." But in Freud's conception it appears as if the incestuous desires of the Oedipus-complex were the real cause of the regression to infantile phantasies. If this were the case, we should have to postulate an unexpected intensity of the primary incestuous tendencies. This

view led Freud to his recent comparison between the so-called psychological "incest-barrier" in children and the "incest-taboo" in primitive man. He supposes that a real incestuous desire has led the primitive man to the invention of a protective law; while to me it looks as if the incest-taboo is one among numerous taboos of all sorts, and due to the typical superstitious fear of primitive man, a fear existing independently of incest and its interdiction. I am able to attribute as little particular strength to incestuous desires in childhood as in primitive humanity. I do not even seek the reason for regression in primary incestuous or any other sexual desires. I must state that a purely sexual ætiology of neurosis seems to me much too narrow. I base this criticism upon no prejudice against sexuality, but upon an intimate acquaintance with the whole problem.

Therefore I suggest that the psychoanalytic theory should be liberated from the purely sexual standpoint. In place of it I should like to introduce an *energetic view-point* into the psychology of neurosis.

All psychological phenomena can be considered as manifestations of energy, in the same way as all physical phenomena are already understood as energetic manifestations since Robert Mayer discovered the law of the conservation of energy. This energy is subjectively and psychologically conceived as *desire*. I call it *libido*, using the word in the original meaning of this term, which is by no means only sexual. Sallustius applies the term exactly in the way we do here: "*Magis in armis et militaribus equis, quam in scortis et conviviis libidinem habebant.*"

From a broader standpoint libido can be understood as vital energy in general, or as Bergson's *élan vital*. The first manifestation of this energy in the suckling is the instinct of *nutrition*. From this stage the libido slowly develops through manifold varieties of the act of sucking into the sexual function. Hence I do not consider the act of sucking as a sexual act. The pleasure in sucking can certainly not be considered as sexual pleasure, but as pleasure in nutrition, for it is nowhere proved that pleasure is sexual in itself. This process of development continues into adult life and is connected with a constantly increased adaptation to the external world. Whenever the libido, in the process of adaptation, meets an obstacle, an accumulation takes place which normally gives rise to an increased effort to overcome the obstacle. But if the obstacle seems to be insurmountable, and the individual renounces the overcoming of it, the stored-up libido makes a

regression. In place of being employed in the increased effort, the libido now gives up the present task and returns to a former and more primitive way of adaptation. We meet with the best examples of such regressions very frequently in hysterical cases where a disappointment in love or marriage gives rise to the neurosis. There we find the well-known disturbances of nutrition, resistance against eating, dyspeptic symptoms of all sorts, etc. In these cases the regressive libido, turning away from its application to the work of adaptation, holds sway over the function of nutrition and provokes considerable disturbance. Such cases are obvious examples of regression. Similar effects of regression are to be found in cases where there are no troubles in the function of nutrition, and here we readily find a regressive revival of reminiscences of a time long past. We find a revival of the images of the parents, of the Œdipus-complex. Here things and events of infancy—never before important—suddenly become so. They are regressively reanimated. Take away the obstacle in the path of life and this whole system of infantile phantasies at once breaks down and becomes again as inactive and as ineffective as before. But do not let us forget that, to a certain extent, it is at work influencing us always and everywhere. I cannot forbear to mention that this view comes very near Janet's hypothesis of the substitution of the "parties supérieures" of a function by its "parties inférieures." I would also remind you of Claparède's conception of neurotic symptoms as emotional reflexes of a primitive nature.

Therefore I no longer find the cause of a neurosis in the past, but in the present. I ask, what is the necessary task which the patient will not accomplish? The whole list of his infantile phantasies does not give me any sufficient ætiological explanation, because I know that these phantasies are only puffed up by the regressive libido, which has not found its natural outlet into a new form of adjustment to the demands of life.

You may ask why the neurotic has a special inclination not to accomplish his necessary tasks. Here let me point out that no living being adjusts itself easily and smoothly to new conditions. The principle of the *minimum of effort* is valid everywhere.

A sensitive and somewhat inharmonious character, as a neurotic always is, will meet special difficulties and perhaps more unusual tasks in life than a normal individual, who as a rule has only to follow the well-established line of an ordinary life. For the neurotic there is no established way, for his aims

and tasks are apt to be of a highly individual character. He tries to follow the more or less uncontrolled and half-conscious way of normal people, not fully realizing his own critical and very different nature, which imposes upon him more effort than the normal person is required to exert. There are neurotics who have shown their increased sensitiveness and their resistance against adaptation in the very first weeks of life, in their difficulty in taking the mother's breast, and in their exaggerated nervous reactions, &c. For this portion of a neurotic predisposition it will always be impossible to find a psychological ætiology, for it is anterior to all psychology. But this predisposition—you may call it "congenital sensitiveness" or by what name you like—is the cause of the first resistances against adaptation. In such case, the way of adaptation being blocked, the biological energy we call libido does not find its appropriate outlet or activity and therefore replaces an up-to-date and suitable form of adaptation by an abnormal or primitive one.

In neurosis we speak of an infantile attitude or the predominance of infantile phantasies and desires. In so far as infantile impressions and desires are of obvious importance in normal people they are equally influential in neurosis, but they have here no ætiological significance, they are reactions merely, being chiefly secondary and regressive phenomena. It is perfectly true, as Freud states, that infantile phantasies determine the form and further development of neurosis, but this is not ætiology. Even when we find perverted sexual phantasies of which we can prove the existence in childhood, we cannot consider them of ætiological significance. A neurosis is not really originated by infantile sexual phantasies and the same must be said of the sexualism of neurotic phantasy in general. It is not a primary phenomenon based upon a perverted sexual disposition, but merely secondary and a consequence of a failure to apply the stored-up libido in a suitable way. I realize that this is a very old view, but this does not prevent its being true. The fact that the patient himself very often believes that this infantile phantasy is the real cause of the neurosis, does not prove that he is right in his belief, or that a theory following the same belief is right either. It may look as if it were so, and I must confess that indeed very many cases do have that appearance. At all events, it is perfectly easy to understand how Freud came to this view. Every one having any psychoanalytic experience will agree with me here.

To sum up: I cannot see the real ætiology of a neurosis in the various manifestations of infantile sexual development and their corresponding phantasies. The fact that they are exaggerated and put into the foreground in neurosis is a consequence of the stored-up energy or libido. The psychological trouble in neurosis, and neurosis itself, can be considered *as an act of adaptation that has failed*. This formulation might reconcile certain views of Janet's with Freud's view, that a neurosis is—under a certain aspect—an attempt at self-cure; a view which can be and has been applied to many diseases.

Here the question arises whether it is still advisable to bring to light all the patient's phantasies by analysis, if we now consider them as of no ætiological significance. Psychoanalysis hitherto has proceeded to the unravelling of these phantasies because they were considered to be ætiologically significant. My altered view concerning the theory of neurosis does not change the procedure of psychoanalysis. The technique remains the same. We no longer imagine we are unearthing the end-root of the disease, but we have to pull up the sexual phantasies because the energy which the patient needs for his health, that is, for his adaptation, is attached to them. By means of psychoanalysis the connexion between the conscious and the libido in the unconscious is re-established. Thus you restore this unconscious libido to the command of conscious intention. Only in this way can the formerly split-off energy become again applicable to the accomplishment of the necessary tasks of life. Considered from this standpoint, psychoanalysis no longer appears to be a mere reduction of the individual to his primitive sexual wishes, but it becomes clear that, if rightly understood, it is a *highly moral task of immense educational value*.

CHAPTER IX

ON SOME CRUCIAL POINTS IN PSYCHOANALYSIS^[176]

CORRESPONDENCE BETWEEN DR. JUNG AND DR. LOÏ APPEARING IN "PSYCHOTHERAPEUTISCHE ZEITFRAGEN." PUBLISHED BY DR. LOÏ, SANATORIUM L'ABRI, TERRITET-MONTREUX, SWITZERLAND, 1914.

I

From Dr. Loï.

12th January, 1913.

What you said at our last conversation was extraordinarily stimulating. I was expecting you to throw light upon the interpretation of my own and my patients' dreams from the standpoint of Freud's "Interpretation of Dreams." Instead, you put before me an entirely new conception: the dream as a means of re-establishing the moral equipoise, fashioned in the realm below the threshold of consciousness. That indeed is a fruitful conception. But still more fruitful appears to me your other suggestion. You regard the problems of psychoanalysis as much deeper than I had ever thought: it is no longer merely a question of getting rid of troublesome pathological symptoms; the analysed person gets to understand not his anxiety-experiences alone, but his whole self most completely, and by means of this understanding he can build up and fashion his whole life anew. But he himself must be the builder, the Analyst only furnishes him with the necessary tools.

To begin with, I would ask you to consider what justification there is for the original procedure of Breuer and Freud, now entirely given up both by Freud himself and by you, but practised by Frank, for instance, as his only method: I mean "the abreaction of the inhibited effects under light hypnosis." Why have you given up the cathartic method? More particularly,

has light hypnosis in psychocatharsis a different value from suggestion during sleep, long customary in treatment by suggestion? that is, has it only the value which the suggestionist contributes, or does it claim to possess only the value which the patient's belief bestows upon it? Or, again, is suggestion in the waking-state equivalent to suggestion in hypnoidal states? This Bernheim now asserts to be the case, after having used suggestion for many years exclusively in hypnosis. You will tell me we must talk of psychoanalysis, not of suggestion. But I really mean this: is not the *suggestion*, by means of which the psychocatharsis in the hypnoidal state produces therapeutic effects, (modified naturally, by the patients' age, etc.) the main factor in the therapeutic success of the psychocatharsis? Frank, in his "*Affektstörungen*," says: "these partial adjustments of effect, suggestibility and suggestion, are almost altogether omitted in the psychocathartic treatment in light sleep, in so far as the content of the reproduced presentations is concerned." Is that really true? Frank himself adds: "How can meditation upon the dreams of youth in itself lead to the discharge of the stored-up anxiety, whether in hypnoidal states or under any other conditions? Must one not suppose, with much greater probability, that the anxiety-states would become more pronounced through such concentration upon them?" [I have noticed that myself, and much more than I at all liked.] One does indeed say to the patient: "First we must stir up, then afterwards comes peace." And it does come. But does it not come *in spite of the stirring-up process*, because gradually, by means of frequent talks under light hypnosis, the patient gets such confidence in the doctor that he becomes susceptible to direct suggestion, and that produces at first improvement and finally, cure? I go still further: in an analysis *in the waking-state*, is not the patient's belief that the *method employed will cure him*, coupled with his ever-growing trust in the doctor, a main cause of his cure? And I ask even further: in every systematically carried-out therapeutic treatment, is not faith in it, trust in the doctor, a main factor in its success? I will not indeed say the only factor, for one cannot deny that the physical, dietetic and chemical procedures, when properly selected, have a real effect in securing a cure, over and above the obvious effect of their indirect suggestion.

II

From Dr. Jung.

28th January, 1913.

With regard to your question as to the applicability of the cathartic method, the following is my standpoint: every method is good if it serves its purpose, including every method of suggestion, even Christian Science, Mental Healing, etc. "*A truth is a truth, when it works.*" It is quite another question whether a scientific physician can answer for it to his conscience should he sell little bottles of Lourdes-water because that suggestion is at times very useful. Even the so-called highly scientific suggestion-therapy employs the wares of the medicine-man and the exorcising Schaman. And please, why should it not? The public is not even now much more advanced and continues to expect miracles from the doctor. And truly those doctors should be deemed clever—worldly-wise in every respect—who understand the art of investing themselves with the halo of the medicine-man. Not only have they the biggest practices—they have also the best results. This is simply because countless physical maladies (leaving out of count the neuroses) are complicated and burdened with psychic elements to an extent scarcely yet suspected. The medical exorcist's whole behaviour betrays his full valuation of the psychic element when he gives the patient the opportunity of fixing his faith firmly upon the doctor's mysterious personality. Thus does he win the sick man's mind, which henceforth helps him indeed to restore his body also to health. The cure works best when the doctor really believes in his own formulæ, otherwise he may be overcome by scientific doubt and so lose the correct, convincing tone. I, too, for a time practised hypnotic suggestion enthusiastically. But there befell me three dubious incidents which I want you to note:—

1. Once there came to me to be hypnotised for various neurotic troubles a withered peasant-woman of some fifty years old. She was not easy to hypnotise, was very restless, kept opening her eyes—but at last I did succeed. When I waked her after about half an hour she seized my hand and with many words testified to her overflowing gratitude. I said: "But you are by no means cured yet, so keep your thanks till the end of the treatment."

She: "I am not thanking you for that, but—(blushing and whispering)—because you have been so *decent*." So she said, looked at me with a sort of tender admiration and departed. I gazed long at the spot where she had stood—and asked myself, confounded, "So decent?"—good heavens! surely she hadn't imagined, somehow or other.... This glimpse made me suspect for the first time that possibly the loose-minded person, by means of that notorious feminine (I should at that time have said "animal") directness of instinct, understood more about the essence of hypnotism than I with all my knowledge of the scientific profundity of the text-books. Therein lay my harmlessness.

2. Next came a pretty, coquettish, seventeen-year-old girl with a harassed, suspicious mother. The young daughter had suffered since early girlhood from *enuresis nocturna*, which, among other difficulties, hindered her from going to a boarding-school abroad.

At once I thought of the old woman and her wisdom. I tried to hypnotise the girl; she laughed affectedly and prevented hypnosis for twenty minutes. Of course I kept quiet and thought: I know why you laugh; you have already fallen in love with me, but I will give you proof of my decency in gratitude for your wasting my time with your challenging laughter. I succeeded in hypnotising her. Success followed at once. The enuresis stopped, and I therefore informed the young lady later that, instead of Wednesday, I would not see her again for hypnosis till the following Saturday. On Saturday she arrived with a cross countenance, presaging failure. The enuresis had come back again. I remembered my wise old woman, and asked: "When did the enuresis return?" She (unsuspecting), "Wednesday night." I thought to myself, There it is again, she wants to show me that I simply must see her on Wednesdays too; not to see me for a whole long week is too much for a tender, loving heart. But I was quite resolved to give no help to such annoying romancing, so I said, "To continue the hypnosis would be quite wrong under these circumstances. We must drop it for quite three weeks, to give the enuresis a chance to stop. Then come again for treatment." In my malicious heart I knew I should then be on my holiday and so the course of hypnotic treatment would come to an end. After the holidays my *locum tenens* told me the young lady had been there with the news that the enuresis had vanished, but her disappointment at not seeing me was very keen. The old woman was right, thought I.

3. The third case gave my joy in suggestion its death-blow. This was the manner of it. She was a lady of sixty-five who came stumbling into the consulting-room with a crutch. She had suffered from pain in the knee-joint for seventeen years, and this at times kept her in bed for many weeks. No doctor had been able to cure her, and she had tried every possible remedy of present-day medicine. After I had suffered the stream of her narrative to flow over me for some ten minutes, I said, "I will try to hypnotise you, perhaps that will do you good." She, "Oh yes, please do!" leaned her head on one side and fell asleep before ever I said or did anything. She passed into somnambulism and showed every form of hypnosis you could possibly desire. After half an hour I had the greatest difficulty in waking her; when at last she was awake she jumped up: "I am well, I am all right, you have cured me." I tried to make timid objections, but her praises drowned me. She could really walk. Then I blushed and said, embarrassed, to my colleagues: "Look! behold the wondrously successful hypnotic therapy." That day saw the death of my connection with treatment by suggestion; the therapeutic praise won by this case shamed and humiliated me. When, a year later, at the beginning of my hypnotic course, the good old lady returned, this time with the pain in her back, I was already sunk in hopeless cynicism; I saw written on her forehead that she had just read the notice of the re-opening of my clinic in the newspaper, that vexatious romanticism had provided her with a convenient pain in the back so that she might have a pretext for seeing me, and again let herself be cured in the same theatrical fashion. This proved true in every particular.

As you will understand, a man possessed of scientific conscience cannot endure such cases without embarrassment. There ripened in me the resolve to renounce suggestion altogether rather than to allow myself passively to be transformed into a miracle-worker. I wanted to understand what really went on in the souls of people. It suddenly seemed to me incredibly childish to think of dispelling an illness with charms, and that this should be the only result of our scientific endeavours for a psychotherapy. Thus for me the discovery of Breuer and Freud was a veritable deliverance. I took up their method with unalloyed enthusiasm and soon recognised how right Freud was, when at a very early date, indeed so far back as the *Studien ueber Hysterie*, he began to direct a searchlight upon the accompanying circumstances of the so-called trauma. I too soon discovered that certainly some traumata with an obvious etiological tinge are opportunely present.

But the greater number appeared highly improbable. So many of them seemed so insignificant, even so normal, that at most one could regard them as just providing the opportunity for the neurosis to appear. But what especially spurred my criticism was the fact that so many traumata were simply inventions of phantasy which had never really existed. This perception was enough to make me sceptical about the whole trauma-theory. (But I have dealt with these matters in detail in my lectures on the theory of psychoanalysis).^[177] I could no longer suppose that the hundred and one cathartic experiences of a phantastically puffed-up or entirely invented trauma were anything but the effect of suggestion. It is well enough if it helps. If one only had not a scientific conscience and that impulsion towards the truth! I found in many cases, especially when dealing with more mentally gifted patients, that I must recognise the therapeutic limitations of this method. It is, of course, a definite plan, and convenient for the doctor, since it makes no particular demands upon his intellect for new adaptations. The theory and practice are both of the pleasantest simplicity: "The neurosis is caused by a trauma. The trauma is abreacted." When the abreaction takes place under hypnotism, or with other magical accessories (dark room, peculiar lighting, and the rest), I remember once more the wise old woman, who opened my eyes not merely to the magic influence of the mesmeric gestures, but also to the essential character of hypnotism itself. But what alienated me once for all from this relatively efficacious indirect method of suggestion, based as it is upon an equally efficacious false theory, was the perception I obtained at the same time that, behind the confused deceptive intricacies of neurotic phantasies, there stands a *conflict*, which may be best described as a *moral* one. With this there began for me a new era of understanding. Research and therapy now coincided in the attempt to discover the causes and the *rational* solution of this conflict. That is what psychoanalysis meant to me. Whilst I had been getting this insight, Freud had built up his sexual theory of the neurosis, and therewith had brought forward an enormous number of questions for discussion, all of which I thought deserved the profoundest consideration. Thus I have had the good fortune of co-operating with Freud for a long time, and working with him in the investigation of the problem of sexuality in neurosis. You, perhaps, know from some of my earlier work that I was always dubious somewhat concerning the significance of sexuality.^[178] This

has now become the exact point where I am no longer altogether of Freud's opinion.

I have preferred to answer your questions in rather non-sequent fashion. Whatever is still unanswered, let me now repeat: *light hypnosis* and *complete hypnosis* are but varying grades of intensity of unconscious attraction towards the hypnotist. Who can here venture to draw sharp distinctions? To a critical intelligence it is unthinkable that suggestibility and suggestion can be excluded in the cathartic method. They are present everywhere and are universal human attributes, even with Dubois and the psychoanalysts who think they work on purely rational lines. *No technique, no self-deception avails here—the doctor works, nolens volens—and perhaps primarily—by means of his personality, that is by suggestion.* In the cathartic treatment, what is of far more importance to the patient than the conjuring up of old phantasies is the being so often with the doctor, and having confidence and belief in him personally, and in his method. The belief, the self-confidence, perhaps also the devotion with which the doctor does his work, are far more important things to the patient (*imponderabilia* though they be) than the recalling of old traumata.^[179]

Ultimately we shall some day know from the history of medicine everything that has ever been of service; then perhaps at last we may come to the really desirable therapy, to psychotherapy. Did not even the old materia medica of filth have brilliant cures?—cures which only faded away with the belief in it!

Because I recognise that the patient does attempt to lay hold of the doctor's personality, in spite of all possible rational safeguards, I have formulated the demand that the psychotherapist shall be held just as responsible for the cleanness of his own hands as is the surgeon. I hold it to be an absolutely indispensable preliminary that the psychoanalyst should himself first undergo an analysis, for his personality is one of the chief factors in the cure.

Patients read the doctor's character intuitively and they should find in him a human being, with faults indeed, but also a man *who has striven at every point to fulfil his own human duties in the fullest sense.* I think that this is the first healing factor. Many times I have had the opportunity of seeing that the analyst is successful with his treatment just in so far as he has succeeded

in his own moral development. I think this answer will satisfy your question.

III

From Dr. Loj.

2nd February, 1913.

You answer several of my questions in a decidedly affirmative sense. You take it as proved that in the cures by the cathartic method the main *rôle* is played by faith in the doctor and in his method, and not by the "abreaction" of real or imaginary traumata. I also. Equally I am at one with your view that the cures of the old *materia medica* of filth, as well as the Lourdes cures, or those of the Mental Healers, Christian Scientists and Persuasionists, are to be attributed to faith in the miracle-worker, rather than to any of the methods employed.

Now comes the ticklish point: the augur can remain an augur so long as he himself believes the will of the gods is made manifest by the entrails of the sacrificial beast. When he no longer believes, he has to ask himself: Shall I continue to use my augur's authority to further the welfare of the State, or shall I make use of my newer, and (I hope) truer convictions of to-day? Both ways are possible. The first is called opportunism; the second the pursuit of truth, and scientific honour. For a doctor, the first way brings perhaps therapeutic success and fame; the second, reproach: such a man is not taken seriously. What I esteem most highly in Freud and his school is just this passionate desire for truth. But again, it is precisely here that people pronounce a different verdict: "It is impossible for the busy practitioner to keep pace with the development of the views of this investigator and his initiates." (Frank, "Affektstörungen Einleitung.")

One can easily disregard this little quip, but one must take more seriously one's self-criticism. We may have to ask ourselves whether, since science is an undivided, ever-flowing stream, we are justified in relinquishing on

conscientious grounds any method or combination of methods by means of which we know cures can be achieved?

Looking more closely at the fundamental grounds of your aversion to the use of hypnosis (or semi-hypnosis, the degree matters nothing) in *treatment by suggestion*, (which as a matter of fact every doctor and every therapeutic method makes use of willy-nilly, no matter what it is called), it is clear that what has disgusted you in hypnotism is at bottom nothing but the so-called "transference" to the doctor, which you, with your unalloyed psychoanalytic treatment, can get rid of as little as any one else, for indeed it plays a chief part in the success of the treatment. Your insistence that the psychoanalyst must be answerable for the cleanness of his own hands—(here I agree with you unreservedly)—is an inevitable conclusion. But, after all, does anything more "augurish" really cling to the use made of hypnosis in psychotherapeutic treatment, than to the quite inevitable use made of the "transference to the doctor" for therapeutic ends? In either case we must perforce "take shares" in faith as a healing agent. As for the feeling which the patient—whether man or woman—entertains for the doctor, is there never anything in the background save conscious or unconscious sexual desire? In many cases your view is most certainly correct; more than one woman has been frank enough to confess that the beginning of hypnosis was accompanied by voluptuous pleasure. But this is not true in all instances—or how would you explain the underlying feeling in the hypnotising of one animal by another, *e.g.* snake and bird? Surely you can say that there the feeling of *fear* reigns, fear which is an inversion of the libido, such as comes upon the bride in that hypnoidal state before she yields to her husband wherein pure sexual desire rules, though possibly it contains an element of fear. However this may be, from your three cases I cannot draw any ethical distinction between the "unconscious readiness towards the hypnotist" and the "transference to the doctor" which should avail to condemn a combination of hypnotism and psychoanalysis as a method of treatment. You will ask why I cling to the use of hypnotism; or rather of hypnoidal states. Because I think there are cases that can be much more rapidly cured thereby, than through a purely psychoanalytic treatment. For example, in no more than five or six interviews I cured a fifteen-year-old girl who had suffered from *enuresis nocturna* from infancy, but was otherwise thoroughly healthy, gifted, and pre-eminent at school: she had previously tried all sorts of treatment without any result.

Perhaps I ought to have sought out the psychoanalytic connexion between the enuresis and her psychosexual attitude and explained it to her, etc., but I could not, she had only the short Easter holidays for treatment: so I just hypnotised her and the tiresome trouble vanished. It was a lasting cure.

In psychoanalysis I use hypnosis to help the patient to overcome "resistances."

Further, I use light hypnosis in association with psychoanalysis, to hasten the advance when the "re-education" stage comes.

For example, a patient afflicted with washing-mania was sent to me after a year's psychocathartic treatment by Dr. X. The symbolic meaning of her washing-ceremonial was first made plain to her; she became more and more agitated during the "abreaction" of alleged traumata in childhood, because she had persuaded herself by auto-suggestion that she was too old to be cured, that she saw no "images," etc. So I used hypnosis to help her to diminish the number of her washings, "so that the anxiety-feeling would be banished"; and to train her to throw things on the ground and pick them up again without washing her hands afterwards, etc.

In view of these considerations, if you feel disposed to go further into the matter, I should be grateful if you would furnish me with more convincing reasons why hypnotic treatment must be dispensed with; and explain how to do without it, or with what to replace it in such cases. Were I convinced, I would give it up as you have done, but what convinced you has, so far, not convinced me. *Si duo faciunt idem, non est idem.*

Now I want to consider another important matter to which you alluded, but only cursorily, and to put one question: behind the neurotic phantasies there stands, you say, almost always (or always) a moral conflict which belongs to the present moment. That is perfectly clear to me. Research and therapy coincide; their task is to search out the foundations and the rational solution of the conflict. Good. But can the rational solution always be found? "Reasons of expediency" so often bar the way, varying with the type of patient, for instance children, young girls and women from "pious" catholic or protestant families. Again that accursed opportunism! A colleague of mine was perfectly right when he began to give sexual enlightenment to a young French patient, a boy who was indulging in masturbation.

Whereupon, like one possessed, in rushed a bigoted grandmother, and a disagreeable sequel ensued. How to act in these and similar cases? What to do in cases where there arises a moral conflict between love and duty (a conflict in married life)?—or in general between instinct and moral duty? What to do in the case of a girl afflicted with hysterical or anxiety symptoms, needing love and having no chance to marry, either because she cannot find a suitable man or because, being "well-connected," she wants to remain chaste? Simply try to get rid of the symptoms by suggestion? But that is wrong as soon as one knows of a better way. How to reconcile these two consciences: that of the man who does not want to confine his fidelity to truth within his own four walls; and that of the doctor who must cure, or if he dare not cure according to his real convictions (owing to opportunist-motives), must at least procure some alleviation? We live in the present, but with the ideas and ideals of the future. That is *our* conflict. How resolve it?

IV

From Dr. Jung.

4th February, 1913.

You have put me in some perplexity by the questions in your yesterday's letter. You have rightly grasped the spirit which dictated my last. I am glad you, too, recognise this spirit. There are not very many who can boast of such tolerance. I should deceive myself if I regarded my standpoint as that of a practical physician. First and foremost I am a scientist; naturally that gives me a different outlook upon many problems. In my last letter I certainly left out of count the doctor's practical needs, but chiefly that I might show you on what grounds we might be moved to relinquish hypnotic therapy. To remove the first objection at once, let me say that I did not give up hypnotism because I desired to avoid dealing with the basic motives of the human soul, but rather because I wanted to battle with them *directly* and *openly*. When once I understood what kind of forces play a part in hypnotism I gave it up, simply to get rid of all the indirect advantages of this method. As we psychoanalysts see regretfully every day—and our patients also—we *do not work with the "transference to the doctor,"*^[180] *but against it and in spite of it.* It is just not upon the *faith* of the sick man that we can build, but upon his *criticism*. So much would I say at the outset upon this delicate question.

As your letter shows, we are at one in regard to the theoretical aspect of treatment by suggestion. So we can now apply ourselves to the further task of coming to mutual understanding about the practical question.

Your remarks on the physician's dilemma—whether to be magician or scientist—bring us to the heart of the discussion. I strive to be no fanatic—although there are not a few who reproach me with fanaticism. I contend not for the application of the psychoanalytic method solely and at all costs, but for the recognition of every method of investigation and treatment. I was a medical practitioner quite long enough to realise that practice obeys, and should obey, other laws than does the search after truth. One might almost say practice must first and foremost submit to the laws of opportunism. The scientist does great injustice to the practitioner if he reproaches him for not using the "one true" scientific method. As I said to you in my last letter: "A truth is a truth, when it works." But on the other hand, the practitioner must not reproach the scientist if in his search for truth and for newer and better methods, he makes trial of unusual ways. After all, it is not the practitioner but the investigator, and the latter's patient, who will have to bear any injury that may arise. The practitioner must certainly use those methods which he knows how to use to greatest advantage, and which give him the best relative results. My tolerance, indeed, extends, as you see, even to Christian Science. But I deem it most uncalled for that Frank, a practising doctor, should depreciate research in which he cannot participate, and particularly the very line of research to which he owes his own method. It is surely time to cease this running down of every new idea. No one asks Frank and all whom he represents to become psychoanalysts; we grant them the right to their existence, why should they always seek to cut ours short?

As my own "cures" show you, I do not doubt the effect of suggestion. Only I had the idea that I could perhaps discover something still better. This hope has been amply justified. Not for ever shall it be said—

"The good attained is oft of fairer still
The enemy, calling it vain illusion, falsehood's snare."

I confess frankly were I doing your work I should often be in difficulties if I relied only on psychoanalysis. I can scarcely imagine a general practice, especially in a sanatorium, with no other means than psychoanalysis. At Dr. Bircher's sanatorium in Zürich the principle of psychoanalysis is adopted completely by several of the assistants, but a whole series of other important educative influences are also brought to bear upon the patients, without which matters would probably go very badly. In my own purely psychoanalytic practice I have often regretted that I could not avail myself of the other methods of re-education that are naturally at hand in an institution—this, of course, only in special cases where one is dealing with extremely uncontrolled, uneducated persons. Which of us has shown any disposition to assert that we have discovered a panacea? There are cases in which psychoanalysis operates less effectively than any other known method. But who has ever claimed psychoanalysis should be employed in every sort of case, and on every occasion? Only a fanatic could maintain such a view. Patients for whom psychoanalysis is suitable have to be selected. I unhesitatingly send cases I think unsuitable to other doctors. As a matter of fact this does not happen often, because patients have a way of sorting themselves out. Those who go to an analyst usually know quite well why they go to him and not to some one else. However, there are very many neurotics well suited for psychoanalysis. In these matters every scheme must be looked at in due perspective. It is never quite wise to try to batter down a stone wall with your head. Whether simple hypnotism, the cathartic treatment, or psychoanalysis shall be used, must be determined by the conditions of the case and the preference of the *particular* doctor. Every doctor will obtain the best results with the instrument he knows best.

But, barring exceptions, *I must say definitely that for me, and for my patients also, psychoanalysis proves itself better than any other method.* This is not merely a matter of feeling; from manifold experiences I know many cases can indeed be cured by psychoanalysis which are refractory to all other methods of treatment. I have many colleagues whose experience is the same, even men engaged exclusively in practice. It is scarcely to be supposed that a method altogether contemptible would meet with so much support.

When once psychoanalysis has been applied in a suitable case, it is *imperative* that rational solutions of the conflicts should be found. The objection is at once advanced that many conflicts are intrinsically incapable of solution. That view is sometimes taken because only an external solution is thought of—and that, at bottom, is no real solution at all. If a man cannot get on with his wife he naturally thinks the conflict would be solved if he were to marry some one else. If such marriages are examined they are seen to be no solution whatsoever. The old Adam enters upon the new marriage and bungles it just as badly as he did the earlier one. *A real solution comes only from within, and only then because the patient has been brought to a new standpoint.*

Where an external solution is possible no psychoanalysis is necessary; in seeking an internal solution we encounter the peculiar virtues of psychoanalysis. The conflict between "love and duty" must be solved upon that particular plane of character where "love and duty" are no longer in opposition, for indeed they really are not so. The familiar conflict between "instinct and conventional morality" must be solved in such a way that both factors are taken

satisfactorily into account, and this is only possible through a change of character. This change psychoanalysis can bring about. In such cases external solutions are worse than none at all. Naturally the particular situation dictates which road the doctor must ultimately follow, and what is then his duty. I regard the conscience-searching question of the doctor's remaining true to his scientific convictions as rather unimportant in comparison with the incomparably weightier question as to how he can best help his patient. The doctor *must*, on occasion, be able to play the augur. *Mundus vult decipi*—but the cure is no deception. It is true that there is a conflict between ideal conviction and concrete possibility. *But we should ill prepare the ground for the seed of the future, were we to forget the tasks of the present, and sought only to cultivate ideals.* That is but idle dreaming. Do not forget that Kepler cast horoscopes for money, and that countless artists have been condemned to work for wages.

V.

From Dr. Loj.

9th February, 1913.

The selfsame passion for truth possesses us both when we think of pure research, and the same desire to cure when we are considering therapy. For the scientist, as for the doctor, we desire the fullest freedom in all directions, fullest freedom to select and use the methods which promise the best fulfilment of their ends at any moment. Here we are at one; but there remains a postulate we must establish to the satisfaction of others if we want recognition for our views.

First and foremost there is a question that must be answered, an old question asked already in the Gospels: *What is Truth?* I think clear definitions of fundamental ideas are most necessary. How shall we contrive a working definition of the conception "Truth"? Perhaps an allegory may help us.

Imagine a gigantic prism extending in front of the sun, so that its rays are broken up, but suppose man entirely ignorant of this fact. I exclude the invisible, chemical and ultra-violet rays. Men who live in a blue-lit region will say: "The sun sends forth blue light only." They are right and yet they are wrong: from their standpoint they are capable of perceiving only a *fragment* of truth. And so too with the inhabitants of the red, yellow, and in-between regions. And they will all scourge and slay one another to force *their* belief in *their* fragment upon the others—till, grown wiser through travelling in each others' regions, they come to the harmonious agreement that the sun sends out light of varying colours. That comprehends more truth, but it is not yet *the* Truth. Only when the giant lens shall have recombined the split-up rays, and when the invisible, chemical and heat rays have given proof of their own specific effects, will a view more in accordance with the facts be able to arise, and men will perceive that the sun emits white light which is split up by the prism into differing rays with different peculiarities, which rays can be recombined by the lens into one mass of white light.

This example shows sufficiently well that the road to Truth leads through far-reaching and comparative observations, the results of which must be controlled by the help of freely chosen *experiments*, until well-grounded hypotheses and theories can be put forward; but these hypotheses and theories will fall to the ground as soon as a single new observation or experiment contradicts them.

The way is difficult, and in the end all man ever attains to is *relative* truth. But such relative truth suffices for the time being, if it serves to explain the most important actual concatenations of the past, to light up present problems, to predict those of the future, so that we are then in a position to achieve adaptation through our knowledge. But *absolute* truth could be accessible only to omniscience, aware of all possible concatenations and combinations; that is not possible, for the concatenations and their combinations are infinite. Accordingly, we shall never know more than an approximate truth. Should new relationships be discovered, new combinations built up, then the picture changes, and with it the entire possibilities in knowledge and power. To what revolutions in daily life does not every new scientific discovery lead: how absurdly little was the beginning of our first ideas of electricity, how inconceivably great the results! Time and again it is necessary to repeat this commonplace, because one sees how life is always made bitter for the innovators in every scientific field, and now is it being made especially so for the disciples of the psychoanalytic school. Of course, every one admits the truth of this platitude so long as it is a matter of "academic" discussion, but only so long; just as soon as a concrete case has to be considered, sympathies and antipathies rush into the foreground and darken judgment. And therefore the scientist must fight tirelessly, appealing to logic and honour, for freedom of research in every field, and must not permit authority, of no matter what political or religious tinge, to advance reasons of *opportunism* to destroy or restrict this freedom; opportunist reasons may be and are in place elsewhere, not here. Finally we must completely disavow that maxim of the Middle Ages: "*Philosophia ancilla Theologiæ*," and no less, too, the war-cries of the university classrooms with their partisanship of one or other religious or political party. All fanaticism is the enemy of science, which must above all things be *independent*.

And when we turn from the search for Truth back once more to therapeutics, we see immediately that here too we are in agreement. In practice expediency *must* rule: the doctor from the yellow region must adapt himself to the sick in the yellow region, as must the doctor in the blue region, to his patients; both have the same object in view. And the doctor who lives in the white light of the sun must take into consideration the past experiences of his patients from the yellow or blue region, in spite of, or perhaps rather because of, his own wider knowledge. In such cases the way to healing will be long and difficult, may indeed lead more easily into a *cul-de-sac*, than in cases where he has to do with patients who, like himself, have already come to a knowledge of the white sunlight, or, one might say, when his patient-material has "already sorted itself out." With such sorted-out material the psychoanalyst can employ psychoanalysis exclusively; and may deem himself happy in that he need not "play the augur." Now, what are these psychoanalytic methods? If I understand you aright, from beginning to end it is a question of dealing directly and openly with *the basic forces of the human soul*, so that the analysed person, be he sick or sound or in some stage between—for health and sickness flow over by imperceptible degrees into one another—shall gradually have his eyes opened to the drama that is being acted within him. He has to come to an understanding of the development of the hostile automatisms of his personality, and by

means of this understanding he must gradually learn to free himself from them; he must learn, too, how to employ and strengthen the favourable automatisms. He must learn to make his self-knowledge real, and of practical use, to control his soul's workings so that a balance may be established between the spheres of emotion and reason. And what share in all this has the physician's *suggestion*? I can scarcely believe that suggestion can be altogether avoided till the patient feels himself really *free*. Such freedom, it goes without saying, is the main thing to strive for, and it must be *active*. The sick man who simply obeys a suggestion, obeys it only just so long as the "transference to the doctor" remains potent.

But if he wishes to be able to adjust himself to all circumstances he must have fortified himself "from within." He should no longer need the crutches of faith, but be capable of encountering all theoretical and practical problems squarely, and of solving them by himself. That is surely your view? Or have I not understood correctly?

I next ask, must not every single case be treated differently, of course *within the limits of the psychoanalytic method*? For if every case is a case by itself, it must indeed demand individual treatment.

"Il n'y a pas de maladies, il n'y a que des malades," said a French doctor whose name escapes me. But *on broad lines*, what course, from a technical point of view, does analysis take, and what deviations occur most frequently? That I would gladly learn from you. I take for granted that all "augurs' tricks," darkened rooms, masquerading, chloroform, are out of the question.

Psychoanalysis—purged so far as is humanly possible from suggestive influence—appears to have an essential difference from Dubois' psychotherapy. With Dubois, from the beginning conversation about the past is forbidden, and "the moral reasons for recovery" placed in the forefront; whilst psychoanalysis uses the subconscious material from the patient's past as well as present, for present self-understanding. Another difference lies in the conception of morality: morals are above all "*relative*." But what essential forms shall they assume at those moments when one can hardly avoid suggestion? You will say, the occasion must decide. Agreed, as regards older people, or adults, who have to live in an unenlightened *milieu*. But if one is dealing with children, the seed of the future, is it not a sacred duty to enlighten them as to the shaky foundations of the so-called "moral" conceptions of the past, which have only a dogmatic basis; is it not a duty to educate them into full freedom by courageously unveiling Truth? I ask this not so much with regard to the analysing doctor as to the teacher. May not the creation of *free schools* be looked for as one task for the psychoanalyst?

VI.

From Dr. Jung.

11th February, 1913.

The idea of the relativity of "Truth" has been current for ages, but whether true or not, it does not stand in the way of anything save the beliefs of dogma and authority.

You ask me, or indeed tell me—what psychoanalysis is. Before considering your views, permit me first to try and mark out the territory and definition of psychoanalysis. Psychoanalysis is primarily just a method—but a method complying with all the rigorous demands insisted upon to-day by the conception "method." Let it be made plain at once that psychoanalysis is not an *anamnesis*, as those who know everything without learning are pleased to believe. It is essentially a method for the exploration of the unconscious associations, into which no question of the conscious self enters. Again, it is not a *kind of examination* of the nature of an intelligence test, though this mistake is common in certain circles. It is no *cathartic method*, abreacting real and phantastic "traumata," with or without hypnosis. *Psychoanalysis is a method which makes possible the analytic reduction of the psychic content to its simplest expression, and the discovery of the line of least resistance in the development of a harmonious personality.* In neurosis, straightforward direction of life's energies is lacking, because opposing tendencies traverse and hinder psychological adaptation. Psychoanalysis, so far as our present knowledge of it goes, thus appears to be simply a rational nerve-therapy.

For the technical application of psychoanalysis no programme can be formulated. There are only general principles, and, for the individual case, working rules. (Here let me refer you to Freud's work in volume I. of the *Internationale Zeitschrift für Ärztliche Psychoanalyse*.) My one working rule is to conduct the analysis as a perfectly ordinary, sensible conversation, and to avoid all appearance of medical magic.

The leading principle of the psychoanalytic technique is to analyse the *psychic material which offers itself then and there*. Every interference on the part of the analyst, with the object of inducing the analysis to follow some systematic course, is a gross mistake in technique. *So-called chance is the law and the order of psychoanalysis.*

Naturally in the beginning of the analysis the anamnesis and the diagnosis come first. The subsequent analytic process develops quite differently in every case. To give rules is well-nigh impossible. All one can say is that very frequently, quite at the beginning, a series of resistances have to be overcome, resistances against both method and man. Patients having no idea of psychoanalysis must first be given some understanding of the method. In those who already know something of it there are very often many misconceptions to set right, and frequently one has to deal also with many reproaches cast by scientific criticism. In either case the misconceptions rest upon arbitrary interpretations, superficiality, or complete ignorance of the facts.

If the patient is himself a doctor his special knowledge may prove extremely tiresome. To intelligent colleagues it is best to give a complete theoretic exposition. With foolish and limited persons you begin quietly with analysis. In the unconscious of such folk there is a confederate that never refuses help. From the analysis of the very earliest dreams the emptiness of the criticism is obvious; and ultimately of the whole beautiful edifice of supposedly scientific scepticism nothing remains, save a little heap of personal vanity. I have had amusing experiences here.

It is best to let the patient talk freely and to confine oneself to pointing out connexions here and there. When the conscious material is exhausted we come to the dreams, which furnish us with the subliminal material. If people have no dreams, as they allege, or if they forget them,

there is usually still some conscious material that ought to be produced and discussed, but is kept back owing to resistances. When the conscious is emptied then come the dreams, which are indeed, as you know, the chief material of the analysis.

How the "Analysis" is to be made and what is to be said to patients depends, firstly, upon the material to be dealt with; secondly, on the doctor's skill; and, thirdly, on the patient's capacity. I must insist that no one ought to undertake analysis except on the basis of a sound knowledge of the subject; that necessitates an intimate understanding of the existing literature. Without this, the work may be bungled.

I do not know what else to tell you beforehand. I must wait for further questions. In regard to questions of morality and education let me say that these belong to the later stages of the analysis, wherein they find—or should find—solutions for themselves. *You cannot compile recipes out of psychoanalysis.*

VII

From Dr. Löj.

10th February, 1913.

You write that a solid knowledge of the psychoanalytic literature is necessary for initiation into psychoanalysis. I should agree, but with a certain reservation: the more one reads, the more one notices how many contradictions there are among the different writers, and less and less does one know—until one has had sufficient personal experience—to which view to give adherence, since quite frequently assertions are made without any proof. For example, I had thought (strengthened in the view by my own experience of suggestion-therapy) that the transference to the doctor might be an essential condition in the patient's cure. But you write: "We psychoanalysts do not build upon the patient's faith, rather do we have to deal with his criticism." And Stekel writes, on the other hand (*Zentralblatt für Psychoanalyse*, 3rd year, vol. IV., p. 176, "Ausgänge der psychoanalytischen Kuren"): "Love for the doctor can become a power essential to recovery. Neurotics never get well for love of themselves. They recover out of love for the doctor. They give him that pleasure." Here again, surely, stress is laid on the power of suggestion? And yet Stekel too thinks he is a psychoanalyst pure and simple. On the other hand, you say in your letter of Jan. 20th that "the doctor's personality is one of the main factors in the cure." Should not this expression be translated: "When the doctor inspires respect in the patient and is worthy of his love, the patient will gladly follow his example and endeavour to recover from his neurosis and fulfil his human duties in the widest sense"? I think one can only emerge from all this uncertainty by means of much personal experience, which will indicate also which way best suits one's own personality and brings the greatest therapeutic success. This is a further reason for undergoing analysis oneself, to recognise fully what one is. I was decidedly in agreement with your definition of psychoanalysis in its first (negative) portion: psychoanalysis is neither an *anamnesis* nor a *method of examination* after the fashion of a test for intelligence, nor yet a *psychocatharsis*. In your second (positive) part, however, your definition: "Psychoanalysis is a method of discovering the line of least

resistance to the harmonious development of the whole personality," seems to me valid for the patient's inertia, but not for the releasing of the sublimated libido with a view to the new direction of life. You consider that the neurosis causes a lack of singleness of aim in life, because opposing tendencies hinder psychic adaptation. True, but will not this psychic adaptation eventuate quite differently according as the patient, when well, directs his life either to the avoidance of pain merely (line of least resistance) or to the achievement of the greatest pleasure?—In the first case he would be more passive, he would merely reconcile himself "to the emptiness of reality" (Stekel, *loc. cit.*, p. 187). In the second he would be "filled with enthusiasm" for something or other or some person or other. But what will determine this choice of his as to whether he will be passive rather than active in his "second life"? In your view, will the determining factor manifest itself spontaneously in the course of the analysis, and must the doctor carefully avoid swaying the balance to one side or other by his influence? Or must he, if he does *not* renounce the right to canalise the patient's libido in some particular direction, renounce the right to be called a psychoanalyst, and is he to be regarded as "moderate" or altogether as "wild"?^[181] (Cf. Furtmüller, "Wandlungen in der Freudschen Schule," *Zentralblatt für Psychoanalyse*, vols. IV., V., 3rd year, p. 191.) But I think you have already answered this question, since in your last letter you write: "Every interference on the part of the analyst is a gross mistake in technique. So-called chance is the law and the order of psychoanalysis." But, torn from its context, perhaps this does not quite give your whole meaning. With regard to detailed explanation of the psychoanalytic method before the beginning of the analysis, I think you agree with Freud and Stekel: give too little rather than too much. For the knowledge *instilled into* a patient remains more or less half-knowledge, and half-knowledge engenders "the desire to know better" (than the analyst), which only impedes progress. So, after brief explanation, first "let the patient talk," then and there point out connexions, then after the exhaustion of the conscious material, take dreams.

But there another difficulty confronts me which I have already pointed out in our talks: you find the patient adapting himself to the doctor's tone, language, jargon, whether from conscious imitation, transference, or even resistance, when he can fight the analyst with his own weapons; how then can you possibly prevent his beginning to produce all manner of phantasies as supposedly real traumata of early childhood, and *dreams* supposedly spontaneous which are in reality, though not designedly, directly or indirectly *suggested*? I then told you that Forel ("Der Hypnotismus") made his patients dream just what he wanted, and I have myself easily repeated the experiment. But if the analyst desires to *suggest nothing*, should he remain silent for the most part and let the patient speak—except that in interpreting dreams he may lay before the patient his own interpretation?

VIII

From Dr. Jung.

18th February, 1913.

I cannot but agree with your observation that confusion reigns in psychoanalytic literature. Just at this moment different points of view are developing in the theoretical conception of the analytic results; not to mention many individual deviations. Over against Freud's almost purely *causal* conception, there has developed, apparently in absolute contradiction, Adler's purely *final* view, but in reality the latter is an essential complement of Freud's theory. I hold rather to a middle course, taking into account both standpoints. That discord still reigns round the ultimate questions of psychoanalysis need not surprise us when we consider the difficulty. The problem of the therapeutic effect of psychoanalysis is bound up in particular with supremely difficult questions, so that it would indeed be astonishing if we had yet reached final certitude. Stekel's statement to which you refer is very characteristic. What he says about love for the doctor is obviously true, but it is a simple affirmation, and not a goal or plumb-line of the analytic therapy. If his statement were the goal, many cures, it is true, would be possible, but also many calamities might result which are avoidable. But the aim is so to educate the patient that he will get well for his own sake and by reason of his own determination, rather than to procure his doctor some sort of advantage; though of course it would be absurd from the therapeutic standpoint not to allow the patient to get better because in doing so he does the doctor a good turn also. It suffices if the patient knows it. But we must not prescribe for him which path he should take to recovery. Naturally it seems to me (from the psychoanalytic standpoint) an inadmissible use of suggestive influence if the patient is compelled to get better out of love for the doctor. And indeed such compulsion may sometimes take bitter revenge. The "you must and shall be saved" is no more to be commended in nerve-therapy than in any other department of life. It contradicts the principle of analytic treatment, which shuns all coercion and desires to let everything grow up from within. I do not, as you know, object to influencing by use of suggestion in general, but merely to a doubtful motivation. If the doctor demands that his patient shall get well from love of himself, the patient may easily reckon on reciprocal services and will without doubt try to extort them. I can but utter a warning against any such method. A far stronger motive for recovery—also a far healthier and ethically more valuable one—consists in the patient's thorough insight into the real state of affairs, the recognition of how things are now and how they ought to be. The man of any sort of worth will then discern that he can hardly sit down at ease in the quagmire of his neurosis.

With your rendering of what I said about the healing power of personality I cannot entirely agree. I wrote that the doctor's personality has a power for healing because the patient reads the doctor's personality: not that he produces a cure through *love* of the doctor. The doctor cannot prevent the patient's beginning to behave himself towards *his* conflicts just as the doctor himself behaves, for nothing is finer than a neurotic's intuition. *But every strong transference serves this same purpose.* If the doctor makes himself charming, he buys off from the patient a series of resistances which he should have overcome, and whose overcoming will certainly have to be gone through later on. Nothing is won by this technique; at most the beginning of the analysis is made easy for the patient (though this is not quite without its use in certain cases). To be able to crawl through a barbed wire fence without some enticing end in view testifies to an ascetic strength of will which you can expect neither from the ordinary person nor from the neurotic. Even the Christian religion, whose moral demands certainly reached a great height, thought it no scorn to represent the near approach of the Kingdom of Heaven as goal and reward of earthly pain. In my view, the doctor may

well speak of the rewards which follow the toils of analysis. But he must not depict himself or his friendship, in hints or promises, as reward, if he is not seriously determined to keep his word.

In regard to your criticism of my outline-definition of the conception of psychoanalysis, it must be observed that the road over the steep mountain is the line of least resistance only when a ferocious bull waits for you in the pleasant valley-road. In other words, the line of least resistance is a compromise with *all* demands, and not with inertia alone. It is prejudice to think that the line of least resistance coincides with the path of inertia. (That's what we thought in the days when we dawdled over Latin exercises.) Inertia is only an immediate advantage and leads to consequences which produce the worst resistances; as a whole, it does not lie in the direction of least resistance. Life along the line of least resistance is not synonymous with a man's regardless pursuit of his own egoistic desires. He who lives thus soon painfully perceives that he is not moving along the line of least resistance, for he is also a social being, and not merely a bundle of egoistic instincts, as some people rather like to depict him. This is best seen among primitive men and herd-animals, who all have a richly developed social sense. Without it, indeed, the herd could not exist at all. Man as herd-animal has therefore by no manner of means to subject himself to laws enforced on him from without; he carries his social imperatives within himself, *a priori*, as an inborn necessity. As you see, I here put myself in decided opposition to certain views—I think quite unjustified—which have been put forth here and there inside the psychoanalytic movement.

So the line of least resistance does not signify *eo ipso* the avoidance of unpleasure so much as the just balancing of unpleasure and pleasure. Painful activity by itself leads to no result but exhaustion. Man must be able to take pleasure in his life, or the struggle of life has no reward. What direction the patient's future life should take is not ours to judge. We must not imagine we know better than his own nature—or we prove ourselves educators of the worst kind. Psychoanalysis is but a means of removing stones from the path, and in no way a method (as hypnotism often pretends to be) of putting anything into the patient which was not there before. So we renounce any attempt to give a direction, and occupy ourselves only with setting in proper relief all that analysis brings into the light of day, in order that the patient may see clearly, and be in a position to draw the appropriate conclusions. Anything that he has not himself won, he does not in the long run believe in; and all that he has received from authority keeps him still infantile. He must rather be put in such a position as will enable him to take control of his own life. It is the art of the psychoanalyst to follow the patient's apparently mistaken paths without prejudice, and thus to discover his strayed and separated sheep. Working on a system, according to a preconceived scheme, we spoil the best results of the analysis. So I hold fast to the maxim you quote from me: "Every interference on the part of the analyst is a gross mistake in technique. So-called chance is the law and the order of psychoanalysis."

You surely recognise that the schoolmaster-view never releases us from the attempt to correct Nature and the desire to force upon her our limited "truths." In nerve-therapy we get so many wonderful experiences—unforeseen and impossible to foresee—that surely we ought to dismiss all hope of being infallibly able to point out the right path. The roundabout way and even the wrong way are necessary. If you deny this you must also deny that the errors in the

history of the whole world have been necessary. That indeed were a world-conception fit for a schoolmaster. For psychoanalysis this view suits not at all.

The question as to how much the analyst involuntarily suggests to the patient is a very ticklish one. Undoubtedly that has a much more important place than psychoanalysts have till now admitted. Experience has convinced us that the patient rapidly avails himself of the ideas won through the analysis, and of whatever comes to light through the shaping of the dreams. You may obtain all manner of such impressions from Stekel's book: "Die Sprache des Traumes" ("The Language of the Dream"). I had once a most instructive experience: a very intelligent lady had from the beginning extreme transference phantasies which appeared in well-recognised erotic forms. Nevertheless she entirely declined to admit their existence. Of course she was betrayed by the dreams in which my own person was hidden behind some other figure, and often difficult to unveil. A long series of such dreams forced me at last to say: "So you see it is always like that, and the person of whom one has really dreamt is replaced and hidden by some one else in the manifest dream." Till then the patient had obstinately contested this point. But this time she could no longer evade it, and had to admit my rule—but only that she might play me a trick. Next day she brought me a dream in which she and I appeared in a manifest lascivious situation. I was naturally perplexed and thought of my rule. Her first association to the dream was the malicious question: "It's always true, isn't it, that the person of whom one is really dreaming is replaced by some one else in the manifest dream-content?"

Clearly, she had made use of her experience to find a protective formula by means of which she secured the open expression of her phantasies in an apparently innocent way.

This example aptly shows how patients avail themselves of insight gained during analysis; they use it symbolically. You get caught in your own net if you give credence to the idea of unalterable, permanent symbols. That has already happened to more than one psychoanalyst. It is therefore fallacious to try to prove any particular theory from the dreams arising in the course of analysis. For this purpose the only conclusive dreams are those derived from demonstrably uninfluenced persons. In such cases one would only have to exclude the possibility of telepathic thought-reading. But if you concede this possibility you will have to subject very many things to a rigorous re-examination and, among others, many judicial verdicts.

But although we must do full justice to the force of suggestion, we must not overrate it. The patient is no empty sack into which you may stuff whatever you like; on the contrary, he brings his own predetermined contents which strive obstinately against suggestion and always obtrude themselves afresh. Through analytic "suggestions," only the outward *form* is determined, never the content—this is always being freshly impressed upon my notice. The form is the unlimited, the ever-changing; but the content is fixed, and only to be assailed slowly and with great difficulty. Were it not so, suggestion-therapy would be in every respect the most effective, profitable, and easiest therapy,—a real panacea. That, alas! it is not, as every honourable hypnotist will freely admit.

To return to your question as to how far it is conceivable that patients may deceive the doctor by making use—perhaps involuntarily—of his expressions: this is indeed a very serious problem. The analyst must exercise all possible care and practise unsparing self-criticism if

he would avoid, as far as possible, being led into error by patients' dreams. It may be admitted that they almost always use modes of expression in their dreams learnt in analysis—some more, some less. Interpretations of earlier symbols will themselves be used again as fresh symbols in later dreams. It happens not seldom, for instance, that sexual situations which appear in symbolic form in the earlier dreams, will appear "undisguised" in later ones, and here again they are the symbolic expression of ideas of another character capable of further analysis. The not infrequent dream of incestuous cohabitation is by no means an "undisguised" content, but a dream as freshly symbolic and capable of analysis as all others. You surely only reach the paradoxical view that such a dream is "undisguised" if you are pledged to the sexual theory of neurosis.

That the patient may mislead the doctor for a longer or shorter time by means of deliberate deception and misrepresentation is possible; just as occasionally happens in all other departments of medicine. Therewith the patient injures himself most, since he has to pay for every deception or suppression, with aggravated or additional symptoms. Deceptions are so obviously disadvantageous to himself that in the end he can scarcely avoid the definite relinquishment of such a course.

The technique of analysis we can best postpone for oral discussion.

IX

From Dr. Loj.

23rd February, 1913.

From your letter of 16th February I want first to single out the end, where you so admirably assign to its proper place the power of suggestion in psychoanalysis: "The patient is no empty sack, into which you can cram what you will; he brings his own predetermined content with him, with which one has always to reckon afresh." With this I fully agree, my own experience confirms it. And you add: "This content remains untouched by involuntary analytical suggestion, but its form is altered, proteus-fashion, beyond measure." So it becomes a matter of a sort of "mimicry" by which the patient seeks to escape the analyst, who is driving him into a corner and therefore for the moment seems to him an enemy. Until at last, through the joint work of patient and analyst—the former spontaneously yielding up his psychic content, the latter only interpreting and explaining—the analysis succeeds in bringing so much light into the darkness of the patient's psyche that he can see the true relationships and, without any preconceived plan of the analyst's, can himself draw the right conclusions and apply them to his future life. This new life will betake itself along the line of least resistance—or should we not rather say, the least resistances, as a "compromise with all the necessities," in a just balancing of pleasure and unpleasure? It is not we who must arbitrarily seek to determine how matters stand for the patient and what will benefit him; his own nature decides. In other words, we must assume the *rôle* of the accoucheur who can bring out into the light of day a child already alive, but who must avoid a series of mistakes if the child is to remain able to live and the mother is not to be injured. All this is very clear to me, since it is only the

application to the psychoanalytic method of a general principle which should have universal validity: never do violence to Nature. Hence I also see that the psychoanalyst must follow his patient's apparently "wrong roads" if the patient is ever to arrive at his own convictions and be freed once and for all from infantile reliance on authority. We ourselves as individuals have learnt or can only learn by making mistakes how to avoid them for the future, and mankind as a whole has created the conditions of its present and future stages of development quite as much by frequent travel along wrong paths as along the right road. Have not many neurotics—I do not know if you will agree, but I think so—become ill partly for the very reason that their infantile faith in authority has fallen to pieces? Now they stand before the wreckage of their faith, weeping over it, in dire distress because they cannot find a substitute which shall show them clearly whither their life's course should now turn. So they remain stuck fast betwixt infancy which they must unwillingly renounce, and the serious duties of the present and future (the moral conflict). I see, particularly in such cases, you are right in saying it is a mistake to seek to replace the lost faith in authority by another similar faith, certain to be useful only so long as the belief lasts. This applies to the deliberate use of suggestion in psychoanalysis, and the building upon the transference to the doctor as the object of the analytic therapy. I am no longer in doubt about your maxim: "Every interference on the analyst's part is a gross mistake in technique. So-called chance is the law and the order of psychoanalysis." Further, I am entirely in agreement with you when you say that *altruism necessarily must be innate in man considered as a herd-animal*. The contrary would be the thing to be wondered at.

I should be much disposed to agree that not the egoistic, but the altruistic instincts are primary. Love and trust of the child for the mother who feeds it, nurses, cherishes and pets it,—love of the man for his wife, regarded as the going out towards another's personality,—love for offspring, care for it,—love for kinsfolk, etc. The egoistic instincts owe their origin to the desire for exclusive possession of all that surrounds love, the desire to possess the mother exclusively, in opposition to the father and the brothers and sisters, the desire to have a woman for himself alone, the desire to possess exclusively ornaments, clothing, etc. But perhaps you will say I am paradoxical and that the instincts, egoistic or altruistic, arise together in the heart of man, and that every instinct is ambivalent in nature. But I have to ask if the feelings and instincts are really ambivalent? Are they exactly bipolar? Are the qualities of all emotions altogether comparable? Is love really the opposite of hate?

However that may be, in any case it is well that man bears the social law within himself, as an inborn imperative; otherwise our civilised humanity would fare badly, having to subject themselves to laws imposed on them from outside only: they would be impervious to the inheritance of the earlier religious faiths, and would soon fall into complete anarchy. Man would then have to ask himself whether it would not be better to maintain by force an extreme belief in religious authority such as prevailed in the Middle Ages. For the benefits of civilisation, which strove to grant every individual as much outward freedom as was consistent with the freedom of others, would be well worth the sacrifice of free research. But the age of this use of force against nature is past, civilised man has left this wrong track behind, not arbitrarily, but obeying an inner necessity, and we may look joyfully towards the future. Mankind, advancing in knowledge, will find its way across the ruins of faith in authority to the moral autonomy of the individual.

X

From Dr. Jung.

March, 1913.

At various places in your letters it has struck me that the problem of "transference" seems to you particularly critical. Your feeling is entirely justified. The transference is indeed at present the central problem of analysis.

You know that Freud regards the transference as the projection of infantile phantasies upon the doctor. To this extent the transference is an infantile-erotic relationship. All the same, viewed from the outside, superficially, the thing by no means always looks like an infantile-erotic situation. As long as it is a question of the so-called "positive" transference, the infantile-erotic character can usually be recognised without difficulty. But if it is a "negative" transference, you can see nothing but violent resistances which sometimes veil themselves in seemingly critical or sceptical dress. In a certain sense the determining factor in such circumstances is the patient's relation to authority, that is, in the last resort, to the father. In both forms of transference the doctor is treated as if he were the father—according to the situation either tenderly or with hostility. In this view the transference has the force of a resistance as soon as it becomes a question of resolving the infantile attitude. But this form of transference must be destroyed, inasmuch as the object of analysis is the patient's moral autonomy. A lofty aim, you will say. Indeed lofty, and far off, but still not altogether so remote, since it actually corresponds to one of the predominating tendencies of our stage of civilisation, namely, that urge towards individualisation by which our whole epoch deserves to be characterised. (Cf. Müller-Lyer: "Die Familie.") If a man does not believe in this orientation and still bows before the scientific causal view-point, he will, of course, be disposed merely to resolve this hostility, and to let the patient remain in a positive relationship towards the father, *thus expressing the ideal of an earlier epoch of civilisation*. It is commonly recognised that the Catholic Church represents one of the most powerful organisations based upon this earlier tendency. I cannot venture to doubt that there are very many individuals who feel happier under compulsion from others than when forced to discipline themselves. (Cf. Shaw: "Man and Superman.") None the less, we do our neurotic patients a grievous wrong if we try to force them all into the category of the unfree. Among neurotics, there are not a few who do not require any reminders of their social duties and obligations; rather are they born or destined to become the bearers of new social ideals. They are neurotic so long as they bow down to authority and refuse the freedom to which they are destined. Whilst we look at life only retrospectively, as is the case in the Viennese psychoanalytic writings, we shall never do justice to this type of case and never bring the longed-for deliverance. For in that fashion we can only educate them to become obedient children, and thereby strengthen the very forces that have made them ill—their conservative retardation and their submissiveness to authority. Up to a certain point this is the right way to take with the infantile resistance which cannot *yet* reconcile itself with authority. But the power which edged them out from their retrograde dependence on the father is not at all a childish desire for insubordination, but the powerful urge towards the development of an

individual personality, and this struggle is their imperative life's task. Adler's psychology does much greater justice to this situation than Freud's.

In the one case (that of infantile intractability) the positive transference signifies a highly important achievement, heralding cure; in the other (infantile submissiveness) it portends a dangerous backsliding, a convenient evasion of life's duty. The negative transference represents in the first case an increased resistance, thus a backsliding and an evasion of duty, but in the second it is an advance of healing significance. (For the two types, cf. Adler's "Trotz und Gehorsam.")

The transference then is, as you see, to be judged quite differently in different cases.

The psychological process of "transference"—be it negative or positive—consists in the libido *entrenching itself*, as it were, round the personality of the doctor, the doctor accordingly representing certain emotional values. (As you know, by *libido* I understand very much what Antiquity meant by the cosmogenic principle of *Eros*; in modern terminology simply "psychic energy.") The patient is bound to the doctor, be it in affection, be it in opposition, and cannot fail to follow and imitate the doctor's psychic adaptations. To this he finds himself urgently compelled. And with the best will in the world and all technical skill, the doctor cannot prevent him, for intuition works surely and instinctively, in despite of the conscious judgment, be it never so strong. Were the doctor himself neurotic, and inadequate in response to the demands of the external life, or inharmonious within, the patient would copy the defect and build it up into the fabric of his own presentations: you may imagine the result.

Accordingly I cannot regard the transference as merely the transference of infantile-erotic phantasies; no doubt that is what it is from one standpoint, but I see also in it, as I said in an earlier letter, the process of the *growth of feeling* and *adaptation*. From this standpoint the infantile erotic phantasies, in spite of their indisputable reality, appear rather as material for comparison or as analogous pictures of something not understood as yet, than as independent desires. This seems to me the real reason of their being unconscious. The patient, not knowing the right attitude, tries to grasp at a right relationship to the doctor by way of comparison and analogy with his infantile experiences. It is not surprising that he gropes back for just the most intimate relations of his childhood, to discover the appropriate formula for his attitude to the doctor, for this relationship also is very intimate, and to some extent different from the sexual relationship, just as is that of the child towards its parents. This relationship—child to parent—which Christianity has everywhere set up as the symbolic formula for human relationships, provides a way of restoring to the patient that directness of ordinary human emotion of which he had been deprived through the inroad of sexual and social values (from the standpoint of power, etc.). The purely sexual, more or less primitive and barbaric valuation, operates in far-reaching ways against a direct, simple human relationship, and thereupon a blocking of the libido occurs which easily gives rise to neurotic formations. By means of analysis of the infantile portion of the transference-phantasies, the patient is brought back to the remembrance of his childhood's relationship, and this—stripped of its infantile qualities—gives him a beautiful, clear picture of direct human intercourse as opposed to the purely sexual valuation. I cannot regard it as other than a misconception to judge the childish relationship retrospectively and therefore as exclusively a sexual one, even though a certain sexual content can in no wise be denied to it.

Recapitulating, let me say this much of the positive transference:—

The patient's libido fastens upon the person of the doctor, taking the shape of expectation, hope, interest, trust, friendship and love. Then the transference produces the projection upon the doctor of infantile phantasies, often of predominatingly erotic tinge. At this stage the transference is usually of a decidedly sexual character, in spite of the sexual component remaining relatively unconscious. But this phase of feeling serves the higher aspect of the growth of human feeling as a bridge, whereby the patient becomes conscious of the defectiveness of his own adaptation, through his recognition of the doctor's attitude, which is accepted as one suitable to life's demands, and normal in its human relationships. By help of the analysis, and the recalling of his childish relationships, the road is seen which leads right out of those exclusively sexual or "power" evaluations of social surroundings which were acquired in puberty and strongly reinforced by social prejudices. This road leads on towards a purely human relation and intimacy, not derived solely from the existence of a sexual or power-relation, but depending much more upon a regard for personality. That is the road to freedom which the doctor must show his patient.

Here indeed I must not omit to say that the obstinate clinging to the sexual valuation would not be maintained so tenaciously if it had not also a very deep significance for that period of life in which propagation is of primary importance. The discovery of the value of human personality belongs to a riper age. For young people the search for the valuable personality is very often merely a cloak for the evasion of their biological duty. On the other hand, an older person's exaggerated looking back towards the sexual valuation of youth, is an undiscerning and often cowardly and convenient retreat from a duty which demands the recognition of personal values and his own enrolment among the ranks of the priesthood of a newer civilisation. The young neurotic shrinks back in terror from the extension of his tasks in life, the old from the dwindling and shrinking of the treasures he has attained.

This conception of the transference is, you will have noted, most intimately connected with the acceptance of the idea of biological "*duties*." By this term you must understand those tendencies or motives in human beings giving rise to civilisation, as inevitably as in the bird they give rise to the exquisitely woven nest, and in the stag to the production of antlers. The purely causal, not to say materialistic conception of the immediately preceding decades, would conceive the organic formation as the reaction of living matter, and this doubtless provides a position heuristically useful, but, as far as any real understanding goes, leads only to a more or less ingenious and *apparent* reduction and postponement of the problem. Let me refer you to Bergson's excellent criticism of this conception. From external forces but half the result, at most, could ensue; the other half lies within the individual disposition of the living material, without which it is obvious the specific reaction-formation could never be achieved. This principle must be applied also in psychology. The psyche does not only *react*; it also gives its own individual reply to the influences at work upon it, and at least half the resulting configuration and its existing disposition is due to this. Civilisation is never, and again never, to be regarded as merely reaction to environment. That shallow explanation we may abandon peacefully to the past century. It is just these very dispositions which we must regard as imperative in the psychological sphere; it is easy to get convincing proof daily of their compulsive power. What I call "biological duty" is identical with these dispositions.

In conclusion, I must deal with a matter which seems to have caused you uneasiness, namely, the *moral* question. Among our patients we see many so-called immoral tendencies, therefore the thought involuntarily forces itself upon the psychotherapist as to how things would go if all these desires were to be gratified. You will have discerned already from my earlier letters that these desires must not be estimated too literally. As a rule it is rather a matter of unmeasured and exaggerated demands, arising out of the patient's stored-up libido, which have usurped a prominent position, usually quite against his own wish. In most cases the canalisation of the libido for the fulfilment of life's simple duties, suffices to reduce these exaggerated desires to zero. But in some cases it must be recognised that such "immoral" tendencies are in no way removed by analysis; on the contrary, they appear more often and more clearly, hence it becomes plain that they belong to the individual's biological duties. And this is particularly true of certain sexual claims, whose aim is an individual valuation of sexuality. This is not a question for pathology, it is a social question of to-day which peremptorily demands an ethical solution. For many it is a biological duty to work for the solution of this question, to discover some sort of practical solution. (Nature, it is well known, does not content herself with theories.) To-day we have no real sexual morality, only a legal attitude towards sexuality; just as the early Middle Ages had no genuine morality for financial transactions, but only prejudices and a legal standpoint. We are not yet sufficiently advanced in the domain of free sexual activity to distinguish between a moral and an immoral relationship. We have a clear expression of this in the customary treatment, or rather ill-treatment, of unmarried motherhood. For a great deal of sickening hypocrisy, for the high tide of prostitution, and for the prevalence of sexual diseases, we may thank both our barbarous, undifferentiated legal judgments about the sexual situation, and our inability to develop a finer moral perception of the immense psychologic differences that may exist in free sexual activity.

This reference to the existence of an exceedingly complicated and significant problem may suffice to explain why we by no means seldom meet with individuals among our patients who are quite specially called, because of their spiritual and social gifts, to take an active part in the work of civilisation—for this they are biologically destined. We must never forget that what to-day is deemed a moral law will to-morrow be cast into the melting-pot and transformed, so that in the near or distant future it may serve as the basis of a new ethical structure. This much we ought to have learnt from the history of civilisation, that the forms of morality belong to the category of transitory things. The finest psychological tact is required with these critical natures, so that the dangerous corners of infantile irresponsibility, indolence and uncontrolledness may be turned, and a pure, untroubled vision of the possibility of a moral autonomous activity made possible. Five per cent. on money lent is fair interest, twenty per cent. is despicable usury. That point of view we have to apply equally to the sexual situation.

So it comes about that there are many neurotics whose innermost delicacy of feeling prevents their being at one with present-day morality, and they cannot adapt themselves to civilisation as long as their moral code has gaps in it, the filling up of which is a crying need of the age. We deceive ourselves greatly if we suppose that many married women are neurotic only because they are unsatisfied sexually or because they have not found the right man, or because they still have a fixation to their infantile sexuality. The real ground of the neurosis is, in many cases, the inability to recognise the work that is waiting for them, of helping to

build up a new civilisation. We are all far too much at the standpoint of the "nothing-but" psychology; we persist in thinking we can squeeze the new future which is pressing in at the door into the framework of the old and the known. And thus the view is only of the present, never of the future. But it was of most profound psychological significance when Christianity first discovered, in the orientation towards the future, a redeeming principle for mankind. In the past nothing can be altered, and in the present little, but the future is ours and capable of raising life's intensity to its highest pitch. A little space of youth belongs to us, all the rest of life belongs to our children.

Thus does your question as to the significance of the loss of faith in authority answer itself. The neurotic is ill not because he has lost his old faith, but because he has not yet found a new form for his finest aspirations.

CHAPTER X

ON THE IMPORTANCE OF THE UNCONSCIOUS IN PSYCHOPATHOLOGY^[182]

When we speak of a thing as being "unconscious" we must not forget that from the point of view of the functioning of the brain a thing may be unconscious to us in two ways—physiologically or psychologically. I shall only deal with the subject from the latter point of view. So that for our purposes we may define the unconscious as "the sum of all those psychological events which are not apperceived, and so are unconscious."

The unconscious contains all those psychic events which, because of the lack of the necessary intensity of their functioning, are unable to pass the threshold which divides the conscious from the unconscious; so that they remain in effect below the surface of the conscious, and flit by in subliminal phantom forms.

It has been known to psychologists since the time of Leibniz that the elements—that is to say, the ideas and feelings which go to make up the conscious mind, the so-called conscious content—are of a complex nature, and rest upon far simpler and altogether unconscious elements; it is the combination of these which gives the element of consciousness. Leibniz has already mentioned the *perceptions insensibles*—those vague perceptions which Kant called "shadowy" representations, which could only attain to consciousness in an indirect manner. Later philosophers assigned the first place to the unconscious, as the foundation upon which the conscious was built.

But this is not the place to consider the many speculative theories nor the endless philosophical discussions concerning the nature and quality of the unconscious. We must be satisfied with the definition already given, which will prove quite sufficient for our purpose, namely the conception of the unconscious as the sum of all psychical processes below the threshold of consciousness.

The question of the importance of the unconscious for psychopathology may be briefly put as follows: "In what manner may we expect to find unconscious psychic material behave in cases of psychosis and neurosis?"

In order to get a better grasp of the situation in connexion with mental disorders, we may profitably consider first how unconscious psychic material behaves in the case of normal people, especially trying to visualize what in normal men is apt to be unconscious. As a preliminary to this knowledge we must get a complete understanding of what is contained in the conscious mind; and then, by a process of elimination we may expect to find what is contained in the unconscious, for obviously—*per exclusionem*—what is in the conscious cannot be unconscious. For this purpose we examine all activities, interests, passions, cares, and joys, which are conscious to the individual. All that we are thus able to discover becomes, *ipso facto*, of no further moment as a content of the unconscious, and we may then expect to

find only those things contained in the unconscious which we have not found in the conscious mind.

Let us take a concrete example: A merchant, who is happily married, father of two children, thorough and painstaking in his business affairs, and at the same time trying in a reasonable degree to improve his position in the world, carries himself with self-respect, is enlightened in religious matters, and even belongs to a society for the discussion of liberal ideas.

What can we reasonably consider to be the content of the unconscious in the case of such an individual?

Considered from the above theoretical standpoint, everything in the personality that is not contained in the conscious mind should be found in the unconscious. Let us agree, then, that this man consciously considers himself to possess all the fine attributes we have just described—no more, no less. Then it must obviously result that he is entirely unaware that a man may be not merely industrious, thorough, and painstaking, but that he may also be careless, indifferent, untrustworthy; for some of these last attributes are the common heritage of mankind and may be found to be an essential component of every character. This worthy merchant forgets that quite recently he allowed several letters to remain unanswered which he could easily have answered at once. He forgets, too, that he failed to bring a book home which his wife has asked him to get at the book-stall, where she had previously ordered it, although he might easily have made a note of her wish. But such occurrences are common with him. Therefore we are obliged to conclude that he is also lazy and untrustworthy. He is convinced that he is a thoroughly loyal subject; but for all that he failed to declare the whole of his income to the assessor, and when they raise his taxes, he votes for the Socialists.

He believes himself to be an independent thinker, yet a little while back he undertook a big deal on the Stock Exchange, and when he came to enter the details of the transaction in his books he noticed with considerable misgivings that it fell upon a Friday, the 13th of the month. Therefore, he is also superstitious and not free in his thinking.

So here we are not at all surprised to find these compensating vices to be an essential content of the unconscious. Obviously, therefore, the reverse is true—namely, that unconscious virtues compensate for conscious deficiencies. The law which ought to follow as the result of such deductions would appear to be quite simple—to wit, the conscious spendthrift is unconsciously a miser; the philanthropist is unconsciously an egoist and misanthrope. But, unfortunately, it is not quite so easy as that, although there is a basis of truth in this simple rule. For there are essential hereditary dispositions of a latent or manifest nature which upset the simple rule of compensation, and which vary greatly in individual cases. From entirely different motives a man may, for instance, be a philanthropist, but the manner of his philanthropy depends upon his originally inherited disposition, and the way in which the philanthropic attitude is compensated depends upon his motives. It is not sufficient simply to know that a certain person is philanthropic in order to diagnose an unconscious egoism. For we must also bring to such a diagnosis a careful study of the motives involved.

In the case of normal people the principal function of the unconscious is to effect a compensation and thus produce a balance. All extreme conscious tendencies are softened and toned down through an effective opposite impulse in the unconscious. This compensating agency, as I have tried to show in the case of the merchant, maintains itself through certain

unconscious, inconsequent activities, as it were, which Freud has very well described as symptomatic acts (*Symptom-handlungen*).

To Freud we owe thanks also for having called attention to the importance of dreams, for by means of them, also, we are able to learn much about this compensating function. There is a fine historical example of this in the well-known dream of Nebuchadnezzar in the fourth chapter of the Book of Daniel, where Nebuchadnezzar at the height of his power had a dream which foretold his downfall. He dreamed of a tree which had raised its head even up to heaven and now must be hewn down. This is a dream which is obviously a counterpoise to the exaggerated feeling of royal power.

Now considering states in which the mental balance is disturbed, we can easily see, from what has preceded, wherein lies the importance of the unconscious for psychopathology. Let us ponder the question of where and in what manner the unconscious manifests itself in abnormal mental conditions. The way in which the unconscious works is most clearly seen in disturbances of a psychogenic nature, such as hysteria, compulsion neurosis, etc.

We have known for a long time that certain symptoms of these disturbances are produced by unconscious psychic events. Just as clear, but less recognised, are the manifestations of the unconscious in actually insane patients. As the intuitive ideas of normal men do not spring from logical combinations of the conscious mind, so the hallucinations and delusions of the insane arise, not out of conscious but out of unconscious processes.

Formerly, when we held a more materialistic view of psychiatry we were inclined to believe that all delusions, hallucinations, stereotypic acts, etc., were provoked by morbid processes in the brain cells. Such a theory, however, ignores that delusions, hallucinations, etc., are also to be met with in certain functional disturbances, and not only in the case of functional disturbances, but also in the case of normal people. Primitive people may have visions and hear strange voices without having their mental processes at all disturbed. To seek to ascribe symptoms of that nature directly to a disease of the brain cells I hold to be superficial and unwarranted. Hallucinations show very plainly how a part of the unconscious content can force itself across the threshold of the conscious. The same is true of a delusion whose appearance is at once strange and unexpected by the patient.

The expression "mental balance" is no mere figure of speech, for its disturbance is a real disturbance of that equilibrium which actually exists between the unconscious and conscious content to a greater extent than has heretofore been recognised or understood. As a matter of fact, it amounts to this—that the normal functioning of the unconscious processes breaks through into the conscious mind in an abnormal manner, and thereby disturbs the adaptation of the individual to his environment.

If we study attentively the history of any such person coming under our observation, we shall often find that he has been living for a considerable time in a sort of peculiar individual isolation, more or less shut off from the world of reality. This constrained condition of aloofness may be traced back to certain innate or early acquired peculiarities, which show themselves in the events of his life. For instance, in the histories of those suffering from dementia præcox we often hear such a remark as this: "He was always of a pensive disposition, and much shut up in himself. After his mother died he cut himself off still more from the world, shunning his friends and acquaintances." Or again, we may hear, "Even as a

child he devised many peculiar inventions; and later, when he became an engineer, he occupied himself with most ambitious schemes."

Without discussing the matter further it must be plain that a counterpoise is produced in the unconscious as a compensation to the one-sidedness of the conscious attitude. In the first case we may expect to find an increasing pressing forward in the unconscious, of a wish for human intercourse, a longing for mother, friends, relatives; while in the second case self-criticism will try to establish a correcting balance. Among normal people a condition never arises so one-sided that the natural corrective tendencies of the unconscious entirely lose their value in the affairs of everyday life; but in the case of abnormal people, it is eminently characteristic that the individual entirely fails to recognise the compensating influences which arise in the unconscious. He even continues to accentuate his one-sidedness; this is in accord with the well-known psychological fact that the worst enemy of the wolf is the wolf-hound, the greatest despiser of the negro is the mulatto, and that the biggest fanatic is the convert; for I should be a fanatic were I to attack a thing outwardly which inwardly I am obliged to concede as right.

The mentally unbalanced man tries to defend himself against his own unconscious, that is to say, he battles against his own compensating influences. The man already dwelling in a sort of atmosphere of isolation, continues to remove himself further and further from the world of reality, and the ambitious engineer strives by increasingly morbid exaggerations of invention to disprove the correctness of his own compensating powers of self-criticism. As a result of this a condition of excitation is produced, from which results a great lack of harmony between the conscious and unconscious attitudes. The pairs of opposites are torn asunder, the resulting division or strife leads to disaster, for the unconscious soon begins to intrude itself violently upon the conscious processes. Then odd and peculiar thoughts and moods supervene, and not infrequently incipient forms of hallucination, which clearly bear the stamp of the internal conflict.

These corrective impulses or compensations which now break through into the conscious mind, should theoretically be the beginning of the healing process, because through them the previously isolated attitude should apparently be relieved. But in reality this does not result, for the reason that the unconscious corrective impulses which thus succeed in making themselves apparent to the conscious mind, do so in a form that is altogether unacceptable to consciousness.

The isolated individual begins to hear strange voices, which accuse him of murder and all sorts of crimes. These voices drive him to desperation and in the resulting agitation he attempts to get into contact with the surrounding *milieu*, and does what he formerly had anxiously avoided. The compensation, to be sure, is reached, but to the detriment of the individual.

The pathological inventor, who is unable to profit by his previous failures, by refusing to recognise the value of his own self-criticism, becomes the creator of still more preposterous designs. He wishes to accomplish the impossible but falls into the absurd. After a while he notices that people talk about him, make unfavourable remarks about him, and even scoff at him. He believes a far-reaching conspiracy exists to frustrate his discoveries and render them objects of ridicule. By this means his unconscious brings about the same results that his self-criticism could have attained, but again only to the detriment of the individual, because the criticism is projected into his surroundings.

An especially typical form of unconscious compensation—to give a further example—is the paranoia of the alcoholic. The alcoholic loses his love for his wife; the unconscious compensation tries to lead him back again to his duty, but only partially succeeds, for it causes him to become jealous of his wife as if he still loved her. As we know, he may even go so far as to kill both his wife and himself, merely out of jealousy. In other words, his love for his wife has not been entirely lost, it has simply become subliminal; but from the realm of the unconscious it can now only reappear in the form of jealousy.

We see something of a similar nature in the case of religious converts. One who turns from protestantism to catholicism has, as is well known, the tendency to be somewhat fanatical. His protestantism is not entirely relinquished, but has merely disappeared into the unconscious, where it is constantly at work as a counter-argument against the newly acquired catholicism. Therefore the new convert feels himself constrained to defend the faith he has adopted in a more or less fanatical way. It is exactly the same in the case of the paranoiac, who feels himself constantly constrained to defend himself against all external criticism, because his delusional system is too much threatened from within.

The strange manner in which these compensating influences break through into the conscious mind derives its peculiarities from the fact that they have to struggle against the resistances already existing in the conscious mind, and therefore present themselves to the patient's mind in a thoroughly distorted manner. And secondly, these compensating equivalents are obliged necessarily to present themselves in the language of the unconscious—that is, in material of a heterogeneous and subliminal nature. For all the material of the conscious mind which is of no further value, and can find no suitable employment, becomes subliminal, such as all those forgotten infantile and phantastic creations that have ever entered the heads of men, of which only the legends and myths still remain. For certain reasons which I cannot discuss further here, this latter material is frequently found in dementia præcox.

I hope I may have been able to give in this brief contribution, which I feel to be unfortunately incomplete, a glimpse of the situation as it presents itself to me of the importance of the unconscious in psychopathology. It would be impossible in a short discourse to give an adequate idea of all the work that has already been done in this field.

To sum up, I may say that the function of the unconscious in conditions of mental disturbance is essentially a compensation of the content of the conscious mind. But because of the characteristic condition of one-sidedness of the conscious striving in all such cases, the compensating correctives are rendered useless. It is, however, inevitable that these unconscious tendencies break through into the conscious mind, but in adapting themselves to the character of the one-sided conscious aims, it is only possible for them to appear in a distorted and unacceptable form.

CHAPTER XI

A CONTRIBUTION TO THE STUDY OF PSYCHOLOGICAL TYPES^[183]

It is well known that in their general physiognomy hysteria and dementia præcox present a striking contrast, which is seen particularly in the attitude of the sufferers towards the external world. The reactions provoked in the hysteric surpass the normal level of intensity of feeling, whilst this level is not reached at all by the precocious dement. The picture presented by these contrasted illnesses is one of exaggerated emotivity in the one, and extreme apathy in the other, with regard to the environment. In their personal relations this difference is very marked. Abstraction creates some exceptions here, for we remain in affective rapport with our hysterical patients, which is not the case in dementia præcox.

The opposition between these two nosological types is also seen in the rest of their symptomatology. From the intellectual point of view the products of hysterical imagination may be accounted for in a very natural and human way in each individual case by the antecedents and individual history of the patient; while the inventions of the precocious dement, on the contrary, are more nearly related to dreams than to normal consciousness, and they display moreover an incontestably archaic tendency, wherein mythological creations of primitive imagination are more in evidence than the personal memories of the patient. From the physical point of view we do not find in dementia præcox those symptoms so common in the hysteric, which simulate well known or severe organic affections.

All this clearly indicates that hysteria is characterised by a centrifugal tendency of the libido,^[184] whilst in dementia præcox its tendency is centripetal. The reverse occurs, however, where the illness has fully established its compensatory effects. In the hysteric the libido is always hampered in its movements of expansion and forced to regress upon itself; one observes that such individuals cease to partake in the common life, are

wrapped up in their phantasies, keep their beds, or are unable to live outside their sick-rooms, etc. The precocious dement, on the contrary, during the incubation of his illness turns away from the outer world in order to withdraw into himself; but when the period of morbid compensation arrives, he seems constrained to draw attention to himself, and to force himself upon the notice of those around him, by his extravagant, insupportable, or directly aggressive conduct.

I propose to use the terms "extroversion" and "introversion" to describe these two opposite directions of the libido, further qualifying them, however, as "regressive" in morbid cases where phantasies, fictions, or phantastic interpretations, inspired by emotivity, falsify the perceptions of the subject about things, or about himself. We say that he is extroverted when he gives his fundamental interest to the outer or objective world, and attributes an all-important and essential value to it: he is introverted, on the contrary, when the objective world suffers a sort of depreciation, or want of consideration, for the sake of the exaltation of the individual himself, who then monopolising all the interest, grows to believe no one but himself worthy of consideration. I will call "regressive extroversion" the phenomenon which Freud calls "transference" (Übertragung), by which the hysteric projects into the objective world the illusions, or subjective values of his feelings. In the same way I shall call "regressive introversion," the opposite pathological phenomenon which we find in dementia præcox, where the subject himself suffers these phantastical transfigurations.

It is obvious that these two contrary movements of the libido, as simple psychic mechanisms, may play a part alternately in the same individual, since after all they serve the same purpose by different methods—namely, to minister to his well-being. Freud has taught us that in the mechanism of hysterical transference the individual aims at getting rid of disagreeable memories or impressions, in order to free himself from painful complexes, by a process of "repression." Conversely in the mechanism of introversion, the personality tends to concentrate itself upon its complexes, and with them, to isolate itself from external reality, by a process which is not properly speaking "repression," but which would be better rendered perhaps by the term "depreciation" (Entwertung) of the objective world.

The existence of two mental affections so opposite in character as hysteria and dementia præcox, in which the contrast rests on the almost exclusive

supremacy of extroversion or introversion, suggests that these two psychological types may exist equally well in normal persons, who may be characterised by the relative predominance of one or other of the two mechanisms. Psychiatrists know very well that before either illness is fully declared, patients already present the characteristic type, traces of which are to be found from the earliest years of life. As Binet pointed out so well, the neurotic only accentuates and shews in relief the characteristic traits of his personality. One knows, of course, that the hysterical character is not simply the product of the illness, but pre-existed it in a measure. And Hoch has shown by his researches into the histories of his dementia præcox patients, that this is also the case with them; dissociations or eccentricities were present before the onset of the illness. If this is so, one may certainly expect to meet the same contrast between psychological temperaments outside the sphere of pathology. It is moreover easy to cull from literature numerous examples which bear witness to the actual existence of these two opposite types of mentality. Without pretending to exhaust the subject, I will give a few striking examples.

In my opinion, we owe the best observations on this subject to the philosophy of William James.^[185] He lays down the principle that no matter what may be the temperament of a "professional philosopher," it is this temperament which he feels himself forced to express and to justify in his philosophy. And starting from this idea, which is altogether in accord with the spirit of psychoanalysis, divides philosophers into two classes: the "tender-minded," who are only interested in the inner life and spiritual things; and the "tough-minded," who lay most stress on material things and objective reality. We see that these two classes are actuated by exactly opposite tendencies of the libido: the "tender-minded" represent introversion, the "tough-minded" extroversion.

James says that the tender-minded are characterised by rationalism; they are men of principles and of systems, they aspire to dominate experience and to transcend it by abstract reasoning, by their logical deductions, and purely rational conceptions. They care little for facts, and the multiplicity of phenomena hardly embarrasses them at all: they forcibly fit data into their ideal constructions, and reduce everything to their *a priori* premises. This was the method of Hegel in settling beforehand the number of the planets. In the domain of mental pathology we again meet this kind of philosopher

in paranoiacs, who, without being disquieted by the flat contradictions presented by experience, impose their delirious conceptions on the universe, and find means of interpreting everything, and according to Adler "arranging" everything, in conformity with their morbidly preconceived system.

The other traits which James depicts in this type follow naturally from its fundamental character. The tender-minded man, he says, is intellectual, idealist, optimist, religious, partisan of free-will, a monist, and a dogmatist. All these qualities betray the almost exclusive concentration of the libido upon the intellectual life. This concentration upon the inner world of thought is nothing else than introversion. In so far as experience plays a *rôle* with these philosophers, it serves only as an allurement or fillip to abstraction, in response to the imperative need to fit forcibly all the chaos of the universe within well-defined limits, which are, in the last resort, the creation of a spirit obedient to its subjective values.

The tough-minded man is positivist and empiricist. He regards only matters of fact. Experience is his master, his exclusive guide and inspiration. It is only empirical phenomena demonstrable in the outside world which count. Thought is merely a reaction to external experience. In the eyes of these philosophers principles are never of such value as facts; they can only reflect and describe the sequence of phenomena and cannot construct a system. Thus their theories are exposed to contradiction under the overwhelming accumulation of empirical material. Psychic reality for the positivist limits itself to the observation and experience of pleasure and pain; he does not go beyond that, nor does he recognise the rights of philosophical thought. Remaining on the ever-changing surface of the phenomenal world, he partakes himself of its instability; carried away in the chaotic tumult of the universe, he sees all its aspects, all its theoretical and practical possibilities, but he never arrives at the unity or the fixity of a settled system, which alone could satisfy the idealist or tender-minded. The positivist depreciates all values in reducing them to elements lower than themselves; he explains the higher by the lower, and dethrones it, by showing that it is "nothing but such another thing," which has no value in itself.

From these general characteristics, the others which James points out logically follow. The positivist is a sensualist, giving greater value to the

specific realm of the senses than to reflection which transcends it. He is a materialist and a pessimist, for he knows only too well the hopeless uncertainty of the course of things. He is irreligious, not being in a state to hold firmly to the realities of the inner world as opposed to the pressure of external facts; he is a determinist and fatalist, only able to show resignation; a pluralist, incapable of all synthesis; and finally a sceptic, as a last and inevitable consequence of all the rest.

The expressions, therefore, used by James, show clearly that the diversity of types is the result of a different localisation of the libido; this libido is the magic power in the depth of our being, which, following the personality, carries it sometimes towards internal life, and sometimes towards the objective world. James compares, for example, the religious subjectivism of the idealist, and the quasi-religious attitude of the contemporary empiricist: "Our esteem for facts has not neutralised in us all religiousness. It is itself almost religious. Our scientific temper is devout."^[186]

A second parallel is furnished by Wilhelm Ostwald,^[187] who divides "savants" and men of genius into classics and romantics. The latter are distinguished by their rapid reactions, their extremely prompt and abundant production of ideas and projects, some of which are badly digested and of doubtful value. They are admirable and brilliant masters, loving to teach, of a contagious ardour and enthusiasm, which attracts many pupils, and makes them founders of schools, exercising great personal influence. Herein our type of extroversion is easily recognised. The classics of Ostwald are, on the contrary, slow to react; they produce with much difficulty, are little capable of teaching or of exercising direct personal influence, and lacking enthusiasm are paralysed by their own severe criticism, living apart and absorbed in themselves, making scarcely any disciples, but producing works of finished perfection which often bring them posthumous fame. All these characteristics correspond to introversion.

We find a further very valuable example in the æsthetic theory of Warringer. Borrowing from A. Riegl his expression "Volonté d'art absolue" to express the internal force which inspires the artist, he distinguishes two forms, viz. sympathy (*Einfühlung*) and abstraction; and the term which he employs indicates that here, too, we witness the activity of the push of the libido, the stirring of the *élan vital*. "In the same way," says Warringer, "as the

sympathetic impulse finds its satisfaction in organic beauty, so abstract impulse discovers beauty in the inorganic, which is the negation of all life, in crystallised forms, and in a general manner wherever the severity of abstract law reigns." Whilst sympathy represents the warmth of passion which carries it into the presence of the object in order to assimilate it and penetrate it with emotional values; abstraction, on the other hand, despoils the object of all that could recall life, and grasps it by purely intellectual thought, crystallised and fixed into the rigid forms of law,—the universal, the typical. Bergson also makes use of these images of crystallisation, solidification, etc., to illustrate the essence of intellectual abstraction.

Warringer's "abstraction" represents the process which I have already remarked as a consequence of introversion, namely, the exaltation of the intellect, in the place of the depreciated reality of the external world. "Sympathy" corresponds in fact to extroversion, for, as Lipps has pointed out, "What I perceive sympathetically in an object is, in a general manner life, and life is power, internal work, effort, and execution. To live, in a word, is to act, and to act is to experience intimately the force which we give out; experience creates activity, which is essentially of a spontaneous character." "Æsthetic enjoyment," said Warringer, "is the enjoyment of one's own self projected into the "object," a formula which corresponds absolutely with our definition of transference. This æsthetic conception does not refer to the positivist in James's sense; it is rather the attitude of the idealist for whom psychological reality only is interesting, and worthy of consideration." Warringer adds, "what is essential lies not in the gradation of the feeling, but pre-eminently in the feeling itself; that is to say, the inner movement, the intimate life, the unfolding of the subject's own activity; the value of a line or of a form, depends in our eyes on the biological value it holds for us; that which gives beauty is solely our own vital feeling, which we unconsciously project into it." This view corresponds exactly with my own way of understanding the theory of the libido, in attempting to keep the true balance between the two psychological opposites of introversion and extroversion.

The polar opposite of sympathy is abstraction. The impulse of abstraction is conceived by Warringer "as the result of a great internal conflict of the human soul in the presence of the external world, and from the religious standpoint, it corresponds to a strong transcendental colouring of all the

representations man has made to himself of reality." We recognise clearly in this definition the primordial tendency to introversion. To the introverted type the universe does not appear beautiful and desirable, but disquieting, and even dangerous; it is a manifestation against which the subject puts himself on the defensive; he entrenches himself in his inner fastness, and fortifies himself therein by the invention of geometrical figures, full of repose, perfectly clear even in their minutest details, the primitive magic power of which assures him of domination over the surrounding world.

"The need of abstraction is the origin of all art," says Warringer. Here is a great principle, which gains weighty confirmation from the fact that precocious dements reproduce forms and figures which present the closest analogy to those of primitive humanity, not only in their thoughts but also in their drawings.

We should recall that Schiller had already tried to formulate the same presentation in what he calls the naïve and sentimental types. The latter is in quest of nature, whilst the former is itself "all nature." Schiller also saw that these two types result from the predominance of psychological mechanisms which might be met with in one and the same individual. "It is not only in the same poet," he said, "but even in the same work that these two types of mentality are found united.... The naïve poet pursues only nature and feeling in their simplicity, and all his effort is limited to the imitation and reproduction of reality. The sentimental poet, on the contrary, reflects the impression he receives from objects. The object here is allied to an idea, and the poetic power of the work depends on this alliance." These quotations shew what types Schiller had in view, and one recognises their fundamental identity with those with which we are here dealing.

We find another instance in Nietzsche's contrast between the minds of Apollo and of Dionysus. The example which Nietzsche uses to illustrate this contrast is instructive—namely, that between a dream and intoxication. In a dream the individual is shut up in himself, in intoxication, on the contrary, he forgets himself to the highest degree, and, set free from his self-consciousness, plunges into the multiplicity of the objective world. To depict Apollo, Nietzsche borrows the words of Schopenhauer, "As upon a tumultuous sea, which disgorges and swallows by turns, lost to view in the mountains of foaming waves, the mariner remains seated tranquilly on his plank, full of confidence in his frail barque; so individual man, in a world of

troubles, lives passive and serene, relying with confidence on the principle of 'individuation.'" "Yes," continues Nietzsche, "we might say that the unshakeable confidence in this principle, and the calm security of those whom it has inspired, have found in Apollo their most sublime expression, and we may always recognise in him the most splendid and divine personification of the principle of making an individual." The Apollonian state, as Nietzsche conceives it, is consequently the withdrawal into oneself, that is, introversion. Conversely in the Dionysian state, psychic intoxication, indicates in his view the unloosening of a torrent of libido which expends itself upon things. "This is not only," says Nietzsche, "the alliance of man with man, which finds itself confirmed afresh under the Dionysian enchantment; it is alienated Nature, hostile or enslaved, which also celebrates her reconciliation with her prodigal child,—man. Spontaneously Earth offers her gifts and the wild beasts from rock and desert draw near peacefully. The car of Dionysus is lost under flowers and garlands; panthers and tigers approach under his yoke."

If we change Beethoven's "Hymn of Praise" into a picture, and giving rein to our imagination, contemplate the millions of beings prostrated and trembling in the dust, at such a moment the Dionysian intoxication will be near at hand. Then is the slave free; then all the rigid and hostile barriers which poverty and arbitrary or insolent custom have established between man and man are broken down. Now, by means of this gospel of universal harmony, each feels himself not only reunited, reconciled, fused with his neighbour, but actually identified with him, as if the veil of "Maïa was torn away, nothing remaining of it but a few shreds floating before the mystery of the Primordial Unity."^[188] It would be superfluous to add comment to these quotations.

In concluding this series of examples culled outside my own special domain, I will quote the linguistic hypothesis of Finck,^[189] where we also see the duality in question. The structure of language, according to Finck, presents two principal types: in one the subject is generally conceived as active: "I see him," "I strike him down;" in the other the subject experiences and feels, and it is the object which acts: "He appears to me," "He succumbs to me." The first type clearly shews the libido as going out of the subject,—this is a centrifugal movement; the second as coming out of the object,—

this movement is centripetal. We meet with this latter introverted type especially in the primitive languages of the Esquimaux.

In the domain of psychiatry also these two types have been described by Otto Gross,^[190] who distinguishes two forms of mental debility: the one a diffuse and shallow consciousness, the other a concentrated and deep consciousness. The first is characterised by weakness of the consecutive function, the second by its excessive reinforcement. Gross has recognised that the consecutive function is in intimate relation with affectivity, from which we might infer that he is dealing once more with our two psychological types. The relation he establishes between maniac depressive insanity and the state of diffuse or extended and shallow mental disease shows that the latter represents the extroverted type; and the relation between the psychology of the paranoiac and repressed mentality, indicates the identity of the former with the introverted type.

After the foregoing considerations no one will be astonished to find that in the domain of psychoanalysis we also have to reckon with the existence of these two psychological types.

On the one side we meet with a theory which is essentially reductive, pluralist, causal and sensualist; this is Freud's standpoint. This theory limits itself rigidly to empirical facts, and traces back complexes to their antecedents and their elemental factors. It regards the psychological life as being only an effect, a reaction to the environment, and accords the greatest *rôle* and the largest place to sensation. On the other side we have the diametrically opposed theory of Adler^[191] which is an entirely philosophical and finalistic one. In it phenomena are not reducible to earlier and very primitive factors, but are conceived as "arrangements," the outcome of intentions and of ends of an extremely complex nature. It is no longer the view of causality but of finality which dominates researches: the history of the patient and the concrete influences of the environment are of much less importance than the dominating principles, the "fictions directrices," of the individual. It is not essential for him to depend upon the object, and to find in it his fill of subjective enjoyment, but to protect his own individuality and to guarantee it against the hostile influences of the environment.

Whilst Freud's psychology has for its predominant note the centrifugal tendency, which demands its happiness and satisfaction in the objective world, in that of Adler the chief *rôle* belongs to the centripetal movement, which tends to the supremacy of the subject, to his triumph and his liberty, as opposed to the overwhelming forces of existence. The expedient to which the type described by Freud has recourse is "infantile transference," by means of which he projects phantasy into the object and finds a compensation for the difficulties of life in this transfiguration. In the type described by Adler what is characteristic is, on the contrary, the "virile protest," personal resistance, the efficacious safeguard which the individual provides for himself, in affirming and stubbornly enclosing himself in his dominating ideas.

The difficult task of elaborating a psychology which should pay equal attention to the two types of mentality belongs to the future.

CHAPTER XII

THE PSYCHOLOGY OF DREAMS^[192]

A dream is a psychic structure which at first sight appears to be in striking contrast with conscious thought, because judging by its form and substance it apparently does not lie within the continuity of development of the conscious contents, it is not integral to it, but is a mere external and apparently accidental occurrence. Its mode of genesis is in itself sufficient to isolate a dream from the other contents of the conscious, for it is a survival of a peculiar psychic activity which takes place during sleep, and does not originate in the manifest and clearly logical and emotional continuity of the event experienced.

But a careful observer should have no difficulty in discovering that a dream is not entirely severed from the continuity of the conscious, for in almost every dream certain details are found which have their origin in the impressions, thoughts, or states of mind of one of the preceding days. In so far a certain continuity does exist, albeit a *retrograde* one. But any one keenly interested in the dream problem cannot have failed to observe that a dream has also a *progressive* continuity—if such an expression be permitted—since dreams occasionally exert a remarkable influence upon the conscious mental life, even of persons who cannot be considered superstitious or particularly abnormal. These occasional after-effects are usually seen in a more or less distinct change in the dreamer's frame of mind.

It is probably in consequence of this loose connection with the other conscious contents, that the recollected dream is so extremely unstable. Many dreams baffle all attempts at reproduction, even immediately after waking; others can only be remembered with doubtful accuracy, and comparatively few can be termed really distinct and clearly reproduceable. This peculiar reaction with regard to recollection may be understood by considering the characteristics of the various elements combined in a dream. The combination of ideas in dreams is essentially *phantastic*; they

are linked together in a sequence which, as a rule, is quite foreign to our current way of thinking, and in striking contrast to the logical sequence of ideas which we consider to be a special characteristic of conscious mental processes.

It is to this characteristic that dreams owe the common epithet of "meaningless." Before pronouncing this verdict, we must reflect that dreams and their chains of ideas are something that *we* do not understand. Such a verdict would therefore be merely a projection of our non-comprehension upon its object. But that would not prevent its own peculiar meaning being inherent in a dream.

In spite of the fact that for centuries endeavours have been made to extract a prophetic meaning from dreams, Freud's discovery is practically the first successful attempt to find their real significance. His work merits the term "scientific," because he has evolved a technique which, not only he, but many other investigators also assert achieves its object, namely, the understanding of the meaning of the dream. This meaning is not identical with the one which the manifest dream content seems to indicate.

This is not the place for a critical discussion of Freud's psychology of dreams. But I will try to give a brief summary of what may be regarded as more or less established facts of dream psychology to-day.

The first question we must discuss is, whence do we deduce the justification for attributing to dreams any other significance than the one indicated in the unsatisfying fragmentary meaning of the manifest dream content?

As regards this point a particularly weighty argument is the fact that Freud discovered the hidden meaning of dreams by *empiric* and not *deductive* methods. A further argument in favour of a possible hidden, as opposed to the manifest meaning of dreams, is obtained by comparing dream-phantasies with other phantasies (day-dreams and the like) in one and the same individual. It is not difficult to conceive that such day-phantasies have not merely a superficial, concrete meaning, but also a deeper psychological meaning. It is solely on account of the brevity that I must impose upon myself, that I do not submit materials in proof of this. But I should like to point out that what may be said about the meaning of phantasies, is well illustrated by an old and widely diffused type of imaginative story, of which

Æsop's Fables are typical examples, wherein, for instance, the story is some objectively impossible phantasy about the deeds of a lion and an ass. The concrete superficial meaning of the fable is an impossible phantasm, but the hidden moral meaning is plain upon reflection. It is characteristic that children are pleased and satisfied with the exoteric meaning of the story. However, the best argument for the existence of a hidden meaning in dreams is provided by conscientious application of the technical procedure to solve the manifest dream content.

This brings us to our second main point, viz.—the question of analytic procedure. Here again I desire neither to defend nor to criticise Freud's views and discoveries, but rather to confine myself to what seem to me to be firmly established facts.

The fact that a dream is a psychic structure, does not give us the slightest ground for assuming that it obeys laws and designs other than those applicable to any other psychic structure. According to the maxim: *principia explicandi præter necessitatem non sunt multiplicanda*, we have to treat dreams, in analysis, just as any other psychic structure, until experience teaches us some better way.

We know that every psychic construction considered from the standpoint of causality, is the resultant of previous psychic contents. Moreover, we know also that every psychic structure, considered from the standpoint of finality, has its own peculiar meaning and purpose in the actual psychic process. This standard must also be applied to dreams. When, therefore, we seek a psychological explanation of a dream, we must first know what were the preceding experiences out of which it is combined. We must trace the antecedents of every element in the dream picture. For example: some one dreams "*that he is walking in a street, a child is running in front of him, who is suddenly run over by a motor-car.*" We will trace the antecedents of this dream-picture, with the aid of the dreamer's recollections.

He recognises the street as one down which he had walked on the previous day. The child he acknowledges as his brother's child, whom he had seen on the previous evening when visiting his brother. The motor accident reminds him of an accident that had actually occurred a few days before, but of which he had only read an account in a newspaper. Popular opinion is

known to be satisfied with this kind of explanation. People say: "Oh, that is why I dreamt such and such a thing!"

Obviously this explanation is absolutely unsatisfactory from a scientific standpoint. The dreamer walked down many streets on the previous day; why was this particular one selected? He had read about several accidents; why did he select just this one? The mere disclosure of an antecedent is by no means sufficient; for a plausible determination of the dream presentation can only be obtained from the competition of various determinants. The collection of additional material proceeds, according to the principle of recollection that has been called the *Association Method*. The result, as will easily be understood, is the admission of a mass of multifarious and quite heterogeneous material, having apparently nothing in common but the fact of its evident associative connection with the dream contents, since it has been reproduced by means of this content.

How far the collection of such material should go, is an important question from the technical point of view. Since the entire psychic content of a life may be ultimately disclosed from any single starting point, theoretically the whole previous life-experience might be found in every dream. But we only need to assemble just so much material as is absolutely necessary in order to comprehend the dream's meaning. The limitation of the material is obviously an arbitrary proceeding, according to that principle of Kant's whereby to *comprehend* is "*to perceive to the extent necessary for our purpose.*" For instance, when undertaking a survey of the causes of the French Revolution, we could, in amassing our material, include not only the history of medieval France but also that of Rome and Greece, which certainly would not be "necessary for our purpose," since we can comprehend the historical genesis of the Revolution from much more limited material.

Except for the aforesaid arbitrary limitation, the collecting of material lies outside the investigator's discretion. The material gathered must now be sifted and examined, according to principles which are always applied to the examination of historical or any empirical scientific material. The method is an essentially comparative one, that obviously cannot be applied automatically, but is largely dependent upon the skill and aim of the investigator.

When a psychological fact has to be explained, it must be remembered that psychological data necessitate a twofold point of view, namely, that of *causality* and that of *finality*. I use the word finality intentionally, in order to avoid confusion with the idea of "teleology." I use finality to denote immanent psychological teleology. In so far as we apply the view point of causality to the material that has been associated with the dream, we reduce the manifest dream content to certain fundamental tendencies or ideas. These, as one would expect, are elementary and universal in character.

For instance, a young patient dreams as follows: "*I am standing in a strange garden, and pluck an apple from a tree. I look about cautiously, to make sure no one sees me.*"

The associated dream material is a memory of having once, when a boy, plucked a couple of pears surreptitiously from another person's garden.

The feeling of having a bad conscience, which is a prominent feature in the dream, reminds him of a situation he experienced on the previous day. He met a young lady in the street—a casual acquaintance—and exchanged a few words with her. At that moment a gentleman passed whom he knew, whereupon our patient was suddenly seized with a curious feeling of embarrassment, as if he had done something wrong. He associated the apple with the scene in Paradise, together with the fact that he had never really understood why the eating of the forbidden fruit should have been fraught with such dire consequences for our first parents. This had always made him feel angry; it seemed to him an unjust act of God, for God had made men as they were, with all their curiosity and greed.

Another association was, that sometimes his father had punished him for certain things in a way that seemed to him incomprehensible. The worst punishment had been bestowed after he had secretly watched girls bathing.

That led up to the confession that he had recently begun a love affair with a housemaid, but had not yet carried it through to a conclusion. On the day before the dream he had had a *rendezvous* with her.

Upon reviewing this material we see that the dream contains a very transparent reference to the last-named incident. The connecting associative material shows that the apple episode is palpably meant for an erotic scene. For various other reasons, too, it may be considered extremely probable that

this experience of the previous day is operative even in this dream. In the dream the young man plucks the apple of Paradise, which in reality he has not yet plucked. The remainder of the material associated with the dream is concerned with another experience of the previous day, namely, with the peculiar feeling of a *bad conscience*, which seized the dreamer when he was talking to his casual lady acquaintance; this, again, was connected with the fall of man in Paradise, and finally with an erotic misdemeanour of his childhood, for which his father had punished him severely. All these associations are linked together by the idea of *guilt*.

In the first place we will consider this material from Freud's view-point of causality; in other words, we will "interpret" it, to use Freud's expression. A wish has been left unfulfilled from the day before the dream. In the dream this wish is realised in the *symbolical* apple scene. But why is this realisation disguised and hidden under a symbolic image instead of being expressed in a distinctly sexual thought? Freud would refer to the unmistakable sense of guilt shown up by the material, and say the morality that has been inculcated in the young man from childhood is bent on repressing such wishes, and to that end brands the natural craving as immoral and reprehensible. The suppressed immoral thought can therefore only achieve expression by means of a *symbol*. As these thoughts are incompatible with the moral content of the conscious ego, a psychic factor adopted by Freud called the *Censor*, prevents this wish from passing undisguised into consciousness.

Reviewing the dream from the standpoint of finality, which I contrast with that of Freud, does not—as I wish to establish explicitly—involve a denial of the dream's *causæ*, but rather a different interpretation of the associative material collected around the dream. The material facts remain the same, but the standard by which they are measured is altered. The question may be formulated simply as follows: What is this dream's purpose? What should it effect? These questions are not arbitrary, in as much as they may be applied to every psychic activity. Everywhere the question of the "why" and "wherefore" may be raised.

It is clear that the material added by the dream to the previous day's erotic experience, chiefly emphasises the sense of guilt in the erotic act. The same association has already been shown to be operative in another experience of the previous day, in the meeting with his casual lady acquaintance, when

the feeling of a bad conscience was automatically and inexplicably aroused, as if, in that instance, too, the young man had done something wrong. This experience also plays a part in the dream, which is even intensified by the association of additional, appropriate material; the erotic experience of the day before, being depicted by the story of the Fall which was followed by such a severe punishment.

I maintain that there exists in the dreamer an unconscious propensity or *tendency to conceive his erotic experiences as guilty*. It is most characteristic that the association with the Fall of Man should ensue, the young man having never really grasped why the punishment should have been so drastic. This association throws light upon the reasons why the dreamer did not think simply, "I am doing what is not right." Obviously he does not *know* that he might condemn his own conduct as morally wrong. This is actually the case. His conscious belief is that his conduct does not matter in the least morally, as all his friends were acting in the same way; besides, for other reasons too, is unable to understand why a fuss should be made about it.

Whether this dream should be considered full or void of meaning depends upon a very important question, viz. whether the standpoint of morality, handed down to us through the ages by our forefathers is held to be full or void of meaning. I do not wish to wander off into a philosophical discussion of this question, but would merely observe that mankind must obviously have had very strong reasons for devising this morality, otherwise it would be truly incomprehensible why such restraints should be imposed upon one of man's strongest cravings. If we attach due value to this fact, we are bound to pronounce this dream to be full of meaning, for it reveals to the young man the necessity of facing his erotic conduct boldly from the view point of morality. Primitive races have in some respects extremely strict legislation concerning sexuality. This fact proves that sexual morality is a not-to-be-neglected factor in the soul's higher functions, but deserves to be taken fully into account. In the case in question it should be added, that the young man—influenced by his friends' example—somewhat thoughtlessly let himself be guided exclusively by his erotic cravings, unmindful of the fact that man is a morally responsible being and must perforce submit—voluntarily or involuntarily—to a morality that he himself has created.

In this dream we can discern a compensating function of the unconscious, consisting in the fact that *those thoughts, propensities, and tendencies of a human personality, which in conscious life are too seldom recognised, come spontaneously into action in the sleeping state, when to a large extent the conscious process is disconnected.*

The question might certainly be raised, of what use is this to the dreamer if he does not understand the dream?

To this I must remark that to understand is not an exclusively intellectual process, for—as experience proves—man may be influenced—nay, even very effectually convinced—by innumerable things, of which he has no intellectual understanding. I will merely remind my readers of the efficacy of religious symbols.

The example given above might suggest the thought that the function of dreams is a distinctly "moral" one. Such it appears to be in this case, but if we recall the formula according to which dreams contain the subliminal materials of a given moment, we cannot speak simply of a "moral" function. For it is worthy of note that the dreams of those persons whose actions are morally unexceptionable, bring materials to light that might well be characterised as "immoral" in the current meaning of that term. Thus it is significant that St. Augustine was glad that God did not hold him responsible for his dreams. The unconscious is the unknown of a given moment, therefore it is not surprising that all those aspects that are essential for a totally different point of view should be added by dreams to the conscious psychological factors of a given moment. It is evident that this function of dreams signifies a psychological adjustment, a compensation essential for properly balanced action. In the conscious process of reflection it is indispensable that, so far as possible, we should realise all the aspects and consequences of a problem, in order to find the right solution. This process is continued automatically in the more or less unconscious state of sleep, wherever—as our previous experience seems to show—all those other points of view occur to the dreamer (at least by way of allusion) that during the day were underestimated or even totally ignored; in other words, were comparatively unconscious.

As regards the much-discussed *symbolism* of dreams, the value attached to it varies according to whether the standpoint of causality or of finality is

adopted. According to Freud's causal view point it proceeds from a *craving*, viz. from the suppressed dream-wish. This craving is always somewhat simple and primitive, and is able to disguise itself under manifold forms. For instance, the young man in question might just as well have dreamt that he had to open a door with a key, or that he had to travel by aeroplane, or that he was kissing his mother, etc. From this standpoint all those things would have had the same meaning. In this way, the typical adherents of Freud's school have come to the point of interpreting—to give a gross instance—almost all long objects in dreams as phallic symbols.

From the view-point of finality, the various dream pictures have each their own peculiar value. For instance, if the young man, instead of dreaming of the apple scene, had dreamt he had to open a door with a key, the altered dream picture would have furnished associative material of an essentially different character; that, again, would have resulted in the conscious situation being supplemented by associations of a totally different kind from those connected with the apple scene. From this point of view, it is the diversity of the dream's mode of expression that is full of meaning, and not the uniformity in its significance. The causal view-point tends by its very nature towards uniformity of meaning, that is, towards a fixed significance of symbols. On the other hand, the final view-point perceives in an altered dream picture, the expression of an altered psychological situation. It recognises no fixed meaning of symbols. From this standpoint all the dream pictures are important in themselves, each one having a special significance of its own, to which it owes its inclusion in the dream. Keeping to our previous example, we see that from the standpoint of finality the symbol in this dream is approximately equivalent to a parable; it does not conceal, but it teaches. The apple scene recalls vividly the sense of guilt, at the same time disguising the real deed of our first parents.

It is obvious we reach very dissimilar interpretations of the meaning of the dream, according to the point of view adopted. The question now arises, which is the better or truer version? After all, for us therapists it is a practical and not a merely theoretical necessity that leads us to seek for some comprehension of the meaning of dreams. In treating our patients we must for practical reasons endeavour to lay hold of any means that will enable us to train them effectually. It should be quite evident from the foregoing example, that the material associated with the dream has opened

up a question calculated to make many matters clear to the young man, which, hitherto, he has heedlessly overlooked. But by disregarding these things he was really overlooking something in himself, for he possesses a moral standard and a moral need just like any other man. By trying to live without taking this fact into consideration, his life is one-sided and incomplete, so to say inco-ordinate; with the same consequences for the psychological life as a one-sided and incomplete diet would have for the physical. In order to develop a person's individuality and independence to the uttermost, we need to bring to fruition all those functions that have hitherto attained but little conscious development or none at all. In order to achieve this aim, we must for therapeutic reasons enter into all those unconscious aspects of things brought forward by the dream material. This makes it abundantly clear that the view-point of finality is singularly important as an aid to the practical development of the individual.

The view-point of causality is obviously more in accord with the scientific spirit of our time, with its strictly causalistic reasoning. Much may be said for Freud's view as a scientific explanation of dream psychology. But I must dispute its completeness, for the psyche cannot be conceived merely from the causal aspect, but necessitates also a final view-point. Only a combination of both points of view—which has not yet been attained to the satisfaction of the scientific mind, owing to great difficulties both of a practical and theoretical nature—can give us a more complete conception of the essence of dreams.

I would like to treat briefly of some further problems of dream psychology, that border on the general discussion of dreams. Firstly, as to the *classification of dreams*; I do not wish to overestimate either the practical or theoretical significance of this question. I investigate yearly some 1500-2000 dreams, and this experience enables me to state that typical dreams actually do exist. But they are not very frequent, and from the view-point of finality they lose much of the importance which attaches to them as a result of the fixed significance of symbols according to the causal view-point. It seems to me that the *typical themes* of dreams are of far greater importance, for they permit of a comparison with the themes of mythology. Many of these mythological themes—in the study of which Frobenius has rendered notable service—are also found in dreams, often with precisely the same

significance. Unfortunately the limited time at my disposal, does not permit me to lay detailed materials before you: this has been done elsewhere.^[193] But I desire to emphasise the fact that the comparison of the typical themes of dreams with those of mythology obviously suggests the idea (already put forward by Nietzsche) that from a phylogenetic point of view dream-thought should be conceived as an older form of thought. Instead of multiplying examples in explanation of my meaning, I will briefly refer you to our specimen dream. As you remember, that dream introduced the apple scene as a typical representation of erotic guilt. The gist of its purport is: "I am doing wrong in acting like this." But it is characteristic that a dream never expresses itself in a logically abstract way, but always in the language of parable or simile. This peculiarity is also a characteristic feature of primitive languages, whose flowery idioms always strike us. If you call to mind the writings of ancient literature—*e.g.* the language of simile in the Bible—you will find that what nowadays is expressed by means of abstract expressions, could then only be expressed by means of simile. Even such a philosopher as Plato did not disdain to express certain fundamental ideas by means of concrete simile.

Just as the body bears traces of its phylogenetic development, so also does the human mind. There is therefore nothing surprising in the possibility of the allegories of our dreams being a survival of archaic modes of thought.

The theft of the apple in our example is a typical theme of dreams, often recurring with various modifications. It is also a well-known theme in mythology, and is found not only in the story of the Garden of Eden, but in numerous myths and fables of all ages and climes. It is one of those universally human symbols, which can reappear in any one, at any time. Thus, dream psychology opens up a way to a general comparative psychology, from which we hope to attain the same sort of understanding of the development and structure of the human soul, as comparative anatomy has given us concerning the human body.

CHAPTER XIII

THE CONTENT OF THE PSYCHOSES^[194]

INTRODUCTION

My short sketch on the Content of the Psychoses which first appeared in the series of "Schriften zur Angewandten Seelenkunde" under Freud's editorship was designed to give the non-professional but interested public some insight into the psychological point of view of recent psychiatry. I chose by way of example a case of the mental disorder known as Dementia Præcox, which Bleuler calls Schizophrenia. Statistically this extensive group contains by far the largest number of cases of psychosis. Many psychiatrists would prefer to limit it, and accordingly make use of other nomenclature and classification. From the psychological standpoint the change of name is unimportant, for it is of less value to know what a thing is called than to know what it is. The cases of mental disorder sketched in this essay belong to well-known and frequently occurring types, familiar to the alienist. The facts will not be altered if these disorders are called by some other name than dementia præcox.

I have presented my view of the psychological basis in a work^[195] whose scientific validity has been contested upon all sorts of grounds. For me it is sufficient justification that a psychiatrist of Bleuler's standing has fully accepted, in his great monograph on the disease, all the essential points in my work. The difference between us is as to the question whether, in relation to the anatomical basis, the psychological disorders should be regarded as primary or secondary. The resolution of this weighty question depends upon the general problem as to whether the prevailing dogma in psychiatry—"disorders of the mind are disorders of the brain"—presents a final truth or not. This dogma leads to absolute sterility as soon as universal validity is ascribed to it. There are undoubted psychogenic mental diseases (the so-called hysterical) which are properly regarded as *functional* in

contrast with organic diseases which rest upon demonstrable anatomical changes. Disorders of the brain should only be called organic when the psychic symptoms depend upon an undoubtedly primary disease of the brain. Now in dementia præcox this is by no means a settled question. Definite anatomical changes are present, but we are very far from being able to relate the psychological symptoms to these changes. We have, at least, positive information as to the functional nature of early schizophrenic conditions; moreover the organic character of paranoia and many paranoid forms is still in great uncertainty. This being so it is worth while to inquire whether manifestations of degeneration could not also be provoked by psychological disturbance of function. Such an idea is only incomprehensible to those who smuggle materialistic preconceptions into their scientific theories. This question does not even rest upon some fundamental and arbitrary spiritualism, but upon the following simple reflection. Instead of assuming that some hereditary disposition, or a toxæmia, gives rise directly to organic processes of disease, I incline to the view that upon the basis of predisposition, whose nature is at present unknown to us, there arises a non-adaptable psychological function which can proceed to develop into manifest mental disorder; this may secondarily determine organic degeneration with its own train of symptoms. In favour of this conception is the fact that we have no proof of the primary nature of the organic disorder, but overwhelming proofs exist of a primary psychological fault in function, whose history can be traced back to the patient's childhood. In perfect agreement with this conception is the fact that analytic practice has given us experience of cases where patients on the borderline of dementia præcox have been brought back to normal life.

Even if anatomical lesions or organic symptoms were constantly present, science ought not to imagine the psychological standpoint could advisedly be neglected, or the undoubted psychological relationship be given up as unimportant. If, for instance, carcinoma were to prove an infectious disease the peculiar growth and degenerative process of carcinomatous cells would still be a constant factor requiring investigation on its own account. But, as I have said, the correlation between the anatomical findings and the psychological picture of the disease is so loose that it is extremely desirable to study the psychological side of it thoroughly.

PART I

Psychiatry is the stepchild of medicine. All the other branches of medicine have one great advantage over it—the scientific methods can be applied; there are things to be seen, and felt, physical and chemical methods of investigation to be followed: the microscope shows the dreaded bacillus, the surgeon's knife halts at no difficulty and gives us glimpses of most inaccessible organs of vital importance. Psychiatry, which engages in the exploration of the mind, stands ever at the door seeking in vain to weigh and measure as in the other departments of science. We have long known that we have to do with a definite organ, the brain; but only beyond the brain, beyond the morphological basis do we reach what is important for us—the mind; as indefinable as it ever was, still eluding any explanation, no matter how ingenious. Former ages, endowing the mind with substance, and personifying every incomprehensible occurrence in nature, regarded mental disorder as the work of evil spirits; the patient was looked upon as one possessed, and the methods of treatment were such as fitted this conception. This mediæval conception occasionally gains credence and expression even to-day. A classical example is the driving out of the devil which the elder Pastor Blumhardt carried out successfully in the famous case of Gottlieb in Deltus.^[196] To the honour of the Middle Ages let it also be said that there are to be found early evidences of a sound rationalism. In the sixteenth century at the Julius Hospital in Würzburg mental patients were already treated side by side with others physically ill, and the treatment seems to have been really humane. With the opening of the modern era, and with the dawn of the first scientific ideas, the original barbaric personification of the unknown Great Power gradually disappeared. A change arose in the conception of mental disease in favour of a more philosophic moral attitude. The old view that every misfortune was the revenge of the offended gods returned new-clothed to fit the times. Just as physical diseases can, in many cases, be regarded as self-inflicted on account of negligence, mental diseases were likewise considered to be due to some moral injury, or sin. Behind this conception the angry godhead also stood. Such views played a great *rôle*, right up to the beginning of last century, especially in Germany. In France, however, about the same time a new idea was appearing, destined to sway psychiatry for a hundred years. Pinel, whose statue fittingly stands at the gateway of the Salpêtrière in Paris, took

away the chains from the insane and thus freed them from the symbol of the criminal. In a very real way he formulated for the world the humane and scientific conception of modern times. A little later Esquirol and Bayle discovered that certain forms of insanity ended in death, after a relatively short time, and that certain constant changes in the brain could be demonstrated *post mortem*. Esquirol had described as an entity general paralysis of the insane, or as it was popularly called "softening of the brain," a disease which is always bound up with chronic inflammatory degeneration of the cerebral matter. Thus was laid the foundation of the dogma which you will find repeated in every text-book of psychiatry, viz. "diseases of the mind are diseases of the brain." Confirmation of this conception was added about the same time by Gall's discoveries which traced partial or complete loss of the power of speech—a psychical capacity—to a lesion in the region of the left lower frontal convolution. Somewhat later this view proved to be of general applicability. Innumerable cases of extreme idiocy or other intense mental disorders were found to be caused by tumours of the brain. Towards the end of the nineteenth century Wernicke (recently deceased) localised the speech centre in the left temporal lobe. This epoch-making discovery raised hopes to the highest pitch. It was expected that at no distant day every characteristic and every psychical activity would be assigned a place in the cortical grey matter. Gradually, increased attempts were made to trace the primary mental changes in the psychoses back to certain parallel changes in the brain. Meynert, the famous Viennese psychiatrist, described a formal scheme in which the alteration in blood-supply in certain regions was to play the chief part in the origin of the psychoses. Wernicke made a similar but far more ingenious attempt at a morphological explanation of psychical disorders. The visible result of this tendency is seen in the fact that even the smallest and least renowned asylum has, to-day, its anatomical laboratory where cerebral sections are cut, stained, and microscoped. Our numerous psychiatric journals are full of morphological contributions, investigations into the structure and distribution of cells in the cortex, and other varying source of disorders in the different mental diseases.

Psychiatry has come into fame as gross materialism. And quite rightly, for it is on the road—or rather reached it long ago—to put the organ, the instrument, above function. Function has become the dependent accessory of its organs, the mind the dependent accessory of the brain. In modern

mental therapy the mind has been the loser, whilst great progress has been made in cerebral anatomy; of the mind we know less than nothing. Current psychiatry behaves like a man who thinks he can unriddle the meaning and importance of a building by a mineralogical investigation of its stones. Let us attempt to realise in which mental diseases obvious changes in the brain are found, and what is their proportion.

In the last four years we have received 1325 patients at Burgholzi,^[197] 331 a year. Of these 9 per cent. suffered from congenital psychic anomalies. By this is understood a certain inborn defect of the psyche. Of these 9 per cent., about a quarter were imbeciles. Here we meet certain changes in the brain such as microcephalus, hydrocephalus, malformations or absence of portions of the brain. The remaining three-quarters of these congenital defects present no typical changes in the brain.

Three per cent. of our patients suffer from epileptic mental troubles. In the course of epilepsy there arises gradually a typical degeneration of the brain. The degeneration is, however, only discoverable in severe cases and when the disease has existed for some time. If the attacks have only existed for a relatively short time, not more than a few years, the brain as a rule shows nothing. Seventeen per cent. of our patients suffer from progressive paralysis and senile dementia. Both diseases present characteristic changes in the brain. In paralysis there is most extensive shrinkage of the brain, so that the cortex is often reduced by one half. The frontal portions of the brain more especially, may be reduced to a third of the normal weight. There is a similar destruction of substance in senile decay.

Fourteen per cent. of the patients annually received are cases of poisoning, at least 13 per cent. of these being due to alcohol. As a rule in slight cases nothing is to be found in the brain; in only a relatively few severe cases is there shrinkage of the cortex, generally of slight degree. The number of these severe cases amounts to less than 1 per cent. of the yearly cases of alcoholism.

Six per cent. of the patients suffer from so-called maniacal depressive insanity which includes the maniacs and the melancholics. The essence of this disease is readily intelligible to the public. Melancholia is a condition of abnormal sadness without disorder of intelligence or memory. Mania is the opposite, the rule being an abnormally excited state with great

restlessness; likewise without deep disturbance of intelligence and memory. In this disease there are no demonstrable morphological changes in the brain.

Forty-five per cent. of the patients suffer from the real and common mental disease called dementia præcox. The name is a very unhappy one, for the dementia is not always precocious, nor in all cases is there dementia. Unfortunately the disease is too often incurable; even in the best cases, in those that recover, where the outside public would not observe any abnormality, there is always present some defect in the emotional life. The picture presented by the disease is extraordinarily diverse; generally there is some disorder of feeling, frequently delusions and hallucinations. As a rule there is nothing to be found in the brain. Even in cases of a most severe type, lasting for years, an intact brain is not infrequently found *post mortem*. In a few cases only certain slight changes are present which, however, cannot as yet be reduced to any law.

To sum up: in round figures a quarter of our insane patients show more or less clearly extensive changes and destruction of the brain, while three-fourths have a brain which seems to be generally unimpaired or at most exhibit such changes as give no explanation of the psychological disturbance.

These figures offer the best possible proof that the purely morphological view-point of modern psychiatry leads only very indirectly, if at all, to the understanding of the mental disorder, which is our aim. We must take into account the fact that those mental diseases which show the most marked disturbances of the brain end in death; for this reason the chronic inmates of the asylum form its real population, consisting of some 70 to 80 per cent. of cases of dementia præcox, that is, of patients in whom anatomical changes are practically non-existent. The psychiatry of the future must come to grips with the core of the thing; the path is thus made clear—*it can only be by way of psychology*. Hence in our Zürich clinic we have entirely discarded the anatomical view and turned to the psychological investigation of insanity. As most of our patients suffer from dementia præcox we were naturally concerned with this as our chief problem.

The older asylum physicians paid great attention to the psychological precursors of mental disorder, just as the public still does, following a true instinct. We accepted this hint and carefully investigated the previous psychological history wherever possible. Our trouble was richly rewarded, for we often found, to our surprise, that the disease broke out at a moment of some great emotion which, in its turn, had arisen in a so-called normal way. We found, moreover, that in the mental disease which ensued a number of symptoms occurred which it was quite labour in vain to study from the morphological standpoint. These same symptoms, however, were comprehensible when considered from the standpoint of the individual's previous history. Freud's fundamental investigations into the psychology of hysteria and dreams afforded us the greatest stimulus and help in our work.

A few instances of the latest method in psychiatry will make the subject clearer than mere dry theory. In order to bring home to you the difference in our conception I will first describe the medical history in the older fashion, and subsequently give the solution characteristic of the new departure.

The case to be considered is that of a cook aged 32; she had no hereditary taint, was always industrious and conscientious, and had never been noticeable for eccentric behaviour or the like. Quite recently she became acquainted with a young man whom she wished to marry. From that time on she began to show certain peculiarities. She often spoke of his not liking her much, was frequently out of sorts, ill-tempered, and sat alone brooding; once she ornamented her Sunday hat very strikingly with red and green feathers, another day she bought a pair of pince-nez in order to wear them when she went out walking with her fiancé. One day the sudden idea that her teeth were rather ugly would not let her rest, and she resolved to get a plate, although there was no absolute need. She had all her teeth out under an anæsthetic. The night after the operation she suddenly had a severe anxiety-attack. She cried and moaned that she was damned for ever, for she had committed a great sin; she should not have allowed her teeth to be extracted. People must pray for her, that God might pardon her sin. In vain her friends attempted to talk her out of her fears, to assure her that the extraction of teeth was really no sin; it availed nothing. At day-break she became somewhat quieter; she worked throughout the day. On following nights the attacks were repeated. When consulted by the patient I found her quiet, but she wore a rather vacant expression. I talked to her about the operation, and she assured me it was not so dreadful to have teeth extracted, but still it was a great sin, from which position, despite every persuasion, she could not be moved. She continually repeated in plaintive, pathetic tones, "I should not have allowed my teeth to be extracted; oh yes, that was a great sin which God will never forgive me." She gave the impression of real insanity. A few days later her condition grew worse, and she had to be brought into the asylum. The anxiety-attack had extended and was persistent, and the mental disorder lasted for months.

The history shows a series of entirely unrelated symptoms. Why all the queer story of the hat and pince-nez? Why those anxiety-attacks? Why this delusion that the extraction of her teeth was an unpardonable sin? Nothing here is clear. The morphologically-minded psychiatrist would say: This is just a typical case of dementia præcox; it is the essence of insanity, of madness, to talk of nothing but mysteries; the standpoint of the diseased mind towards the world is displaced, is "mad." What is no sin for the normal, the patient finds a sin. It is a bizarre delusion characteristic of dementia præcox. The extravagant lamentation about this supposed sin is what is known as "inadequate"^[198] emotional emphasis. The queer ornamentation of the hat, the pince-nez, are bizarre notions such as are very common in these patients. Somewhere in the brain certain cells have fallen into disorder, and manufacture illogical, senseless ideas of one kind and another which are quite without psychological meaning. The patient is obviously a hereditary degenerate with a weak brain, having a kink which is the origin of the disorder. For some reason or other the disease has suddenly broken out. It could just as easily have broken out at any other time. Perhaps we should have had to capitulate to these arguments had real psychological analysis not come to our aid. In filling up the certificate required for her removal to the asylum, it transpired that many years ago she had had an affair which terminated; her lover left her with an illegitimate child. Nobody had

been told of this. When she was again in love a dilemma arose, and she asked herself, What will this new lover say about it? At first she postponed the marriage, becoming more and more worried, and then the eccentricities began. To understand these we must immerse ourselves in the psychology of a naïve soul. If we have to disclose some painful secret to a beloved person we try first to strengthen his love in order to obtain beforehand a guarantee of his forgiveness. We do it by flattery or by caresses, or we try to impress the value of our own personality in order to raise it in the eyes of the other. Our patient decked herself out with beautiful feathers, which to her simple taste seemed precious. The wearing of "pince-nez" increases the respect of children even of a mature age. And who does not know people who will have their teeth extracted, out of pure vanity, in order that they may wear a plate to improve their appearance?

After such an operation most people have a slight, nervous reaction, and then everything becomes more difficult to bear. This was, as a matter of fact, just the moment when the catastrophe did occur, in her terror lest her fiancé should break with her when he heard of her previous life. That was the first anxiety-attack. Just as the patient had not acknowledged her secret in all these years, so she now sought to guard it, and shifted the fear in her guilty conscience on to the extraction of the teeth; she thus followed a method well known to us, for when we dare not acknowledge some great sin we deplore some small sin with the greater emphasis.

The problem seemed insoluble to the weak and sensitive mind of the patient, hence the affect became insurmountably great; this is the mental desire as presented from the psychological side. The series of apparently meaningless events, the so-called madness, have now a meaning; a significance appertains to the delusions, making the patient more human to us. Here is a person like ourselves, beset by universal human problems, no longer merely a cerebral machine thrown out of gear. Hitherto we thought that the insane patient revealed nothing to us by symptoms, save the senseless products of his disordered cerebral cells, but that was academic wisdom reeking of the study. When we penetrate into the human secrets of our patients, we recognise mental disease to be an unusual reaction to emotional problems which are in no wise foreign to ourselves, and the delusion discloses the psychological system upon which it is based.

The light which shines forth from this conception seems to us so enormously powerful because it forces us into the innermost depths of that tremendous disorder which is most common in our asylums, and hitherto least understood; by reason of the craziness of the symptoms it is the type that strikes the public as madness *in excelsis*.

The case which I have just sketched is a simple one. It is transparent. My second example is somewhat more complicated. It is the case of a man between 30 and 40 years of age; he is a foreign archæologist of great learning and most unusual intelligence. He was a precocious boy of quite excellent character, great sensitiveness and rare gifts. Physically he was small, always weakly, and a stammerer. He grew up and was educated abroad, and afterwards studied for several terms at B——. So far there had been no disorder of any kind. On the completion of his university career he became zealously absorbed in his archæological work, which gradually engulfed him to such an extent that he was dead to the world and all its pleasures. He worked incessantly, and buried himself entirely in his books. He became quite unsociable; before, awkward and shy in society, he now fled from it altogether, and saw no

one beyond a few friends. He thus led the life of a hermit devoted entirely to science. A few years later, on a holiday tour, he revisited B——, where he remained a few days. He walked a great deal in the environs of the town. His few acquaintances now found him somewhat strange, taciturn, and nervous. After a somewhat protracted walk he seemed tired, and said that he did not feel very well. He then remarked he must get himself hypnotised, he felt his nerves unsteady. On top of this he was attacked by physical illness, viz. inflammation of the lungs. Very soon a peculiar state of excitement supervened which led to suicidal ideas. He was brought to the asylum, where for weeks he remained in an extremely excited state. He was completely deranged, and did not know where he was; he spoke in broken sentences which no one could understand. He was often so excited and aggressive that it took several attendants to hold him. He gradually became quieter, and one day came to himself, as if waking out of a long, confused dream. He soon completely regained his health, and was discharged as cured. He returned to his home and again immersed himself in books. In the following years he published several remarkable works, but, as before, his life was that of a hermit living entirely in his books and dead to the world. He then gradually acquired the name of a dried-up misanthrope, lost to all meaning of the beauty of life. A few years after his first illness a brief holiday brought him again to B——. As before he took his solitary walks in the environs. One day he was suddenly overcome by a faint feeling, and lay down in the street. He was carried into a neighbouring house where he immediately became extremely excited. He began to perform gymnastics, jumped over the rails of the bed, turned somersaults in the room, began to declaim in a loud, voice, sang his own improvisations, etc. He was again brought to the asylum. The excitement continued. He extolled his wonderful muscles, his beautiful figure, his enormous strength. He believed that he had discovered a natural law by which a wonderful voice could be developed. He regarded himself as a great singer, and a marvellous reciter, and at the same time he was a great inspired poet and composer to whom verse and melody came spontaneously.

All this was in pitiable and very remarkable contrast to reality. He is a small weakly man of unimposing build, with poorly developed muscles betraying at the first glance the atrophying effect of his studious life. He is unmusical, his voice is weak and he sings out of tune; he is a bad speaker, because of his stutter. For weeks he occupied himself in the asylum with peculiar jumping, and contortions of the body which he called gymnastics, he sang and declaimed. Then he became more quiet and dreamy, often stared thoughtfully in front of him for a long time, now and then sang a love song which, despite its want of musical expression, betrayed a pretty feeling for love's aspirations. This also was in complete contrast with the dryness and isolation of his normal life. He gradually became accessible for lengthy conversations.

We will break off the history of the disease here, and sum up what is furnished so far by observation of the patient.

In the first illness the delirium broke out unexpectedly, and was followed by a mental disorder with confused ideas and violence which lasted for several weeks. Complete recovery appeared to have taken place. Six years later there was a sudden outbreak of mania, grandiose delusions, bizarre actions, followed by a twilight-stage gradually leading to recovery. Here we again see a typical case of dementia præcox, of the katatonic variety, especially characterised by peculiar movements and actions. In psychiatry the views obtaining at present would regard this as localised cellular disease of some part of the cortex, exhibiting confusional states,

delusions of grandeur, peculiar contortions of the muscles, or twilight-states, which taken all together have as little psychological meaning as the bizarre shapes of a drop of lead thrown into water.

This is not my view. It was certainly no accidental freak of the brain-cells that created the dramatic contrasts shown in the second illness. We can see that these contrasts, the so-called grandiose delusions, were very subtly determined by the deficiencies in the patient's personality. Without doubt, any one of us would naturally regard these deficiencies seriously in ourselves. Who would not have the desire to find compensation for the aridness of his profession and of his life in the joys of poetry and music and to restore to his body the natural power and beauty stolen from it by the study's atmosphere? Do we not recall with envy the energy of a Demosthenes who, despite his stammering, became a great orator? If our patient thus fulfilled the obvious gaps in his physical and mental life by delusional wishes, the supposition is warranted that the whispered love-song which he sang from time to time filled up a painful blank in his being, which became more painful the more it was concealed. The explanation is not far to seek. It is simply the old story, born anew in every human soul, in a guise befitting the destined creature's highest sensibilities.

When our patient was a student he learnt to know and love a girl-student. Together they made many excursions in the environs of the town, but his exceeding timidity and bashfulness (the lot of the stammerer) never permitted him an opportunity of getting out the appropriate words. Moreover, he was poor and had nothing to offer her but hopes. The time came for the termination of his studies; she went away, and he also, and they never saw one another again. And not long afterwards he heard she had married some one else. Then he relinquished his hopes, but he did not know that Eros never emancipates his slaves.

He buried himself in abstract learning, not to forget, but to work for her in his thoughts. He wanted to keep the love in his heart quite secret, and never to betray that secret. He would dedicate his works to her without her ever knowing it. The compromise succeeded, but not for long. Once he travelled through the town where he heard she lived—it seems to have been an accident that he travelled through that town. He did not leave the train, which only made a short halt there. From the window he saw standing in the distance a young woman with a little child, and thought it was she. Impossible to say whether it was really so or not. He does not think he felt any peculiar feeling at that moment; anyway he gave himself no trouble to ascertain whether it was she, which makes the presumption strong that it was not really she. The unconscious wanted to be left in peace with its illusion. Shortly afterwards he again came to B——, the place of old memories. Then he felt something strange stir in his soul, an uneasy feeling, akin to Nietzsche's—

"Not for long shalt thou thirst, O burning heart!
There is promise in the air,
Winds come to me from unknown mouths—
The healing coolness comes."

Civilised man no longer believes in demons, he calls in the doctor. Our patient wanted to be hypnotised. Then madness overcame him. What was going on in him?

He answered this question in broken sentences, with long pauses, in that twilight-stage that heralds convalescence. I give as faithfully as may be his own words. When he fell ill he suddenly lost the well-regulated world and found himself in the chaos of an overmastering dream, a sea of blood and fire; the world was out of joint; everywhere conflagration, volcanic outbreaks, earthquakes, mountains fell in, followed by enormous battles where the peoples fell upon one another; he became involved more and more in the battle of nature, he was right in the midst of those fighting, wrestling, defending himself, enduring unutterable misery and pain; gradually he was exalted and strengthened by a strange calming feeling that some one was watching his struggles, that his loved one saw all from afar. That was the time when he showed real violence to the attendants. He felt his strength increasing and saw himself at the head of great armies which he would lead to victory. Then more great battles and at length victory. He would try to get his loved one as prize of victory. As he drew near her the illness ceased, and he awoke from a long dream.

His daily life again began to follow the regular routine. He shut himself up in his work and forgot the abyss within himself. A few years later he is again at B—— Demon or Destiny? Again he followed the old trail and again was overborne by old memories. But this time he was not immersed in the depths of confusion. He remained orientated and *en rapport* with his surroundings. The struggle was considerably milder, but he did gymnastics, practised the arts, and made good his deficiencies; then followed the dreamy stage with the love-songs, corresponding to the period of victory in the first psychosis. In this state, according to his own words, he had a dreamlike feeling as if he stood upon the borders of two worlds and knew not whether truth stood on the right or on the left. He told me, "It is said she is married, but I believe she is not, but is still waiting for me; I feel that it must be so. It is ever to me as if she were not married, and as if success were yet attainable."

Our patient here portrayed but a pale copy of the scene in the first attack of psychosis, when he, the victor, stood before his mistress. In the course of a few weeks after this conversation the scientific interests of the patient again began to predominate. He spoke with obvious unwillingness about his intimate life, he repressed it more and more, and finally turned away from it as if it did not belong to himself. Thus gradually the gate of the under-world became closed. There remained nothing but a certain tense expression, and a look which, though fixed on the outer world, was turned inwards at the same time; and this alone hinted at the silent activity of the unconscious, preparing new solutions for his insoluble problem. This is the so-called cure in dementia præcox.

Hitherto we psychiatrists used not to be able to suppress a laugh when we read an artist's attempts to portray a psychosis. These attempts have been generally regarded as quite useless, for the writer introduces into his conception of the psychosis psychological relationships quite foreign to the clinical picture of the disease. But the artist has not simply proceeded to copy a case out of a psychiatric text-book; he knows as a rule better than the psychiatrist.

The case which I have sketched is not unique, it is typical of a whole class for which the artist Spitteler has created a model of universal validity; the model is *Imago*. I may take for granted that you know his book of that name. The psychological gulf, however, between the creation of the artist and the insane person is great. The world of the artist is one of solved problems; the world of reality, that of unsolved problems. The mental patient is a faithful image of this reality. His solutions are unsatisfying illusions, his cure a temporary giving up of the problem,

which yet goes on working in the depths of the unconscious, and at the appointed time again rises to the surface and creates new illusions with new scenery; part of the history of mankind is here seen abridged.

Psychological analysis is far from being able to explain in complete and illuminating fashion all cases of the disease with which we are here concerned. On the contrary, the majority remain obscure and difficult to understand, and chiefly because only a certain proportion of patients recover. Our last patient is noteworthy because his return to a normal state afforded us a survey of the period of his illness. Unfortunately the advantage of this standpoint is not always possible to us, for a great number of persons never find their way back from their dreams. They are lost in the maze of a magic garden where the same old story is repeated again and again in a timeless present. For patients the hands of the clock of the world remain stationary; there is no time, no further development. It makes no difference to them whether they dream for two days or thirty years. I had a patient in my ward who was five years without uttering a word, in bed, and entirely buried in himself. For years I visited him twice daily, and as I reached his bedside I could see at once that there was no change. One day I was just about to leave the room when a voice I did not recognise called out—"Who are you? What do you want here?" I saw with astonishment that it was the dumb patient who had suddenly regained his voice, and obviously his senses also. I told him I was his doctor, whereupon he asked angrily, why was he kept a prisoner here, and why did no one ever speak to him? He said this in an injured voice just like a normal person whom one had neglected for a couple of days. I informed him that he had been in bed quite speechless for five years and had responded to nothing, whereat he looked at me fixedly and without understanding. Naturally I tried to discover what had gone on in him during these five years, but could learn nothing. Another patient with a similar symptom, when asked why he had remained silent for years, maintained, "Because I wanted to spare the German language."^[199] These examples show that it is often impossible to lift the veil of the secret, for the patients themselves have neither interest nor pleasure in explaining their strange experiences, in which as a rule they realise nothing peculiar.

Occasionally the symptoms themselves are a sign-post to the understanding of the psychology of the disease.

We had a patient who was for thirty-five years an inmate at Burghölzli. For decades she lay in bed, she never spoke or reacted to anything, her head was always bowed, her back bent and the knees somewhat drawn up. She was always making peculiar rubbing movements with her hands, so as to give rise during the course of years to thick horny patches on her hands. She kept the thumb and index finger of her right hand together as in the movement of sewing. When she died I tried to discover what she had been formerly. Nobody in the asylum recalled ever having seen her out of bed. Only our chief attendant had a memory of having seen her sitting in the same attitude as that she afterwards took up in bed, at which time she was making rapid movements of extension of the arm across the right knee; it was said of her that she was sewing shoes, later that she was polishing shoes. As time went on the movements became more limited till finally there remained but a slight rubbing movement, and only the finger and thumb retained the sewing position. In vain I consulted our old attendant, she knew nothing about the patient's previous history. When the seventy-year-old brother came to the funeral I asked him what had been the cause of his sister's illness; he told me that she had had

a love-affair, but for various reasons it had come to nothing. The girl had taken this so to heart that she became low-spirited. In answer to a query about her lover it was found that he was a *shoemaker*.

Unless you see here some strange play of accident, you must agree that the patient had kept the memory-picture of her lover unaltered in her heart for thirty-five years.

One might easily think that these patients who give an impression of imbecility are only burnt-out ruins of humanity. But such is probably not the case. One can often prove directly that such patients register everything going on around them even with a certain curiosity, and have an excellent memory for it all. This is the reason why many patients become for a time pretty sensible again, and develop mental powers which one believed they had long since lost. Such intervals occur occasionally during serious physical disease, or just before death. We had a patient with whom it was impossible to carry on a sane conversation; he only produced a mad medley of delusions and words. He once fell seriously ill physically, and I expected it would be very difficult to treat him. Not at all. He was quite changed, he became friendly and amiable, and carried out all his doctor's orders patiently and gratefully. His eyes lost their evil darting looks, and shone quietly and understandingly. One morning I came to his room with the usual greeting: "Good morning. How are you getting on?" The patient answered me in the well-known way: "There again comes one of the dog and monkey troupe wanting to play the Saviour." Then I knew his physical trouble was over. From that moment the whole of his reason was as if "blown away" again.

From these observations we see that reason still survives, but is pushed away into some corner by the complete preoccupation of the mind with diseased thoughts.

Why is the mind compelled to exhaust itself in the elaboration of diseased nonsense? On this difficult question our new insight throws considerable light. To-day we can say that the pathological images dominate the interests of the patient so completely, because they are simply derivatives of the most important questions that used to occupy the person when normal—what in insanity is now an incomprehensible maze of symptoms used to be fields of vital interest to the former personality.

I will cite as an example a patient who was twenty years in the asylum. She was always a puzzle to the physicians, for the absurdity of her delusions exceeded anything that the boldest imagination could create.

She was a dressmaker by trade, born in 1845, of very poor family. Her sister early went wrong and was finally lost in the swamp of prostitution. The patient herself led an industrious, respectable, reserved life. She fell ill in 1886 in her 39th year—at the threshold of the age when so many a dream is brought to naught. Her illness consisted in delusions and hallucinations which increased rapidly, and soon became so absurd that no one could understand her wishes and complaints. In 1887 she came to the asylum. In 1888 her statements, so far as the delusions were concerned, were not intelligible. She maintained such monstrous things as that: "At night her spinal marrow had been torn out; pains in the back had been caused by substances that went through the walls and were covered with magnetism." "The monopoly fixed the sorrows which are not in the body and do not fly about in the air." "Excursions are made by breathing in chemistry, and by suffocation regions are destroyed."

In 1892 the patient styled herself the "Bank Note Monopoly, Queen of the Orphans, Proprietress of the Burghölzli Asylum;" she said: "Naples and I must provide the world with macaroni" (Nudel).

In 1896 she became "Germania and Helvetia from exclusively pure butter"; she also said, "I am Noah's Ark, the boat of salvation and respect."

Since then the disease has greatly increased; her last creation is the delusion that she is the "lily red sea monster and the blue one."

These instances will show you how far the incomprehensibility of such pathological formations go. Our patient was for years the classic example of meaningless delusional ideas in dementia præcox; and many hundreds of medical students have received from the demonstration of this case a permanent impression of the sinister power of insanity. But even this case has not withstood the newer technique of psychoanalysis. What the patient says is not at all meaningless; it is full of significance, so that he who has the key can understand without overmuch difficulty.

Time does not allow me to describe the technique by means of which I succeeded in lifting the veil of her secret. I must content myself by giving a few examples to make the strange changes of thought and of speech in this patient clear to you.

She said of herself that *she was Socrates*. The analysis of this delusion presented the following ideas: Socrates was the wisest man, the man of greatest learning; he was infamously accused, and had to die in prison at the hands of strange men. She was the best dressmaker, but "never unnecessarily cut a thread, and never allowed a piece of material to lie about on the floor." She worked ceaselessly, and now she has been falsely accused, wicked men have shut her up, and she will have to die in the asylum.

Therefore she is Socrates; this is, as you see, simple metaphor, based upon obvious analogy. Take another example: "*I am the finest professor and the finest artist in the world.*"

The analysis furnishes the remarks that she is the best dressmaker and chooses the most beautiful models which show up well and waste little material; she puts on the trimming only where it can be seen. She is a professor, and an artist in her work. She makes the best clothes and calls them absurdly "The Schneck Museum-clothes." Her customers are only such persons as frequent the Schneck House and the Museum (the Schneck House is the aristocratic club. It is near the Museum and the Library, another rendezvous of the aristocratic set of Zürich), for she is the best dressmaker and makes only Schneck Museum^[200] clothing.

The patient also *calls herself Mary Stuart*. Analysis showed the same analogy as with Socrates: innocent suffering and death of a heroine.

"*I am the Lorelei.*" Analysis: This is an old and well-known song: "I know not what it means," etc. Whenever she wants to speak about her affairs people do not understand her, and say they don't know what it means; hence she is the Lorelei.

"*I am Switzerland.*" Analysis: Switzerland is free, no one can rob Switzerland of her freedom. The patient does not belong to the asylum, she would be free like Switzerland, hence she is Switzerland.

"*I am a crane.*" Analysis: In the "Cranes of Ibykus" it is said: "Whosoever is free of sin and fault shall preserve the pure soul of a child." She has been brought innocent to the asylum and has never committed a crime—hence she is a crane.

"*I am Schiller's Bell.*" Analysis: Schiller's Bell is the greatest work of the great master. She is the best and most industrious dressmaker, and has achieved the highest rung in the art of dressmaking—hence she is Schiller's Bell.

"*I am Hufeland.*" Analysis: Hufeland was the best doctor. She suffers intolerably in the asylum and is moreover treated by the worst doctors. She is, however, so prominent a personality that she had a claim to the best doctors, that is to a doctor like Hufeland—hence she is Hufeland.

The patient used the expression "I am" in a very arbitrary way. Sometimes it meant "it belongs to me" or "it is proper for me"; sometimes it means "I should have." This is seen from the following analysis:

"*I am the master-key.*" Analysis: The master-key is the key that opens all the doors of the asylum. Properly, according to all rights, the patient should long since have obtained this key for she has been for many years "the proprietress of the Burghölzli Asylum." She expresses this reflection very much simplified in the sentence, "I am the master-key."

The chief content of her delusions is concentrated in the following words:—

"*I am the monopoly.*" Analysis: The patient means the banknote monopoly, which has belonged to her for some time. She believes that she possesses the monopoly of the entire bank notes of the world, thus creating enormous riches for herself, in compensation for the poverty and lowliness of her lot. Her parents died early; hence she is the Queen of the Orphans. Her parents lived and died in great poverty. Her blessings are extended to them also, the dreamlike delusions of the patient benefit them in many ways. She says textually: "My parents are clothed by me, my sorely-tried mother, full of sorrow—I sat with her at table—covered in white with superfluity."

This is another of these malleable hallucinations which the patient had daily. It is one of those scenes of wish-fulfilment, with poverty on one side and riches on the other, recalling Hauptmann's Hannele; more especially that scene where Gottwald says: "She was clothed in rags—now she is bedeckt in silken robes; and she ran about barefoot—now she has shoes of glass to her feet. Soon she will live in a golden castle and eat each day of baked meats. Here has she lived on cold potatoes...."

The wish-fulfilments of our patient go even further. Switzerland has to furnish her with an income of 150,000 francs. The Director of the Burghölzli owes her 80,000 francs damages for wrongful incarceration. She is the proprietress of a distant island with silver mines, the "mightiest silver island in the world." Therefore she is also the greatest orator, possesses the most wonderful eloquence, for, as she says, "Speech is *silver*, silence gold." To her all the beautiful landed estates belong—all the rich quarters, towns and lands, she is the proprietress of a world, even a "threefold proprietress of the world." Whilst poor Hannele was only elevated to the side of the Heavenly Bridegroom, our patient has the "Key of Heaven," she is not only the honoured earthly queens Mary Stuart and Queen Louise of Prussia, but she is also the Queen of Heaven, the Mother of God as well as the Godhead. Even in this earthly

world where she was but a poor, ill-regarded homely dressmaker she attained fulfilments of her human wishes, for she had taken three husbands from the best families in the town and her fourth was the Emperor Francis. From these marriages there were two phantom children—a little boy and a little girl. Just as she clothed, fed and feasted her parents, so she provided for the future of her children. To her son she bequeathed the great bazaar of Zürich, therefore her son is a "Zur," for the proprietor of a *Bazaar* is a "Zur." The daughter resembles her mother; hence she becomes the proprietress of the asylum and takes her mother's place so that the mother is released from captivity. The daughter therefore receives the title of "Agency of Socrates," for she replaces Socrates in captivity.

These instances by no means exhaust the delusional fancies of the patient. But they will give you some idea, I hope, of the richness of her inner life although she was apparently so dull and apathetic, or, as was said *imbecile*, and sat for twenty years in her workroom, where she mechanically repaired her linen, occasionally uttering a complex of meaningless fragments which no one had hitherto been able to understand. Her odd lack of words can now be seen in another light; they are fragments of enigmatical inscriptions, of fairy-story phantasies, which have escaped from the hard world to found a world of their own. Here the tables are ever laden, and a thousand feasts are celebrated in golden palaces. The patient can only spare a few mysterious symbols for the gloomy dim shores of reality; they need not be understood, for our understanding has not been necessary for her for this long time.

Nor is this patient at all unique. She is one of a type. Similar phantasies are always found in patients of this kind, though not always in such profusion.

The parallels with Hauptmann's Hannele show that here likewise the artist has shown us the way with the free creation of his own phantasy. From this coincidence, which is not accidental, we may conclude that there is something common both to the artist and the insane and not to them alone. Every human being has also within himself that restless creative phantasy which is ever engaged in assuaging the harshness of reality. Whoever gives himself unsparingly and carefully to self-observation, will realise that there dwells within him something which would gladly hide and cover up all that is difficult and questionable in life, and thus procure an easy and free path. Insanity grants the upper hand to this something. When once it is uppermost, reality is more or less quickly driven out. It becomes a distant dream, and the dream which enchains the patient wholly or in part, and often for life, has now the attributes of reality. We normal persons, who have to do entirely with reality, see only the products of disordered fancy, but not the wealth of that side of the mind which is turned away from us. Unfortunately only too often no further knowledge reaches us of the things which are transpiring on that other side, because all the bridges are broken down which unite this side with that.

We do not know to-day whether these new views are of universal or only of limited validity; the more carefully and perseveringly we examine our patients, the more we shall meet cases, which, despite apparent total imbecility, will yet afford us at least some fragmentary insight into the obscurities of the psychical life. This life is far removed from that mental poverty which the prevailing theories were compelled to accept.

However far we are from being able to understand fully the concatenations of that obscure world, at least we may maintain, with complete assurance, that in dementia præcox there is no

symptom which can be described as psychologically baseless and meaningless. The most absurd things are in reality symbols of ideas which are not only generally understandable, but also universally operative in the human heart. In insanity we do not discover anything new and unknown, but we look at the foundation of our own being, the source of those life-problems in which we are all engaged.

PART II.^[201]

The number of psychoanalytic investigations into the psychology of dementia præcox has considerably increased since the publication of my book upon the subject.^[202] When, in 1903, I made the first analysis of a case of dementia præcox, there dawned on me a premonition of the possibilities of future discoveries in this sphere. This has been confirmed.

Freud first submitted a case of paranoid dementia to closer psychological investigation.^[203] This he was enabled to do by means of an analytic technique perfected through his rich experiences with neurotics. He selected the famous autobiography of P. Schreber, "Denkwürdigkeiten eines Nervenkranken." The patient could not be analysed personally, but having published his most interesting autobiography all the material wanted for an analysis was to be found in it.

In this study Freud shows out of what infantile forms of thought and instincts the delusional system was built up. The peculiar delusions which the patient had about his doctor whom he identified with God or with a god-like being, and certain other surprising and really blasphemous ideas, Freud was able to reduce most ingeniously to his infantile relationship to his father. This case also presented similar bizarre and grotesque concatenations of ideas to the one I have described. As the author himself says, his work confines itself to the task of pointing out those universally existent and undifferentiated foundations out of which we may say every psychological formation is historically developed.^[204] This reductive analytical process did not, however, furnish such enlightening results in regard to the rich and surprising symbolism in patients of this kind as we had been accustomed to expect from the same method in the realm of the psychology of hysteria. In reading certain works of the Zürich school, for example, Maeder,^[205] Spielrein,^[206] Nelken,^[207] Grebelskaja,^[208] Itten,^[209] one is powerfully impressed by the enormous symbol-formation in dementia præcox.

Some of the authors still proceed essentially by the method of analytic reduction, tracing back the complicated delusional formation into its simpler and more universal components, as I have done in the preceding pages. One cannot, however, resist the feeling that this method hardly does justice to the fulness and the almost overpowering wealth of phantastic symbol-formation, although it does undoubtedly throw a light upon the subject in certain directions.

Let me illustrate with an example. We should be thankful for a commentary upon "Faust" which traced back all the diverse material of Part II. to its historical sources, or for a psychological analysis of Part I. which pointed out how the dramatic conflict corresponds to a personal conflict in the soul of the poet; we should be glad of an exposition which pointed out how this subjective conflict is itself based upon those ultimate and universal human things which are nowise foreign to us since we all carry the seeds of them in our hearts. Nevertheless we should be a little disappointed. We do not read "Faust" just in order to

discover that also we are, in all things, "human, all too human." Alas, we know that but too well already. Let any one who has not yet learnt it go for a little while out into the world and look at it without preconceptions and with open eyes. He will turn back from the might and power of the "too human," hungrily he will pick up his "Faust," not to find again what he has just left, but to learn how a man like Goethe shakes off these elemental human things and finds freedom for his soul. When we once know who was the "Proktophantasmist," to what chronological events the mass of symbols in Part II. relates, how it is all intimately bound up with the poet's own soul and conditioned by it, we come to regard this determination as less important than the problem itself—what does the poet mean by his symbolic creation? Proceeding purely reductively, one discovers the final meaning in these universal human things; and demands nothing further from an explanation than that the unknown and complicated shall be reduced to the known and simple. I should like to designate this kind of understanding as *retrospective understanding*. But there is another kind of understanding, which is not analytic reduction, but is of a *synthetic* or *constructive* nature. I would designate this *prospective understanding*, and the corresponding method as the *Constructive method*.

It is common knowledge that present-day scientific explanation rests upon the basis of the causal principle. Scientific explanation is causal explanation. We are therefore naturally inclined, whenever we think scientifically, to explain causally, to understand a thing and to regard it as explained whenever it is reduced analytically to its cause and general principle. In so far Freud's psychological method of interpretation is strictly scientific.

If we apply this method to "Faust" it must become clear that something more is required for a true understanding. It will even seem to us that we have not gathered the poet's deepest meaning if we only see in it universal foregone human conclusions. What we really want to find out is how this man has redeemed himself as an individual, and when we arrive at this comprehension then we shall also understand the symbol given by Goethe. It is true we may then fall into the error that we understand Goethe himself. But let us be cautious and modest, simply saying we have thereby arrived at an understanding of ourselves. I am thinking here of Kant's thought-compelling definition of comprehension, as "the realisation of a thing to the extent which is sufficient for our purpose."

This understanding is, it is true, subjective, and therefore not scientific for those to whom science and explanation by the causal principle are identical. But the validity of this identification is open to question. In the sphere of psychology I must emphasise my doubt on this point.

We speak of "objective" understanding when we have given a causal explanation. But at bottom, understanding is a subjective process upon which we confer the quality "objective" really only to differentiate it from another kind of understanding which is also a psychological and subjective process, but upon which, without further ado, we bestow the quality "subjective." The attitude of to-day only grants scientific value to "objective" understanding on account of its universal validity. This standpoint is incontestably correct wherever it is not a question of the psychological process itself, and hence it is valid in all sciences apart from pure psychology.

To interpret Faust objectively, *i.e.* from the causal standpoint, is as though a man were to consider a sculpture from the historical, technical and—last but not least—from the

mineralogical standpoint. But where lurks the *real meaning* of the wondrous work? Where is the answer to that most important question: what aim had the artist in mind, and how are we ourselves to understand his work subjectively? To the scientific spirit this seems an idle question which anyhow has nothing to do with science. It comes furthermore into collision with the causal principle, for it is a purely speculative constructive view. And the modern world has overthrown this spirit of scholasticism.

But if we would approach to an understanding of psychological things we must remember the fact of the subjective conditioning of all knowledge. The world is *as we see it* and not simply objective; this holds true even more of the mind. Of course it is possible to look at the mind objectively, just as at Faust, or a Gothic Cathedral. In this objective conception there is comprised the whole worth and worthlessness of current experimental psychology and psychoanalysis. The scientific mind, thinking causally, is incapable of understanding what is ahead; it only understands what is past, that is, retrospective. Like Ahriman, the Persian devil, it has the gift of After-Knowledge. But this spirit is only one half of a complete comprehension. The other more important half is prospective or constructive; if we are not able to understand what lies ahead, then nothing is understood. If psychoanalysis, following Freud's orientation, should succeed in presenting an uninterrupted and conclusive connection between Goethe's infantile sexual development and his work, or, following Adler, between the infantile struggle for power and the adult Goethe and his work, an interesting proposition would have been solved—we should have learnt how a masterpiece can be reduced to the simplest thinkable elements, which are universal, and to be found working within the depths of everything and everybody. But did Goethe construct his work to *this* end? Was it his intention that it should be thus conceived?

It must be sufficiently clear that such an understanding, though undoubtedly scientific, would be entirely, utterly, beside the mark. This statement is valid for psychology in general. To understand the psyche causally, means to understand but half of it. The causal understanding of Faust enlightens us as to how it became a finished work of art, but reveals nothing of the living meaning of the poet. That meaning only lives if we experience it, in and through ourselves. In so far as our actual present life is for us something essentially new and not a repetition of all that has gone before, the great value of such a work is to be seen, not in its causal development, but in its living reality for our own lives. We should be indeed depreciating a work like Faust if we were only to regard it as something that has been perfected and finished; it is only understood when conceived as a becoming and as an ever new-experiencing.

Thus we must regard the human psyche. Only on one side is the mind a Has Been, and as such subordinate to the causal principle. On the other side the mind is a Becoming that can only be grasped synthetically or constructively. The causal standpoint asks how it is this actual mind has become what it appears to-day? The constructive standpoint asks how a bridge can be built from this actual psyche to its own future?

Just as the causal method finally reaches the general principles of human psychology by the analysis and reduction of individual events, so does the constructive standpoint reach aims that are general by the synthesis of individual tendencies. The mind is a point of passage and thus necessarily determined from two sides. On the one side it offers a picture of the

precipitate of the past, and on the other side a picture of the germinating knowledge of all that is to come, in so far as the psyche creates its own future.

What has been is, on the one hand, the result and apex of all that was—as such it appears to the causal standpoint; on the other hand, it is an expression of all that is to be. The future is only *apparently* like the past, but in its essence always new and unique, (the causal standpoint would like to invert this sentence) thus the actual formula is incomplete, germlike so to say, in relation to what is to be.

To get any conception of this expression of what is to be we are forced to apply a constructive interest to it. I almost felt myself tempted to say, "a scientific interest." But modern science is identical with the causal principle. So long as we consider the actual mind causally, that is scientifically, we elude the mind as a Becoming. This other side of the psyche can never be grasped by the exclusive use of the causal principle, but only by means of the constructive standpoint. The causal standpoint reduces things to their elements, the constructive standpoint elaborates them into something higher and more complicated. This latter standpoint is necessarily a speculative one.

Constructive understanding is, however, differentiated from scholastic speculation because it imposes no general validity, but only subjective validity. When the speculative philosopher believes he has comprehended the world once for all by his System, he deceives himself; he has only comprehended himself and then naïvely projected that view upon the world. In reaction against this, the scientific method of the modern world has almost put an end to speculation and gone to the other extreme. It would create an "objective" psychology. In opposition to such efforts, the stress which Freud has placed upon individual psychology is of immortal merit. The extraordinary importance of the subjective in the development of the objective mental process was thus first brought adequately into prominence.

Subjective speculation lays no claim to universal validity, it is identical with constructive understanding. It is a subjective creation, which, looked at externally, easily seems to be a so-called infantile phantasy, or at least an unmistakable derivative of it; from an objective standpoint it must be judged as such, in so far as objective is regarded as identical with scientific or causal. Looked at from within, however, constructive understanding means redemption.

"Creation—that is the great redemption from suffering and easiness of living."^[210]

Starting from these considerations as to the psychology of those mental patients to whom the Schreber case belongs, we must, from the "objective-scientific" standpoint, reduce the structural phantasy of the patient to its simple and most generally valid elements. This Freud had done. But that is only half of the work to be done. The other half is the constructive understanding of Schreber's system. The question is: What end, what freedom, did the patient hope to achieve by the creation of his system?

The scientific thinker of to-day will regard this question as inappropriate. The psychiatrist will certainly smile at it, for he is thoroughly assured of the universal validity of his causalism, he knows the psyche merely as something that is made, descendent, reactive. Not uncommonly there lurks the unconscious prejudice that the psyche is a brain-secretion.

Looking at such a morbid system without preconception, and asking ourselves what goal this delusional system is aiming at, we see, in fact, firstly, that it *is* endeavouring to get at something, and secondly, that the patient also devotes all his will-power to the service of the system. There are patients who develop their delusions with scientific thoroughness, often dragging in an immense material of comparison and proof. Schreber certainly belongs to this class. Others do not proceed so thoroughly and learnedly, but content themselves with heaping up synonymous expressions for that at which they are aiming. The case of the patient I have described, who assumes all kinds of titles, is a good instance of this.

The patient's unmistakable striving to express something through and by means of his delusion Freud conceives retrospectively, as the satisfaction of his infantile wishes by means of imagination. Adler reduces it to the desire for power.

For him the delusion-formation is a "manly protest," a means of gaining security for himself against his menaced superiority. Thus characterised, this struggle is likewise infantile and the means employed—the delusional creation—is infantile because insufficient for its purpose; one can therefore understand why Freud declines to accept Adler's point of view. Freud, rightly on the whole, subsumes this infantile struggle for power under the concept of the infantile wish.

The constructive standpoint is different. Here the delusional system is neither infantile nor, upon the whole, *eo ipso* pathological but *subjective*, and hence justified within the scope of the subjective. The constructive standpoint absolutely denies the conception that the subjective phantasy-creation is merely an infantile wish, symbolically veiled; or that it is merely that in a higher degree; it denies that it is a convulsive and egoistic adhesion to the fiction of its own superiority, in so far as these are to be regarded as finalistic explanations. The subjective activity of the mind can be judged from without, just as one can, in the end, so judge everything. But this judgment is inadequate, because it is the very essence of the subjective that it cannot be judged objectively. We cannot measure distance in pints. The subjective can be only understood and judged subjectively, that is, constructively. Any other judgment is unfair and does not meet the question.

The absolute credit which the constructive standpoint confers upon the subjective, naturally seems to the "scientific" spirit as an utter violation of reason. But this scientific spirit can only take up arms against it so long as the constructive is not avowedly *subjective*. The constructive comprehension also *analyses*, but it does not *reduce*. It decomposes the delusion into *typical* components. What is to be regarded as the type at a given time is shown from the attainment of experience and knowledge reached at that time.

Even the most individual delusional systems are not absolutely unique, occurring only once, for they offer striking and obvious analogies with other systems. From the comparative analysis of many systems the typical formations are drawn. If one can speak of reduction at all, it is only a question of reduction to general type, but not to some universal principle obtained inductively or deductively, such as "Sexuality" or "Struggle for Power." This paralleling with other typical formations only serves for a widening of the basis upon which the construction is to be built. If one were to proceed entirely subjectively one would go on constructing in the language of the patient and in his mental range. One would arrive at some structure which was illuminating to the patient and to the investigator of the case but not to

the outer scientific public. The public would be unable to enter into the peculiarities of the speech and thought of the individual case in question without further help.

The works of the Zürich school referred to contain careful and detailed expositions of individual material. In these materials there are very many typical formations which are unmistakably *analogies* with *mythological formations*^[211]. There arose from the perception of this relationship a new and valuable source for comparative study. The acceptance of the possibility of such a comparison will not be granted immediately, but the question is only whether the materials to be compared really are similar or not. It will also be contended that pathological and mythological formations are not immediately comparable. But this objection must not be raised *a priori*, for only a conscientious comparison can determine whether any true parallelism exists or not. At the present moment all we know is that they are both structures of the imagination which, like all such products, rest essentially upon the activity of the unconscious. Experience must teach us whether such a comparison is valid. The results hitherto obtained are so encouraging that further work along these lines seems to me most hopeful and important. I made practical use of the constructive method in a case which Flournoy published in the *Archives de Psychologie*, although he offered no opinion as to its nature at that time.

The case dealt with a rather neurotic young lady who, in Flournoy's publication, described how surprised she was at the connected phantasy-formations which penetrated from the unconscious into the conscious. I subjected these phantasies, which the lady herself reproduced in some detail, to my constructive methods and gave the results of these investigations in my book, "The Psychology of the Unconscious."

This book has, I regret to say, met with many perhaps inevitable misunderstandings. But I have had one precious consolation, for my book received the approval of Flournoy himself, who published the original case which he knew personally. It is to be hoped that later works will make the standpoint of the Zürich school intelligible to a wider public. Whoever, by the help of this work, has taken the trouble to grasp the essence of the constructive method, will readily imagine how great are the difficulties of investigation, and how much greater still are the difficulties of objective presentation of such investigations.

Among the many difficulties and opportunities for misunderstanding I should like to adduce one difficulty which is especially characteristic. In an intensive study of Schreber's or any similar case, it will be discovered that these patients are consumed by the desire for a new world-philosophy which may be of the most bizarre kind. Their aim is obviously to create a system such as will help them in the assimilation of unknown psychical phenomena, *i.e.* enable them to adapt their own unconscious to the world. This arrangement produces a subjective system which must be considered as a necessary transition-stage on the path to the adaptation of their personality in regard to the world in general. But the patient remains stationary at this transitory stage and assumes his subjective view is the world's, hence he remains ill. He cannot free himself from his subjectivism and does not find the link to objective thinking, *i.e.* to society. He does not reach the real summit of self-understanding, for he remains with a merely subjective understanding of himself. But a *mere* subjective understanding is not real and adequate. As Feuerbach says: *Understanding is only real when*

it is in accord with that of some other rational beings. Then it becomes objective^[212] and the link with life is reached.

I am convinced that not a few will raise the objection that in the first place the psychological process of adaptation does not proceed by the method of first creating a world-philosophy; secondly, that it is in itself a sign of unhealthy mental disposition even to make the attempt to adapt oneself by way of a "world-philosophy."

Undoubtedly there are innumerable persons who are capable of adaptation without creating any preliminary philosophy. If they ever arrive at any general theory of the world it is always subsequently. But, on the other hand, there are just as many who are only able to adapt themselves by means of a preliminary intellectual formulation. To everything which they do not understand they are unable to adapt themselves. Generally it comes about that they do adapt themselves just in so far as they can grasp the situation intellectually. To this latter group seem to belong all those patients to whom we have been giving our consideration.

Medical experience has taught us that there are two large groups of functional nervous disorders. The one embraces all those forms of disease which are designated *hysterical*, the other all those forms which the French school has designated *psychasthenic*. Although the line of demarcation is rather uncertain, one can mark off two psychological types which are obviously different; their psychology is diametrically opposed. I have called these—the *Introverted* and *Extroverted* types. The hysteric belongs to the type of *Extroversion*, the psychasthenic to the type of *Introversion*, as does dementia præcox, in so far as we know it to-day. This terminology, *Introversion* and *Extroversion*, is bound up with my way of regarding mental phenomena as forms of energy. I postulate a hypothetical fundamental striving which I designate *libido*.^[213] In the classical use of the word, *libido* never had an exclusively sexual connotation as it has in medicine. The word *interest*, as Claparède once suggested to me, could be used in this special sense, if this expression had to-day a less extensive application. Bergson's concept, *élan vital*, would also serve if this expression were less biological and more psychological. *Libido* is intended to be an energising expression for *psychological values*. The psychological value is something active and determining; hence it can be regarded from the energetic standpoint without any pretence of exact measurement.

The introverted type is characterised by the fact that his *libido* is turned towards his own personality to a certain extent—he finds within himself the unconditioned value. The extroverted type has his *libido* to a certain extent externally; he finds the unconditioned value outside himself. The introvert regards everything from the aspect of his own personality; the extrovert is dependent upon the value of his object. I must emphasise the statement that this question of types is *the* question of our psychology, and that every further advance must probably proceed by way of this question. The difference between these types is almost alarming in extent. So far there is only one small preliminary communication by myself^[214] on this theory of type, which is particularly important for the conception of dementia præcox. On the psychiatric side Gross^[215] has called attention to the existence of two psychological types. His two types are (1) those with limited but deep consciousness, and (2) those with broad but superficial consciousness. The former correspond to my introverted and the latter to my extroverted type. In my article I have collected some other instances among which I would especially call attention to the striking description of the two types given by William

James in his book on "Pragmatism." Fr. Th. Vischer has differentiated the two types very wittily by her division of the learned into "reason-mongers," and "matter-mongers." In the sphere of psychoanalysis Freud follows the psychology of Extraversion, Adler that of Introversion. The irreconcilable opposition between the views of Freud and those of Adler (see especially his book "Über den nervösen Charakter") is readily explained by the existence of two diametrically opposed psychological types which view the same things from entirely different aspects. An Extrovert can hardly, or only with great difficulty, come to any understanding with an Introvert, on any delicate psychological question.

An Extrovert can hardly conceive the necessity which compels the Introvert to conquer the world by means of a system. And yet this necessity exists, otherwise we should have no philosophical systems and dogmas, presumed to be universally valid. Civilised humanity would be only empiricists and the sciences only the experimental sciences. Causalism and empiricism are undoubtedly mighty forces in our present-day mental life but it may come to be otherwise.

This difference in type is the first great obstacle which stands in the way of an understanding concerning fundamental conceptions of our psychology. A second objection arises from the circumstance that the constructive method, faithful to itself, must adapt itself to the lines of the delusion. The direction along which the patient develops his morbid thoughts has to be accepted seriously, and followed out to its end; the investigator thus places himself at the standpoint of the psychosis. This procedure may expose him to the suspicion of being deranged himself; or at least risks a misunderstanding which is considered terribly disgraceful—he may himself have some world-philosophy! The confirmation of such a possibility is as bad as being "unscientific." But every one has a world-philosophy though not every one knows he has. And those who do not know it have simply an unconscious and therefore inadequate and archaic philosophy. But everything psychological that is allowed to remain in the mind neglected and not developed, remains in a primitive state. A striking instance of how universal theories are influenced by unconscious archaic points of view has been furnished by a famous German historian whose name matters to us not at all. This historian took it for granted that once upon a time people propagated themselves through incest, for in the first human families the brother was assigned to the sister. This theory is wholly based upon his still unconscious belief in Adam and Eve as the first and only parents of mankind. It is on the whole better to discover for oneself a modern world-philosophy, or at least to make use of some decent system which will prevent any errors of that kind.

One could put up with being despised as the possessor of a world-philosophy; but there is a greater danger. The public may come to believe the philosophy, beaten out by the constructive method, is to be regarded as a theoretical and objectively valid insight into the meaning of the world in general.

I must now again point out that it is an obstinate, scholastic misunderstanding not to be able to distinguish between a world-philosophy which is only psychological, and an extra-psychological theory, which concerns the objective thing. It is absolutely essential that the student of the results of the constructive method should be able to draw this distinction. In its first results the constructive method does not produce anything that could be called a scientific theory; it furnishes the *psychological lines of development*, a *path* so to say. I must here refer the reader to my book, "Psychology of the Unconscious."

The analytic reductive method has the advantage of being much simpler than the constructive method. The former reduces to well-known universal elements of an extremely simple nature. The latter has, with extremely complicated material, to construct the further path to some often unknown end. This obliges the psychologist to take full account of all those forces which are at work in the human mind. The reductive method strives to replace the religious and philosophical needs of man, by their more elementary components, following the principle of the "nothing but," as James so aptly calls it. But to *construct* aright, we must accept the developed aspirations as indispensable components, essential elements, of spiritual growth. Such work extends far beyond empirical concepts but that is in accordance with the nature of the human soul which has never hitherto rested content with experience alone. Everything new in the human mind proceeds from speculation. Mental development proceeds by way of speculation, never by way of limitation to mere experience. I realise that my views are parallel with those of Bergson, and that in my book the concept of the libido which I have given, is a concept parallel to that of "élan vital"; my constructive method corresponds to Bergson's "intuitive method." I, however, confine myself to the psychological side and to practical work. When I first read Bergson a year and a half ago I discovered to my great pleasure everything which I had worked out practically, but expressed by him in consummate language and in a wonderfully clear philosophic style.

Working speculatively with psychological material there is a risk of being sacrificed to the general misunderstanding which bestows the value of an objective theory upon the line of psychological evolution thus elaborated. So many people feel themselves in this way at pains to find grounds whether such a theory is correct or not. Those who are particularly brilliant even discover that the fundamental concepts can be traced back to Heraclitus or some one even earlier. Let me confide to these knowing folk that the fundamental ideas employed in the constructive method stretch back even beyond any historical philosophy, viz. to the dynamic "views" of primitive peoples. If the result of the constructive method were scientific theory, it would go very ill with it, for then it would be a falling back to the deepest superstition. But since the constructive method results in something far removed from scientific theory the great antiquity of the basic concepts therein must speak in favour of its extreme correctness. Not until the constructive method has presented us with much practical experience can we come to the construction of a *scientific theory, a theory of the psychological lines of development*. But we must first of all content ourselves with confirming these lines individually.

FOREWORD TO CHAPTER XIV

This essay was originally written in 1913, when I limited myself entirely to presenting an essential part of the psychological point of view inaugurated by *Freud*. A few months ago my Swiss publisher asked for a second and revised edition. The many and great changes which the last few years have brought about in our understanding of the psychology of the unconscious necessitated a substantial enlargement of my essay. In this new edition some expositions about *Freud's* theories are shortened, whilst *Adler's* psychological views are more fully considered, and—so far as the scope of this paper permits—a general outline of my own views are given. I must at the outset draw the reader's attention to the fact that this is no longer an easy "popular" scientific paper, but a presentation making great demands upon the patience and attention of the reader. The material is extremely complicated and difficult. I do not for a moment deceive myself into thinking this contribution is in any way conclusive or adequately convincing. Only detailed scientific treatises about the various problems touched upon in these pages could really do justice to the subject. Any one who wishes to go deeply into the questions that are raised here must be referred to the special literature of the subject. My attention is solely to give the orientation in regard to the newest concepts of the inner nature of unconscious psychology. I consider the subject of the unconscious to be specially important and opportune at this moment. In my opinion, it would be a great loss if this problem, concerning every one so closely as it does, were to disappear from the horizon of the educated lay public, by being interned in some inaccessible specialised scientific journal. The psychological events that accompany the present war—the incredible brutalisation of public opinion, the epidemic of mutual calumnies, the unsuspected mania for destruction, the unexampled flood of mendacity, and man's incapacity to arrest the bloody demon—are they not, one and all, better adapted than anything else, to force obtrusively the problem of the chaotic unconscious—which slumbers uneasily beneath the ordered world of consciousness,—before the eyes of every thinking individual? This war has inexorably shown to the man of culture that he is still a barbarian. It testifies also what an iron scourge awaits him, if ever again it should occur

to him to make his neighbour responsible for his own bad qualities. The psychology of the individual corresponds to the psychology of nations. What nations do, each individual does also, and as long as the individual does it, the nation will do it too. A metamorphosis in the attitude of the individual is the only possible beginning of a transformation in the psychology of the nation. The great problems of humanity have never been solved by universal laws, but always and only by a remodelling of the attitude of the individual. If ever there was a time when self-examination was the absolutely indispensable and the only right thing, it is now, in the present catastrophic epoch. But he who bethinks himself about his own being strikes against the confines of the unconscious, which indeed contains precisely that which it is most needful for him to know.

C. G. JUNG.

KÜSNACHT-ZÜRICH,
March, 1917.

CHAPTER XIV

THE PSYCHOLOGY OF THE UNCONSCIOUS PROCESSES^[216]

Being a Survey of the Modern Theory and Method of Analytical Psychology

I.—THE BEGINNINGS OF PSYCHOANALYSIS

In common with other sciences, psychology had to go through its scholastic-philosophic stage, and to some extent this has lasted on into the present time. This philosophic psychology has incurred our condemnation in that it decides *ex cathedra* what is the nature of the soul, and whence and how it derives its attributes. The spirit of modern scientific investigation has summarily disposed of all these phantasies and in their place has established an exact empiric method. We owe to this our present-day experimental psychology or "*psychophysiology*," as the French call it. This new direction originated with Fechner, that Janus-minded spirit, who in his remarkable *Psychophysik* (1860) embarked on the mighty enterprise of introducing the physical standpoint into the conception of psychical phenomena. The whole idea of this work—and not least its astonishing mistakes—proved most fruitful in results. For Wundt, Fechner's young contemporary, carried on his work, and it is Wundt's great erudition, enormous power of work and genius for elaborating methods of experimental research, which have given to modern psychology its prevailing direction.

Until quite recently experimental psychology remained essentially academic. The first notable attempt to utilise some few at any rate of its innumerable experimental methods in the service of practical psychology came from the psychiatrists of the former Heidelberg school (Kræpelin, Aschaffenburg, etc.); it is quite intelligible that the psychotherapists should be the first to feel the urgent need for more exact knowledge of psychic processes.

Next came pedagogy, making its own demands upon psychology. Out of this has recently grown up an "experimental pedagogy," and in this field Neumann in Germany and Binet in France have rendered signal services. The physician, the so-called "nerve-specialist," has the most urgent need of psychological knowledge if he would really help his patients, for neurotic disturbances, such as hysteria, and all things classed as "nervousness," are of psychic origin, and necessarily demand psychic treatment. Cold water, light, air, electricity, magnetism, etc., are only effective temporarily, and quite often are of no use at all. They are frequently introduced into treatment in a not very commendable fashion, simply because reliance is placed upon their suggestive effect. But it is in his soul that the patient is really sick; in those most complicated and lofty functions which we scarcely dare to include in the province of medicine. The doctor must needs, in such a case, be a psychologist, must needs understand the human soul. He cannot evade the urgent demand upon him. So he naturally turns for help to psychology, since his psychiatry text-books have nothing to offer him. But modern experimental psychology is very far from being able to afford him any connected insight into the most vital psychic processes, that is not its aim. As far as possible it tries to isolate those simple elementary phenomena which border on the physiological, and then study them in an isolated state. It quite ignores the infinite variation and movement of the mental life of the individual, and accordingly, its knowledge and its facts are so many isolated details, uninspired by any comprehensive idea capable of bringing them into co-ordination. Hence it comes about that the inquirer after the secrets of the human soul, learns rather less than nothing from experimental psychology. He would be better advised to abandon exact science, take off his scholar's gown, say farewell to his study, and then, strong in manly courage, set out to wander through the world; alike through the horrors of prisons, lunatic asylums and hospitals, through dreary outlying taverns, through brothels and gambling-halls, into elegant drawing-rooms, the Stock Exchanges, socialist meetings, churches, revival gatherings of strange religious sects, experiencing in his own person love and hate and every kind of suffering. He would return laden with richer knowledge than his yard-long text-books could ever have given him, and thus equipped, he can indeed be a physician to his patients, for he understands the soul of man. He may be pardoned if his respect for the "corner-stones" of experimental psychology is no longer very considerable.

There is a great gulf fixed between what science calls "psychology," on the one hand, and what the practice of everyday life expects from psychology on the other.

This need became the starting-point of a new psychology whose inception we owe first and foremost to the genius of Sigmund Freud, of Vienna, to his researches into functional nervous disease. The new type of psychology might be described as "analytical psychology." Professor Bleuler has coined the name "Deep Psychology,"^[217] to indicate that the Freudian psychology takes as its province the deeper regions, the "hinterland" of the soul, the "unconscious." Freud names his method of investigation "psychoanalysis."

Before we approach the matter more closely, we must first consider the relationship of the new psychology to the earlier science. Here we encounter a singular little farce which once again proves the truth of Anatole France's apothegm: "Les savants ne sont pas curieux."

The first important piece of work^[218] in this new field awakened only the faintest echo, in spite of the fact that it offered a new and fundamental conception of the neuroses. Certain writers expressed their approbation, and then, on the next page, proceeded to explain their cases of hysteria in the good old way. It was much as if a man should subscribe fully to the idea of the earth's being spherical, and yet continue to represent it as flat. Freud's next publications^[219] were practically unnoticed, although they contributed findings of immeasurable importance to the domain of psychiatry. When in 1900 he produced the first real psychological elucidation of the dream^[220] (previously there had reigned over this territory a suitable nocturnal darkness), he was ridiculed; and when in the middle of the last decade he began to illumine the psychology of sexuality itself,^[221] and at the same time the "Zürich school" decided to range itself on his side, a storm of abuse, sometimes of the coarsest kind, burst upon him, nor has it yet ceased to rage. At the last South-West German Congress of alienists in Baden-Baden, the adherents of the new psychology had the pleasure of hearing Hoche, University Professor of Psychiatry at Freiburg in Breisgau, describe the movement in a long and much-applauded address, as an outbreak of mental aberration *among doctors*. The old proverb: "Medicus medicum non decimat" was here quite put to shame. How carefully the question had been studied was shewn by the naïve remark of one of the most distinguished

neurologists of Paris, which I myself heard at the International Congress in 1907: "It is true I have not read Freud's works (he did not happen to know any German!), but as for his theories, they are nothing but a *mauvaise plaisanterie*." Freud, dignified, masterly, once said to me, I first became clearly conscious of the value of my discoveries when they were met everywhere with resistance and anger; since that time I have judged the value of my work according to the degree of opposition provoked. It is against my sexual theory that the greatest indignation is felt, so it would seem therein lies my best work. Perhaps after all the real benefactors of mankind are its false teachers, for opposition to the false doctrine pushes men willy nilly into truth. Your truth-teller is a pernicious fellow, he drives men into error."

The reader must now calmly accept the idea that in this psychology he is dealing with something quite unique, if not indeed with some altogether irrational, sectarian, or occult wisdom; for what else could possibly provoke all the scientific authorities to turn away on the very threshold and utterly refuse to cross it?

Accordingly, we must look more closely into this psychology. As long ago as Charcot's time it was recognised that neurotic symptoms are "psychogenic," that is, that they have their origin in the psyche. It was also known, thanks mainly to the work of the Nancy School, that every hysterical symptom can be exactly reproduced by means of suggestion. But *how* a hysterical system arises, and its relationship to psychic causes, were altogether unknown. In the beginning of the eighties Dr. Breuer, an old Viennese doctor, made a discovery^[222] which was really the true starting-point of the new psychology. He had a very intelligent young patient (a woman) suffering from hysteria, who exhibited the following symptoms among others: A spastic paralysis of the right arm, occasional disturbances of consciousness or twilight-states, and loss of the power of speech in so far as she no longer retained any knowledge of her mother-tongue, and could only express herself in English (so-called systematic aphasia). They sought at that time, and still seek, in such a case to establish some theory of anatomical disturbance, although there was just as little disturbance in the arm-centre in the brain as in that of any normal man who boxes another's ears. The symptomatology of hysteria is full of anatomical impossibilities; such as the case of the lady who had lost her hearing completely through

some hysterical malady. None the less she often used to sing, and once when she was singing her doctor sat down at the piano unnoticed by her and softly accompanied her. Passing from one strophe to another he suddenly altered the key, and she, quite unconscious of what she was doing, sang on in the altered key. Thus she heard—yet did not hear. The various forms of systematic blindness present similar phenomena. We have the case of a man suffering from complete hysterical blindness. In the course of the treatment he recovers his sight, but at first, and for some long time, only partially: he could see everything with one exception—people's heads. He saw all the people around him without heads. Thus he saw—yet did not see. From a large number of like experiences it has long been concluded that it is only the patient's consciousness which does not see, does not hear, but the sense-function has nothing at all the matter with it. This state of affairs is directly contradictory to the essence of an organic disturbance, which always materially involves the function.

After this digression let us return to Breuer's case. Since there was no organic cause for the disturbance, the case was clearly to be regarded as hysterical, that is, psychogenic. Dr. Breuer had noticed that if during her twilight-states (whether spontaneous or artificially induced) he let the patient freely express the reminiscences and phantasies that thronged in upon her, her condition was afterwards much improved for some hours. He made systematic use of this observation in her further treatment. The patient herself invented the appropriate name for it of "talking cure" or, in jest, "chimney sweeping."

Her illness began whilst she was nursing her dying father. It is easy to understand that her phantasies busied themselves mainly with this disturbing time. In the twilight-states memories of this period reappeared with photographic fidelity, distinct in every detail: no waking recollection is ever so plastically and exactly reproduced. The term hypermnesia is applied to this heightening of the power of memory, which occurs without difficulty in certain states of contracted consciousness. Remarkable things now came to light. Out of the many things told, one ran somewhat as follows.^[223]

On a certain night she was in a state of great anxiety about her father's high temperature. She sat by his bed, waiting for the surgeon who was coming from Vienna to perform an operation. Her mother had gone out of the room

for a little while, and Anna (the patient) sat by the bed, with her right arm hanging over the back of her chair. She fell into a kind of waking-dream in which she saw a black snake come out from the wall and approach the sick man, prepared to bite. (It is very probable that some real snakes had been seen in the fields behind the house, and that she had been frightened by them; this would furnish the material for her hallucination.) She wanted to drive the creature away, but felt paralysed; her right arm, hanging over the chair, had "gone to sleep," was anæsthetic and paretic, and as she looked her fingers turned into little snakes with death's heads (the nails). Probably she tried to drive the snake away with her paralysed right hand, and thereby the anæsthesia and paralysis became associated with the snake-hallucination. Even after the snake had disappeared, her terror remained great. She tried to pray, but found she had no words in any language, until at length she managed to remember some English nursery rhymes, and then she could go on thinking and praying in that language.

This was the actual scene in which the paralysis and speech-disturbance arose; the describing it served to remove the speech-trouble, and in this same fashion the case was finally completely cured.

I must restrict myself to this one instance. In Breuer and Freud's book there is a wealth of similar examples. It is easy to understand that scenes such as these make a very strong impression, and accordingly there is an inclination to attribute a causal significance to them in the genesis of the symptoms. The then current conception of hysteria, arising from the English "nervous shock" theory, which Charcot strongly supported, came in conveniently to elucidate Breuer's discovery, hence arose the *trauma-theory* maintaining that the hysterical symptom and in so far as the symptoms comprise the disease, hysteria itself, arises from some *psychic injury* (or *trauma*), the effect of which is retained in the unconscious indefinitely. Freud, working as Breuer's colleague, amply confirmed this discovery. It was fully demonstrated that not one out of the many hundred hysterical symptoms came down ready made from heaven; they had already been conditioned by past psychic experiences. To some extent, therefore, this new conception opened up a field of very important empirical work. But Freud's tireless spirit of inquiry could not long rest content at this superficial layer, since already there obtruded deeper and more difficult problems. It is obvious enough that moments of great fear and anxiety, such as Breuer's patient

went through, would leave behind a lasting effect, but how is it that these happenings are themselves already deeply stamped with the mark of morbidity? Must we suppose that the trying sick-nursing in itself produce such a result? If so, such effects should occur much more frequently, for there are, unfortunately, many trying cases of sick-nursing, and the nurse's nervous constitution is by no means always of the soundest. To this problem medicine gives its admirable answer; the "x" in the calculation is *predisposition*; there is a tendency to these things. But for Freud the problem was, what exactly constitutes this predisposition? This question led logically to an investigation of all that had preceded the psychic trauma. It is a matter of common observation that distressing scenes have markedly different effects upon the different participants, and that things which to some are quite indifferent or even pleasant, such as frogs, mice, snakes, cats, excite the greatest aversion in others. There are the cases of women who can calmly be present at a very bad operation, but who tremble all over with horror and nausea at the touch of a cat. By way of illustration let me give the case of a young lady suffering from severe hysteria following a sudden fright.^[224] She had been at a social gathering, and was on her way home at midnight accompanied by several acquaintances, when a carriage came up behind them at full speed. All the others moved out of the way, but she, beside herself with fright, ran down the middle of the road just in front of the horses. The coachman cracked his whip and cursed and swore in vain. She ran down the whole length of the street till a bridge was reached. There her strength failed her, and to escape the horses' feet in her despair she would have jumped into the water had not passers-by prevented her. This same lady happened to be in Petrograd during that sanguinary Revolution of the 22nd of January, and saw a street cleared by the volleys of soldiers. All around her people were dropping down dead or wounded, but she retained her calmness and self-possession, and caught sight of a door which gave her escape into another street. These terrible moments agitated her neither at the time nor later on. She was quite well afterwards, indeed felt better than usual.

Essentially similar reactions can quite often be observed. Hence it follows that the intensity of the trauma is of small pathogenic importance; the peculiar circumstances determine its pathogenic effect. Here, then, we have the key which enables us to unlock at least one of the anterooms to an

understanding of predisposition. We must now ask what were the unusual circumstances in this carriage scene? The terror and apprehension began as soon as the lady heard the trampling horses. For a moment she thought this portended some terrible fate, her death, or something equally frightful; the next, she lost all sense of what she was doing.

This powerful impression was evidently connected in some way with the horses. The predisposition of the patient to react in such an exaggerated fashion to a not very remarkable incident, might result from the fact that horses had some special significance for her. It might be suspected that she had experienced some dangerous accident with them; this actually turned out to be the case. When a child of about seven years old she was out for a drive with the coachman; the horses shied and galloped at full speed towards a steep river-bank. The coachman jumped down, and shouted to her to do the same, but in her extreme terror she could scarcely bring herself to obey. She did, however, just manage to jump out in the nick of time, whilst the horses and carriage were dashed to pieces below. No proof is needed that such an experience must leave a lasting impression behind it. But it does not offer any explanation for such an exaggerated reaction to an inadequate stimulus. So far we only know that this later symptom had its prologue in childhood, but its pathological aspect remains obscure. To penetrate into the heart of such a mystery it was necessary to accumulate further material. And the greater our experience the clearer does it become that in all cases with such traumatic experiences analysed up to the present, there co-exists a special kind of disturbance which can only be described as a derangement in the sphere of *love*. Not all of us give due credit to the anomalous nature of love, reaching high as heaven, sinking low as hell, uniting in itself all extremes of good and evil, of lofty and low.^[225]

As soon as Freud recognised this, a decisive change came about in his view. In his earlier researches, whilst more or less dominated by Charcot's trauma-theory, he had sought for the origin of the neurosis in actual traumatic experiences; but now the centre of gravity shifted to a very different point. This is best demonstrated by reference to our case; we can understand that horses might easily play a significant part in the patient's life, but it is not clear why there should be this later reaction, so exaggerated, so uncalled for. It is not her fear of horses which forms the morbid factor in this curious story; to get at the real truth we must

remember our empirical conclusion, that, side by side with traumatic experiences, there is also invariably present some disturbance in the sphere of love. We must now go on to inquire whether perhaps there is anything unsatisfactory in this respect in the case under review.

Our patient has a young man friend, to whom she is thinking of becoming engaged, she loves him and expects to be happy with him. At first nothing more is discoverable; but the investigator must not let himself be deterred by a negative result in the beginning of this preliminary questioning. When the direct way does not lead to the desired end, an indirect way may be taken. We accordingly turn our attention back to that strange moment when she ran away in front of the horses. We inquire who were her companions and what kind of social gathering was it, and find it was a farewell-party to her best friend, on her departure to a foreign health-resort on account of a nervous breakdown. We are told this friend is happily married and is the mother of one child. We may well doubt the assertion that she is happy. If she really were so, it is hardly to be supposed she would be "nervous" and in need of a cure. When I attacked the situation from a different vantage-ground, I learnt that our patient—after this episode—had been taken by her friends to the nearest safe place—her host's house. In her exhausted state he took charge of her. When the patient came to this part of her story, she suddenly broke off, was embarrassed, fidgeted and tried to turn the subject. Evidently some disagreeable reminiscences had suddenly cropped up. After obstinate resistances had been overcome, she admitted something very strange had happened that night. Her host had made her a passionate declaration of love, thus occasioning a situation that, in the absence of his wife, might well be considered both painful and difficult. Ostensibly this declaration came upon her like a "bolt from the blue." But a small dose of criticism applied to such an assertion soon apprises us that these things never do drop suddenly from the sky; they always have their previous history. It was a task of the following weeks to dig out piecemeal a long love-story. I will attempt to sketch in the picture as it appeared finally.

As a child the patient was a thorough tomboy, loved boys' boisterous games, laughed at her own sex, and would have nothing to do with feminine ways or occupations. After puberty, just when the sex-issue should have meant much to her, she began to shun all society; she seemingly hated and despised everything which could remind her even remotely of the biological

destiny of mankind, and lived in a world of phantasy which had nothing in common with rude reality. Thus, till her twenty-fourth year, she escaped all the little adventures, hopes and expectations which ordinarily move a girl at this age. But finally she got to know the two men who were destined to destroy the thorny hedge which had grown up around her. Mr. A. was her best friend's husband; Mr. B. was their bachelor-friend. She liked both; but pretty soon found B. the more sympathetic, and an intimacy grew up between them which made an engagement seem likely. Through her friendship with him and with Mrs. A., she often met Mr. A. His presence excited her inexplicably, made her nervous. Just at this time she went to a big party. All her friends were there. She became lost in thought, and in a reverie was playing with her ring, when suddenly it slipped out of her hand and rolled under the table. Both men tried to find it and Mr. B. managed to get it. With a meaning smile he put the ring back on her finger, and said, "You know what that means!" Overcome by some strange, irresistible feeling, she tore the ring from her finger and flung it out of the open window. Naturally a painful moment for all ensued, and she soon went away, much depressed. A little while after, so-called chance brought her for her summer holidays to the health-resort where A. and his wife were staying. It was then that Mrs. A. began to suffer from nerve-trouble, and frequently felt too unwell to leave the house. So our patient could often go out for walks alone with A. One day they were out in a small boat. She was boisterously merry and fell overboard. Mr. A. saved her with difficulty as she could not swim, and he managed to lift her into the boat in a half-unconscious state. Then he kissed her. This romantic event wove fast the bonds between them. In self-defence she did her best to get herself engaged to B. and to persuade herself that she loved him. Of course this queer comedy could not escape the sharp eye of feminine jealousy. Mrs. A., her friend, guessed the secret, and was so much upset by it that her nervous condition grew bad enough to necessitate her trying a cure at a foreign health-resort. At the farewell gathering the demon came to our patient and whispered: "To-night he will be alone, something must happen to you so that you can go to his house." And so indeed it came about; her strange behaviour made her friends take her to his house, and thus she achieved her desire.

After this explanation the reader will probably be inclined to assume that only diabolical subtlety could think out and set in motion such a chain of

circumstances. There is no doubt about the subtlety, but the moral evaluation is less certain. I desire to lay special emphasis upon the fact that the patient was *in no sense conscious of the motives* of this dramatic performance. The incident apparently just came about of itself without any conscious motive whatsoever. But the whole previous history makes it perfectly clear that everything was most ingeniously directed towards the other aim; whilst the conscious self was apparently working to bring about the engagement to Mr. B., the unconscious compulsion to take the other road was still stronger.

So once more we must return to our original question, whence comes the pathological, the peculiar and exaggerated reaction to the trauma? Relying on a conclusion obtained from other analogous experiences, we ventured the conjecture that in the present case we had to do with a disturbance in the love-life, in addition to the trauma. This supposition was thoroughly borne out; the trauma, which was apparently the cause of the illness, was merely the *occasion* for some factor, till then unconscious, to manifest itself. This was the *significant erotic conflict*. With this finding the trauma loses its pathogenic significance and is replaced by a much deeper and more comprehensive conception, which regards the erotic conflict as the pathogenic agent. This conception may be described as the sexual theory of the neurosis.

I am often asked why it is just the erotic conflict rather than any other which is the cause of the neurosis. There is but one answer to this. No one asserts that this ought necessarily to be the case, but as a simple matter of fact it is always found to be so, notwithstanding all the cousins and aunts, godparents, and teachers, who rage against it. Despite all the indignant assertions to the contrary, the problem and conflicts of love are of fundamental importance for humanity,^[226] and with increasingly careful study, it comes out ever more clearly that the love-life is of immensely greater importance than the individual suspects.

As a consequence of the recognition that the true root of the neurosis is not the trauma, but the hidden erotic conflict, the trauma loses its pathogenic significance.

II.—THE SEXUAL THEORY.

Thus, it will be seen, the theory had to be shifted on to an entirely different basis, for the investigation now had to face the erotic conflict itself. Our example shows that this contains extremely abnormal elements and cannot, *primâ facie*, be compared with an ordinary love conflict. It is surprising, indeed hardly credible, that only the postulated affection should be conscious, whilst the real passion remained unknown to the patient. But in this case it is beyond dispute that the real erotic relation remained unilluminated, whilst the field of consciousness was dominated by the assumption. If we try to formulate this fact, something like the following proposition results: *in a neurosis*, two erotic tendencies exist which stand in extreme opposition to one another, and one at least is unconscious. Against this formula the objection can be raised that it has obviously been derived from this one particular case, and is therefore lacking in general validity. The criticism will be the more readily urged because no one unpossessed of special reasons is willing to admit that the erotic conflict is of universal prevalence. On the contrary, it is assumed that this conflict belongs more properly to the sphere of novels, since it is generally depicted as something in the nature of such wild adventures as are described by Karin Michaelis in her "Aberrations of Marriage," or by Forel in "The Sexual Question." But indeed this is not the case; for we know the wildest and most moving dramas are not played on the stage, but every day in the hearts of ordinary men and women who pass by without exciting attention, and who betray to the world, save through the symbol of a nervous breakdown, nothing of the conflicts that rage within them. But what is so difficult for the layman to grasp is the fact that in most cases patients have no suspicion whatever of the internecine war raging in their unconscious. But remembering that there are many people who understand nothing at all about themselves, we shall be less surprised at the realisation that there are also people who are utterly unaware of their actual conflicts.

If the reader is now inclined to admit the possible existence of pathogenic, and perhaps even of unconscious conflicts, he will certainly protest that they are not erotic conflicts. If this kind reader should happen himself to be somewhat nervous, the mere suggestion will arouse his indignation, for we are all inclined, as a result of our education in school and at home, to cross ourselves three times where we meet such words as "erotic" and "sexual"—and so we are conveniently able to think that nothing of that nature exists,

or at least very seldom, and at a great distance from ourselves. But it is just this attitude which in the first instance brings about neurotic conflicts.

We recognise that the course of civilisation consists in the progressive mastering of the animal element in man; it is a process of domestication which cannot be carried through without rebellion on the part of the animal nature still thirsting for its liberty. Humanity forces itself to endure the restrictions of the civilising process; but from time to time there comes a frenzied bursting of all bonds. Antiquity had experience of it in that wave of Dionysian orgies, surging hither from the East, which became an essentially characteristic element of antique culture. Its spirit was partly instrumental in causing the numerous sects and philosophic schools of the last century before Christ, to develop the Stoic ideal into asceticism; and in producing from the polytheistic chaos of those times, the ascetic twin-religions of Mithras and of Christ. A second clearly marked wave of the Dionysian impulse towards freedom swept over the Western world during the Renaissance. It is difficult to judge of one's own time, but we gain some insight if we note how the Arts are developing, what is the prevailing type of public taste, what men read and write, what societies they found, what "questions" are the order of the day, and against what the Philistines are fighting. We find in the long list of our present social problems that the sexual question occupies by no means the last place. It agitates men and women who would shake the foundations of sexual morality, and throw off the burden of moral shame which past centuries have heaped upon Eros. The existence of these aspirations and endeavours cannot be simply denied, or declared indefensible; they exist and are therefore presumably not without justification. It is both more interesting and more useful to study carefully the basic causes of these movements than to chime in with the lamentations of the professional mourners over morals, who prophesy with unction the moral downfall of humanity. The moralist least of all trusts God, for he thinks that the beautiful tree of humanity can only thrive by dint of being pruned, bound, and trained on a trellis, whereas Father-Sun and Mother-Earth have combined to make it grow joyfully in accordance with its own laws, which are full of the deepest meaning.

Serious people are aware that a very real sexual problem does exist at the present time. The rapid development of the towns, coupled with methods of work brought about by the extraordinary division of labour, the increasing

industrialisation of the country and the growing security of life, combine to deprive humanity of many opportunities of expending emotional energy. Think of the life of the peasant, whose work so rich and full of change, affords him unconscious satisfaction by means of its symbolic content; a like satisfaction the factory-hand and the clerk can never know. Think of a life with nature; of those wonderful moments when, as lord and fructifier, man drives the plough through the earth, and with kingly gesture scatters the seed of the future harvest; see his justifiable awe before the destructive power of the elements, his joy in the fruitfulness of his wife, who gives him daughters and sons, who mean to him increased working power and enhanced prosperity. Alas! from all this we town-dwellers, we modern machines, are far, far removed.

Must we not admit that we are already deprived of the most natural and most beautiful of all satisfactions, since we can no longer contemplate the arrival of our own seed, the "blessing" of children, with unmixed pleasure? Marriages where no artifices are resorted to are rare. Is this not an all-important departure from the joys which Mother Nature gave her first-born sons? Can such a state of affairs bring satisfaction? Note how men slink to their work, watch their faces at an early morning hour in the tram-cars. One of them makes his little wheels, and another writes trivial things which do not interest him. What wonder is it if such men belong to as many clubs as there are days in the week, and that among women little societies flourish, where they pour out on some particular hero or cause those unsatisfied desires which the man dulls at his restaurant or club, imbibing beer and playing at being important? To these sources of dissatisfaction is added a more serious factor. Nature has provided defenceless, weaponless man with a great amount of energy to enable him not merely to bear passively the grave dangers of existence, but also to conquer them. Mother Nature has equipped her son for tremendous hardships and has placed a costly premium on the overcoming of them, as Schopenhauer quite understood when he said that "happiness is really but the termination of unhappiness." Civilized people are, as a rule, shielded from the immediately pressing dangers, and they are therefore daily tempted to excess, for in man the animal always becomes rampant when he is not constrained by fierce necessity. Are we then indeed unrestrained? In what orgiastic festivals do we dispose of the surplus of vital power? Our moral views do not permit us that outlet.

But reckon up in how many directions we are met by unsatisfied longings; the denial of procreation and begetting, for which purpose nature has endowed us with great energy; the unending monotony of our highly developed modern methods of "division of labour," which excludes any interest in the work itself; and above all our effortless security against war, lawlessness, robbery, epidemics, infant and woman mortality—all this gives a sum of surplus energy which must needs find an outlet. But how? A relatively few create quasi-natural dangers for themselves in reckless sport; many more, seeking to find some equivalent for their more primitive energy, take to alcoholic excess; others expend themselves in the rush of money-making, or in the morbid performance of duties, in perpetual over-work. By such means they try to escape a dangerous storing-up of energy which might force mad outlets for itself. It is for such reasons that we have to-day a *sexual question*. It is in this direction that men's energy would like to expend itself as it has done from time immemorial in periods of security and abundance. Under such circumstances it is not only rabbits that multiply; men and women, too, become the sport of these accesses of nature: the sport, because their moral views have confined them in a narrow cage, the excessive narrowness of which was not felt so long as harsh external necessity pressed upon them with even greater constraint. But now the man of the cities finds the space too circumscribed. He is surrounded by alluring temptation, and like an invisible *procureur* there slinks through society the knowledge of preventive methods which evade all consequences. Why then moral restraint? Out of religious consideration for an angry God? Apart from the prevalence of widespread unbelief, even the believing man might quietly ask himself whether, if he himself were God, he would punish the youthful erotic uncontrol of John and Mary with twice twenty-four years of imprisonment and seething in boiling oil. Such ideas are no longer compatible with our decorous conception of God. The God of our time is necessarily much too tolerant to make a great fuss over it; (knaveishness and hypocrisy are a thousand times worse). In this way the somewhat ascetic and hypocritical sexual morality of our time has had the ground cut from under its feet. Or is it the case that we are now protected from dissoluteness by superior wisdom, recognition of the nothingness of human happenings? Unfortunately we are very far from that; rather does the hypnotic power of tradition keep us in bonds, and through cowardice and thoughtlessness and habit the herd goes tramping on in this same path. But

man possesses in the unconscious a fine scent for the spirit of his time; he has an inkling of his own possibilities and he feels in his innermost heart the instability of the foundations of present-day morality, no longer supported by living religious conviction. It is thus the greater number of the erotic conflicts of our time originate. Instinct thirsting for liberty thrusts itself up against the yielding barriers of morality: men are tempted, they desire and do not desire. And because they will not and cannot think out to its logical conclusion what it is they really desire, their erotic conflict is largely unconscious; whence comes neurosis. Neurosis then is most intimately bound up with the problem of our times and represents an unsuccessful attempt of the individual to solve the general problem in his own person. Neurosis is a tearing in two of the *inner self*. For most men the reason of this cleavage is the fact that their conscious self desires to hold to its moral ideal, whilst the unconscious strives after the amoral ideal, steadfastly rejected by the conscious self. People of this kind would like to appear more decent than they really are. But the conflict is often of an opposite kind. There are those who do not outwardly live a decent life at all and do not place the slightest constraint upon their sexuality, but in reality this is a sinful pose assumed for goodness knows what reasons, for down below they have a decorous soul which has somehow gone astray in their unconscious, just as has the real immoral nature in the case of apparently moral people. Extremes of conduct always arouse suspicions of the opposite tendencies in the unconscious.

It was necessary to make this general statement in order to elucidate the idea of the "erotic conflict" in analytical psychology, for it is the key to the conception of neurosis. We can now proceed to consider the psychoanalytic technique. Obviously the main problem is, how to arrive by the shortest and best path at a knowledge of the patient's "unconscious." The method first used was hypnotism, the patient being questioned, on the production of spontaneous phantasies observed while in a state of hypnotic concentration. This method is still occasionally used, but in comparison with the present technique is primitive and frequently unsatisfactory. A second method, evolved by the Psychiatric Clinic, Zürich, was the so-called association method,^[227] which is chiefly of theoretic, experimental value. Its result is an extensive, though superficial orientation, concerning the unconscious

conflict ("complex").^[228] The more penetrating method is that of dream-analysis whose discovery belongs to Sigmund Freud.^[229]

Of the dream it can be said that "the stone which the builders rejected has become the head of the corner." It is only in modern times that the dream (that fleeting and seemingly insignificant product of the soul), has met with such complete contempt. Formerly it was esteemed, as a harbinger of fate, a warning or a consolation, a messenger of the gods. Now we use it as a messenger of the unconscious; it must disclose to us the secrets which our unconscious self enviously hides from our consciousness, and it does so with astonishing completeness.

On analytical investigation it becomes plain that the dream, as we remember it, is only a façade which conceals the contents within the house. But if, observing certain technical rules, we get the dreamer to talk about the details of his dream, it soon appears that his free associations group themselves in certain directions and round certain topics. These appear to be of personal significance, and have a meaning which at first sight would not be suspected. Careful comparison shows that they are in close and subtle symbolic connection with the dream-façade.^[230] This particular complex of ideas in which all the threads of the dream unite, is the conflict for which we are seeking; is its particular form at the moment, conditioned by the immediate circumstances. What is painful and incompatible is in this way so covered up or split that we can call it a wish-fulfilment; but we must immediately add that the wishes fulfilled in the dream do not seem at first sight to be *our* wishes, but rather the very opposite. For instance, a daughter loves her mother tenderly, but she dreams that her mother is dead; this causes her great grief. Such dreams, where apparently there is no trace of any wish-fulfilment are innumerable, and are a constant stumbling-block to our learned critics, for—*incredible dictu*—they still cannot grasp the simple distinction between the *manifest* and the *latent* content of the dream. We must guard against such an error; the conflict dealt with in the dream is an unconscious one, and equally so also is the manner its solution. Our dreamer has, as a matter of fact, the wish to get away from her mother—expressed in the language of the unconscious, she wants her mother to die. Now we know that a certain section of the unconscious contains all our lost memories, and also all those infantile impulses that cannot find any application in adult life—a series, that is, of ruthless childish desires. We

may say that for the most part the unconscious bears an infantile stamp; like the child's simple wish: "Daddy, when Mummie is dead, will you marry me?" In a dream that infantile expression of a wish is the substitute for a recent wish to marry, which is painful to the dreamer for reasons still undiscovered. This thought, or rather the seriousness of its corresponding intention, is said to be "repressed into the unconscious" and must there necessarily express itself in an infantile way, for the material which is at the disposal of the unconscious consists chiefly of infantile memories. As the latest researches of the Zürich school have shown,^[231] these are not only infantile memories but also "racial" memories, extending far beyond the limits of individual existence.

Important desires which have not been sufficiently gratified, or have been "repressed," during the day find their symbolic substitution in dreams. Because moral tendencies usually predominate in waking hours, these ungratified desires which strive to realise themselves symbolically in the dream are, as rule, erotic ones. It is, therefore, somewhat rash to tell dreams before one who understands, for the symbolism is often extremely transparent to him who knows the rules! The clearest in this respect are "anxiety-dreams" which are so common, and which invariably symbolise a strong erotic desire.

Often the dream apparently deals with quite irrelevant details, thereby making a ridiculous impression; or else it is so unintelligible that we are simply amazed at it, and accordingly have to overcome considerable resistance in ourselves before we can set to work seriously to unravel its symbolic weaving by patient work. But when at last we penetrate into its real meaning we find ourselves at a bound in the very heart of the dreamer's secrets, and find to our astonishment that an apparently senseless dream is quite full of sense, and deals with extraordinarily important and serious problems of the soul. Having acquired this knowledge we cannot refrain from giving rather more credit to the old superstitions concerning the meaning of dreams for which our rationalising tendencies, until lately, had no use.

As Freud says: "Dream-analysis is the *via regia* to the unconscious." Dream-analysis leads us into the deepest personal secrets, and it is therefore an invaluable instrument in the hand of the psychotherapist and educator.

The objections of the opponents of this method are based, as might be expected, upon argument, which (setting aside undercurrents of personal feeling) show the bias of present-day Scholasticism. It so happens that it is just the analysis of dreams which mercilessly uncovers the deceptive morals and hypocritical affectations of man, and shows him the under side of his character; can we wonder if many feel that their toes have been rather painfully trodden upon? In connection with the dream-analysis I am always reminded of the striking statue of Carnal Pleasure in Bâle Cathedral, which shows in front the sweet smile of archaic sculpture, but behind is covered with toads and serpents. Dream-analysis reverses the figure and for once shows the other side. The ethical value of this reality-correction (Wirklichkeitscorrectur) cannot be disputed. It is a painful but extremely useful operation, which makes great demands on both physician and patient.

Psychoanalysis, in so far as we are considering it as a therapeutic technique, consists mainly of the analysis of many dreams; the dreams in the course of the treatment bringing up successively the contents of the unconscious in order that they may be subjected to the disinfecting power of daylight, and in this process many a valuable thing believed to have been lost is found again. It is not surprising that for those persons who have adopted a certain pose towards themselves, psychoanalysis is at times a real torture, since in accordance with the old mystic saying, "Give all thou hast, then only shalt thou receive," there is first the necessity to get rid of almost all the dearly cherished illusions, to permit the advent of something deeper, finer, and greater, for only through the mystery of self-sacrifice is it possible to be "born-again." It is indeed ancient wisdom which again sees the daylight in psychoanalytic treatment, and it is a curious thing that this kind of psychic re-education proves to be necessary at the height of our modern culture; this education which in more than one respect can be compared to the technique of Socrates, even though psychoanalysis penetrates to much greater depths.

We always find in a patient some conflict, which at a particular point, is connected with the great problems of society; so that when the analysis has arrived at this point the apparently individual conflict is revealed as a universal conflict of the environment and the epoch. Neurosis is thus, strictly speaking, nothing but an individual attempt, however unsuccessful, at a solution of the general problem; it must be so, for a general problem, a

"question," is not an end in itself; it only exists in the hearts and heads of individual men and women. The "question" which troubles the patient is—whether you like it or not—the "sexual" question, or more precisely, the problem of present-day *sexual morality*. His increased demands upon life and the joy of life, upon glowing reality, can stand the necessary limitations which *reality* sets, but not the arbitrary, ill-supported prohibitions of present-day morals, which would curb too much the creative spirit rising up from the depths of the darkness of the beasts that perish. For the *neurotic has in him the soul of a child* that can but ill-endure arbitrary limitations of which it does not see the meaning; it tries to adopt the moral standard, but thereby only falls into deeper disunion and distress within itself. On the one hand it tries to suppress itself, and on the other to free itself—this is the struggle that is called Neurosis. If this conflict were altogether clear to consciousness it would of course never give rise to neurotic symptoms; these only arise when we cannot see the other side of our character, and the urgency of the problems of that other side. In these circumstances symptoms arise which partially express what is unrecognised in the soul. The symptom is, therefore, an indirect expression of unrecognised desires, which, were they conscious, would be in violent opposition to the sufferer's moral views. As we have already said, this dark side of the soul does not come within the purview of consciousness, and therefore the patient cannot deal with it, correct it, resign himself to it, or renounce it, for he cannot be said to *possess* the unconscious impulses. By being repressed from the hierarchy of the conscious soul, they have become *autonomous complexes* which can be brought again under control by analysis of the unconscious, though not without great resistance. There are a great many patients whose great boast it is that the erotic conflict does not exist for them; they are sure that the sexual question is nonsense, that they have, so to say, no sexuality. These people do not see that other things of unknown origin cumber their path, such as hysterical whims, underhand tricks, from which they make themselves, or those nearest them, suffer; nervous stomach-catarrh, pain here and there, irritability without reason, and a whole host of nervous symptoms. All which things show what is wrong with them, for relatively, only a few specially favoured by fate, avoid the great conflict.

Analytical psychology has already been reproached with setting at liberty the animal instincts of men, hitherto happily repressed, and causing thereby untold harm. This childish apprehension clearly proves how little trust is

put in the efficacy of present-day moral principles. It is pretended that only morals can restrain men from dissoluteness; a much more efficient regulator, however, is *necessity*, which sets much more real and convincing bounds than any moral principles. It is true that analysis liberates animal instincts, but not, as some have said, just in order to let them loose, but rather to make them available for higher application, in so far as this is possible to the particular individual, and in so far as such "sublimated" application is required. Under all circumstances it is an advantage to be in full possession of one's own personality, for otherwise the repressed desires will get in the way in a most serious manner, and overthrow us just in that place where we are most vulnerable. It is surely better that a man learn to tolerate himself, and instead of making war on himself convert his inner difficulties into real experiences, rather than uselessly repeat them again and again in phantasy. Then at least he lives, and does not merely consume himself in fruitless struggles. But when men are educated to recognise the baser side of their own natures, it may be hoped they will learn to understand and love their fellow-men better too. A decrease of hypocrisy and an increase of tolerance towards oneself, can have only good results in tolerance towards one's neighbours, for men are only too easily disposed to extend to others the unfairness and violence which they do to their own natures.

Freud's theory of repression does, indeed, seem to postulate the existence only of people who, being too moral, are continually repressing the immorality of their natural instincts. According to this idea, the immoral man who allows his natural instincts an unbridled existence should be proof against neurosis. But daily experience proves this is obviously not the case; he may be just as neurotic as other men. If we analyse him, we find that it is simply his decency that has been repressed. Therefore, when an immoral man is neurotic, he represents what Nietzsche appropriately described as "the pale criminal," a man who does not stand upon the same level as his deed.^[232]

The opinion may be held, that in such a case the repressed remnants of decency are merely infantile traditional legacies, that impose unnecessary fetters upon natural instincts, for which reason they should be eradicated. The principle "écraser l'infâme" would be the natural culmination of such an absolute let-instinct-live theory.^[233] That would obviously be quite

phantastic and nonsensical. It should, indeed, never be forgotten—and the Freudian School needs this reminder—that morality was not brought down upon tables of stone from Sinai and forced upon the people, but that morality is a function of the human soul, which is as old as humanity itself. Morality is not inculcated from without. Man has it primarily within himself—not the law indeed, but the essence of morals.

After all, does a more moral view-point exist than the let-instinct-live theory? Is there a more heroic morality than this? That is why Nietzsche, the heroic, is especially partial to it. It is natural and inborn cowardice that makes people say, "God preserve me from following my instincts," thinking that they thus prove their high moral standard. They do not understand that following one's bent is really much too costly for them, too strenuous, too dangerous, and finally it cuts somewhat against that sense of decency which most people associate rather with taste than with a categorical imperative. The unpardonable fault of the let-instinct-live theory is, that it is much too heroic, too ideologic for the multitude.

There is, therefore, probably no other way for the immoral man but to accept the moral corrective of his unconscious, just as he who is moral must come to terms as best he may, with his demons of the netherworld. It cannot be gainsaid that the Freudian School is so convinced of the fundamental, and even exclusive importance of sexuality in neurosis, that it has been courageous enough to face the consequences of its convictions by heroically attacking the sexual morality of the present day. Many different opinions prevail upon this subject. What is significant is, that the problem of sexual morality is being widely discussed at the present time. This is doubtless both useful and necessary, for hitherto we have not really had any sexual morality at all, but merely a low barbaric view, quite insufficiently differentiated. In the Middle Ages, usury was considered absolutely despicable, for at that time the morality of finance was not casuistically differentiated; there was nothing but a kind of lump-morality. So nowadays, there exists nothing but sexual morality in the lump. A girl who has an illegitimate child is condemned, without any inquiry as to whether she is a decent person or not. Any form of love that has no legal sanction is immoral, no matter whether it occurs between thoughtful people of value or irresponsible scamps. People are still barbarically hypnotised by the thing itself, to such an extent that they forget the individual.

Therefore the discussion of and attack upon sexual morality of the present day signifies at bottom, a moral deed, constraining people towards a differentiated and really ethical conception of the subject.

As already stated, Freud sees the great conflict between the ego and natural instinct chiefly under its sexual aspect. This aspect does exist, but a big query should be placed behind its actuality. The question is whether what appears in a sexual form must always essentially be sexuality? It is conceivable that one instinct may disguise itself under another. Freud himself has supplied several notable instances of such a disguise, proving therewith, convincingly, that many of the deeds and aims of human kind are, at bottom, nothing but somewhat figurative expressions substituted, on account of embarrassment, in place of important elementary things. The substitution is not seen through on account of reasons of mutual consideration. There is nothing to hinder certain elementary things being also pushed conveniently into the foreground, in place of more necessary but less pleasant ones, under the illusion that the elementary things only are really in question.

The theory of sexuality although one-sided is absolutely right up to a certain point. It would, therefore, be just as false to repudiate it as to accept it as universally valid.

III.—THE OTHER VIEWPOINT: THE WILL TO POWER.

We have so far considered the problem of the psychology of unconscious processes mainly from the point of view of Freud. We have thereby doubtless gained an inkling of a real truth, which perhaps our pride, our consciousness of civilisation, tries to deny, although something else in us affirms it. This situation is extremely irritating to some people, arousing resistances, and at the same time they are terror-stricken by it, a fact which they are most unwilling to acknowledge. There is something terrible in admitting this conflict, for it is an acknowledgment of being swayed by instinct. Has it ever been understood what it means to confess to the sway of instinct? Nietzsche desired to be so swayed and advocated it most seriously. He even sacrificed himself throughout his whole life, with rare passion, to the idea of the Superman, that is to the idea of the man who, obeying his instincts, transcends even his very self. And what was the

course of his life? It turned out as Nietzsche himself prophesied in the passage in "Zarathustra" relating to the fatal fall of the rope-dancer, of the man who did not want to be "surpassed." Zarathustra says to the dying rope-dancer: "Thy soul will be dead even sooner than thy body." And later, the dwarf says to Zarathustra: "Oh, Zarathustra, thou stone of wisdom! Thou threwest thyself high, but every thrown-stone must fall! Condemned of thyself, and to thine own stoning: oh, Zarathustra, far indeed threwest thou the stone—but upon *thyself* will it recoil!"

When he cried his "ecce homo" over himself, it was again too late, and the crucifixion of the soul began even before the body was dead. He who thus taught *yea-saying* to the instincts of life, must have his own career looked at critically, in order to discover the effects of this teaching upon the teacher. But if we consider his life from this point of view, we must say that Nietzsche lived *beyond instinct*, in the lofty atmosphere of heroic "sublimity." This height could only be maintained by means of most careful diet, choice climate and above all by many opiates. Finally, the tension of this living shattered his brain. He spoke of *yea-saying*, but lived the nay. His horror of people, especially of the animal man, who lives by instinct, was too great. He could not swallow the toad of which he so often dreamt, and which he feared he must yet gulp down. The Zarathustrian lion roared all the "higher" men, who craved for life, back into the cavernous depths of the unconscious. That is why his life does not convince us of the truth of his teaching. The "higher man" should be able to sleep without chloral, and be competent to live in Naumburg or Basle despite "the fogs and shadows." He wants woman and offspring; he needs to feel he has some value and position in the herd, he longs for innumerable commonplaces, and not least for what is humdrum: it is this instinct that Nietzsche did not recognise; it is, in other words, the natural animal instinct for life.

But how did he live if it was not from natural impulse? Should Nietzsche really be accused of a practical denial of his natural instincts? He would hardly agree to that; indeed he might even prove, and that without difficulty, that he really was following his instincts in the highest sense. But we may well ask how is it possible that human instincts could have led him so far from humanity, into absolute isolation, into an aloofness from the herd which he supported with loathing and disgust? One would have thought that instinct would have united, would have coupled and begot, that it would

tend towards pleasure and good cheer, towards gratification of all sensual desires. But we have quite overlooked the fact that this is only one of the possible directions of instinct. There exists not only the instinct for the preservation of the species (the sexual instinct), but also the instinct for the preservation of the self.

Nietzsche obviously speaks of this latter instinct, that is of *the will to power*. Whatever other kinds of instinct may exist are for him only a consequence of the will to power. Viewed from the standpoint of Freud's sexual-psychology this is a gross error, a misconception of biology, a bad choice made by a decadent neurotic human being. For it would be easy for any adherent of sexual psychology to prove that all that was too lofty, too heroic, in Nietzsche's conception of the world and of life, was nothing but a consequence of the repression and misconception of "instinct," that is of the instinct that *this* psychology considers fundamental.

This brings us to the *question of perception*, or rather it were better to say of the various lenses through which the world may be perceived. For it would hardly be permissible to pronounce a judgment on a life like Nietzsche's. It was lived with rare consistency, from the beginning to the fateful end, in accordance with his underlying natural fundamental instinct for power. It would hardly do to pronounce it to be merely figurative, otherwise we should make the same unjust condemnation that Nietzsche pronounced upon his polar opposite Richard Wagner, of whom he said, "*Everything in him is false; what is genuine is hidden or disguised. He is an actor, in every bad and good meaning of the word.*" Why this judgment? Wagner is a precise representative of that other fundamental instinct, which Nietzsche overlooked, and upon which Freud's psychology is based. If we inquire whether the other main instinct—that of power—was unconsidered by Freud, we shall find that he has included it under the name of the "ego instinct." But these ego instincts drag out an obscure existence, according to his psychology, alongside the broad, all-too-broad, development of the sexual theme. In reality, however, human nature wages a cruel and hardly-to-be-ended warfare between the ego-principle and that of formless instinct. The ego is all barriers; instinct, on the other hand, is without any limits. Both principles are equally powerful. In a certain sense men may account themselves fortunate in being conscious of only one instinct: therefore he who is wise avoids getting to know the other. But if, after all, he does get to

know the other instinct, he is indeed a lost man. For then he enters upon the Faustian conflict. Goethe has shown us in the first part of "Faust" what the acceptance of instinct involves, and in the second part, what the acceptance of the ego and of his gruesome unconscious world would signify. Everything that is insignificant, *petty*, and cowardly in us shrinks from it, and would avoid it—and there is one admirable means of doing so. Namely, by discovering that the other thing in us is "another fellow," a live man who actually thinks, feels, does and desires all the things that are despicable and odious. In this way the bogey is seized, and the battle against him is begun to our satisfaction. Hence arise, also, those chronic idiosyncrasies of which the history of morals has preserved a few examples for us. The instance of Nietzsche contra Wagner, already cited, is particularly transparent. But ordinary human life is crammed full of such cases. It is by these ingenuous devices that man saves himself from the Faustian catastrophe for which he evidently lacks both courage and strength. But a sincere man knows that even his bitterest opponent, or any number of them, does not by any means equal his one worst adversary, that is his other self who "bides within his breast." Nietzsche unconsciously had Wagner *in himself*, that is why he envied him his Parsifal. But even worse, he was a Saul and also had Paul within. That is why Nietzsche became a stigmatised outcast of the Spirit; he had like Saul to experience Christification when "the other self" inspired him with his "ecce homo." Which man in him "broke down before the cross," Wagner or Nietzsche?

It was ordained by destiny that one of Freud's earliest pupils, Adler,^[234] should formulate a view of neurosis as founded exclusively upon the principle of power. It is interesting and even fascinating to observe how totally different the same things appear when viewed in another light. In order to emphasise the main contrast, I would like at once to draw attention to the fact that, according to Freud, everything is a strictly causal consequence of previously-occurring facts; Adler, on the contrary, sees everything as a finally conditioned arrangement. To take a simple example: A young woman begins to have attacks of terror. She wakes at night from some nightmare with a piercing cry; calming herself with difficulty, she clings to her husband, imploring him not to leave her, making him repeat again and again that he loves her, etc. Gradually a nervous asthma develops, attacks of which also come on during the day.

In such a case, the Freudian system begins at once to burrow in the inner causality of the illness: What did the initial anxiety-dreams contain. She recalls wild bulls, lions, tigers, bad men. What does the patient associate with them? She told a story of something that had happened to her when she was still single. It ran as follows: She was staying at a summer-resort in the mountains, a great deal of tennis was played, the usual acquaintances being made. There was a young Italian who played particularly well, and who also knew how to handle the guitar in the evenings. A harmless flirtation developed, leading once to a moon-light walk. On this occasion, the Italian temperament "unexpectedly" broke through, running away with the young man to the great terror of the unsuspecting girl. He "looked at her with such a look," that she could never forget it. This look follows her even in her dreams; the wild animals that persecuted her had it. As a matter of fact, does this look originally come from the Italian? Another reminiscence enlightens us. The patient had lost her father through an accident, when she was about fourteen years old. The father was a man of the world, and travelled a great deal. Not long before his death he took her to Paris, where, among other things, they visited the *Follies Bergères*. Something happened there that at the time made a deep impression upon her. As they were leaving the theatre, a rouged female suddenly pressed close up to her father in an impertinent way. She looked at her father in fear as to what he would do—and then she saw that look, that animal glare in his eyes. An inexplicable something clung to her day and night. From this moment her attitude to her father was quite changed. At one instant she was irritable and full of venomous moods, at another she loved him extravagantly; then causeless fits of crying suddenly began, and, for a time, whenever her father was at home, she was tormented by terrible choking at table, with apparent attacks of suffocation, which were usually followed by voicelessness lasting from one to two days. When the news of her father's sudden death arrived, she was overcome by uncontrolled grief ending in hysterical laughter. But she soon calmed down, her condition improving quickly, and the neurotic symptoms disappearing almost completely. It seemed as if a veil of forgetfulness had descended over the past. Only the experience with the Italian roused something in her of which she was afraid. She had broken off completely with the young man. A few years later she married. The present neurosis only began after the birth of her second child, that is at the moment

when she discovered that her husband took a certain tender interest in another woman.

This history raises a number of questions. For instance, what do we know about the mother? It should be said of her that she was very nervous, and had tried many kinds of sanatoria and systems of cure. She also had symptoms of fear and nervous asthma. The relations between her and her husband had been very strained as far back as the patient could remember. The mother did not understand the father; the daughter always felt that she understood him better. She was moreover her father's declared favourite, being inwardly correspondingly cool towards her mother.

These facts are indications for a survey of the meaning of the illness. Behind the present symptoms phantasies are operative, connected in the first place with the young Italian, but further clearly referring to the father, whose unhappy marriage furnished the little daughter with an early opportunity of acquiring a position that really should have been filled by her mother. Behind this conquest there lies, of course, a phantasy of being the woman who was really suited to her father. The first attack of neurosis broke out at the moment when this phantasy received a violent shock, presumably similar to that the mother had once experienced (a fact that was, however, unknown to the child). The symptoms are easily comprehensible as the expression of disappointed and rejected love. The choking is based upon a sensation of tightening in the throat that is a well-known accompanying phenomenon of violent effects which we cannot quite "swallow." The metaphors of language often refer to similar physiological occurrences. When the father died, it seemed that her consciousness sorrowed deeply but her unconscious laughed, after the manner of Till Eulenspiegel, who was sad when he went downhill but was jolly when climbing laboriously, happy in anticipation of what was coming. When the father was at home the girl was low-spirited and ill, but whenever he was away she felt much better. Herein she resembles numerous husbands and wives who as yet are mutually hiding from each other the secret that they are not under all circumstances indispensable to one another.

That the unconscious had some right to laugh was shown by the subsequent period of good health. She succeeded in letting all that had passed retire behind the trap-door. The experience with the Italian, however, threatened to bring the netherworld up again. But she quickly pulled the handle and shut the door. She remained quite well until the dragon of neurosis came creeping in, just when she imagined herself to be already safely out of her

troubles, in the so-to-say perfected state of wife and mother. Sexual psychology finds the cause of the neurosis in the fact that the patient is not at bottom free from the father. This forces her to resuscitate her former experience at the moment when she discovered in the Italian the very same disturbing something that had formerly made such a deep impression upon her when perceived in her father. These recollections were naturally revived by the analogous experience with another man, and formed the starting-point of the neurosis. It might therefore be said that the content and cause of the neurosis lay in the conflict between the phantastic infantile-erotic relation to the father on the one hand, and her love for the husband on the other.

But if we now consider the course of the same illness from the standpoint of the other instinct, that is, of the will to power, a different complexion is put upon the matter. Her parents' unhappy marriage afforded an excellent opportunity for the exhibition of childish instinct for power. The instinct for power desires that, under all circumstances, the ego should be "on top," whether by straight or crooked means. At all costs the integrity of the personality must be preserved.

Every attempt, even what appears to be an attempt of the surroundings, to bring about the slightest subjection of the individual, is retorted to by the "masculine protest," as Adler expresses it. The mother's disappointment and her taking refuge in a neurosis brought about an opportunity for the development of power and the attainment of a dominating position. Love and excellence of conduct are, as everybody knows, extremely well-adapted weapons for the purposes of the instinct for power. Virtue is not seldom made the means of *forcing* recognition from others. Already as a child she knew how to obtain a privileged position with her father by means of specially pleasing and amiable behaviour, even occasionally to supplant her mother. This was not out of love for her father, although love was a good means of obtaining the coveted superiority. The hysterical laughter at the death of her father is a striking proof of this fact. One is inclined to consider such an explanation as a deplorable depreciation of love, if not actually a malicious insinuation. But let us pause a moment, reflect, and look at the world as it really is. Have we never seen those innumerable people who love, and believe in their love, only until its purpose is achieved, and who then turn away as if they had never loved? And, after all, does not Nature

herself do the same? In fact, is a "purposeless" love possible? If so, it belongs to the highest human virtues, which confessedly are extremely rare. Perhaps there is a general disposition to reflect as little as possible about the nature and purpose of love; discoveries might be made which would show the value of one's own love to be less considerable than we had supposed. However, it were dangerous to life to subtract anything from the value of fundamental instincts, perhaps specially so to-day, when we seem to have only a minimum of values left.

So the patient had an attack of hysterical laughter at the death of her father; she had finally arrived at the top. It was hysterical laughter, therefore a psychogenic symptom, that is, something proceeding from unconscious motives and not from those of the conscious ego. That is a difference that should not be underrated, for it enables us to recognise whence and how human virtues arise. Their contraries led to hell, that is, in modern terms, to the unconscious, where the counterparts of our conscious virtue have long been gathering. That is why our very virtue makes us desire to know nothing of the unconscious; indeed, it is even the summit of virtuous wisdom to maintain that there is no unconscious at all. But unfortunately we are all in a like predicament with Brother Medardus in E. T. A. Hoffman's "The Elixir of the Devil": somewhere or other there exists a sinister, terrible brother, our own incarnate counterpart bound to us by flesh and blood, who comprehends everything, maliciously hoarding whatever we most desire should disappear beneath the table.

The first outbreak of neurosis occurred in our patient at the moment when she became aware of the fact that there was something in her father which she did not control. And then it dawned upon her of what use her mother's neurosis was. When one meets with an obstacle that cannot be overcome by sensible and charming means, there yet exists an arrangement hitherto unknown to her which her mother had been beforehand in discovering, and that is neurosis. That is the reason why she now imitates her mother. But, the astonished reader asks, what is supposed to be the use of neurosis? What does it effect? Whoever has had a pronounced case of neurosis in his immediate environment, knows all that can be "effected" by a neurosis. In fact, there is altogether no better means of tyrannising over a whole household than by a striking neurosis. Heart attacks, choking fits, convulsions of all kinds achieve enormous effects, that can hardly be

surpassed. Picture the fountains of pity let loose, the sublime anxiety of the dear kind parents, the hurried running to and fro of the servants, the incessant sounding of the call to the telephone, the hasty arrival of the physicians, the delicacy of the diagnosis, the detailed examinations, the lengthy courses of treatment, the considerable expense; and there, in the midst of all the uproar, lies the innocent sufferer, to whom the household is even overflowingly grateful, when he has recovered from the "spasms."

The girl discovered this incomparable "arrangement" (to use Adler's term), applying it on occasion when the father was there with success. It became unnecessary when the father died, for now she was finally uppermost. The Italian was soon dismissed, because he laid too much stress upon her femininity by an inopportune reminder of his manliness. When the way opened to the possibility of a suitable marriage, she loved, adapting herself without any complaint to the deplorable rôle of the queen bee. As long as she held the position of admired superiority, everything went splendidly. But when her husband evinced a small outside interest, she was obliged again to have recourse to the extremely efficacious "arrangement," that is, to the indirect application of power, because she had once again come upon that thing—this time in her husband—that had already previously withdrawn her father from her influence.

That is how the matter appears from the standpoint of the psychology of power. I fear that the reader will feel as did the Kadi, before whom the counsel of one party spoke first. When he had ended, the Kadi said: "Thou hast spoken well. I perceive that thou art right." Then spoke the counsel for the other party, and when he had ended, the Kadi scratched himself behind his ear and said: "Thou hast spoken well. I perceive that thou also art right." There is no doubt that the instinct for power plays a most extraordinary part. It is true that the complexes of neurotic symptoms are also exquisite "arrangements," that inexorably realise their aims with incredible obstinacy and unequalled cunning. The neurosis is final; that is, it is directed towards an aim. Adler merits considerable distinction for having demonstrated this.

Which of the two points of view is right? That is a question that might well cause much brain-racking. For the two explanations cannot be simply combined, being absolutely contradictory. In one case, it is love and its course that is the principal and decisive fact; and in the other case, it is the power of the ego. In the first case the ego is merely a kind of appendage to

the passion for love; and in the second love is upon occasion merely a means to the end, that of gaining the upper hand. Whoever has the power of the ego most at heart rebels against the former conception, whilst he who cares most about love, will never be able to be reconciled to the latter.

IV.—THE TWO TYPES OF PSYCHOLOGY.

It is at this point that our most recent researches may suitably be introduced. We have found, in the first place, that there are two types of human psychology.^[235] In the one type the fundamental function is feeling, and in the other it is thought. The one feels his way into the object, the other thinks about it. The one adapts himself to his surroundings by feeling, thinking coming later; whilst the other adapts himself by means of thought, preceded by understanding. The one who feels his way transfers himself to some extent to the object; whilst the other withdraws himself from the object to some extent, or pauses before it and reflects about it. The first we called the *extroverted* type, because in the main he goes outside himself to the object, the latter is called the *introverted* type, because in a major degree he turns away from the object, withdrawing into himself and thinking about it.

These remarks only give the broadest outline of the two types. But even this quite inadequate sketch enables us to recognise that the two theories are the outcome of the contrast between the two types. The sexual theory is promulgated from the standpoint of feeling, the power theory from that of thought; for the extrovert always places the accent upon the feelings that are connected with the object, whereas the introvert always puts the accent upon the ego, and is as much detached by thought from the object as possible.

The irreconcilable contradictions of the two theories are now to be understood, because both theories are the product of a one-sided psychology. We find an instance of the contrast of types in Nietzsche and Wagner. The dissension between the two is due to the contrast in their ideas of psychological values. What is most prized by the one is "affectation" for the other, and is deemed false to the very core. Each depreciates the other.

If we apply the sexual theory to an extrovert it tallies with the facts of the case; but if we apply it to an introvert, we simply maltreat and do violence to his psychology. The same applies to the contrary case. The relative

rightness of the two hostile theories is explained by the fact that each one draws its material from cases that prove the correctness of the theory. There is a remnant of persons whom neither theory fits—has not every rule its exceptions?

Criticism of both theories is indispensable. Recognition of facts showed the necessity of overcoming their contrast, and of evolving a theory that should do justice not only to one or the other type, but equally to both.

Even the layman will to some extent have been struck by the fact that in spite of their correctness both theories really have a very unpleasant character and one not altogether pertinent under all circumstances to the strict views of science. The sexual theory is unæsthetic and unsatisfying intellectually. The power theory, on the other hand, is decidedly venomous. Both inevitably reduce high-flown ideals, heroic attitudes, pathos, and deep convictions, in a painful manner to a reality which is hackneyed and trite; that is, if these theories are applied to such things—but they should certainly not be so applied. Both theories are really only therapeutic instruments out of the tool-chest of the physician, whose sharp and merciless knife cuts out all that is pernicious and diseased. It was just such a misapplication of theory Nietzsche tried with his destructive criticism of ideals. He regarded ideals as rampant diseases of the soul of humanity; as indeed they really are. However, in the hands of a good physician who really knows the human soul, who, as Nietzsche says, "has a finger for the slightest shade," who applies the treatment only to what is really diseased in a soul—in such hands both theories prove wholesome caustics. The application must be adapted to the individual case. It is a dangerous therapy in the hands of those who do not understand how to deal out the treatment. These applications of criticism do good when there is something that should and must be destroyed, dissolved or brought low, but can easily damage what is being built up, or growing in response to life's requirements.

Both theories might, therefore, be allowed to pass without attack, in so far as they, like medicinal poisons, are entrusted to the safe hands of the physician. But fate has ordained that they should not remain solely in the care of those who are qualified to use them. First of all they naturally became known to the medical public. Every practising physician has an indefinitely high percentage of neurotics among his patients; he is therefore more or less obliged to look out for new and suitable systems of treatment.

He ultimately lights upon the difficult method of psychoanalysis. He is at first not competent for this, for how should he have learnt about the secrets of the human soul? Certainly not through his academic studies. The smattering of psychiatry that he acquired for his examination barely suffices to enable him to recognise the symptoms of the commonest mental disturbances, and is far from giving him any sufficient insight into the human soul. He is, therefore, practically quite unprepared to apply the analytic method. An unusually far-reaching knowledge of the soul is indeed necessary in order to be able to apply this caustic treatment with advantage. One must be in a position to differentiate elements that are diseased and should be discarded, from those which are valuable and should be retained. This is plainly a matter of great difficulty. Any one who wishes to get a vivid impression of the way in which a psychologising physician may unwarrantably violate a patient through an ignoble pseudo-scientific prejudice, should read what Moebius has written about Nietzsche. Or he may study various psychiatric writings about the "case of Christ," and will surely not hesitate to lament the lot of the patient whose fate it is to meet with such "understanding." Psychoanalysis—greatly to the regret of the medical man who, however, had not accepted it—then passed over into the hands of the teaching profession. This is right: for it is really, when rightly understood and handled, an educational method, and one of the social sciences. I would, however, never personally recommend that Freud's purely sexual analysis should be exclusively applied as an educational method. It might do much harm because of its one-sidedness. In order to make psychoanalysis available for educational purposes, all the metamorphoses that have been the work of the last few years were needed. The method had to be expanded from a general psychological point of view.

But the two theories of which I have spoken are not general theories. They are, as I have said, caustics to be applied, so to say, "locally," for they are both destructive and reductive. They explain to the patient that his symptoms come from here or there, and are "nothing but" this or that. It would be very unjust to wish to maintain that this reductive theory is wrong in a given case, but when exalted into a general explanation of the nature of the soul—whether sick or healthy—*a reductive theory becomes impossible*. For the human soul, whether it be sick or healthy, cannot be *merely* reductively explained. Sexuality it is true is always and everywhere present; the instinct for power certainly does penetrate the heights and the depths of

the soul; but the soul itself is not solely either the one or the other, or even both together, it is also that which it has made and will make out of them both. A person is only half understood when one knows how everything in him came about. Only a dead man can be explained in terms of the past, a living one must be otherwise explained. Life is not made up of yesterdays only, nor is it understood nor explained by reducing to-day to yesterday. Life has also a to-morrow, and to-day is only understood if we are able to add the indications of to-morrow to our knowledge of what was yesterday. This holds good for all expressions of psychological life, even for symptoms of disease. Symptoms of neurosis are not merely consequences of causes that once have been, whether they were "infantile sexuality" or "infantile instinct for power." They are endeavours towards a new synthesis of life. It must immediately be added, however, they are endeavours that have miscarried. None the less they are attempts; they represent the germinal striving which has both meaning and value. They are embryos that failed to achieve life, owing to unpropitious conditions of an internal and external nature.

The reader will now probably propound the question: What possible value and meaning can a neurosis have? Is it not a most useless and repulsive pest of humanity? Can being nervous do anybody good? Possibly, in a way similar to that of flies and other vermin, which were created by God in order that man might exercise the useful virtue of patience. Stupid as this thought is from the standpoint of natural science, it might be quite shrewd from that of psychology; that is, if we substitute "nervous symptoms" in the place of "vermin." Even Nietzsche, who had an uncommon disdain for anything stupid and trite in thought, more than once acknowledged how much he owed to his illness. I have known more than one person who attributed all his usefulness, and the justification for his existence even, to a neurosis, that hindered all decisive stupidities of his life, *compelling* him to lead an existence which developed what was valuable in him; material that would have been crushed had not the neurosis with its iron grip forced the man to keep to the place where he really belonged. There are people the meaning of whose life—whose real significance—lies in the unconscious; in consciousness lies only all that is vain and delusive. With others the reverse is the case, and for them the neurosis has another significance. An extended reduction is appropriate to the one, but emphatically unsuitable to the other.

The reader will now, indeed, be inclined to agree to the possibility of certain cases of neurosis having such a significance but will nevertheless be ready to deny an expediency that is so far-reaching and full of meaning to ordinary cases of this illness. What value, for instance, might there be in the afore-mentioned case of asthma and hysterical attacks of fear? I confess that the value here is not so obvious, especially if the case be looked at from the standpoint of a reductive theory, that is, from that of a *chronique scandaleuse* of the psychological development of an individual.

We perceive that both the theories hitherto discussed have this one point in common, viz. they relentlessly disclose everything that is valueless in people. They are theories, or rather hypotheses, which explain wherein the cause of the sickness lies. They are accordingly concerned not with the *values* of a person, but with his lack of value that makes itself evident in a disturbing way. From this point of view, it is possible to be reconciled to both standpoints.

A "value" is a possibility by means of which energy may attain development. But in so far as a negative value is also a possibility through which energy may attain development—as may, for instance, be clearly seen in the very considerable manifestations of energy shown in neurosis—it also stands for a value, albeit it brings about manifestations of energy which are useless and harmful. In itself energy is neither useful nor harmful, neither full of value nor lacking in it; it is indifferent, everything depending upon the *form* into which it enters. The form gives the quality to the energy. On the other side, mere form without energy is also indifferent. Therefore in order to bring about a positive value, on the one hand energy is necessary, and upon the other a valuable form. In a neurosis psychic energy is undoubtedly present, but in an inferior and not realisable form. Both the analytic methods that have been discussed above are of service only as solvents of this inferior form. They prove themselves good here as caustics.

By these methods we gain energy that is certainly free, but which, being as yet unapplied, is indifferent. Hitherto the supposition prevailed, that this newly acquired energy was at the patient's conscious disposal, that he might apply it in any way he liked. In so far as it was thought that the energy was nothing but the sexual impulse, people spoke of a sublimated application of the same, under the presumption that the patient could, without further ado, transfer what was thought of as sexual energy into a "sublimation"; that is,

into a non-sexual form of use. It might, for instance, be transferred to the cultivation of an art, or to some other good or useful activity. According to this concept, the patient had the possibility of deciding, either arbitrarily or from inclination, how his energy should be sublimated.

This conception may be accorded a justification for its existence, in so far as it is at all possible for a human being to assign a definite direction to his life, in which its course should run. But we know that there is no human forethought nor philosophy which can enable us to give our lives a prescribed direction, except for quite a short distance. Destiny lies before us, perplexing us, and teeming with possibilities, and yet only one of these many possibilities is our own particular right way. Who should presume to designate the one possibility beforehand, even though he have the most complete knowledge of his own character that a man can have? Much can certainly be attained by means of will-power. But having regard to the fate of certain personalities with particularly strong wills, it is entirely misleading for us to want at all costs to change our own fate by power of will. Our will is a function that is directed by our *powers of reflection*; it depends, therefore, upon how our powers of reflection are constituted. In order to deserve its name reflection must be *rational*, that is, according to reason. But has it ever been proved, or can it ever be proved, that life and destiny harmonise with our human reason, that is, that they are exclusively rational? On the contrary, we have ground for supposing that they are also irrational, that is to say, that in the last resort they too are based in regions beyond the human reason. The irrationality of the great process is shown by its so-called *accidentalness*, which perforce we ought to deny, since, obviously, we cannot think of a process not being causally and necessarily conditioned. But actually, accidentality exists everywhere, and does so indeed so obtrusively that we might as well pocket our causal philosophy! The rich store of life both is, and is not, determined by law; it is at the same time rational and irrational. Therefore, the reason and the will founded upon it are only valid for a short distance. The further we extend this rationally chosen direction, the surer we may be that we are thereby excluding the irrational possibilities of life, which have, however, just as good a right to be lived. Aye, we even injure ourselves, since we cut off the wealth of accidental eventualities by a too rigid and conscious direction. It was certainly very expedient for man to be able to give his life a direction; it would, therefore, be quite right to maintain that the attainment of

reasonableness was the greatest achievement of mankind. But that is not to say that under all circumstances, this must or will always continue to be the case. The present fearful catastrophic world-war has tremendously upset the most optimistic upholder of rationalism and culture.

In 1913 Ostwald wrote^[236] as follows: "The whole world agrees that the present state of armed peace is untenable, and is gradually becoming an impossible condition. It demands tremendous sacrifices from individual nations far surpassing the outlay for cultural purposes, without any positive values being gained thereby. Therefore, if mankind could discover ways and means of putting an end to these preparations for a war *that will never come*, this conscripting of a considerable part of the nation at the best and most capable age for training for war purposes, if it could overcome all the innumerable other injuries caused by the present customs, such an enormous saving of energy would be effected, that an undreamt-of development of the evolution of culture might be expected. For like a hand-to-hand fight, war is the oldest, and also the most unsuitable of all possible means of solving a conflict between wills, being indeed accompanied by the most deplorable waste of energy. The complete setting aside of potential as well as of actual warfare is, therefore, absolutely one of the most important tasks of culture in our time, a real necessity from the point of view of energy."

But the irrationality of destiny ordained otherwise than the rationality of the well-meaning thinker; since it not only determined to use the piled-up weapons and soldiers, but much more than that, it brought about a tremendous insane devastation and unparalleled slaughter. From this catastrophe humanity may possibly draw the conclusion, that only one side of fate can be mastered by rational intention.

What can be said of mankind in general applies also to individuals, for mankind as a whole consists of nothing but individuals. And whatever the psychology of mankind is, that is also the psychology of the individual. We are experiencing in the world-war a fearful balancing-up with the rational intentionality of organised culture. What is called "will" in the individual, is termed "imperialism" among nations, for the will is a demonstration of power over fate, that is, exclusion of what is accidental. The organisation of culture is a rational and "expedient" sublimation of free and indifferent

energies, brought about by design and intention. The same is the case in the individual. And just as the hope of a universal international organisation of culture has experienced a cruel right-about through this war, so also must the individual, in the course of his life, often find that so-called "disposable" energies do not suffer themselves to be disposed of.

I was once consulted by a business man of about forty-five, whose case is a good illustration of the foregoing. He was a typical American self-made man, who had worked himself up from the bottom. He had been successful, and had founded a very extensive business. He had also gradually organised the business in such a way that he could now retire from its management. He had indeed resigned two years before I saw him. Until then he had only lived for his business, concentrating all his energy upon it, with that incredible intensity and one-sidedness that is so peculiar to the successful American man of business. He had bought himself a splendid country seat, where he thought he would "live," which he imagined to mean keeping horses, automobiles, playing golf and tennis, attending and giving parties, etc. But he had reckoned without his host. The energy that had become "disposable" did not enter into these tempting prospects, but betook itself capriciously to quite other ways. A couple of weeks after the commencement of his longed-for life of bliss, he began to brood over peculiar vague physical sensations. A few more weeks sufficed to plunge him into an unprecedented state of hypochondria. His nerves broke down completely. He, who was physically an uncommonly strong and exceptionally energetic man, became like a whining child. And that put an end to all his paradise. He fell from one apprehension to another, worrying himself almost to death. He then consulted a celebrated specialist, who immediately perceived quite rightly that there was nothing wrong with the man but lack of employment. The patient saw the sense of this, and betook himself to his former position. But to his great disappointment no interest for his business presented itself. Neither the application of patience nor determination availed to help. His energy would not by any means be forced back into the business. His condition naturally became worse than before. Energy that hitherto had been actively creative was now turned back into himself, with fearfully destructive force. His creative genius rose up, so to speak, in revolt against him, and instead of, as before, producing great organisations in the world, his demon now created equally clever systems of hypochondriac fallacies, by which the man was absolutely crushed. When I

saw him, he was already a hopeless moral ruin. I tried to make clear to him that such a gigantic amount of energy might indeed be withdrawn from business, but the problem remained as to where it should go. The finest horses, the fastest automobiles, and the most amusing parties are in themselves no inducement for energy, although it is certainly quite rational to think that a man who has devoted his whole life to serious work, has a natural right to enjoy himself. This would necessarily be the case if things happened "humanly" in destiny; first would come work, then well-earned leisure. But things happen irrationally and inconveniently enough, energy requires a congenial channel, otherwise it is dammed up and becomes destructive. My arguments met with no response, as was indeed to be expected. Such an advanced case can only be taken care of till death; it cannot be cured.

This case clearly illustrates the fact that it does not lie in our power to transfer a "disposable" energy to whatever rationally chosen object we may like. Exactly the same may be said of those apparently available energies that are made available by the fact that the psychoanalytical caustic has destroyed their unsuitable forms. These energies can be arbitrarily applied, as has already been said, at the very most only for a short time. They resist following the rationally presented possibilities for any length of time. Psychic energy is indeed a fastidious thing, that insists upon having its own conditions fulfilled. There may be ever so much energy existing, but we cannot make it useful, so long as we do not succeed in finding a congenial channel for it.

The whole of my research work for the last years has been concentrated upon this question. The *first stage* of this work was to discover the extent to which the two theories discussed above were tenable. The *second stage* consisted in the recognition of the fact, that these two theories correspond to two opposite psychological types, which I have designated the introversion and the extroversion types. William James^[237] was struck by the existence of these two types among thinkers. He differentiated them as the "tough-minded," and the "tender-minded." Similarly, Ostwald^[238] discovered an analogous difference in the classical and romantic types among great scholars. I am not therefore alone in my ideas about the types, as is testified by mentioning only these two well-known names out of many others. Historical researches have proved to me that not a few of the great

controversies in the history of thought were based upon the contrast between the types. The most significant case of this kind is the contrast between nominalism and realism, which, beginning with the difference between the Platonic and the Megarian schools, descended to scholastic philosophy, where Abelard won the immortal distinction of at least having ventured an attempt to unite the two contradictory standpoints in conceptualism. This conflict has continued down to the present day, where it finds expression in the antagonism of spiritualism and materialism.

Just as in the general history of thought, so too every individual has a share in this contrast of types. Close investigation proves that people of opposite types have an unconscious predilection for marrying each other, that they may mutually complement one another. Each type has one function that is specially well developed, the introvert using his thought as the function of adaptation, thinking beforehand about how he shall act; whilst the extrovert, on the contrary, feels his way into the object by acting. To some extent he acts beforehand. Hence by daily application the one has developed his thought, and the other his feeling. In extreme cases the one limits himself to thinking and observing, and the other to feeling and acting. It is true that the introvert feels also, very deeply indeed, almost too deeply; that is why an English investigator^[239] has gone so far as to describe his as "the emotional type." True, the emotion is there, but it all remains inside, and the more passionate and deeper his feeling is, the quieter is his outward demeanour. As the proverb puts it, "Still waters run deep." Similarly, the extrovert *thinks* also, but that likewise mostly inside, whilst his feelings visibly go outside, that is why he is held to be full of feeling whilst the introvert is considered cold and dry. But as the feeling of the thinker goes inwards, it is not developed as a function adapted to external situations, but remains in a relatively undeveloped state. Similarly the thinking of one who feels remains also relatively undeveloped.

But if comparatively well-adapted individuals are under consideration, then the introvert will normally be found to have his feeling directed outwards, and the result may be extraordinarily deceptive. He shows feelings; he is amiable, sympathetic, even emotional. But a critical examination of the expressions of his feelings reveals that they are markedly conventional. They are not individualised. He shows to every one, without any essential difference, the same friendliness and the same sympathy; whilst the

extrovert's expressions of feeling are throughout delicately graded and individualised. With the introvert the expression of feelings is really a gesture that is artificially adopted and conventional. Similarly, the extrovert may apparently think, and that even very clearly and scientifically. But upon closer investigation, his thoughts are found to be really foreign property, merely conventional forms which have been artificially acquired. They lack anything individual and original, and are just as lukewarm and colourless as the conventional feelings of the introvert. Under these conventional disguises, quite other things are slumbering in both, which occasionally when awakened by some overpowering effect, suddenly break out to the astonishment and horror of the environment.

Most civilised people incline more to one type than the other. Taken together they would supplement each other exceedingly well. That is why they are so apt to marry one another, and so long as they are fully occupied with adapting themselves to the necessities of life they suit one another splendidly. But if the man has earned a competence, or if a big legacy drop from the sky, terminating the external urgencies of life, then they have time to occupy themselves with each other. Until now they stood back to back, defending themselves against want. But now they turn to each other expecting to understand one another; and they make the discovery that they have never understood one another. They speak different languages. Thus the conflict between the two types of psychology begins. This conflict is venomous, violent and full of mutual depreciation, even if it be conducted very quietly in the utmost intimacy. *This is so because the value of the one is the worthlessness of the other.* The one, starting from the standpoint of his valuable thinking, takes for granted that the feelings of the other correspond to his own inferior feelings, this because he knows absolutely nothing of any other feelings. But the other, starting from the standpoint of his valuable feelings, assumes that his partner has the same inferior thought that he himself has. Evidently there is plenty of work here for Goethe's Homunculus, who had to find out "why husband and wife get on so badly." Now as many cases of neurosis have a basis in such differences, I, as a physician, found myself obliged to relieve the Homunculus of some of his ungrateful task. I am glad to be able to say that many a sufferer has been helped in grave difficulties by the enlightenment I could give.

The *third stage* of the path of increasing understanding consisted in formulating a theory of the psychology of types which would be of practical use for the development of man. Viewed from the newly-gained standpoint, there resulted, first of all, *a totally new theory of psychogenic disturbances*.

The foundation of the facts remains the same: the first hypothesis of every neurosis is the existence of an unconscious conflict. According to Freud's theory, this is an erotic conflict, or to speak more exactly, a battle of the moral consciousness against the unconscious infantile sexual world of phantasy and its transference to external objects. According to Adler's theory, it is a battle of the superiority of the ego against all oppressive influences, whether from inside or outside.

But the new idea asserts that *the neurotic conflict always takes place between the adapted function and the co-function that is undifferentiated, and that lies to a great extent in the unconscious*; therefore in the case of the introvert, between thought and unconscious feeling, but in that of the extrovert, between feeling and unconscious thought.^[240] Another theory of the etiological moment results from this. If a man who naturally adapts himself by thinking is faced by a demand that cannot be met by thinking alone, but which requires differentiated feeling, the traumatic or pathogenic conflict breaks out. On the contrary, the critical moment comes to the man who adapts by feeling when he is faced by a problem requiring differentiated thought. The afore-mentioned case of the business man is a clear example of this. The man was an introvert, who all through his life had left every consideration of sentiment in the background, that is, in the unconscious. But when, for the first time in his life, he found himself in a situation in which nothing could be done except by means of differentiated feeling, he failed utterly. At the same time, a very instructive phenomenon occurred; his unconscious feelings manifested themselves as *physical sensations* of a vague nature. This fact harmonises with a generally accepted experience in our psychology, to wit, that undeveloped feelings partake of the character of vague physical sensations, since undifferentiated feelings are as yet identical with subjective physical sensations. Differentiated feelings are of a more "abstract" objective nature. This phenomenon may well be the unconscious basis of the earliest statement of psychological types that is known to me; namely, the three types of the Valentinian School. They held the undifferentiated type to be the so-called

hyletic (material) man. He was ranked below the differentiated types, that is, the psychic (soulful) man, who corresponds to the extroversion type; and the pneumatic (spiritual) man, who corresponds to the introversion type. For these gnostics the "pneumatikos" stood of course the highest. Christianity, with its "psychic" (spiritual) nature (principle of love), has indeed contested this privilege of the gnosis. But even this page may be turned in the course of time: since, if the signs of the age are not deceptive, we are now in the great final settlement of the Christian epoch. We know that, evolution not being uniformly continuous, when one form of creation has been outlived, the evolutionary tendency harks back to resume that form which, after having made a beginning, was left behind in an undeveloped state.

After this brief digression to generalities, let us return to our case. If a similar disturbance were to take place in an extrovert, he would have what are called hysterical symptoms, that is, symptoms that are also of an apparently physical nature, which, as our theory indicates, would this time represent the patient's unconscious undifferentiated thought. As a matter of fact, we find also a widespread region of phantasy as the basis of hysterical symptoms, of which many have been described in detail in the literature of the subject. They are phantasies of a pronounced sexual, that is physical complexion. But in reality they are undifferentiated thoughts, which in common with the undifferentiated feelings are to some extent physical, and therefore appear as what may be called physical symptoms.

By taking up again here the thread that was dropped before, we can now clearly see why it is precisely in the neurosis that those values which are most lacking to the individual lie hidden. We might also now return to the case of the young woman, and apply to it the newly-won insight. She is an extrovert with an hysterical neurosis. Let us suppose that this patient had been "analysed," that is, that the treatment having made it clear to her what kind of unconscious thoughts lay behind her symptoms, she had regained possession of the psychic energy which by becoming unconscious had constituted the strength of the symptoms. The following practical question now arises: what can be done with the so-called available energy? It would be rational, and in accordance with the psychological type of the invalid, to extrovert this energy again, that is to transfer it to an object, as for instance to philanthropic or some other useful activities. This way is possible only in

exceptional cases—there are energetic natures who do not shrink from care and trouble in a useful cause, there are people who care immensely about just such occupations—otherwise it is not feasible. For it must not be forgotten, that in the case under consideration, the libido (that is the technical expression for the psychic energy) has found its object already unconsciously in the young Italian, or an appropriate real human substitute. Under these circumstances such a desirable sublimation, however natural, is out of the question. For the object of the energy usually affords a better channel than an ethical activity, however attractive. Unfortunately there are many people who always speak of a person, not as he is, but as he would be if their desires for him were realised. But the physician is necessarily concerned with the actual personality, which will obdurately remain the same, until its real character has been recognised on all sides. An analysis must necessarily be based upon the recognition of naked reality, not upon any arbitrarily selected phantasies about a person, however desirable.

The fact is that the so-called available energy unfortunately cannot be arbitrarily directed as desired. It follows its own channel, one which it had already found, even before we had quite released it from its bondage to the unadapted form. For we now make the discovery that the phantasies which were formerly occupied with the young Italian, have been transferred to the physician himself. The physician has therefore himself become the object of the unconscious libido. If this is not the case, or if the patient will on no account acknowledge the fact of transference, or again, if the physician either does not understand the phenomenon at all, or does so wrongly, then violent resistances make their appearance, which aim at completely breaking off relations with the doctor. At this point patients leave and look for another doctor or for people who "understand" them; or if they hopelessly relinquish this search they go to pieces.

But if the transference to the physician takes place and is accepted, a natural channel has thereby been found, which not only replaces the former, but also makes a discharge of the energetic process possible, and provides a course that is relatively free from conflict. Therefore if the libido is allowed its natural course, it will of its own accord find its way into the transference. Where this is not the case, it is always a question either of arbitrary rebellion against the laws of Nature, or of some deficiency in the physician's work.

Into the transference every conceivable infantile phantasy is first of all projected; these must then be subjected to the caustic, that is, analytically dissolved. This was formerly called the *dissolution of the transference*. Thereby the energy is freed from this unsuitable form also, and once again we are confronted by the problem of disposable energy. We shall find that an object affording the most favourable channel has been chosen by Nature even before our search began.

V.—THE PERSONAL AND THE IMPERSONAL UNCONSCIOUS

The fourth stage of our newly won insight is now reached. The analytical dissolution of the infantile transference phantasies was continued until it became sufficiently clear, even to the patient, that he was making his physician into father, mother, uncle, guardian, teacher, friend or any other kind of surrogate for parental authority conceivable. But, as experience is constantly proving, further phantasies make their appearance, representing the physician as saviour or as some other divine being. Obviously this is in flagrant contradiction to the sane reasoning of consciousness. Moreover, it appears that these divine attributes considerably overstep the bounds of the Christian conception in which we grew up. They even assume the guise of heathen allurements, and, for instance, not infrequently assume the form of animals.

The transference is in itself nothing but a projection of unconscious contents on to the analyst. At first it is the so-called superficial contents that are projected. During this stage the physician is interesting as a possible lover (somewhat after the manner of the young Italian in our case). Later on, he is a representation of the father, and is the symbol either of kindness or of severity, according to what the patient formerly imputed to his real father. Occasionally the doctor even appears to the patient as a kind of mother, which, though sounding somewhat strange, really lies well within the bounds of possibility. All these projections of phantasy have an underlying basis of personal reminiscences.

But presently other forms of phantasy appear, bearing an extravagantly effusive and impossible character. The physician now appears to be endowed with uncanny qualities; he may be either a wizard or a demoniacal criminal, or his counterpart of virtue, a saviour. Later on he appears as an

incomprehensible mixture of both sides. It should be clearly understood that the physician does not appear to the patient's consciousness in these forms, but that phantasies come up to the surface representing the doctor in this guise. If, as is not seldom the case, the patient cannot forthwith perceive that his view of the physician is a projection of his own unconscious, then he will probably behave rather foolishly. Difficulties often arise at this stage of analysis, making severe demands upon the good will and patience of both physician and patient. In a few exceptional cases, a patient cannot refrain from disseminating the stupidest tales about the physician. Such people cannot get it into their head that, as a matter of fact, their phantasies originate in themselves, and have nothing or very little to do with the physician's actual character. The pertinacity of this error arises from the circumstance that there is no foundation of personal memory for this particular kind of projection. It is occasionally possible to prove that similar phantasies, for which neither parent gave reasonable occasion, had at some time in childhood been attached to the father or mother.

In one of his shorter books, Freud has shown how Leonardo da Vinci was influenced in his later life by the fact that he had two mothers. The fact of the two mothers (or the double descent) had indeed a reality in Leonardo's case, but it plays a part with other artists as well. Benvenuto Cellini had this phantasy of a double descent. It is unquestionably a mythological theme; many heroes of legend have two mothers. The phantasy is not founded upon the actual fact of the hero's having two mothers, but is a widespread "primordial image" belonging to the secrets of the universal history of the human mind. It does not belong to the sphere of personal reminiscences.

In every individual, in addition to the personal memories, there are also, in Jacob Burckhardt's excellent phrase, the great "primordial images," the inherited potentialities of human imagination. They have always been potentially latent in the structure of the brain. The fact of this inheritance also explains the otherwise incredible phenomenon, that the matter and themes of certain legends are met with all the world over in identical forms. Further, it explains how it is that persons who are mentally deranged are able to produce precisely the same images and associations that are known to us from the study of old manuscripts. I gave some examples of this in my book on "The Psychology of the Unconscious." I do not hereby assert the

transmission of representations, but only of the *possibility of such representations*, which is a very different thing.

It is therefore in this further stage of the transference that those phantasies are produced that have no basis in personal reminiscence. Here it is a matter of the manifestation of the deeper layers of the unconscious, where the primordial universally-human images are lying dormant.

This discovery leads to the fourth stage of the new conception: that is, to the recognition of a *differentiation in the unconscious itself*. We are now obliged to differentiate a personal unconscious and an impersonal or super-personal unconscious. We also term the latter the *absolute or collective unconscious*, because it is quite detached from what is personal, and because it is also absolutely universal, wherefore its contents may be found in every head, which of course is not the case with the personal contents.

The primordial images are quite the most ancient, universal, and deep thoughts of mankind. They are feeling just as much as thought, and might therefore be termed *original thought-feelings*.

We have therewith now found the object selected by the libido when it was freed from the personal-infantile form of transference. Namely, that it sinks down into the depths of the unconscious, reviving what has been dormant there from immemorial ages. It has discovered the buried treasure out of which mankind from time to time has drawn, raising thence its gods and demons, and all those finest and most tremendous thoughts without which man would cease to be man.

Let us take as an example one of the greatest thoughts to which the nineteenth century gave birth—the idea of the *conservation of energy*. *Robert Mayer* is the originator of this idea. He was a physician, not a physicist nor a natural philosopher, to either of whom the creation of such an idea would have been more germane. It is of great importance to realise that in the real sense of the word, Robert Mayer's idea was not *created*. Neither was it brought about through the fusion of the then-existent conceptions and scientific hypotheses. It grew in the originator, and was conditioned by him. Robert Mayer wrote (1841) to Griesinger as follows: "I by no means concocted the theory at the writing-desk." He goes on to report about certain physiological investigations that he made in 1840-41 as doctor

on board ship, and continues: "If one wishes to be enlightened about physiological matters, some knowledge of physical processes is indispensable, unless one prefers to work from the metaphysical side, which is immensely distasteful to me. I therefore kept to physics, clinging to the subject with such ardour that, although it may well seem ridiculous to say so, I cared little about what part of the world we were in. I preferred to remain aboard where I could work uninterruptedly, and where many an hour gave me such a feeling of *being inspired* in a way I can never remember having experienced either before or since.

"A few flashes of thought that thrilled through me"—this was in the harbour of Surabaja—"were immediately diligently pursued, leading again in their turn to new subjects. Those times are passed, but subsequent quiet examination of *what then emerged*, has taught me that it was a truth which can *not only be subjectively felt*, but also proved objectively; whether this could be done by *one who has so little knowledge* of physics as I have, is a matter which obviously, I must leave undecided."

Heim, in his book on Energetics, expresses the opinion: "that Robert Mayer's new thought did not gradually detach itself by dint of revolving it in his mind, from the conceptions of power transmitted from the past, *but belongs to those ideas that are intuitively conceived, which, originating in other spheres of a mental kind, surprise thought, as it were, compelling it to transform its inherited notions conformably with those ideas.*"

The question now arises, whence did this new idea that forced itself upon consciousness with such elemental power spring? And whence did it derive such strength that it was able to effect consciousness so forcibly that it could be completely withdrawn from all the manifold impressions of a first voyage in the tropics? These questions are not easy to answer. If we apply our theory to this case the explanation would run as follows: *The idea of energy and of its conservation must be a primordial image that lay dormant in the absolute unconscious.* This conclusion obviously compels us to prove that a similar primordial image did really exist in the history of the human mind, and continued to be effective through thousands of years. As a matter of fact, evidence of this can be produced without difficulty. *Primitive religions, in the most dissimilar regions of the earth, are founded upon this image.* These are the so-called *dynamistic religions*, whose sole and distinctive thought is the existence of some universal magical power upon

which everything depends. The well-known English scholars, Taylor and Frazer, both wrongly interpreted this idea as animism. Primitive peoples do not mean souls or spirits by their conception of power, but in reality something that the American investigator *Lovejoy*^[241] most aptly terms "primitive energetics."

In an investigation appertaining to this subject, I showed that this notion comprises the idea of soul, spirit, God, health, physical strength, fertility, magic power, influence, might, prestige, curative remedies, as well as certain states of mind which are characterised by the setting loose of affects. Among certain Polynesians "Melungu" (that is this primitive concept of energy) is spirit, soul, demoniacal being, magic, prestige. If anything astonishing happens, the people cry "Melungu." This notion of power is also the first rendering of the concept of God among primitive peoples. The image has undergone many variations in the course of history. In the Old Testament this magic power is seen in the burning bush, and shines in the face of Moses. It is manifest in the Gospels as the outpouring of the Holy Spirit, as cloven tongues of fire from heaven. In Heraclitus it appears as universal energy, as "eternally living fire"; for the Persians it is the fiery brightness, haôma, divine mercy; for the Stoics it is heimarmene, the power of destiny. In mediæval legend it is seen as the aura, or the halo of the saint. It blazes forth in great flames from the hut where the saint is lying in ecstasy. The saints reflect the sum of this power, the storehouse of light, in their faces. According to ancient concepts this power is the soul itself; the idea of its immortality contains that of its *conservation*. The Buddhistic and primitive conception of the metempsychosis (transmigration of souls) contains the idea of its *unlimited capacity for transformation under constant conservation*.

This thought has obviously therefore been imprinted on the human brain for untold ages. That is why it lies ready in the unconscious of every one. Only certain conditions are needed in order to let it appear again. These conditions were obviously fulfilled in the example of Robert Mayer. The greatest and best thoughts form themselves upon these primordial images, which are the ancient common property of humanity.

After this instance of the nascence of new ideas out of the treasury of primordial images, we will resume the further delineation of the process of

transference. It was seen that the libido of the patient seizes upon its new object in those apparently preposterous and peculiar phantasies, namely the contents of the absolute unconscious. As I already observed, the unacknowledged projection of primordial images upon the physician constitutes a danger for further treatment which should not be undervalued. The images contain not only every beautiful and great thought and feeling of humanity, but also every deed of shame and devilry of which human beings have ever been capable. Now, if the patient cannot differentiate the physician's personality from these projections, there is an end to mutual understanding, and human relations become impossible. If however the patient avoids this Charybdis, he falls into the Scylla of *introjecting* these images, that is, he does not ascribe their qualities to the physician but to himself. This peril is just as great. If he projects, he vacillates between an extravagant and morbid deification, and a spiteful contempt of his physician. In the case of introjection, he falls into a ludicrous self-deification or moral self-laceration. The mistake that he makes in both cases consists in attributing the contents of the absolute unconscious to himself personally. Thus he makes himself into both God and devil. This is the psychological reason why human beings have always needed demons, and could not live without gods. There is the exception, of course, of a few specially clever specimens of the *homo occidentalis* of yesterday and the day before—supermen whose God is dead, wherefore they themselves become gods. There is also the example of Nietzsche, who confessedly required chloral in order to be able to exist. These supermen even become rationalistic petty gods, with thick skulls and cold hearts. The concept of God is simply a necessary psychological function of an irrational nature that has altogether no connection with the question of God's existence. This latter question is one of the most fatuous that can be put. It is indeed sufficiently evident that man cannot conceive a God, much less realise that he actually exists, so little is he able to imagine a process that is not causally conditioned. Theoretically, of course, no accidentality can exist, that is certain, once and for all. On the other hand, in practical life, we are continually stumbling upon accidental happenings. It is similar with the existence of God; it is once and for all an absurd problem. But the *consensus gentium* has spoken of gods for æons past, and will be speaking of them in æons to come. Beautiful and perfect as man may think his reason, he may nevertheless assure himself that it is only one of the possible

mental functions, coinciding merely with the corresponding side of the phenomena of the universe. All around is the irrational, that which is not congruous with reason. And this irrationalism is likewise a psychological function, namely the absolute unconscious; whilst the function of consciousness is essentially rational. Consciousness must have rational relations, first of all in order to discover some order in the chaos of disordered individual phenomena in the universe; and secondly, in order to labour at whatever lies within the area of human possibility. We are laudably and usefully endeavouring to exterminate so far as is practicable the chaos of what is irrational, both in and around us. Apparently we are making considerable progress with this process. A mental patient once said to me, "Last night, doctor, I disinfected the whole heavens with sublimate, and yet did not discover any God." Something of the kind has happened to us. Heraclitus, the ancient, that really very wise man, discovered the most wonderful of all psychological laws, namely, the *regulating function of antithesis*. He termed this "enantiodromia" (clashing together), by which he meant that at some time everything meets with its opposite. (Here I beg to remind the reader of the case of the American business man, which shows the enantiodromia most distinctly.) The rational attitude of civilisation necessarily terminates in its antithesis, namely in the irrational devastation of civilisation. Man may not *identify* himself with reason, for he is not wholly a rational being, and never can or ever will become one. That is a fact of which every pedant of civilisation should take note. What is irrational cannot and may not be stamped out. The gods cannot and may not die. Woe betide those men who have disinfected heaven with rationalism; God-Almightiness has entered into them, because they would not admit God as an absolute function. They are identified with their unconscious, and are therefore its sport. (For where God is nearest, there the danger is greatest.) Is the present war supposed to be a war of economics? That is a neutral American "business-like" standpoint, that does not take the blood, tears, unprecedented deeds of infamy and great distress into account, and which completely ignores the fact that this war is really an *epidemic of madness*. The several parties project their unconscious upon each other, hence the mad confusion of ideas in every head. This is the enantiodromia that occurs in the individual life of man, as well as in that of peoples. The legend of the Tower of Babel turns out to be a tenable truth.

Only he escapes from the cruel law of enantiodromia who knows how to separate himself from the unconscious—not by repressing it, for then it seizes him from behind—but *by presenting it visibly to himself as something that is totally different from him.*

This gives the solution of the Scylla and Charybdis problem which I described above. The patient must learn to differentiate in his thoughts between what is the ego and what is the non-ego. The latter is the collective psyche or absolute unconscious. By this means he will acquire the material with which henceforward, for a long time, he will have to come to terms. Thereby the energy, that before was invested in unsuitable pathological forms, will have found its appropriate sphere. In order to differentiate the psychological ego from the psychological non-ego, man must necessarily stand *upon firm feet* in his ego-function; that is, *he must fulfil his duty towards life completely, so that he may in every respect be a vitally living member of human society.* Anything that he neglects in this respect descends into the unconscious and reinforces its position, so that he is in danger of being swallowed up by it, if his ego-function is not established. Severe penalties are attached to that. As indicated by old Synesius, the "spiritualised soul (pneumatike psyché) becomes god and demon, a state in which it suffers the divine penalties," that is, it suffers being torn asunder by the Zagreus, an experience which Nietzsche also underwent at the beginning of his insanity, where, in "Ecce Homo," the God whom he was despairingly resisting in front assailed him from behind. Enantiodromia is the being torn asunder into the pairs of opposites, which opposites are only proper to "the god," and therefore also to the deified man, who owes likeness to God to his having prevailed over his gods.

VI.—THE SYNTHETIC OR CONSTRUCTIVE METHOD

We now reach the fifth stage of progressive understanding. The coming to terms with the unconscious is a technical performance to which the name of *transcendental function* has been given because a new function is produced, which being based upon both real and imaginary, or rational and irrational data, makes a bridge between the rational and irrational functions of the psyche. The basis of the transcendental function is a *new method of treating psychological materials* such as dreams and phantasies. The theories previously discussed were based upon an exclusively causal-reductive procedure, which reduces the dream or phantasy to its component

reminiscences, and the instinctive processes that underlie them. I have already stated the justification as well as the limitations of this proceeding. It reaches the end of its usefulness at the moment when the dream symbols no longer permit of a reduction to personal reminiscences or aspirations; that is when the images of the absolute unconscious begin to be produced. It would be quite inappropriate to reduce these collective ideas to what is personal, and not only inappropriate but even actually pernicious, a fact that has been impressed upon me by disagreeable experiences. The values of the images or symbols of the absolute unconscious are only disclosed if they are subjected to a synthetic (not analytical) treatment. Just as analysis (the causally reductive procedure) disintegrates the symbol into its components, so the synthetic procedure synthesises the symbol into a universal and comprehensible expression. The synthetic procedure is by no means easy; I will therefore give an example, by means of which I can explain the whole process.

A patient had the following dream. She was just at the critical juncture between the analysis of the personal unconscious and the commencement of the production of the absolute unconscious. "*I am on the point of crossing a broad and rapid stream. There is no bridge, but I find a ford where I can cross. As I am just on the point of doing so, a big crab that lay hidden in the water seizes my foot and does not let it go.*" She awoke in fear. Associations with the dream were as follows:—

1. *Stream*.—It forms a boundary that is difficult to cross. I must surmount an obstacle; I suppose it refers to the fact that I am getting on very slowly; I suppose I ought to reach the other side.
2. *Ford*.—An opportunity for getting safely across, a possible way; otherwise the stream would be too difficult. The possibility of surmounting the obstacle lies in the analytical treatment.
3. *Crab*.—The crab lay quite hidden in the water; I did not see it at first. Cancer is a fearful incurable illness. (A series of recollections of Mrs. X., who died of cancer, followed.) I am afraid of this illness. A crab^[242] is an animal that walks backwards; obviously it wants to pull me down into the stream. It clutched me in a gruesome way, and I was awfully afraid. What prevents my getting across? Oh yes, I had another great scene with my friend.

It must be explained that there is something special about this friendship. We have here an ardent attachment, bordering on the homosexual. It has been going on for years. The friend is in many respects like the patient, and is also nervous. They have pronounced artistic interests in common. But the patient is the stronger personality of the two. They are both nervous, and their mutual relation being too engrossing, cuts them off too much from other possibilities of life. In spite of an "ideal friendship" they have at times tremendous scenes, owing to their mutual irritability. Evidently the unconscious wishes to put some distance between them, but they refuse to pay attention to it. A "scene" usually begins by one of them finding that she does not yet understand the other well enough, and that they ought to talk more openly together; whereupon both make enthusiastic endeavours to talk things out. Misunderstandings supervene almost directly, provoking fresh scenes, each worse than the last. The quarrel was in its way and *faute de mieux* a pleasure to both of them, which they were unwilling to relinquish. My patient, especially, was unable for a very long time to renounce the sweet pain of not being understood by her best friend, although, as she said, every scene "tired her to death." She had long since realised that this friendship had become superfluous, and that it was only from mistaken ambition that she clung to the belief that she could yet make something ideal out of it. The patient had formerly had an extravagant, fantastic relation to her mother, and after her mother's death had transferred her feelings to her friend.

VII.—ANALYTICAL (CAUSAL-REDUCTIVE) INTERPRETATION. [243]

This interpretation may be summed up in a sentence: "I understand that I ought to get to the other side of the stream (that is, give up the relation with the friend), but I would much rather that my friend did not let me out of her claws (embrace)." That is, expressed as an *infantile wish*: Mother would like to attract me to herself again by the well-known mode of enthusiastic embraces. The incompatibility of the wish lies in the strong under-current of *homosexuality*, the existence of which had been abundantly proved by obvious facts. The crab seizes her foot. The patient having big, "manly" feet, she plays a masculine part towards her friend, having also corresponding sexual fantasies. The foot is known to have phallic significance. (Detailed evidence of this is to be found in *Aigremont's*

writings.) The complete interpretation would run as follows: The reason why she will not let her friend go is because her unconscious homosexual wishes are set upon her. As these wishes are morally and aesthetically incompatible with the tendency of the conscious personality, they are repressed, and therefore unconscious. The fear is an expression of this repressed wish.

This interpretation is exceedingly depreciative of the patient's high-pitched conscious ideal of friendship. It is true at this point in analysis she would no longer have taken this interpretation amiss. Some time before certain facts had sufficiently convinced her of her homosexual tendency, so that she was able to acknowledge the existence of this inclination frankly, although it was of course painful for her to do so. Therefore if, at this stage of the treatment, I had informed her that this was the interpretation, I should not have encountered resistances from her. She had already overcome the painfulness of this unwelcome tendency by understanding it. But she would have said to me: "Why do we analyse this dream at all? It is only repeating what I have now known for a long while." It is true this interpretation does not reveal anything new to the patient, and it is therefore uninteresting and ineffective. This kind of interpretation would at the beginning of the treatment have been impossible in this case, because the patient's prudishness would under no circumstances have acknowledged it. The "venom" of understanding had to be instilled very carefully, and in the smallest of doses, until the patient gradually became more enlightened. But when the analytical or causal-reductive interpretation, instead of furnishing something new, persistently brings the same material in different variations, then the moment has come when another mode of interpretation is called for. The causal-reductive procedure has certain drawbacks. First, it does not take strictly into account the patient's associations—*e.g.* in this case the association of the illness ("cancer") with "crab" (Krebs = cancer). Second, the particular choice of symbol remains obscure. For instance, why does the friend-mother appear as a crab? A prettier and more plastic representation would have been a nymph. ("Half dragged she him, half sank he down,"^[244] etc.) An octopus, a dragon, a serpent, or a fish could have performed the same services. Third, the causal-reductive procedure completely ignores that a dream is a subjective phenomenon, and that consequently even an exhaustive interpretation can never connect the crab with the mother or the

friend, but only with the dreamer's idea of them. The whole dream is the dreamer; she is the stream, the crossing, and the crab. That is to say these details are expressions of psychological conditions and tendencies in the subject's unconscious.

I have therefore introduced the following terminology. I call interpretations in which the dream symbols are treated as representations of the real objects *interpretation upon the objective plane*. The opposite interpretation is that which connects every fragment of the dream (e.g. all the persons who do anything) with the dreamer himself. This is *interpretation upon the subjective plane*. Objective interpretation is *analytical*, because it dissects the dream contents into complexes of reminiscence, and finds their relation to real conditions. Subjective interpretation is *synthetic*, because it detaches the fundamental underlying complexes of reminiscence from their actual causes, regarding them as tendencies or parts of the subject, and reintegrating them with the subject. (In experiencing something I do not merely experience the object, but in the first place myself, although this is only the case if I render myself account of the experience.)

The synthetic or constructive procedure of interpretation^[245] is therefore based upon the version on the subjective plane.

VIII.—THE SYNTHETIC (CONSTRUCTIVE) INTERPRETATION.

The patient is unconscious of the fact that it is in herself that the obstacle lies which should be overcome, the boundary that is difficult to cross which impedes further progress. But it is possible to cross the boundary. It is true that just here a peculiar and unexpected peril threatens, namely, something "animal" (non-human or super-human) which moves backwards and goes into the depths of the stream, wanting to draw down the dreamer as a whole personality. This danger is, moreover, like the deadly disease of cancer, which begins secretly somewhere, and is incurable (overpowering). The patient imagines that her friend hinders her, pulling her down. So long as this is her belief she must perforce influence her friend, "draw her up," teach, improve, educate her, and make futile and impractically idealistic efforts in order to avoid being dragged down herself. Of course, the friend makes similar endeavours, being in a like case with the patient. So both of them keep jumping upon each other like fighting cocks, each trying to fly over the other's head. The higher the point to which the one screws herself, the higher must the other also try to get. Why? Because each thinks the fault lies in the other, in the object. Interpretation of the dream on the subjective plane brings deliverance from this absurdity, for it shows the patient that

she has something in herself that is hindering her from crossing the boundary; that is, from getting out of the one position or attitude into another. To interpret change of place as change of attitude is supported by the mode of expression in certain primitive languages, where, *e.g.*, the phrase "I am on the point of going," is "I am at the place of going." In order to understand the language of dreams, we need plenty of parallels from the psychology of primitive peoples, as well as from historical symbolism. This is so because dreams originate in the unconscious, which contains the residual potentialities of function of all preceding epochs of the history of the evolution of man.

Obviously, in our interpretation everything now depends upon understanding what is meant by the crab. We know that it symbolizes something that comes to light in the friend (she connects the crab with the friend), and also something that came to light in the mother. Whether both mother and friend really have this quality in them is irrelevant as regards the patient. The situation will only be changed when the patient herself has changed. Nothing can be changed in the mother because she is dead. The friend cannot be urged to alter; if she wants to alter herself, that is her own affair. The fact that the quality in question is associated with the mother indicates that it is something infantile. What is there in common in the patient's relation both to her mother and her friend? What is common to both is a violently extravagant demand for love, the patient feeling herself overwhelmed by its passion. This claim is an overpowering infantile craving which is characteristically blind. What is in question here is a part of her libido that has not been educated, differentiated, nor humanized, retaining still the compulsive character of an instinct, because it has not yet been tamed by domestication. An *animal* is a perfectly appropriate symbol for this rôle of libido. But why is the animal a crab in this particular instance? The patient associates cancer with it, of which disease Mrs. X. died at the age the patient has just reached. It may, therefore, well be that this is an allusion to an identification with Mrs. X. We must therefore make inquiries about this Mrs. X. The patient relates the following facts about her: Mrs. X. was widowed early; she was very cheerful and enjoyed life. She had a number of adventures with men, especially with one particular man, a gifted artist, who the patient herself knew personally and who always impressed her as very fascinating and weird.

An identification can only result from an unrecognized unconscious resemblance. Now what is the resemblance between our patient and Mrs. X.? I was able here to remind the patient of a series of former fantasies and dreams, which had shown plainly that she also had a frivolous vein in her, although anxiously repressing it, because she vaguely feared it might seduce her to an immoral life. We have now gained a further essential contribution for a right understanding of the "animal" rôle, which evidently represents an untamed, instinctive greed, which in this case is directed to men. At the same time we understand a further reason why she cannot let go of her friend. She must cling to her in order not to fall a prey to this other tendency, which seems so much more dangerous. By these means she remains at an infantile homosexual stage, which serves her as a defence. (Experience proves this erection of defences to be one of the most effective motives for the retention of unadapted, infantile relations.) But in this missing libido in the animal rôle lies her well-being, the germ of her future healthy personality, which does not shrink from the hazards of human life.

But the patient had drawn another conclusion from the fate of Mrs. X., having conceived her severe illness and early death as a punishment of fate for her gay life which the patient, although certainly not confessing to this feeling, always envied her. When Mrs. X. died, the patient pulled a long face, beneath which a "human, all too human," malicious satisfaction was hidden. As a punishment for this tendency the patient, taking Mrs. X.'s example as a warning, deterred herself from living and from further development, and burdened herself with the misery of this unsatisfying friendship. Of course this concatenation had not been consciously clear to her, otherwise she would never have acted as she had done. The truth of this conclusion can be proved by the material.

The history of this identification by no means ends here. The patient subsequently emphasized the fact that Mrs. X. had a not inconsiderable artistic capacity which developed only after her husband's death and which led to her friendship with the artist. This fact seems to be one of the essential incentives to the identification, if we call to mind that the patient had already told us what a striking impression she had received from the artist. A fascination of this kind is never exclusively exercised by one person only upon the other. It is a phenomenon of reciprocal relation between two persons in so far as the fascinated person must provide a

suitable predisposition. But she must be unconscious of this predisposition, otherwise there will be no fascination. Fascination is a phenomenon of compulsion which lacks conscious ground; that is, it is not a process of the will, but a phenomenon coming to the surface from the unconscious, and forcing itself compulsorily upon consciousness. All compulsions arise from unconscious motives. It must therefore be assumed that the patient possesses a similar unconscious predisposition to that of the artist. She becomes identified with this artist, and is also identified with him *as man*. Here we are at once reminded of the analysis of the dream, where we met an allusion to the "masculine" foot. As a matter of fact, the patient plays a thoroughly masculine part towards her friend, being the active one who continually takes the lead, commanding her friend and occasionally even forcing her somewhat violently to some course that only the patient desires. Her friend is distinctly feminine both in her external appearance and otherwise, whilst the patient is also externally of a somewhat masculine type. Her voice is stronger and deeper than that of her friend. She now describes Mrs. X. as a very feminine woman, her gentleness and amiability being comparable to that of her friend, so she thinks. This gives us a new clue. The patient is obviously playing towards her friend the artist's part towards Mrs. X. Thus she unconsciously completes her identification with Mrs. X. and her lover. In this way she is giving expression to her frivolous vein which she had repressed so carefully. She is not living it consciously, however, but is herself played upon by her own unconscious tendency.

We now know a great deal about the crab: it represents the inner psychology of this untamed part of the libido. The unconscious identifications always keep drawing her on. They have this power because being unconscious they cannot be subjected to insight and correction. The crab is the symbol of the unconscious contents. These contents are always seducing the patient to retain her relation to the friend. (The "crab goes backwards.") But the relation to the friend is synonymous with illness, she became nervous through it (hence the association of illness).

Strictly speaking, this really belongs to the analysis on the objective plane. But we must not forget that we only arrive at understanding by applying the *subjective* interpretation, which thereby proves itself to be an important heuristic principle. For practical purposes we might rest quite satisfied with the result we have already reached. But we seek here to satisfy all the

requirements of the theory. Not all the associations have yet been used; neither is the significance of the choice of symbols yet demonstrated sufficiently.

We will now recur to the patient's remark that the crab lay hidden under the water in the stream, and that she had not seen it at first. She had not at first perceived the unconscious relations that have just been elucidated; they lay hidden in the water. But the stream is the obstacle preventing her from going across. It is precisely the unconscious relations binding her to her friend that have been hindering her. The unconscious was the obstacle. In this case, therefore, the water signifies the unconscious, or, it were better to say, the *being unconscious* the being hidden, for the crab is also something unconscious, namely, the portion of the libido that was hidden in the unconscious.

IX.—THE DOMINANTS OF THE SUPER-PERSONAL UNCONSCIOUS.

The task now lies before us of raising the unconscious data and their relations that have been hitherto understood upon the objective plane, to the *subjective* plane. To this end we must once more separate them from their objects, conceiving them as images, related in a subjective way to function-complexes in the patient's own unconscious. Raised to the subjective plane, Mrs. X. is the person who showed the patient the way to do something that the patient herself feared while unconsciously desiring it. Mrs. X. therefore represents that which the patient would like to become, and yet does not quite want to. In a certain sense Mrs. X. is a picture of the patient's future character. The fascinating artist cannot be raised to the subjective plane, because the unconscious artistic gift lying dormant in the patient has already been covered over by Mrs. X. It would be quite right to say that the artist is the image of the masculine element in the patient, which not being consciously realised, is still lying in the unconscious. In a certain sense this is indeed true, the patient actually deluding herself as regards this matter. That is, she seems to herself to be particularly tender, sensitive and feminine, with nothing in the least masculine about her. She was indignantly amazed when I drew her attention to her masculine traits. But the reason why she is fascinated by something mysterious in the artist cannot be attributed to what is masculine in her. That seems to be

completely unknown to her. And yet it must be hiding somewhere, for she has produced this feeling out of herself.

Whenever a part of libido similar to this cannot be found, experience teaches us that it has always been *projected*. But into whom? Is it still attached to the artist? He has long ago disappeared from her horizon, and can hardly have taken the projection with him, because it was firmly fixed in the patient's unconscious. A similar projection is always actually present, that is, there must somewhere be some one upon whom this amount of libido is actually projected, otherwise she would have felt it consciously.

Thus we once more reach the objective plane, for we cannot discover this missing projection in any other way. The patient does not know any man except myself who means anything at all to her, and as her doctor I mean a good deal to her. Therefore she has probably projected this part upon me. It is true I had never noticed anything of the kind. But the exquisitely deceptive rôles are never presented to the analyst on the surface, coming to light always only outside the hour of treatment. I therefore carefully inquire: "Tell me what do I seem like to you when you are not with me? Am I just the same then?" Reply: "When I am with you, you are very pleasant and kind; but when I am alone, or have not seen you for rather a long time, then the picture I have in my mind of you changes in an extraordinary way. Sometimes you seem quite idealized, and then again different." She hesitates; I help by saying: "Yes, what am I like then?" Reply: "Sometimes quite dangerous, sinister like an evil magician or demon. I do not know how I get hold of such ideas. You are not really a bit like that."

So this part was attached to me as part of a transference; that is why it was lacking in her inventory. Therewith we recognize a further important thing. I was confused with (identified with) the artist, and in her unconscious fantasy she is Mrs. X. I was easily able to prove this fact by means of material that had previously been brought to light (sexual fantasies). But I myself then am the obstacle, the crab, that is hindering her from getting across. The state of affairs would be critical if at this particular point we were to limit ourselves to the objective plane of interpretation. What would be the use of my explaining: "But I am not this artist at all, I am not in the least weird as he is, nor am I like an evil magician." That would leave the patient quite unconvinced because she would know as well I do that the projection would continue to exist all the same, and that it is really I who

am hindering her further progress. It is at this point that many a treatment has come to a standstill. For there is no other way for the patient here of escaping from the embrace of the unconscious, but for the physician to raise himself to the subjective plane, where he is to be regarded as an image. But an image of what? This is where the greatest difficulty lies. The doctor will say: "An image of something in the patient's unconscious." But the patient may object: "What, am I to suppose myself to be a man, a mysteriously fascinating one to boot, a wicked wizard and a demon? No, I cannot accept that; it is nonsense. I'd sooner believe that you are all that." She is really, so to speak, quite right. It is too preposterous to want to transfer such things to herself. She cannot permit herself to be made into a demon, any more than can the physician. Her eyes flash, a wicked expression appears upon her face, a glimmer of an unknown hate never seen before, something snake-like seeming to creep into her. I am suddenly faced by the possibility of a fatal misunderstanding with her. What is it? Is it disappointed love? Is she offended? Does she feel depreciated? There seems to lurk something of the beast of prey, something really demoniac in her glance. Is she then after all a demon? Or am I myself the beast of prey, the demon, and is this a terrified victim sitting before me, who is trying to defend herself with the brute force of despair against my wicked spells? But either idea must be nonsense, phantastical delusion. What have I come in contact with? What new string is vibrating? But it is only for a passing moment. The expression upon the patient's face becoming quiet again, she says, as if relieved: "It is extraordinary. I feel as if you had touched the point which I could never get over in relation to my friend. It is a horrible feeling, something non-human, wicked, and cruel. I cannot describe how queer this feeling is. At such moments it makes me hate and despise my friend, although I struggle against it with all my might and main."

An explanatory light is thrown upon what has happened by this observation. I have now taken the friend's place. The friendship has been overcome, the ice of repression is broken. The patient has without knowing it entered upon a new phase of her existence. I know that now upon me will fall everything painful and bad in the relation to the friend. So also will whatever was good in it, although in violent conflict with the mysterious unknown quantity X, about which the patient could never get clear. A new phase, therefore, of the transference supervenes, which, however, does not as yet make clearly apparent what the X that is projected upon me consists of.

It is quite certain, that the most troublesome misunderstandings threaten if the patient should stick at this stage of the transference. In that case she will necessarily treat me as she treated her friend; that is the X will continually be somewhere in the air giving rise to misunderstandings. The end would probably be that she would see the evil demon in me, because she is quite unable to accept the fact that she is herself the demon. All insoluble conflicts are brought about in this way. And an insoluble conflict signifies a standstill in life.

Another possibility is, that the patient should disregard the obscure point by applying her old preventative against this new difficulty. That is, she would repress it again, instead of keeping it conscious, which is the necessary and obvious demand of the whole method. Nothing is gained by such repression; on the contrary, the X threatens more from the unconscious where it is considerably more unpleasant.

Whenever such an unacceptable image emerges, one must decide whether at bottom it is destined to represent a human quality or not. "Magician" and "demon" may represent qualities that are described in this particular fashion, in order that they may speedily be recognized as *not human but mythological qualities*. Magician and demon being mythological figures aptly express the unknown "non-human" feelings which had surprised the patient. These attributes are not applicable to a human personality; being as a rule judgments of character *intuitively* and not critically approved, which are projected upon our fellow-beings, inevitably doing serious injury to human relations.

Such attributes always indicate that contents of the super-personal or absolute unconscious are being projected. Neither demons nor wicked magicians are reminiscences of personal experiences, although every one has, of course, at some time or other heard or read of them. Although one has heard of a rattle-snake, it would hardly be appropriate to describe a lizard or a blind-worm as a rattle-snake, simply because one was startled by their rustling. Similarly, one would hardly term a fellow-being a demon, unless some kind of demoniacal influence were closely associated with him. If, however, the demoniacal influence were really part of his personal character, it would show itself everywhere, and then this human being would be a demon, a kind of werewolf. But such an ascription is mythology; in other words, it is from the collective and not from the individual psyche.

Inasmuch as through our unconscious we have a share in the historical collective psyche, we naturally dwell unconsciously in a world of werwolves, demons, magicians, etc., these being things which have always affected man most profoundly. We have just as much a part in gods and devils, saviours and criminals. But it would be absurd to want to ascribe to one's personal self the possibilities that are potentially existing in the human unconscious. It is, therefore, essential to make as clear a distinction as possible between the personal and the impersonal assets of our psyche. This is by no means intended to nullify the occasional great effects due to the existence of the contents of the absolute unconscious; but these contents of the collective psyche should be differentiated from those belonging to the individual psyche. For simple-minded people, of course, these things were never separated, the projection of gods, demons, etc., not having been understood as a psychological function were simply accounted concretistical realities. Their projectional character was never perceived. It was only with the advent of the epoch of scepticism that it was realized that the gods did not really exist except as projections. With that the matter was set at rest. But the psychological function corresponding to it was by no means set at rest, for it lapsed into the unconscious and began to poison men with a surplus of libido that had hitherto been invested in the cult of idols or gods. Obviously, the depreciation and repression of such a powerful function as that of religion has serious consequences for the psychology of the individual. The reflux of this libido strengthens the unconscious prodigiously, so that it begins to exercise a powerful compulsory influence upon consciousness and its archaic collective contents. One period of scepticism came to a close with the horrors of the French Revolution. At the present time we are again experiencing an ebullition of the unconscious destructive powers of the collective psyche. The result is an unparalleled general slaughter. That is just what the unconscious was tending towards. This tendency had previously been inordinately strengthened by the rationalism of modern life, which by depreciating everything irrational, caused the function of irrationalism to sink into the unconscious. But the function once in the unconscious will from thence work unceasing havoc, like an incurable disease whose centre cannot be eradicated. For then the individual and the nation alike are compelled to live irrationally, and even to apply their highest idealism and their best wit to make this madness of irrationalism as complete as possible. We see examples of this on a small

scale in our patient. She turned from a possibility of life that seemed to her irrational (Mrs. X.) in order to live it in a pathological form, to her own loss, and with an unsuitable object.

There is, indeed, no possible alternative but to acknowledge irrationalism as a psychological function that is necessary and always existent. Its results are not to be taken as concrete realities (that would involve repression), but as *psychological realities*. They are realities because they are *effective* things, that is, they are *actualities*.

The collective unconscious is the sediment of all the experience of the universe of all time, and is also an image of the universe that has been in process of formation for untold ages. In the course of time certain features have become prominent in this image, the so-called *dominants*. These dominants are the ruling powers, the gods; that is, the representations resulting from dominating laws and principles, from average regularities in the issue of the images that the brain has received as a consequence of secular processes.

In so far as the images formed in the brain are relatively faithful portrayals of psychic happenings they will correspond to their dominants; that is, their general characteristic features, made prominent by the accumulation of similar experiences, will correspond to certain physical fundamental facts that are also universal. Hence it is possible to transfer unconscious images to physical events direct as intuitive ideas; *e.g. ether* the primeval breath or soul-substance appears in man's conceptions the whole world over; so, too, *energy*, the magic force, which is equally widespread.

On account of their connection with physical things the dominants usually make their appearance as projections, appearing, indeed—if the projections are unconscious—in the persons of the immediate environment, as a rule in the form of abnormal under- or over-valuations, which excite misunderstandings, conflict, infatuations, and various kinds of folly. People say: "He makes a god of So-and-so," or "So-and-so is X.'s *bête noire*." They also give rise to the formation of modern myths, that is, fantastic rumours, suspicions and prejudices.

The dominants of the collective unconscious are therefore extremely important things of significant effect, to which great attention should be

paid. They must not be repressed, but must be given most careful consideration. They usually appear as projections, and since projections are only attached where there is some external stimulus, it is very difficult to appraise them aright, on account of the relation of the unconscious images with the object. If some one projects the dominant of "devil" into a fellow-being, this occurs because this other person has something in him that makes the attachment of the devil dominant possible. But that is by no means to say that this person is therefore, so to speak, a devil; on the contrary, he may be a particularly good fellow, but being antipathetic to the one who projects, a "devilish effect" is brought about between the two. This does not mean that the one who projects is a devil, although he must recognize that he too, just as much, has something devilish in him, and has been gulled by it, inasmuch as he projected it; but that does not make him a devil; indeed, he may be just as decent a man as the other. In such a case the appearance of the devil dominant means: the two persons are incompatible (for the moment and for the near future), wherefore the unconscious splits them asunder and holds them apart from each other.

One of the dominants that is almost always met in the analysis of projections of collective unconscious contents is the "magical demon;" it is of preponderating sinister effect. "The Golem," by *Meyrink*, is a good example of this; also the Thibetan wizard in Meyrink's "Fledermäusen," who lets the world-war loose by magic. Obviously Meyrink formed this image independently and freely out of his unconscious, by giving word and picture to a feeling similar to the one that my patient had projected upon me. The dominant of magic also appears in "Zarathustra," whilst in "Faust" it is, so to say, the hero himself.

The picture of this demon is the lowest and most elementary concept of God. It is the dominant of the primitive tribal magic-man, or a singularly gifted personality endowed with magic power. This figure very frequently makes an appearance in my patient's unconscious as a *dark-skinned being of Mongolian type*.

An important step forward has been taken by the recognition of the dominants of the absolute unconscious. The magical or demoniac effect of the fellow-being is made to disappear by the feeling being realised as a definite projection of the absolute unconscious. On the other hand, a completely new and unsuspected task now lies before us: namely, the

question in what way the ego should come to terms with this psychological non-ego. Should one rest satisfied with having verified the effective existence of unconscious dominants, leaving the matter to take care of itself?

To leave it at this point would be the means of creating a permanent state of dissociation in the subject, a conflict between the individual psyche and the collective psyche. Upon the one side we should have the differentiated modern ego, whilst upon the other a kind of uncivilized negro representative of a thoroughly primitive state. That would mean that we should have what really does exist, a crust of civilization over a dark-skinned brute; the cleavage would be distinct and demonstrable before our very eyes. But such a dissociation requires immediate synthesis and cultivation of what is undeveloped. There must be a union of these two aspects.

Before entering upon this new question let us first return to the dream from which we started. The discussion has given us a broader understanding of the dream, and especially of an essential part of it, namely, the fear. This fear is a demoniac fear of the dominants of the collective unconscious. We saw that the patient identifies herself with Mrs. X., expressing thereby that she also has some relation to the mysterious artist. It was apparent also that she identified the physician (myself) with the artist; and further that when taken upon the subjective plane, the image of the wizard dominants of the collective unconscious represented me.

All this is covered in the dream by the symbol of the crab which walks backwards. The crab stands for the living content of the unconscious that can by no means be exhausted or rendered inoperative by analysis on the objective plane. But what we were able to do was to *detach the mythological or collective psychological contents from the objects of consciousness, and to consolidate them as psychological realities outside the individual psyche.*

So long as the absolute unconscious and the individual psyche are coupled together without differentiation, no progress can be made, or, as the dream expresses it, no boundary be crossed. If the dreamer does nevertheless prepare to cross the boundary, the unconscious that was hitherto unnoticed becomes animated, seizing her and dragging her down. The dream and its

material characterize the absolute unconscious, on the one side as a lower animal living hidden in the depths of the water; and on the other side, as a dangerous disease that can only be cured by a timely operation. To what extent this characterization is appropriate has already been seen. As was pointed out, the animal symbol specially refers to what is *extra* human, that is super-personal; for the contents of the absolute unconscious are not merely the residue of archaic human functions, but also the residue of functions of the animal ancestry of mankind, whose duration of life was indeed vastly greater than the relatively brief epoch of specifically human existence. If such residues are active, they are apt, as nothing else is, not merely to arrest the progress of development, but also to divert the libido into regressive channels, until the quantity which the absolute unconscious has activated has been absorbed. The energy becomes profitable again after it has been consciously contrasted with the absolute unconscious, a process which enables it to be converted into a valuable source from which to draw. This transference of energy was established by religions in a concretistic manner through cultural communication with the gods (the dominants of the absolute unconscious). But these modes and customs are too much at variance with our intellect and our moral sense for us to be able to declare this solution of the problem as still binding, or even possible. If, on the other hand, we apprehend the images of the unconscious as collective unconscious dominants, therefore as collective-psychological phenomena or functions, this hypothesis is in no way opposed to our intellect and conscience. This solution is rationally acceptable. We have thus gained the possibility of coming to terms with the activated residues of our ancestral history. This mode of settlement makes it possible to traverse the boundary line hitherto limiting us, and is therefore appropriately termed the *transcendental function*, which is synonymous with progressive development to a new attitude. In the dream this development is indicated by the other side of the stream.

The similarity to hero-myths is striking. The typical combat of the hero with the monster (the unconscious content) frequently takes place on the banks of some water; sometimes at a ford. This circumstance is prominent in legends of Red Indians, as, for example, in Longfellow's "Hiawatha." In the decisive battle the hero is swallowed by a monster (*cf.* story of Jonah), as Frobenius^[246] has shown by means of extensive material. But inside the

monster the hero begins to come to terms with the beast in his own way: whilst the creature swims with him towards the sunrise, he cuts off a valuable piece of the viscera, *e.g.* the heart, by which the monster lived, that is, the valuable energy by which the unconscious was activated. Through this deed he kills the monster, who then drifts to land, where the hero, born anew through the transcendental function (the "night-journey under the sea" of Frobenius), steps forth, often in company with all those beings whom the monster had previously swallowed. This enables the normal state to be restored, as the unconscious having been robbed of its energy no longer occupies a preponderating position. In this way the myth—which is the dream of a people—graphically describes the problem with which our patient is concerned.^[247]

The problem of how to come to terms with the absolute unconscious is a question apart. I must content myself here with a general survey of the new theory of the unconscious up to the transcendental function, leaving the presentation of the transcendental function itself to a later work.

X.—THE DEVELOPMENT OF THE TYPES OF INTROVERSION AND EXTROVERSION IN THE ANALYTICAL PROCESS.

The description of the analysis of the unconscious would be incomplete if a word were not said about the question whether this method is equally applicable to the two types. As a matter of fact, both the development and the conception of the unconscious are different for each type. Although making every effort to find out a formulation that shall be as universally valid as possible, we must emphatically impress upon our minds the fact that the two modes of conception of the types are essentially different; a universal formulation that is just, only becomes possible when both standpoints are given equal consideration. I do not conceal from myself the fact that this subject is of less interest to the layman than to the specialist. Nevertheless, certain aspects of the question are of such a general character that the layman should not find the perusal of this last section entirely without interest.

Let us first consider the concept of the unconscious. I have here introduced the unconscious under the conception of a psychological function, namely, the function of the sum of all those psychic contents which do not reach the

threshold of consciousness. I have divided the unconscious materials into *personal*—that is to reminiscences attributable to personal experiences, combinations and tendencies—and into *impersonal* collective contents, that is, those whose contents cannot be attributed to personal experiences.

The contents of the psyche are fundamentally images indicating function on the one hand, and upon the other objects and the world generally. The conscious contains the recent object-images; the personal unconscious, the object-images of the individual past, so far as they have either been forgotten or repressed; whilst the absolute or collective unconscious contains the inherited world-images generally, under the form of primordial images or mythical themes. All psychic images have two sides: the one, being directed towards the object, is as faithful a likeness of the object as possible, framed without any intention or obligation to be anything else. The other side is directed towards the soul, that is towards the psychic function and the laws peculiar to it.

Let us take as an example, a primordial image out of a hero-myth. There is in the West a demon ancestress with a large mouth. The hero creeps into it, and at the same moment a certain little bird sings; the ancient dame shuts her mouth with a bang, and the hero disappears.

The side of the image directed towards the physical object means, the sun goes down in the evening into the mouth of the ocean. At this hour a certain little bird sings (which is an objective fact), and the sun disappears into the depths of the sea.

The side of the image directed towards the soul, that is the *idea*, signifies: The energy contained in consciousness disappears (like the sun in the evening) into the monster of the unconscious.

If we consider the collective-unconscious from the side of the soul or idea, it is something entirely distinct, and it must be differentiated, *abstracted* from the object, if its contents are to attain the perfection of an idea. If, on the other hand, we consider the collective-unconscious from the side of the physical object, that is as an image of the object, it is weaker and less clear than the object itself, and can only be brought to perfection if it is objectified, that is projected on to the object itself.

As previously explained, there are two types of human psychology that can be clearly distinguished, viz. introversion and extroversion. The introvert is characterised by the thought standpoint; the extrovert by the feeling standpoint. As I showed, they are quite different in their relation to the object: the introvert abstracting from the object and thinking about it, whilst the extrovert goes to the object and feels himself into it. The accent of value lies upon the ego for the introvert, but upon the object for the extrovert. The former's chief concern is the preservation of the ego; that of the latter the preservation of the object. The two types will adopt a different attitude towards the unconscious, namely, the introvert will and must seize the idea-side of the unconscious image; the extrovert, on the other hand, seizing the side of the physical reflection. The introvert will purify as far as possible the idea-side from the "alloy" of the concretistic admixture of the physical image, in order to arrive at the abstract idea; whilst, on the other hand, the extrovert will purify the physical image as far as possible from the "phantastic" admixture of the enveloping ideas. The former, by raising himself to a world of idea, will endeavour to overcome the disturbing influence of the unconscious; whilst the latter will approach the object as near as possible and project the unconscious image into the physical object, thus freeing himself from the grip of the unconscious.

What for the extrovert is a phantastic and disturbing admixture in the unconscious picture, is for the introvert precisely that which has the most value, for it is the germ of the pure idea, and *vice versâ*; what for the introvert are merely concretistical "imperfections," survivals of a physical origin, are for the extrovert a most valuable hint, the bridge by which the unconscious can be united with the object.

This description makes it manifest that the two types go contrary ways in the course of the development of their unconscious, arriving therefore at opposite extremes: the one at the idea, the other at the object of his feeling. The psychological characteristics of the types are eventually pushed to extremes, where according to the enantiodromic law the moment has arrived when in each case the "other" function enters into its fully acknowledged right, that is, feeling in the case of the introvert, and thought in that of the extrovert. The introvert attains the lacking function of autonomous feeling by means of a differentiation and enhancement of his thought; whilst the extrovert, on the other hand, attains his thinking by the

way of an increasingly differentiated love. These functions that hitherto were secondary are found at first in the unconscious, gradually reaching consciousness in the course of development. At first they are unconscious functions in a state that is more or less incompatible with consciousness and have the typical qualities of unconscious contents. These qualities are such as are not tolerated in consciousness. The lunatic Schreber^[248] says most aptly that the language of God (the unconscious) is a somewhat archaic but vigorous German, of which he gives a few striking examples. As the contrary function that emerges from the unconscious into consciousness differs to such an extent from what appears to be acceptable to consciousness, the necessity arises of a technique for coming to terms with the contrary function. It is impossible to accept the contrary function as it stands, as it always drags extraneous qualities and accompanying circumstances with it from the absolute unconscious. Through the above-described development the extrovert has acquired an adaptation to the object that is absolutely real and free from all phantasies; he will therefore be able to turn his attention towards the "alloy" which for the introvert was the valuable germ of idea. From this he will then develop similar ideas to those which the introvert has already developed. *Vice versâ*, the introvert will now be able to turn his attention to those materials which before he was obliged to reject, as being side-tracks on the road to physical reality; that is, he will carry out the same clearing and winnowing in his feeling-relations, that the extrovert has already completed.

The development of the contrary function that was hitherto unconscious, leads to individuation beyond the type, and thereby to a new relation to the world and mind. The process which begins with the complementation of the types is the transcendental function, which leads to the new adaptation by means of the clearing and winnowing of unconscious feelings and thoughts that have been brought up by the contrary function that had been neglected.

Following the old maxim: "naturam si sequemur ducem nunquam aberrabimus," we have obeyed the natural impulse of the thinker to carry the principle of thought through to its utmost perfection attainable, as also that of the feeler, of carrying the principle of feeling through to the end. By these means the salutary extreme was produced, to wit, the hunger, the desire for the compensatory function. For, by means of thought, the one is landed in a lifeless ice-cold world of crystalline ideas; whereas, by means of

feeling, the other reaches a limitless ocean of never ending flood of sentiment. The former will, therefore, yearn for living warmth of feeling, and the latter for the restrictive precision and solidity of thought.

An enrichment of the individual is attained by this compensatory process, giving him greater decision and the possibility of a harmony that is complete in itself. The assimilation of the contrary function discloses new inner springs, which guarantee to the individual considerably greater independence from external conditions. This acquisition is an indisputable advantage that none would like to surrender in face of the fact so unavoidably connected with it, that a new adaptation and orientation of this kind places the individual in a certain contrast to the great bulk of people who yet have the old attitude. This contrast is no drawback; it is rather a welcome and effective spur to life and work, for thereby is created the channel required by our psychic energy for its development.

XI.—GENERAL REMARKS ON THE THERAPY.

I have still to draw the reader's attention to an important fact. Throughout the course of this paper, I have seemed to associate the idea of disturbance or even of peril with the unconscious. But it would give a false impression if we were only to emphasize the dangerous side of the unconscious. *The unconscious is a source of danger when the individual is not at one with it.* If we succeed in establishing the function or attitude that I call transcendental, the disharmony ceases, and we are permitted to enjoy the favourable side of the unconscious. In such case the unconscious vouchsafes us that furtherance and assistance which bountiful Nature is always ready to give to man in overflowing abundance. The unconscious possesses possibilities of wisdom that are completely closed to consciousness, for the unconscious has at its disposal not only all the psychic contents that are under the threshold because they had been forgotten or overlooked, but also the wisdom of the experience of untold ages, deposited in the course of time and lying potential in the human brain. The unconscious is continually active, creating combinations of its materials; these serve to indicate the future path of the individual. It creates prospective combinations just as our consciousness does, only they are considerably superior to the conscious combinations both in refinement and

extent. The unconscious may therefore be an unparalleled guide for human beings.

The reader must on no account suppose that the complicated psychological changes described must all be passed through in every individual case. In practice the treatment is adjusted according to the therapeutic result attained. The particular result arrived at may be reached at any stage of the treatment, quite apart from the seriousness or duration of the malady. The treatment of a serious case may last a long time, without the higher phases of the evolution ever being reached, or needing to be reached. There are comparatively few people who, after attaining the desired therapeutical result, pursue the further stages of evolution for the sake of their own development. It is, therefore, not the seriousness of the case which obliges one to pass through the whole development. In any case, only those people attain a higher degree of differentiation who are by nature destined and called to it, that is, who have both a capacity and tendency towards the higher differentiation. This is a matter in which people are extremely different, just as among species of animals there are some that are stationary and conservative, and others that are evolutionary. Nature is aristocratic, but not in the sense of having reserved the possibility of differentiation exclusively for those species that stand high. Similarly, the possibility of the psychological development of human beings is not reserved for specially *gifted* individuals. In other words: neither special intelligence nor any other talent is necessary in order to achieve a far-reaching psychological development, inasmuch as in this development moral qualities step in to supplement where intellect does not suffice. But it must not be supposed under any circumstances that the treatment consists in grafting general formulas and complicated doctrines on to people; this is not so. Each one can acquire that which he needs, after his own fashion and in his own language. What I have here presented is only the intellectual formulation of the subject, founded upon preliminary scientific study of an empirical as well as a theoretical nature; but this formulation does not become a subject of discussion in the ordinary practical analytical work. The brief notes of cases that I have inserted give an approximate idea of the practical side of analysis.

The reader should realize that our new understanding of psychology has a side that is entirely practical, and another that is entirely theoretical. It is not

merely a practical method of treatment or education, but it is also a scientific theory, that is closely related to other co-ordinated sciences.

CONCLUSION.

In conclusion, I must beg the reader to pardon me for having ventured to say so many new and abstruse things in such a brief compass. I lay myself open to adverse criticism, because I conceive it to be the duty of every one who isolates himself by taking his own path, to tell others what he has found or discovered, whether it be a refreshing spring for the thirsty, or a sandy desert of sterile error. The one helps, the other warns. Not the opinion of any individual contemporary will decide the truth and error of what has been discovered, but rather future generations and destiny. There are things that are not yet true to-day, perhaps we are not yet permitted to recognize them as true, although they may be true to-morrow. Therefore every pioneer must take his own path, alone but hopeful, with the open eyes of one who is conscious of its solitude and of the perils of its dim precipices. Our age is seeking a new spring of life. I found one and drank of it and the water tasted good. That is all that I can or want to say. My intention and my duty to society is fulfilled when I have described, as well as I can, the way that led me to the spring; the reproaches of those who do not follow this way have never troubled me, nor ever will. New ideas always encounter resistance from the old. That always was and always will be the case; it appertains to the self-regulation of mental progress.

CHAPTER XV

THE CONCEPTION OF THE UNCONSCIOUS^[249]

I.—THE DISTINCTION BETWEEN THE PERSONAL AND THE IMPERSONAL UNCONSCIOUS

Since the breach with the Viennese school upon the question of the fundamental explanatory principle of analysis—that is, the question if it be sexuality or energy—our concepts have undergone considerable development. After the prejudice concerning the explanatory basis had been removed by the acceptance of a purely abstract view of it, the nature of which was not anticipated, interest was directed to the concept of the unconscious.

According to Freud's theory the contents of the unconscious are limited to infantile wish-tendencies, which are repressed on account of the incompatibility of their character. Repression is a process which begins in early childhood under the moral influence of environment; it continues throughout life. These repressions are done away with by means of analysis, and the repressed wishes are made conscious. That should theoretically empty the unconscious, and, so to say, do away with it; but in reality the production of infantile sexual wish-fantasies continues into old age.

According to this theory, the unconscious contains only those parts of the personality which might just as well be conscious, and have really only been repressed by the processes of civilisation. According to Freud the essential content of the unconscious would therefore be *personal*. But although, from such a view-point the infantile tendencies of the unconscious are the more prominent, it would be a mistake to estimate or define the unconscious from this alone, for it has another side.

Not only must the repressed materials be included in the periphery of the unconscious, but also all the psychic material that does not reach the threshold of consciousness. It is impossible to explain all these materials by

the principle of repression, for in that case by the removal of the repression a phenomenal memory would be acquired, one that never forgets anything. As a matter of fact repression exists, but it is a special phenomenon. If a so-called bad memory were only the consequence of repression, then those persons who have an excellent memory should have no repression, that is, be incapable of being neurotic. But experience teaches us that this is not the case. There are, undoubtedly, cases with abnormally bad memories, where it is clear that the main cause must be attributed to repression. But such cases are comparatively rare.

We therefore emphatically say that the unconscious contains all that part of the psyche that is found under the threshold, including subliminal sense-perceptions, in addition to the repressed material. We also know—not only on account of accumulated experience, but also for theoretical reasons—that the unconscious must contain all the material that has *not yet* reached the level of consciousness. These are the germs of future conscious contents. We have also every reason to suppose that the unconscious is far from being quiescent, in the sense that it is inactive, but that it is probably constantly busied with the formation and re-formation of so-called unconscious phantasies. Only in pathological cases should this activity be thought of as comparatively autonomous, for normally it is co-ordinated with consciousness.

It may be assumed that all these contents are of a personal nature in so far as they are acquisitions of the individual life. As this life is limited, the number of acquisitions of the unconscious must also be limited, wherefore an exhaustion of the contents of the unconscious through analysis might be held to be possible. In other words, by the analysis of the unconscious the inventory of unconscious contents might be completed, possibly in the sense that the unconscious cannot produce anything besides what is already known and accepted in the conscious. Also, as has already been said, we should have to accept the fact that the unconscious activity had thereby been paralysed, and that by the removal of the repression we could stop the conscious contents from descending into the unconscious. Experience teaches us that is only possible to a very limited extent. We urge our patients to retain their hold upon repressed contents that have been brought to consciousness, and to insert them in their scheme of life. But, as we may daily convince ourselves, this procedure seems to make no impression upon

the unconscious, inasmuch as it goes on producing apparently the same phantasies, namely, the so-called infantile-sexual ones, which according to the earlier theory were based upon personal repressions. If in such cases analysis be systematically continued, an inventory of incompatible wish-phantasies is gradually revealed, whose combinations amaze us. In addition to all the sexual perversions every conceivable kind of crime is discovered, as well as every conceivable heroic action and great thought, whose existence in the analysed person no one would have suspected.

In order to give an example of this, I would like to refer to Maeder's Schizophrenic patient who called the world his picture-book. He was a locksmith's apprentice who fell ill very early in life; he had never been blessed with intellectual gifts. As regards his idea that the world was his picture-book and that he was turning its pages over when he looked about in the world, it is just Schopenhauer's world, conceived as will and representation, expressed in primitive picture-language. This idea has just as universal a character as Schopenhauer's. The difference consists in the fact that the patient's notion has stood still at an embryonic stage in a process of growth, whereas with Schopenhauer the same idea has been changed from a mere image into an abstraction expressed in terms that are universally valid.

It would be false to assume that the patient's idea had a personal character and value. That would be to attribute to him the dignity of a philosopher. But he alone is a philosopher who raises an image that has naturally sprung up into an abstract idea, thereby translating it into terms of universal validity. Schopenhauer's philosophical conception is his personal value, whereas the notion of the patient has merely an impersonal value of natural growth, in which personal proprietary rights can only be acquired by making an abstraction of the images, and translating them into terms that are universally valid. But it would be wrong if an exaggerated sense of the value of this achievement led us to ascribe to the philosopher the merit of having made or conceived the original image itself. The primordial image has also sprung up naturally in the philosopher, and is nothing but a part of the universal human heritage in which, theoretically at least, every one has a share. The golden apples come from the same tree whether they are gathered by a locksmith's apprentice or a Schopenhauer.

The recognition of such primordial images obliges me to differentiate between the contents of the unconscious; a differentiation of another kind than that between the pre-conscious and unconscious, or between the subconscious and unconscious. The justification for those distinctions cannot be discussed here; they have a value of their own and probably merit to be carried further as affording a point of view. The differentiation which I propose follows obviously from what has previously been said, namely, that in the so-called unconscious we must differentiate a layer which may be termed the *personal unconscious*. The materials contained in this layer are of a personal kind, inasmuch as on the one hand they may be characterised as acquisitions of the individual existence, and on the other as psychological factors which might just as well be conscious. It is, for instance, comprehensible that incompatible psychological elements succumb to repression on the one hand and are therefore unconscious, but on the other hand there exists the possibility of bringing the repressed contents into consciousness and keeping them there, once they are known and recognised. We recognise these materials as personal contents, because we can prove their effects, their partial appearance, or their origin to lie in our personal past. They are integral constituents of the personality, and belong to a complete inventory of the same. They are constituents whose omission in consciousness implies an inferiority in one respect or another, not indeed an inferiority bearing the psychological character of an organic deformity or a natural defect, but rather the character of a neglect which arouses a moral reaction. The feeling of moral inferiority always indicates that in the portion omitted is something that according to the feelings should not be missing; or in other words, could be conscious if we took sufficient trouble about it. The sense of moral inferiority is not the result of a collision with the universal, in a certain sense arbitrary, moral law, but rather the result of a conflict with the personal ego, which by reason of the psychic economy demands an adjustment of the deficiency. Wherever a feeling of inferiority appears, it reveals not only the presence of a demand for the assimilation of an unconscious constituent, but also the possibility of such an assimilation. It is, after all, a person's moral qualities that make him assimilate his unconscious self and retain it in consciousness, whether he be forced to it by a recognition of its necessity, or by a painful neurosis. He who continues to tread this path of the realisation of his unconscious self, necessarily transposes the content of the personal unconscious into

consciousness, whereby the periphery of the personality is considerably enlarged.

II—THE CONSEQUENCES OF THE ASSIMILATION OF THE UNCONSCIOUS.

This process of assimilating the unconscious leads to remarkable results. Some people build up from it an unmistakable, even unpleasantly increased self-consciousness or self-confidence; they "know everything," and are completely aware of everything so far as their unconscious is concerned. They think themselves accurately informed about everything that comes up from the unconscious. Others are increasingly oppressed by the contents of the unconscious, they lose their self-reliance or their self-consciousness more and more, and come near to a state of depressed resignation in regard to all the extraordinary things the unconscious produces. The former undertake in the exuberance of their self-confidence, a responsibility for their unconscious that goes much too far, beyond every reasonable possibility; the latter ultimately decline to accept any responsibility in the depressing recognition of the powerlessness of the ego confronted by relentless Destiny, working through the unconscious.

If we give the two types close analytical consideration, we shall discover that behind the optimistic self-confidence of the former there is hidden a just as deep, or rather a far deeper, helplessness; a helplessness to which the conscious optimism acts as an unsuccessful effort at compensation. Behind the pessimistic resignation of the latter there is hidden a defiant desire for power, far exceeding in self-confidence the conscious optimism of the former type.

This condition of the personality may well be expressed by the idea of "God-Almightiness" (Gottähnlichkeit),^[250] to which *Adler* has particularly drawn our attention.

When the devil wrote the serpent's words in the student's album, *Eritis sicut Deus scientes bonum et malum*, he added:

"Follow the ancient text and the snake thou wast ordered to trample!
With all thy likeness to God, thou'lt yet be a sorry example."

The idea of "likeness to God," or "God-Almightiness," is not a scientific one, although it characterises the psychological state of affairs most exactly. Still we must examine whence this attitude comes, and ask why it merits the name of "God-Almightiness." As the expression denotes, the patient's abnormal condition is constituted by the fact that he ascribes to himself qualities or values which obviously do not belong to him, for "God-Almightiness" means being like the spirit which is set above the human spirit.

If for psychological purposes we abstract from the hypostasis of the God-idea, we find that this expression does not only include every dynamic fact discussed in my book on "The Psychology of the Unconscious,"^[251] but also a certain mental function having a collective character, which is of another order from that of the individual character of the mind. In the same way as the individual is not only an isolated and separate, but also a social being, so also the human mind is not only something isolated and absolutely individual, but also a collective function. And just as certain social functions or impulses are, so to speak, opposed to the ego-centric interests of the individual, so also the human mind has certain functions or tendencies which, on account of their collective nature, are to some extent opposed to the personal mental functions. This is due to the fact that every human being is born with a highly differentiated brain, which gives him the possibility of attaining a rich mental function that he has neither acquired ontogenetically nor developed. In proportion as human brains are similarly differentiated, the corresponding mental functions are collective and universal. This circumstance explains the fact that the unconscious of far-separated peoples and races possesses a remarkable number of points of agreement. One example among many others which has been demonstrated is the extraordinary unanimity shown by the autochthonous forms and themes of myths.

The universal similarity of brains results in a universal possibility of a similar mental function. This function is the collective psyche, which is divided into *collective mind* and *collective soul*.^[252] In so far as there exist differentiations corresponding to race, descent, or even family, so, beyond the level of the "universal" collective psyche, we find a collective psyche limited by race, descent, and family. To quote *P. Janet*, the collective psyche contains the "parties inférieures" of the mental function, that is, the part of the mental function which, being fixed and automatic in its action, inherited and present everywhere, is therefore super-personal or impersonal. The conscious and the personal unconscious contain as personal differentiations the "parties supérieures" of the mental function, therefore the part that has been acquired and developed ontogenetically.

An individual therefore who joins the *a priori* and unconsciously-given collective psyche on to his ontogenetically acquired assets, enlarges thereby the periphery of his personality in an unjustifiable way, with the corresponding consequences. Inasmuch as the collective psyche is the "partie inférieure" of the mental function, and therefore is the fundamental structure underlying every personality, it weighs heavily upon and depreciates the personality; a fact that is expressed in the afore-mentioned stifling of self-confidence, and in the unconscious increase of the ego-emphasis up to the point of a morbid will to power. Inasmuch as the

collective psyche ranks even above the personality, because it is the mother foundation upon which all personal differentiations are based, and because it is the common mental function of the sum total of the individual, therefore its incorporation in the personality may evoke inflation of self-confidence, an inflation which is then compensated by an extraordinary sense of inferiority in the unconscious.

*A dissolution of the pairs of opposites in the personality sets in if, through the assimilation of the unconscious, the collective psyche be included in the inventory of the personal mental functions. Alongside the pairs of opposites already alluded to that are so particularly evident in the neurotic, viz. megalomania and sense of inferiority, there are also many other pairs, of which I will only mention the specifically moral pair, that is, good and evil (*scientes bonum et malum*). They accompany the increase or depreciation of self-confidence. The specific virtues and vices of humanity are contained in the collective psyche, just as everything else is. One man ascribes all the collective virtue to himself as his own personal merit; another accounts as personal guilt what is but collective vice. Both are just as illusory as the sense of greatness and of inferiority, for imaginary virtues as well as imaginary vices are only the pairs of moral opposites contained in the collective psyche, which have become perceptible or have artificially been made conscious. How far the collective psyche contains these pairs of opposites is shown by primitive peoples, whose great virtue is praised by one observer; whereas another observer of the same race reports only the worst impressions. Both views are true of primitive man, whose personal differentiation is only beginning; his mental function is essentially collective. He is more or less identified with the collective psyche, and therefore without any personal responsibility or inner conflict; his virtues and vices are collective. Conflict only begins when a conscious personal development of the mind has already started, whereby the reason becomes aware of the irreconcilable nature of the pairs of opposites. The struggle to repress is the consequence of this realisation. Man wants to be good, therefore the bad must be repressed; this puts an end to the paradise of the collective psyche.*

The repression of the collective psyche, in so far as it was conscious, was a necessity for the development of the personality, because collective psychology and personal psychology are in a certain sense irreconcilable. In the history of thought, whenever a fresh psychological attitude acquires collective value the formation of schisms begins. Nowhere is this more clearly seen than in the history of religion. A collective point of view, although it may be necessary, is always dangerous for the individual. It is dangerous because it is apt to choke and smother personal differentiation. It has derived this capacity from the collective psyche, which is itself a result of psychological differentiation of the strong gregarious instincts of humanity. Collective thought and feeling, and collective accomplishment, are relatively easy in comparison with individual function and performance; a fact that is only too prone to lead to a fining down to the collective level, and is peculiarly disastrous to personal development. The concomitant loss of personality is replaced—as is always the case in psychology—by an unconscious all-compelling binding to and identification with the collective psyche. It cannot be denied, and should be warningly emphasized that in the analysis of the unconscious, the collective psychology is merged into the personal psychology, with the afore-mentioned unpleasant consequences. These consequences are either bad for the individual's vital feeling (*Lebensgefühl*), or they injure his fellow-beings if he have any power over his environment. Being identified with the collective psyche he will inevitably try to force the claims of his unconscious upon others, for identification with the collective psyche is accompanied by a

feeling of universal validity ("God-Almightiness"), which disregards the different psychology of his fellows.

The worst abuses of this kind may be removed by a clear understanding and appreciation of the fact that there are totally different psychological types, and that a psychology of one type cannot be forced into the mould of another. It is indeed almost impossible for one type to understand the other completely, and a perfect comprehension of another's individuality is impossible. *Due regard for another's individuality* is not only advisable but is absolutely essential in analysis, if the development of the other's personality is not to be stifled. It should not be forgotten that the one type thinks that he is leaving another person free when he grants him freedom of action, and the other type when he grants him freedom of thought. In analysis both must be conceded, in so far as reasons of self-preservation permit the analyst to accord them. An excessive desire to understand or explain things is just as useless and injurious as a lack of comprehension.

The collective natural propensities and primary forms of idea and feeling which analysis of the unconscious has shown to be effective are an acquisition for the conscious personality which cannot be admitted unreservedly without prejudicial results.

In practical treatment^[253] it is therefore of the utmost importance to keep the aim of individual development constantly before us. If for instance the collective psyche be conceived as a personal possession or as a personal burden, an unbearable weight or strain is put upon the personality. Hence we must make a clear distinction between the personal and the collective psyche. In practice this distinction is not easy because the personal grows out of the collective psyche, and is most closely joined with it. It is therefore difficult to say which materials are to be termed collective and which personal. There is no doubt, for instance, that the archaic symbols so often found in phantasies and dreams are collective factors. All primary propensities and forms of thought and feeling are collective; so is everything about which men are universally agreed, or which is universally understood, said or done. Upon close consideration it is astonishing to note how much of our so-called individual psychology is really collective; so much that the individual element quite disappears. Individuation, however, is an indispensable psychological requirement. The crushing predominance of what is collective should make us realise what peculiar care and attention must be given to the delicate plant "individuality," if it is to develop.

Human beings have a capacity which is of the utmost use for purposes of collectivism and most prejudicial to individuation, and that is the capacity to *imitate*. Collective psychology cannot dispense with imitation, without which the organization of the State and Society would be impossible. Imitation includes the idea of suggestibility, suggestive effect, and mental infection.

But we see daily how the mechanism of imitation is used, or rather abused, for the purposes of personal differentiation; some prominent personality, or peculiar trait or activity is simply imitated, which at least brings about an external differentiation from the environment. As a rule this delusive attempt to attain individual differentiation by means of imitation comes to a standstill as mere affectation, the individual remaining on the same plane as before, only a few degrees more sterile than formerly, and under an unconscious compulsory bondage to his environment.

In order to find out what is really individual in us, we should have to give the matter deep thought, and we should certainly become aware how exceedingly difficult such a discovery is.

III.—THE INDIVIDUAL AS AN EXCERPT OF THE COLLECTIVE PSYCHE.

We now come to a problem the overlooking of which would cause the greatest confusion.

As I said before, the immediate result of the analysis of the unconscious is that additional personal portions of the unconscious are incorporated into the conscious. I called those parts of the unconscious which are repressed but capable of being made conscious, *the personal unconscious*. I showed moreover that through the annexation of the deeper layers of the unconscious, which I called the *impersonal unconscious*, an extension of the personality is brought about which leads to the state of God-Almightiness ("Gottähnlichkeit"). This state is reached by a continuation of the analytical work, by means of which we have already re-introduced what is repressed to consciousness. By continuing analysis further we incorporate some distinctly impersonal universal basic qualities of humanity with the personal consciousness, which brings about the aforesaid enlargement, and this to some extent may be described as an unpleasant consequence of analysis.

From this standpoint, the conscious personality seems to be a more or less arbitrary excerpt of the collective psyche. It appears to consist of a number of universal basic human qualities of which it is *à priori* unconscious, and further of a series of impulses and forms which might just as well have been conscious, but were more or less arbitrarily repressed, in order to attain that excerpt of the collective psyche, which we call personality. The term *persona* is really an excellent one, for *persona* was originally the mask which an actor wore, that served to indicate the character in which he appeared. For if we really venture to undertake to decide what psychic material must be accounted personal and what impersonal, we shall soon reach a state of great perplexity; for, in truth, we must make the same assertion regarding the contents of the personality as we have already made with respect to the impersonal unconscious, that is to say that it is *collective*, whereas we can only concede *individuality to the bounds of the persona*, that is to the particular choice of personal elements, and that only to a very limited extent. It is only by virtue of the fact that the *persona* is a more or less accidental or arbitrary excerpt of the collective psyche that we can lapse into the error of deeming it to be *in toto* individual, whereas as its name denotes, it is only a mask of the collective psyche; *a mask which simulates individuality*, making others and oneself believe that one is individual, whilst one is only acting a part through which the collective psyche speaks.

If we analyse the *persona* we remove the mask and discover that what appeared to be individual is at bottom collective. We thus trace "the Little God of the World" back to his origin, that is, to a personification of the collective psyche. Finally, to our astonishment, we realise that the *persona* was only the mask of the collective psyche. Whether we follow Freud and reduce the primary impulse to sexuality, or Adler and reduce it to the elementary desire for power, or reduce it to the general principle of the collective psyche which contains the principles of both Freud and Adler, we arrive at the same result; namely, the dissolution of the personal into the collective. Therefore in every analysis that is continued sufficiently far, the moment arrives when the aforesaid God-Almightiness must be realised. This condition is

often ushered in by peculiar symptoms; for instance, by dreams of flying through space like a comet, of being either the earth, the sun, or a star, or of being either extraordinarily big or small, of having died, etc. Physical sensations also occur, such as sensations of being too large for one's skin, or too fat; or hypnagogic feelings of endless sinking or rising occur, of enlargement of the body or of dizziness. This state is characterised psychologically by an extraordinary loss of orientation about one's personality, about what one really is, or else the individual has a positive but mistaken idea of that which he has just become. Intolerance, dogmatism, self-conceit, self-depreciation, contempt and belittling of "not analysed" fellow-beings, and also of their opinions and activities, all very frequently occur. An increased disposition to physical disorders may also occasionally be observed, but this occurs only if pleasure be taken therein, thus prolonging this stage unduly.

The wealth of the possibilities of the collective psyche is both confusing and dazzling. The dissolution of the persona results in the release of phantasy, which apparently is nothing else but the functioning of the collective psyche. This release brings materials into consciousness of whose existence we had no suspicion before. A rich mine of mythological thought and feeling is revealed. It is very hard to hold one's own against such an overwhelming impression. That is why this phase must be reckoned one of the real dangers of analysis, a fact that should not be concealed.

As may easily be understood, this condition is hardly bearable, and one would like to put an end to it as soon as possible, for the analogy with a mental derangement is too close. The essence of the most frequent form of derangement—dementia præcox or schizophrenia—consists, as is well known, in the fact that the unconscious to a large extent ejects and replaces the conscious. The unconscious is given the value of reality, being substituted for the reality function. The unconscious thoughts become audible as voices, or visible as visions, or perceptible as physical hallucinations, or they become fixed ideas of a kind that supersede reality. In a similar, although not in the same way, by the resolution of the persona of the collective psyche, the unconscious is drawn into the conscious. The difference between this state of mind and that of mental derangement consists in the fact that the unconscious is brought up by the help of the conscious analysis; at least that is the case in the beginning of analysis, when there are still strong cultural resistances against the unconscious to be overcome. Later on, after the removal of the barriers erected by time and custom, the unconscious usually proceeds, so to say, in a peremptory manner, sometimes even discharging itself in torrents into the consciousness. In this phase the analogy with mental derangement is very close. But it would only be a real mental disorder should the content of the unconscious *take the place of the conscious reality*, that is, in other words, if the contents of the unconscious were believed absolutely and without reserve.

IV.—THE ENDEAVOURS TO FREE THE INDIVIDUALITY FROM THE COLLECTIVE PSYCHE.

1. The Regressive Restoration of the Persona.

The unbearableness of thus being identified with the collective psyche forces us to find a radical solution. There are two ways open. The first possibility is the regressive one of trying to restore the persona to its former condition, by endeavouring to restrain the unconscious by the application of a reductive theory; for instance, by declaring it to be nothing but long-

repressed and overdue infantile sexuality, for which it would really be best to substitute the normal sexual function. This solution is based upon the unmistakable sexualistic symbolism of the language of the unconscious, and upon the concretistic interpretation of the same. Or an attempt may be made to apply the power theory, by conceiving the God-Almightiness as a "virile protest," and as an infantile striving for power and self-preservation: a theory for which support is found in the unmistakable pretensions to power that the unconscious material contains. A further possibility would be to declare the unconscious to be the archaic collective psychology of primitive man, an explanation that would not only cover the sexualistic symbolism and the "God-Almighty" aiming for power of the unconscious content, but would also apparently do justice to the religious, philosophical, and mythological aspects and tendencies of the unconscious content. In every case the conclusion arrived at is the same, viz. that the unconscious is nothing but this or that, which has already been adequately recognised and acknowledged as infantile, useless, meaningless, impossible, and out of date. There is nothing to be done but to shrug one's shoulders and resign one's self to the inevitable.

To the patient there seems to be no alternative, if one wishes to continue to live sensibly, but to restore in so far as is possible that extract of the collective psyche termed persona, to lay the fact of analysis silently aside, and do one's utmost to forget that one possesses an unconscious. We shall find support in Faust's words:—

"The sphere of earth is known enough to me;
The view beyond is barred immutably:
A fool, who there his blinking eyes directeth,
And o'er his clouds of peers a place expecteth!
Firm let him stand, and look around him well!
This world means something to the capable.
Why needs he through Eternity to wend?
He here acquires what he can apprehend.
Thus let him wander down his earthly day;
When spirits haunt go quietly his way;
In marching onward, bliss and torment find,
Though every moment, with unsated mind!"

This would be a happy solution if one really could succeed in throwing off the unconscious to such an extent as to withdraw the libido from it, and so render it inoperative. But experience proves that energy cannot be withdrawn from the unconscious; it continues operative, for the unconscious contains and is indeed itself the source of libido, from which issue the primary psychic elements, thought-feelings, or feeling-thoughts—undifferentiated germs of idea and sentiment. It would therefore be a delusion to believe that by means of some, so to say, magical theory or method, the libido could be conclusively wrested from the unconscious, or that it could be to a certain extent disconnected. One may yield to this illusion for a time, but some day he will be obliged to declare with Faust:—

"Now fills the air so many a haunting shape,
That no one knows how best he may escape.
What though one day with rational brightness beams,
The night entangles us in webs of dreams.

From our young fields of life we come, elate:
There croaks a bird; what croaks he? Evil fate!
By superstition constantly ensnared,
It grows to us and warns and is declared.
Intimidated thus we stand alone.—
The portal jars, yet entrance is there none.
Is any one here?

CARE: Yes! must be my reply.

FAUST: And, thou, who art thou, then?

CARE: Well—here am I.

FAUST: Avaunt!

CARE: *I am where I should be:*
Though no ear should choose to hear me,
Yet the shrinking heart must fear me;
Though transformed to mortal eyes,
Grimmest power I exercise."

The unconscious cannot be "analysed" to a finish, and thus brought to a standstill. No one can wrest active force from it for any length of time. Therefore to act according to the method just described is only to deceive one's self, and is nothing but a new edition of an ordinary repression.

2. *The Identification with the Collective Psyche.*

The second way would be that of identification with the collective psyche. That would mean the symptom of "God-Almightiness" developed into a system; in other words, one would be the fortunate possessor of the absolute truth, that had yet to be discovered; of the conclusive knowledge, which would be the people's salvation. This attitude is not necessarily megalomania ("Grössenwahn") in a direct form, but the well-known milder form of having a prophetic mission. Weak minds which, as is so often the case, have correspondingly an undue share of vanity and misplaced naïveté at their disposal, run a considerable risk of succumbing to this temptation. The obtaining access to the collective psyche signifies a renewal of life for the individual, whether this renewal of life be felt as something pleasant or unpleasant. It would seem desirable to retain a hold upon this renewal: for one person, because it increases his feeling for life ("Lebensgefühl"); for another, because it promises a great accretion to his knowledge. Therefore both of them, not wishing to deprive themselves of the rich values that lie buried in the collective psyche, will endeavour by every means possible to retain their newly gained union with the primal cause of life. Identification appears to be the nearest way to it, for the merging of the persona in the collective psyche is a veritable lure to unite one's self with this "ocean of divinity," and, oblivious of the past, to become absorbed in it. This piece of mysticism belongs to every finer individual, just as the "yearning for the mother"—the looking back to the source whence one originated—is innate in every one.

As I have demonstrated explicitly before,^[254] there is a special value and a special necessity hidden in the regressive longing—which, as is well-known, Freud conceives as "infantile fixation" or as "incest-wish." This necessity and longing is particularly emphasized in myths, where it is always the strongest and best of people, in other words, the hero, who follows the regressive longing and deliberately runs into danger of letting himself be devoured by the monster of the maternal first cause. But he is a hero only because, instead of letting himself be finally devoured by the monster, he conquers it, and that not only once but several times. It is only through the conquest of the collective psyche that its true value can be attained, whether it be under the symbol of capture of treasure, of an invincible weapon, of a magical means of defence, or whatever else the myth devises as the most desirable possession. Hence whoever identifies himself with the collective psyche, also reaches the treasure which the dragon guards, but against his will and to his own great injury, by thus allowing himself (mythologically speaking) to be devoured by the monster and merged with it.

Identification with the collective psyche is therefore a failure; this way ends just as disastrously as did the first, which led to the severance of the persona from the collective psyche.

V.—LEADING PRINCIPLES FOR THE TREATMENT OF COLLECTIVE IDENTITY.

In order to solve the problem how practical treatment can overcome the assimilation of the collective psyche, we must first of all make quite clear to ourselves what was the error of the two ways already described. We saw that neither the one way nor the other led to any appropriate result. The first way simply leads the patient back to the point of departure, having lost the vital values contained in the collective psyche. The second way leads him straight into the collective psyche, having lost that detached human existence which alone renders possible a bearable and satisfying life. There are on both sides values that should not be lost to the individual.

The mistake is, therefore, neither in the collective psyche nor in the individual psyche, *but in allowing the one to exclude the other*. The monistic tendency assists this propensity, for it always suspects and looks for *one* principle everywhere. As a general psychological tendency, monism is a peculiarity of differentiated feeling and thought, corresponding to the keen desire to make the one or the other function the supreme psychological principle. The introversion type only knows the thought principle, and the extroversion type only that of feeling. This psychological monism—or it would be better to say monotheism—has the advantage of simplicity, and the disadvantage of one-sidedness. On the one hand, it signifies the exclusion of the variety and true riches of life; whilst on the other, it means the practicability of realizing the ideals of the present day and of the near past. But it does not in itself signify any actual possibility of human progress.

In the same way *rationalism* tends towards exclusiveness. Its essence is to exclude instantly whatever is opposed to its standpoint, whether it be intellectually logical or emotionally so. In regard to reason it is both monistic and autocratic. Special thanks are due to Bergson for having broken a lance for the right of the irrational to exist. Psychology will probably be obliged to acknowledge and to submit to a plurality of principles, in spite of the fact that this does not suit the scientific mind. Only so can psychology be saved from ship-wreck.

But with regard to individual psychology science must waive its claims. For to speak of a scientific individual psychology is in itself a *contradictio in adjecto*. It is necessarily always only the collective part of an individual psychology that can be the subject of scientific study, for the individual is—according to definition—something unique and incomparable. A "scientific" individual psychology is a denial of individual psychology. It may justly be suspected that individual psychology is indeed a projection of the psychology of him who defines it. Every individual psychology must have its own text-book, for the universal text-book only contains collective psychology.

These remarks are intended to prepare for what has to be said about the treatment of the aforesaid problem. The fundamental error of both the afore-mentioned ways is simply that the subject is collectively identified with the one or the other part of his psychology. His psychology is individual as well as collective, but not in such a manner as to merge the individual with what is collective, or the collective with what is individual. The persona must be strictly separated from the concept of the individual, in so far as the persona can be absolutely merged with the collective. But what is individual is just that which can never be absorbed in the collective, and is, too, never identical with the collective. Therefore, an identification with the collective or an arbitrary cutting-off from the collective is equivalent to illness; it is pathological.

As has already been indicated, what is individual appears at first as the particular selection of those elements of the collective psyche that contribute to the composition of the persona. As I said before, the components are not individual but collective. It is only their combination, or the selection as a model of particular groups that had already been combined, which is individual. That would be the individual nucleus which is concealed by the personal mask. By the particular differentiation of the persona, the resistance is shown of the individuality to the collective psyche. By analysing the persona, we transfer a greater value to the individuality, increasing thereby its conflict with collectivity. This conflict obviously is a psychological conflict in the individual. The dissolution of the compromise between the two halves of a pair of opposites increases the effectiveness of the contrast. This conflict does not exist within the sphere of purely unconscious natural life, although the purely physiological life of the individual also has to comply with collective demands.

The natural unconscious attitude is harmonious; the body, with its capacities and needs, providing immediately indications and limitations, that prevent intemperance and lack of proportion. A differentiated psychological function, however, always inclines towards disproportion, on account of the one-sidedness which is cultivated by the conscious rationality of intention. What is called mental individuality, is, also, an expression of the individual corporeity, being, so to speak, identical with it. This sentence might obviously also be reversed, a fact that does not materially alter the real psychological data concerning the intimate relation of the individuality to the body. At the same time, the body is also that which makes the subject resemble all others to a great extent, although it is the individual body that is differentiated from all others.

Similarly the mental or moral individuality differs from all others, although in every respect it is so constituted as to place one person on an equality with all others. Every living creature that is able freely to develop itself individually without any coercion at all, will, through the

perfecting of its individuality, soonest realize the ideal type of its species, and therefore, figuratively speaking, will have collective validity.

The persona is always identical with a *typical* attitude, in which *one* psychological function dominates, *e.g.* feeling, or thought, or intuition. This one-sidedness always causes the relative repression of the other functions. In consequence of this circumstance, the persona is hindering to the development of the individual. The dissolution of the persona is, therefore, an indispensable condition of individuation. It is, therefore, to some extent impossible to achieve individuation by means of conscious intention; for conscious intention leads to a conscious attitude, which excludes everything that "does not suit." But the assimilation of the unconscious contents leads, on the contrary, to a condition in which conscious intention is excluded, being replaced by a process of development that appears to us irrational. This process alone signifies individuation, its *product* being individuality as defined above, *viz.* as something individual that is at the same time universal. So long as the persona exists individuality is repressed, betraying itself at most by the particular selection of personal requisites, of what might be called the actor's costumes. Only when the unconscious is assimilated does the individuality become more prominent, and with it also that uniting psychological phenomenon between the ego and non-ego, expressed by the word *attitude*, is now no longer a typical attitude but an individual one.

What is paradoxical in these formulations arises from the same cause from which the conflict about the "universalia" formerly arose. The phrase "animal nullumque animal genus est" makes the fundamental paradox clearly comprehensible. What exists "really" is individual: that which is universal is existing psychologically, but being caused by the real-existing similarities of individual things. The individual is, therefore, the individual thing that has, to a greater or less extent, those attributes upon which the collective conception of "collectivity" rests; and the more individual he is, the more he develops those attributes that are the basis of a collective concept of human nature.

If a grotesque figure, suggested by the initial situation of our problem be permitted, it is Buridan's ass between the two bundles of hay. His questioning is obviously wrong: the question is not whether the hay-bundle on the right or the left be the better one, or whether he should begin to eat on the right or the left hand, *but what he himself would like to do, what he is eager for*—that is the point. He is thinking of the hay and not of himself, and therefore he does not know what he really wants.

The question is: what at this moment is the natural direction of the growth of this individual?

This question cannot be settled by any philosophy, religion or good advice, but solely by an unprejudiced review of the psychological germs of life which have resulted from the natural co-operation of the conscious and unconscious on the one hand, and of the individual and the collective on the other. One person looks for them in the conscious, and another in the unconscious. But the conscious is only one side, and the unconscious is only the other. For it should never be forgotten that dreams are compensatory or complementary to consciousness. Were this not the case, we should be obliged to regard dreams as a source of knowledge superior to the conscious. This view would undoubtedly carry us back to the mentality of the augur, and we should have to accept all the consequences of such a superstitious attitude, unless, indeed, we look upon dreams as valueless, as does the vulgar mind.

We find the *unifying function* that we are seeking, *in the phantasies* in which everything that has any effectual determination is present. But phantasies have a bad reputation among psychologists. The psychoanalytical theories hitherto obtaining have treated them accordingly. For both Freud and Adler the phantasy is nothing but a so-called "symbolic" disguise of what both investigators suppose to be the primary propensities and aims. But in opposition to these views it should be emphasised—not for theoretical but for essentially practical reasons—that the phantasy may indeed be thus causally explained and depreciated, but that it nevertheless is the creative soil for everything that has ever brought development to humanity. The phantasy as a psychological function has a peculiar non-reducible value of its own, whose roots are in both the conscious and the unconscious contents, and in what is collective as well as in what is individual.

But whence comes the bad reputation of the phantasy? It owes that reputation chiefly to the circumstance that it ought not to be taken literally. It is worthless if understood concretistically. If we understand semiotically, as Freud does, it is interesting from the scientific standpoint. But if it be understood *hermeneutically, as an actual symbol*, it provides us with the cue that we need in order to develop our life in harmony with ourselves.

For the significance of a symbol is not that it is a disguised indication of something that is generally known,^[255] but that it is an endeavour to elucidate by analogy what is as yet completely unknown and only in process of formation.^[256] The phantasy represents to us that which is just developing under the form of a more or less apposite analogy. By analytical reduction to something universally known, we destroy the actual value of the symbol; but it is appropriate to its value and meaning to give it an hermeneutical interpretation.

The essence of hermeneutics—an art that was formerly much practised—consists in adding more analogies to that already given by the symbol: in the first place, subjective analogies given by the patient as they occur to him; and in the second place, objective analogies provided by the analyst out of his general knowledge. The initial symbol is much enlarged and enriched by this procedure, the result being a highly complex and many-sided picture, which may now be reduced to *tertia comparationis*. Thence result certain psychological lines of development of an individual as well as collective nature. No science upon earth could prove the accuracy of these lines; on the contrary, rationalism could very easily prove that they are wrong. But these lines vindicate their validity by their *value for life*. The chief thing in practical treatment is that people should get a hold of their own life, not that the principle of their life should be provable or "right."

Of course, true to the spirit of scientific superstition *suggestion* will be mooted. But it should long ago have been realised that a suggestion is only accepted by one it suits. Beyond that there is no suggestion, otherwise the treatment of neurosis would be extremely simple, for we should only need to suggest health. This pseudo-scientific talk about suggestion is based upon the unconscious superstition that suggestion actually possesses some real magic power. No one succumbs to suggestion unless from the very bottom of his heart he be willing to co-operate.

By means of the hermeneutical treatment of the phantasies we arrive at the synthesis of the individual with the collective psyche, put theoretically, that is, but practically, one indispensable condition is yet lacking. For it belongs to the regressive disposition of the

neurotic—a disposition in which he has been confirmed in the course of his illness—to take neither himself nor the world seriously, but always to rely on this or that method or circumstance to effect a cure, quite apart from his own serious co-operation. "But you can't wash the dog without getting his skin wet." No cure can be effected without unlimited willingness and absolute seriousness on the part of the patient. There are no magical cures for neurosis. Just as soon as we begin to elaborate the symbolic outlines of the path, the patient must begin to walk thereon. If he delude himself and shirk it, no cure can result. He must really work and live according to what he has seen and recognised as the direction for the time being of his individual life-line, and must continue thereon until a distinct reaction of his unconscious shows him that he is beginning in good faith to go a wrong way.

He who does not possess this moral function of faithfulness to himself will never get rid of his neurosis; but he who has this faithfulness can find the way out.

Neither physician nor patient must yield to the delusion that "being analysed" is in itself sufficient to remove a neurosis. That would be deception and self-delusion. Ultimately it is infallibly the moral factor that decides between health and illness.

By the construction of the individual's life-line the ever-varying trends and tendencies of his libido are made conscious. These life-lines are not identical with the "directing fictions" discovered by Adler, which are none other than arbitrary attempts to cut the persona off from the collective psyche, and to give it independence. It might rather be said that the "directing fiction" is an unsuccessful attempt to construct a life-line. The unsuitability of the "directing fiction" is also proved by the fact that the lines are tenaciously retained for much too long a time. The hermeneutically constructed life-line is short, for life follows no straight lines that indicate the future long beforehand, for, as Nietzsche says, "All truth is crooked." Life-lines are therefore neither principles nor ideals of universal validity, but points of view and adaptations of ephemeral validity. An abatement of vital intensity, a perceptible loss of libido, or an excessive passion or ecstasy—all show that one such line is left, and that a new line begins, or rather should begin. Sometimes it is enough to leave the revealing of the new line to the unconscious; but this course should indeed not be recommended to the neurotic under all circumstances, though there are cases where what is needed is to learn to trust to so-called chance. However, it is not advisable to let one's self drift for any length of time; a watchful eye should at least be kept upon the reactions of the unconscious, that is to say, upon the dreams: these indicate like a barometer the one-sidedness of our attitude.^[257] Therefore, I consider it necessary, in contrast to some other analysts, for the patient after analysis to remain in contact with the unconscious, if he would avoid a relapse. That is why I am convinced that the real end of analysis is reached when the patient has acquired adequate knowledge of the method to remain in contact with the unconscious, and sufficient psychological knowledge to be able to understand approximately his ever-changing life-line; otherwise he is not in a position to follow the direction of the libido currents in the unconscious, and thereby to gain conscious support in the development of his individuality. Every serious case of neurosis needs this weapon in order to maintain the cure.

In this sense analysis is not a method that is a medical monopoly, but rather an art or technique or science of psychological life, which he who has been cured must continue to foster, for the sake of his own welfare and that of his environment. If he understands this aright he will not pose as a psychoanalytical prophet nor as a public reformer, but truly

understanding the common weal, he will first himself reap the benefit of the self-knowledge acquired in his treatment, and then he will let the example of his life work what good it can, rather than indulge in aggressive talk and missionary propaganda.

SUMMARY.

A. *Psychological Material must be divided into CONSCIOUS and UNCONSCIOUS Contents.*

1. The *conscious contents* are partly *personal*, in so far as their universal validity is not recognised; and partly *impersonal*, that is, collective, in so far as their universal validity is recognised.

2. The *unconscious contents* are partly *personal*, in so far as they concern solely repressed materials of a personal nature, that have once been relatively conscious and whose universal validity is therefore not recognised when they are made conscious; partly *impersonal*, in so far as the materials concerned are recognised as *impersonal* and of purely universal validity, of whose earlier even relative consciousness we have no means of proof.

B. *The Composition of the Persona.*

1. The conscious personal contents constitute the conscious personality, the conscious ego.

2. The unconscious personal contents constitute the *self*, the unconscious or subconscious ego.

3. The conscious and unconscious contents of a personal nature constitute the persona.

C. *The Composition of the Collective Psyche.*

1. The conscious and unconscious contents of an *impersonal* or collective nature compose the psychological *non-ego*, the *image of the object*. These materials can appear analytically as projections of feeling or of opinion, but they are *a priori* collectively identical with the object-*imago*, that is they appear as qualities of the object, and are only *a posteriori* recognised as subjective psychological qualities.

2. The persona is that grouping of conscious and unconscious contents which is opposed as ego to the non-ego. The general comparison of personal contents of different individuals establishes their far-reaching similarity, extending even to identity, by which the *individual* nature of personal contents, and therewith of the persona, is for the most part suspended. To this extent the persona must be considered an excerpt of the collective psyche, and also a component of the collective psyche.

3. The collective psyche is therefore composed of the object-*imago* and the persona.

D. *What is Individual.*

1. What is individual appears partly as the principle that decides the selection and limitation of the contents that are accepted as personal.

2. What is individual is the principle by which an increasing differentiation from the collective psyche is made possible and enforced.
3. What is individual manifests itself partly as an impediment to collective accomplishment, and as a resistance against collective thinking and feeling.
4. What is individual is the uniqueness of the combination of universal (collective) psychological elements.

E. *We must divide the Conscious and Unconscious Contents into Individualistic and Collectivistic.*

1. A content is individualistic whose developing tendency is directed towards the differentiation from the collective.
 2. A content is collectivistic whose developing tendency aims at universal validity.
 3. There are insufficient criteria by which to designate a given content as simply individual or collective, for uniqueness is very difficult to prove, although it is a perpetually and universally recurrent phenomenon.
 4. The life-line of an individual is the resultant of the individualistic and collectivistic tendency of the psychological process at any given moment.

- [14] Goethe: *Zur Naturwissenschaft in Allgemeinen*. "I was able, when I closed my eyes and bent my head, to conjure the imaginary picture of a flower. This flower did not retain its first shape for a single instant, but unfolded out of itself new flowers composed of coloured petals and green leaves. They were not natural flowers, but phantastic ones. They were as regular in shape as a sculptor's rosettes. It was impossible to fix the creation which sprang up, nevertheless the dream-image lasted as long as I desired it to last; it neither faded nor grew stronger."

- [28] As is known, during the waking-state the hands and arms are never quite still, but are constantly subjected to fine tremors. Preyer, Lehmann, and others have proved that these movements are influenced in a high degree by the predominant presentations. Preyer shows that the outstretched hand drew small, more or less faithful, copies of figures which were vividly presented. These purposeful tremors can be demonstrated in a very simple way by experiments with the pendulum.

- [79] Delbrück, *l.c.*, and Redlich, *l.c.* Cf. the development of delusions in epileptic stupor mentioned by Mörchen, "Essay on Stupor," pp. 51 and 59, 1901.
- [80] Cf. Flournoy's very interesting supposition as to the origin of the Hindu *cycle* of H.S.: "Je ne serais pas étonné que la remarque de Martes sur la beauté des femmes du Kanara ait été le clou, l'atome crochu, qui a piqué l'attention subliminale et l'a très naturellement rivée sur cette unique passage avec les deux ou trois lignes consécutives, à l'exclusion de tout le contexte environnant beaucoup moins intéressant" (*L.c.*, p. 285).

[81] Janet says, "From forgetfulness there arises frequently, even if not invariably, the so-called lying of hysteria. The same explanation holds good of a hysteric's whims, changes of mood, ingratitude—in a word, of his inconstancy. The link between the past and present, which gives to the whole personality its seriousness and poise, depends to a large extent upon memory" ("Mental States," etc., p. 67).

[82] Freud, "The Interpretation of Dreams," p. 469.

[83] Binet, *l.c.*, p. 84.

[84] "Une autre considération rapproche encore ces deux états, c'est que les actes subconscients ont un effet en quelque sorte hypnotisant et contribuant par eux-mêmes à amener le somnambulisme" ("L'Automatisme," p. 329).

[85] Janet, *l.c.*, p. 329.

[86] In literature Gustave Flaubert has made use of a similar falling asleep at the moment of extreme excitement in his novel "Salambo." When the hero, after many struggles, has at last captured Salambo, he suddenly falls asleep just as he touches her virginal bosom.

[87] Perhaps the cases of paralysis of the emotions also belong here. Cf. Baetz, *Allg. Zeitsch. f. Psych.*, LVIII., p. 717.

[111] *Cryptomnesia* must not be regarded as synonymous with *Hypermnnesia*; by the latter term is meant the abnormal quickening of the power of recollection which reproduces the memory-pictures as such.

[112] "Has any one at the end of the nineteenth century any clear conception of what the poets in vigorous ages called inspiration? If not, I will describe it. The slight remnant of superstition by itself would scarcely have sufficed to reject the idea of being merely incarnation, merely mouthpiece, merely the medium of superior forces. The concept revelation in the sense that quite suddenly, with ineffable certainty and delicacy, something is seen, something is heard, something convulsing and breaking into one's inmost self, does but describe the fact. You hear—you do not seek; you accept—asking not who is the giver. Like lightning, flashes the thought, compelling without hesitation as to form—I have had no choice" (Nietzsche's "Works," vol. III., p. 482.).

[113] "There is an ecstasy so great that the immense strain of it is sometimes relaxed by a flood of tears, during which one's steps now involuntarily rush, and anon involuntarily lag. There is the feeling that one is utterly out of hand, with the very distinct consciousness of an endless number of fine thrills and titillations descending to one's very toes;—there is a depth of happiness in which the most painful and gloomy parts do not act as antitheses to the rest, but are produced and required as necessary shades of colour in such an overflow of light" (Nietzsche, "Ecce Homo," vol. XVII. of English translation, by A. M. Ludovici, p. 103).

[114] Eckermann, "Conversations with Goethe," vol. III.

[120] Flournoy, *l.c.*, p. 378.

[121] For a case of this kind see Krafft Ebing, "Lehrbuch," 4th edition, p. 578.

[122] The limitation of the associative processes and the concentration of attention upon a definite sphere of presentation can also lead to the development of new ideas, which no effort of will in the waking state would have been able to accomplish (Loewenfeld, "Hypnotismus," p. 289).

[123] Zschokke, "Eine Selbstschau," III., Aufl. Aarau, 1843, p. 227 ff.

[124] Gilles de la Tourette says, "We have seen somnambolic girls, poor, uneducated, quite stupid in the waking state, whose whole appearance altered so soon as they were sent to sleep. Whilst previously they were boring, now they are lively, alert, sometimes even witty" (Cf. Loewenfeld, *l.c.*, p. 132).

[125] Lectures delivered at the celebration of the twentieth anniversary of the opening of Clark University, September, 1909; translated from the German by Dr. A. A. Brill, of New York. Reprinted by kind permission of Dr. Stanley Hall.

[126] The selection of these stimulus words was naturally made for the German language only, and would probably have to be considerably changed for the English language.

[155] By this type I understand reactions where the response to the stimulus-word is a predicate subjectively accentuated instead of an objective relation, e.g., Flower, pleasant; frog, horrible; piano, terrible; salt, bad; singing, sweet; cooking, useful (see p. 124).

[156] Cf. Vigouroux et Jaqueliers, "La contagion mentale," Chapitre VI. Doin, Paris, 1905.

[157] Between whiles we believe ourselves masters of our acts at any given moment. But when we look back along our life's path and fix our eyes chiefly upon our unfortunate steps and their consequences, often we cannot understand how we came to do this and leave that undone, and it seems as if some power outside ourselves had directed our steps. Shakespeare says;

"Fate show thy force: ourselves we do not owe;
What is decreed must be, and be this so!"

Schopenhauer, "Ueber die anscheinende Absichtlichkeit im Schicksale des Einzelnen. Parerga und Paralipomena."

[158] This was seen in the Amsterdam Congress of 1907, where a prominent French savant assured us that the Freudian theory was but "une plaisanterie." This gentleman has demonstrably neither read Freud's latest works nor mine, he knows less about the subject than a little child. This opinion, so admirably grounded, ended with the applause of a well-known German professor. One can but bow before such thoroughness. At the same Congress another well-known German neurologist immortalised his name with the following intellectual reasoning: "If hysteria on Freud's conception does indeed rest on repressed affects, then the whole German army must be hysterical."

[159] Cf. Freud, "Zeitschrift für Religionspsychologie," 1907.

[178] See Author's preface to "The Psychology of Dementia Præcox."

[179] Thus a patient, who had been treated by a young colleague without very much result, once said to me: "Certainly I made great progress with him, and I am much better than I was. He tried to analyse my dreams. It's true he never understood them, but he took *so much trouble* over them. He is really a good doctor."

[180] Defined in the Freudian sense, as the transference to the doctor of infantile and sexual phantasies. A more advanced conception of the transference perceives

in it the important process of emotional approach [*Einfühlung*] which at first makes use of infantile and sexual analogies.

[181] "Selected Papers on Hysteria and other Psychoneuroses." *Monograph Series*, No. 4, last edition.

[182] Paper given before the Section of Neurology and Psychological Medicine, Aberdeen, 1914. Reprinted from the *British Medical Journal*, by kind permission of the Editor, Dr. Dawson Williams.

[183] Delivered at the Psychoanalytical Congress, Munich, 1913. Translated from *Archives de Psychologie*, by kind permission of the Editor, Dr. Claparède. Translator, C. E. Long.

[184] "The concept of energy is that which comes nearest to the concept of libido. Libido can perhaps be described as "effect," or "capacity for effect." It is capable of transformation from one form to another. The metamorphosis can be sudden, as when one function replaces another in a moment of danger; or it can be gradual, as we see it in the process of sublimation, where the libido is led over a long and difficult path through a variety of forms into a different function."—MARY MOLTZER.

[249] Lecture given before the Zürich School for Analytical Psychology, 1916.

[250] In a certain sense the "likeness to God" is always *a priori* present even before analysis, not only in the neurotic, but also in the normal individual, with the difference only that the normal individual is effectively separated from the perception of the unconscious, whilst this separation becomes increasingly impossible to the neurotic. In consequence of his special sensitiveness, the neurotic is *a priori* more closely affected by the processes of the unconscious than is the normal person, wherefore the God-Almightiness becomes more distinct in him than in the normal individual. By means of the knowledge of the unconscious acquired through analysis the "God-likeness" is increased.

[251] Pp. 69 and 95.

[252] The collective mind represents collective thought, the collective soul represents collective feeling, and the *collective psyche* represents the general collective psychological function.

[253] I should here observe that I am intentionally refraining from discussing our problem from the standpoint of the psychology of types. A specialised and somewhat complicated investigation was necessary in order to discover formulations appropriate to the types. For instance, "person" means something totally different to the extrovert from what it does to the introvert. I must content myself here with pointing out the difficulties such a task would involve. In the types, the conscious and real adapted function in childhood is collective, but soon acquires a personal character, and may retain this to the end, unless the individual feels impelled to develop his type to the uttermost. If this happens, the conscious real adapted function attains a degree of perfection which may claim universal validity and therefore bears a collectivistic character, in contrast to its originally collective character. According to this mode of expression collective psyche would be identical with "herd soul" in the individual; but the collectivistic psychology would be a highly differentiated adaptation to society. For the introvert the conscious real adapted function is *thinking*, which in the lower stages of development is entirely personal, but has a tendency to acquire a universal character of a collectivistic kind; his feeling remains distinctly personal so far as it is conscious, and collective-archaic in so far as it has remained unconscious or is repressed. The opposite applies to the *feeling* and thought of the extrovert. The introvert is always concerned with the endeavour to preserve the integrity of his ego, which results in a different attitude towards his own person from that of the extrovert, whose adaptation is made through his feelings, even at the cost of his own person. These few sentences indicate into what an extraordinarily difficult situation we should have been led had we considered our problem from the standpoint of the types.

[254] "Psychology of the Unconscious."

[255] That is, of a universal primary propensity or a universal primal aim.

[256] Cp. *Silberer*: "Probleme der Mystic und ihrer Symbolik." Wien, 1914. ("Problems of Mysticism and its Symbolism.")

[257] It should be borne in mind that no moral function is to be sought in this conception of dreams, nor do I look for it there. This function is just as little "teleological" in the sense of a philosophical teleology, that is to say of a set aim or purpose. It is in the first place compensatory, because it presents a subliminal

picture of the actual situation. The phenomenon should first of all be understood from a purely causal standpoint. But it would be unjust to the essence of what is psychological if one were to consider it purely causally. For it does not only tolerate, but also demand, a final point of view. In other words, the question arises, what is the use of bringing just this material to constellation? This is not to assert that the final meaning of a phenomenon had already existed as an *a priori* given purpose in the preparatory stages of the phenomenon. It would not be permissible, according to the theory of cognition, to presuppose some pre-existing purpose from the unmistakable final meaning of biological mechanisms. But it would be narrow-minded if, with the justifiable omission of the teleological conclusion, one wished also to give up the point of view of finality. The utmost that can be said is, it is *as if* there were some pre-existing purpose present. In psychology one must be on one's guard against exclusive reliance either upon causality or upon teleology.

Transcriber notes:

[P.XXI](#). 'C. C.' changed to 'C. G.'.

[P.22](#). 'Occasionlly' typo for 'Occasionally', changed.

[P.23](#). 'third kind of taste' changed 'taste' to 'state'.

[P.72](#). 'Our patent develops', 'patent' changed to 'patient'.

[P.103](#). added '+ denotes' in footnote 9 for multiple footnote.

[P.201](#). 'Pyschology' typo for 'Psychology', changed.

[P.217](#). 'unnecessary' typo for 'unnecessary', changed.

[P.305](#). 'casuality' typo for 'causality', changed.

[P.340](#). 'beween' typo for 'between', changed.

[P.345](#). Placed footnote anchor after 'mythological formations', but could be elsewhere on the page. It may be an independant reference to the whole section.

[P.384](#). 'castastrophe' typo for 'catastrophe', changed.

[P.451](#). 'colective' typo for 'collective', changed.

[P.471](#). 'devolopment' typo for 'development' changed.

[P.482](#). in index, 'Hommunculus' is 'Homunculus' in the book, changed.

Fixed various punctuation.

*** END OF THIS PROJECT GUTENBERG EBOOK COLLECTED PAPERS--ANALYTICAL PSYCHOLOGY ***

***** This file should be named 48225-h.htm or 48225-h.zip *****

This and all associated files of various formats will be found in:
<http://www.gutenberg.org/4/8/2/2/48225/>

Produced by Sami Sieranoja, Jane Robins and the Online Distributed Proofreading Team at <http://www.pgdp.net> (This file was produced from images generously made available by The Internet Archive)

Updated editions will replace the previous one--the old editions will be renamed.

Creating the works from print editions not protected by U.S. copyright law means that no one owns a United States copyright in these works, so the Foundation (and you!) can copy and distribute it in the United

States without permission and without paying copyright royalties. Special rules, set forth in the General Terms of Use part of this license, apply to copying and distributing Project Gutenberg-tm electronic works to protect the PROJECT GUTENBERG-tm concept and trademark. Project Gutenberg is a registered trademark, and may not be used if you charge for the eBooks, unless you receive specific permission. If you do not charge anything for copies of this eBook, complying with the rules is very easy. You may use this eBook for nearly any purpose such as creation of derivative works, reports, performances and research. They may be modified and printed and given away--you may do practically ANYTHING in the United States with eBooks not protected by U.S. copyright law. Redistribution is subject to the trademark license, especially commercial redistribution.

START: FULL LICENSE

THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg-tm mission of promoting the free distribution of electronic works, by using or distributing this work (or any other work associated in any way with the phrase "Project Gutenberg"), you agree to comply with all the terms of the Full Project Gutenberg-tm License available with this file or online at www.gutenberg.org/license.

Section 1. General Terms of Use and Redistributing Project Gutenberg-tm electronic works

1.A. By reading or using any part of this Project Gutenberg-tm electronic work, you indicate that you have read, understand, agree to and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg-tm electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg-tm electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. "Project Gutenberg" is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg-tm electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg-tm electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg-tm electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation ("the Foundation" or PGLAF), owns a compilation copyright in the collection of Project Gutenberg-tm electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is unprotected by copyright law in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg-tm mission of promoting

free access to electronic works by freely sharing Project Gutenberg-tm works in compliance with the terms of this agreement for keeping the Project Gutenberg-tm name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg-tm License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg-tm work. The Foundation makes no representations concerning the copyright status of any work in any country outside the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg-tm License must appear prominently whenever any copy of a Project Gutenberg-tm work (any work on which the phrase "Project Gutenberg" appears, or with which the phrase "Project Gutenberg" is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located in the United States, you'll have to check the laws of the country where you are located before using this ebook.

1.E.2. If an individual Project Gutenberg-tm electronic work is derived from texts not protected by U.S. copyright law (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase "Project Gutenberg" associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg-tm trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg-tm electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg-tm License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg-tm License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg-tm.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project

Gutenberg-tm License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg-tm work in a format other than "Plain Vanilla ASCII" or other format used in the official version posted on the official Project Gutenberg-tm web site (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original "Plain Vanilla ASCII" or other form. Any alternate format must include the full Project Gutenberg-tm License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg-tm works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg-tm electronic works provided that

- * You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg-tm works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg-tm trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, "Information about donations to the Project Gutenberg Literary Archive Foundation."
- * You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg-tm License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg-tm works.
- * You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- * You comply with all other terms of this agreement for free distribution of Project Gutenberg-tm works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg-tm electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from both the Project Gutenberg Literary Archive Foundation and The Project Gutenberg Trademark LLC, the owner of the Project Gutenberg-tm trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable

effort to identify, do copyright research on, transcribe and proofread works not protected by U.S. copyright law in creating the Project Gutenberg-tm collection. Despite these efforts, Project Gutenberg-tm electronic works, and the medium on which they may be stored, may contain "Defects," such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the "Right of Replacement or Refund" described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg-tm trademark, and any other party distributing a Project Gutenberg-tm electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH 1.F.3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS', WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg-tm electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg-tm electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg-tm work, (b) alteration, modification, or additions or deletions to any Project Gutenberg-tm work, and (c) any

Defect you cause.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need are critical to reaching Project Gutenberg-tm's goals and ensuring that the Project Gutenberg-tm collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg-tm and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation information page at www.gutenberg.org

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's principal office is in Fairbanks, Alaska, with the mailing address: PO Box 750175, Fairbanks, AK 99775, but its volunteers and employees are scattered throughout numerous locations. Its business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887. Email contact links and up to date contact information can be found at the Foundation's web site and official page at www.gutenberg.org/contact

For additional contact information:

Dr. Gregory B. Newby
Chief Executive and Director
gnewby@pglaf.org

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide spread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a

considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit www.gutenberg.org/donate

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: www.gutenberg.org/donate

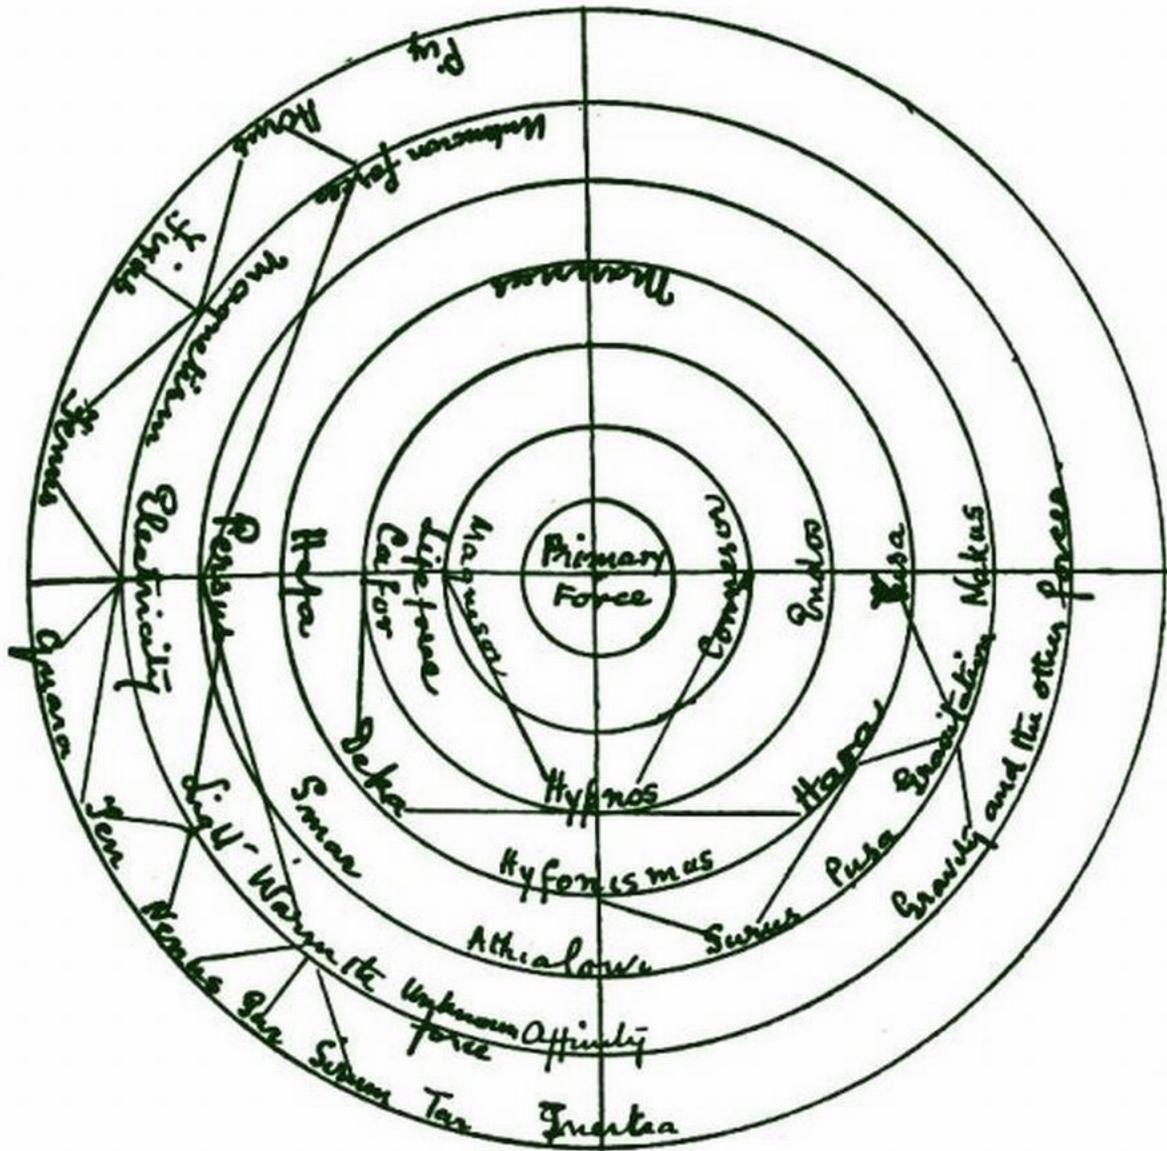

Section 5. General Information About Project Gutenberg-tm electronic works.

Professor Michael S. Hart was the originator of the Project Gutenberg-tm concept of a library of electronic works that could be freely shared with anyone. For forty years, he produced and distributed Project Gutenberg-tm eBooks with only a loose network of volunteer support.

Project Gutenberg-tm eBooks are often created from several printed editions, all of which are confirmed as not protected by copyright in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility: www.gutenberg.org

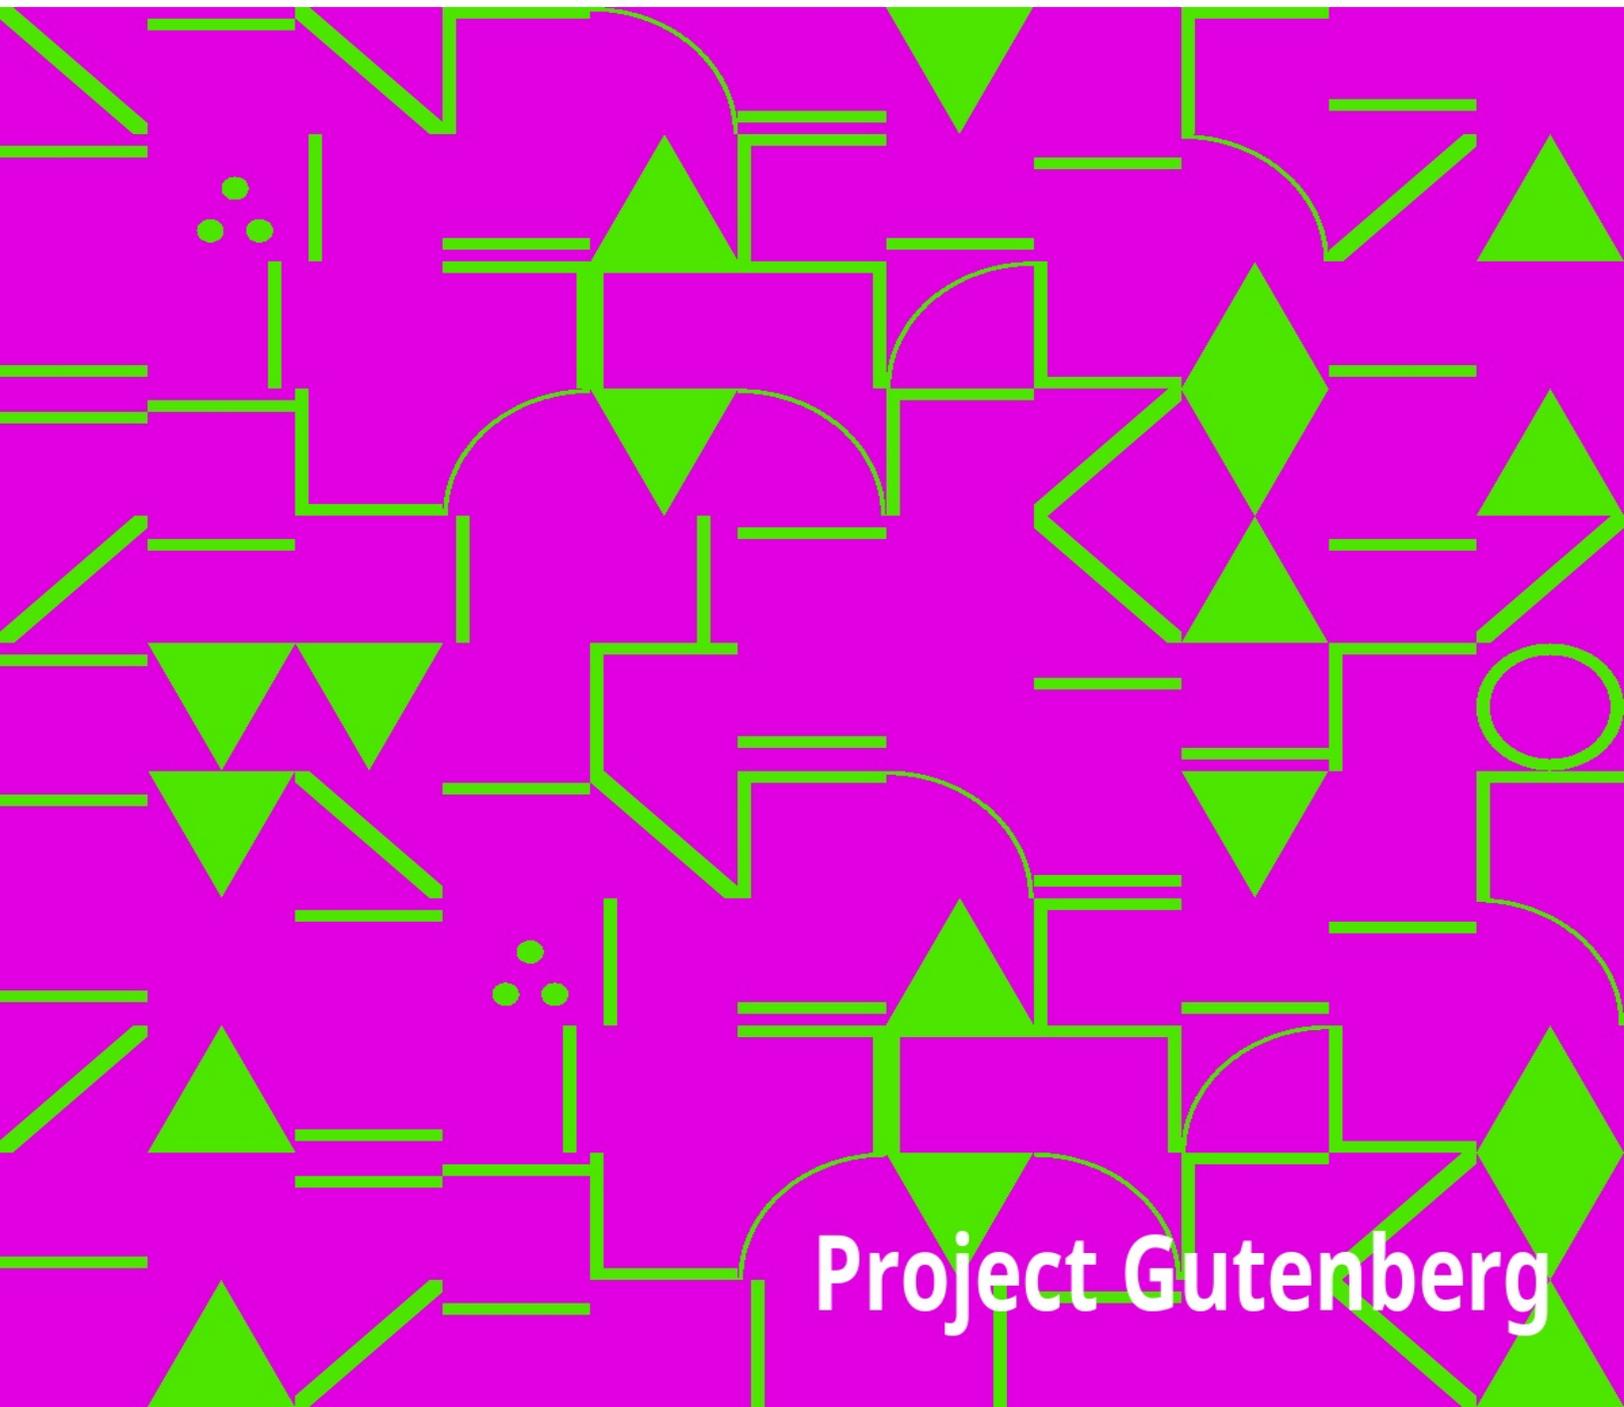

This Web site includes information about Project Gutenberg-tm, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.

CONTENTS.

THE MISSISSIPPI SCHEME.

John Law; his birth and youthful career—Duel between Law and Wilson—Law's escape from the King's Bench—The "Land-bank"—Law's gambling propensities on the continent, and acquaintance with the Duke of Orleans—State of France after the reign of Louis XIV.—Paper money instituted in that country by Law—Enthusiasm of the French people at the Mississippi Scheme—Marshal Villars—Stratagems employed and bribes given for an interview with Law—Great fluctuations in Mississippi stock—Dreadful murders—Law created comptroller-general of finances—Great sale for all kinds of ornaments in Paris—Financial difficulties commence—Men sent out to work the mines on the Mississippi, as a blind—Payment stopped at the bank—Law dismissed from the ministry—Payments made in specie—Law and the Regent satirised in song—Dreadful crisis of the Mississippi Scheme—Law, almost a ruined man, flies to Venice—Death of the Regent—Law obliged to resort again to gambling—His death at Venice

THE SOUTH-SEA BUBBLE.

Originated by Harley Earl of Oxford—Exchange Alley a scene of great excitement—Mr. Walpole—Sir John Blunt—Great demand for shares—Innumerable “Bubbles”—List of nefarious projects and bubbles—Great rise in South-sea stock—Sudden fall—General meeting of the directors—Fearful climax of the South-sea expedition—Its effects on society—Uproar in the House of Commons—Escape of Knight—Apprehension of Sir John Blunt—Recapture of Knight at Tirllemont—His second escape—Persons connected with the scheme examined—Their respective punishments—Concluding remarks

THE TULIPOMANIA.

Conrad Gesner—Tulips brought from Vienna to England—Rage for the tulip among the Dutch—Its great value—Curious anecdote of a sailor and a tulip—Regular marts for tulips—Tulips employed as a means of speculation—Great depreciation in their value—End of the mania

THE ALCHEMISTS.

Introductory remarks—Pretended antiquity of the art—Geber—Alfarabi—Avicenna—Albertus Magnus—Thomas Aquinas—Artephius—Alain de Lisle—Arnold de Villeneuve—Pietro d’Apone—Raymond Lulli—Roger Bacon—Pope John XXII.—Jean de Meung—Nicholas Flamel—George Ripley—Basil Valentine—Bernard of Trèves—Trithemius—The Maréchal de Rays—Jacques Cœur—Inferior adepts—Progress of the infatuation during the sixteenth and seventeenth centuries—Augurello—Cornelius Agrippa—Paracelsus—George Agricola—Denys Zachaire—Dr. Dee and Edward Kelly

—The Cosmopolite—Sendivogius—The Rosicrucians—Michael Mayer—Robert Fludd—Jacob Böhmen—John Heydon—Joseph Francis Borri—Alchymical writers of the seventeenth century—Delisle—Albert Aluys—Count de St. Germain—Cagliostro—Present state of the science

MODERN PROPHECIES.

Terror of the approaching day of judgment—A comet the signal of that day—The prophecy of Whiston—The people of Leeds greatly alarmed at that event—The plague in Milan—Fortune-tellers and Astrologers—Prophecy concerning the overflow of the Thames—Mother Shipton—Merlin—Heywood—Peter of Pontefract—Robert Nixon—Almanac-makers

FORTUNE-TELLING.

Presumption and weakness of man—Union of Fortune-tellers and Alchymists—Judicial astrology encouraged in England from the time of Elizabeth to William and Mary—Lilly the astrologer consulted by the House of Commons as to the cause of the Fire of London—Encouragement of the art in France and Germany—Nostradamus—Basil of Florence—Antiochus Tibertus—Kepler—Necromancy—Roger Bacon, Albertus Magnus, Arnold Villeneuve—Geomancy—Augury—Divination: list of various species of divination—Oneiro-criticism (interpretation of dreams)—Omens

THE MAGNETISERS.

The influence of imagination in curing diseases—Mineral magnetisers—Paracelsus—Kircher the Jesuit—Sebastian Wirdig—William Maxwell—The Convulsionaries of St. Medard

—Father Hell—Mesmer, the founder of Animal Magnetism—
D’Eslon, his disciple—M. de Puysegur—Dr. Mainauduc’s
success in London—Holloway, Louthembourg, Mary Pratt, &c.
—Perkins’s “Metallic Tractors”—Decline of the science

INFLUENCE OF POLITICS AND RELIGION ON THE HAIR AND BEARD.

Early modes of wearing the hair and beard—
Excommunication and outlawry decreed against curls—Louis
VII.’s submission thereto the cause of the long wars between
England and France—Charles V. of Spain and his courtiers—
Peter the Great—His tax upon beards—Revival of beards and
moustaches after the French Revolution of 1830—The King of
Bavaria (1838) orders all civilians wearing moustaches to be
arrested and shaved—Examples from Bayeux tapestry

LIST OF ENGRAVINGS IN VOL. I.

Frontispiece—Gardens of the Hotel de Soissons. (From a print in Mr. Hawkins' collection.)

Vignette—The Bubblers' Arms, Prosperity. (*Bubblers' Mirror, or England's Folly.*)

John Law. (From a rare print by Leon Schenk. 1720)

The Regent D'Orleans

Old Palais Royal from the Garden. (From a scarce print, *circa* 1720)

Law's House; Rue de Quincampoix. (From Nodier's *Paris*)

Humpbacked Man hiring himself as a Table

Hôtel de Soissons. (From Nodier's *Paris*)

The Coach upset

Murder of a Broker by Count D'Horn

John Law as Atlas. (From *England under the House of Hanover*)

Caricature—Lucifer's new Row Barge

Procession of Miners for the Mississippi

The Chancellor D'Aguesseau

Caricature—Law in a Car drawn by Cocks

M. D'Argenson

Caricature—Neck or Nothing, or Downfall of the Mississippi Company

The South-Sea House. (From a print, *circa* 1750)

Harley Earl of Oxford

Sir Robert Walpole

Cornhill. (Print, *circa* 1720)

Stock-jobbing Card, or the Humours of Change Alley. 1720.
(From the *Bubblers' Medley*)

Caricature—People climbing the Tree of Fortune. (From the *Bubblers' Medley*)

The Gateway to Merchant Tailors' Hall. (Gateway from old print)

Mr. Secretary Craggs

Caricature—Beggars on Horseback. (From the *Bubblers' Medley*)

Caricature—Britannia stript by a South-Sea Director

Caricature—The Brabant Screen. (Copied from a rare print of the time, in the collection of E. Hawkins, Esq., F.S.A.)

Bonfires on Tower Hill

The Earl of Sunderland

Caricature—Emblematic Print of the South-Sea Scheme. (From a print by Hogarth)

Caricature—Bubblers' Arms: Despair. (From *Bubblers' Mirror, or England's Glory*)

Conrad Gesner

The Alchymist. (From print after Teniers)

Albertus Magnus

Arnold de Villeneuve

Raymond Lulli

House of Jacques Cœur at Bourges. (From *Sommerard's Album*)

Cornelius Agrippa

Paracelsus

Dr. Dee

Dr. Dee's Show-stone and Magic Crystal. (Originals in the possession of Lord Londesborough and British Museum)

Innsbruck. (From Nodier's *Paris*)

House of Cagliostro (Rue de Clery, No. 278), Paris

Mother Shipton's House

Henry Andrews, the original "Francis Moore, physician"

Nostradamus. (From the frontispiece to a collection of his Prophecies, published at Amsterdam A.D. 1666)

Preface.

IN reading the history of nations, we find that, like individuals, they have their whims and their peculiarities; their seasons of excitement and recklessness, when they care not what they do. We find that whole communities suddenly fix their minds upon one object, and go mad in its pursuit; that millions of people become simultaneously impressed with one delusion, and run after it, till their attention is caught by some new folly more captivating than the first. We see one nation suddenly seized, from its highest to its lowest members, with a fierce desire of military glory; another as suddenly becoming crazed upon a religious scruple; and neither of them recovering its senses until it has shed rivers of blood and sowed a harvest of groans and tears, to be reaped by its posterity. At an early age in the annals of Europe its population lost their wits about the sepulchre of Jesus, and crowded in frenzied multitudes to the Holy Land; another age went mad for fear of the devil, and offered up hundreds of thousands of victims to the delusion of witchcraft. At another time, the many became crazed on the subject of the philosopher's stone, and committed follies till then unheard of in the pursuit. It was once thought a venial offence, in very many countries of Europe, to destroy an enemy by slow poison. Persons who would have revolted at the idea of stabbing a man to the heart, drugged his pottage without scruple. Ladies of gentle birth and manners caught the contagion of murder, until poisoning, under their auspices, became quite fashionable. Some delusions, though notorious to all the world, have subsisted for ages, flourishing as widely among civilised and

polished nations as among the early barbarians with whom they originated,—that of duelling, for instance, and the belief in omens and divination of the future, which seem to defy the progress of knowledge to eradicate them entirely from the popular mind. Money, again, has often been a cause of the delusion of multitudes. Sober nations have all at once become desperate gamblers, and risked almost their existence upon the turn of a piece of paper. To trace the history of the most prominent of these delusions is the object of the present pages. Men, it has been well said, think in herds; it will be seen that they go mad in herds, while they only recover their senses slowly, and one by one.

Some of the subjects introduced may be familiar to the reader; but the Author hopes that sufficient novelty of detail will be found even in these, to render them acceptable, while they could not be wholly omitted in justice to the subject of which it was proposed to treat. The memoirs of the South-Sea madness and the Mississippi delusion are more complete and copious than are to be found elsewhere; and the same may be said of the history of the Witch Mania, which contains an account of its terrific progress in Germany, a part of the subject which has been left comparatively untouched by Sir Walter Scott in his *Letters on Demonology and Witchcraft*, the most important that have yet appeared on this fearful but most interesting subject.

Popular delusions began so early, spread so widely, and have lasted so long, that instead of two or three volumes, fifty would scarcely suffice to detail their history. The present may be considered more of a miscellany of delusions than a history—a chapter only in the great and awful book of human folly which yet remains to be

written, and which Porson once jestingly said he would write in five hundred volumes! Interspersed are sketches of some lighter matters, —amusing instances of the imitiveness and wrongheadedness of the people, rather than examples of folly and delusion.

Religious matters have been purposely excluded as incompatible with the limits prescribed to the present work; a mere list of them would alone be sufficient to occupy a volume.

JOHN LAW.

MONEY MANIA.—THE MISSISSIPPI SCHEME.

Some in clandestine companies combine;
Erect new stocks to trade beyond the line;
With air and empty names beguile the town,
And raise new credits first, then cry 'em down;
Divide the empty nothing into shares,
And set the crowd together by the ears.—*Defoe.*

THE personal character and career of one man are so intimately connected with the great scheme of the years 1719 and 1720, that a history of the Mississippi madness can have no fitter introduction than a sketch of the life of its great author John Law. Historians are divided in opinion as to whether they should designate him a knave or a madman. Both epithets were unsparingly applied to him in his lifetime, and while the unhappy consequences of his projects were still deeply felt. Posterity, however, has found reason to doubt the justice of the accusation, and to confess that John Law was neither knave nor madman, but one more deceived than deceiving, more sinned against than sinning. He was thoroughly acquainted with the philosophy and true principles of credit. He understood the monetary question better than any man of his day; and if his system fell with a crash so tremendous, it was not so much his fault as that of the people amongst whom he had erected it. He did not calculate upon the avaricious frenzy of a whole nation; he did not see that confidence, like mistrust, could be increased almost *ad infinitum*, and that hope was as extravagant as fear. How was he to foretell that the French people, like the man in the fable, would kill, in their frantic eagerness, the

fine goose he had brought to lay them so many golden eggs? His fate was like that which may be supposed to have overtaken the first adventurous boatman who rowed from Erie to Ontario. Broad and smooth was the river on which he embarked; rapid and pleasant was his progress; and who was to stay him in his career? Alas for him! the cataract was nigh. He saw, when it was too late, that the tide which wafted him so joyously along was a tide of destruction; and when he endeavoured to retrace his way, he found that the current was too strong for his weak efforts to stem, and that he drew nearer every instant to the tremendous falls. Down he went over the sharp rocks, and the waters with him. *He* was dashed to pieces with his bark, but the waters, maddened and turned to foam by the rough descent, only boiled and bubbled for a time, and then flowed on again as smoothly as ever. Just so it was with Law and the French people. He was the boatman, and they were the waters.

John Law was born at Edinburgh in the year 1671. His father was the younger son of an ancient family in Fife, and carried on the business of a goldsmith and banker. He amassed considerable wealth in his trade, sufficient to enable him to gratify the wish, so common among his countrymen, of adding a territorial designation to his name. He purchased with this view the estates of Lauriston and Randleston, on the Frith of Forth, on the borders of West and Mid Lothian, and was thenceforth known as Law of Lauriston. The subject of our memoir, being the eldest son, was received into his father's counting-house at the age of fourteen, and for three years laboured hard to acquire an insight into the principles of banking as then carried on in Scotland. He had always manifested great love for the study of numbers, and his proficiency in the mathematics was considered extraordinary in one of his tender years. At the age of seventeen he was tall, strong, and well made; and his face, although deeply scarred with the small-pox, was agreeable in its expression, and full of intelligence. At this time he began to neglect his business, and becoming vain of his person, indulged in considerable extravagance of attire. He was a great

favourite with the ladies, by whom he was called Beau Law; while the other sex, despising his foppery, nicknamed him Jessamy John. At the death of his father, which happened in 1688, he withdrew entirely from the desk, which had become so irksome, and being possessed of the revenues of the paternal estate of Lauriston, he proceeded to London, to see the world.

He was now very young, very vain, good-looking, tolerably rich, and quite uncontrolled. It is no wonder that, on his arrival in the capital, he should launch out into extravagance. He soon became a regular frequenter of the gaming-houses, and by pursuing a certain plan, based upon some abstruse calculation of chances, he contrived to gain considerable sums. All the gamblers envied him his luck, and many made it a point to watch his play, and stake their money on the same chances. In affairs of gallantry he was equally fortunate; ladies of the first rank smiled graciously upon the handsome Scotchman—the young, the rich, the witty, and the obliging. But all these successes only paved the way for reverses. After he had been for nine years exposed to the dangerous attractions of the gay life he was leading, he became an irrecoverable gambler. As his love of play increased in violence, it diminished in prudence. Great losses were only to be repaired by still greater ventures, and one unhappy day he lost more than he could repay without mortgaging his family estate. To that step he was driven at last. At the same time his gallantry brought him into trouble. A love affair, or slight flirtation, with a lady of the name of Villiers,¹ exposed him to the resentment of a Mr. Wilson, by whom he was challenged to fight a duel. Law accepted, and had the ill fortune to shoot his antagonist dead upon the spot. He was arrested the same day, and brought to trial for murder by the relatives of Mr. Wilson. He was afterwards found guilty, and sentenced to death. The sentence was commuted to a fine, upon the ground that the offence only amounted to manslaughter. An appeal being lodged by a brother of the deceased, Law was detained in the King's Bench, whence, by some means or other, which he never explained, he contrived to escape; and an action being instituted against the sheriffs, he was

advertised in the Gazette, and a reward offered for his apprehension. He was described as “Captain John Law, a Scotchman, aged twenty-six; a very tall, black, lean man; well shaped, above six feet high, with large pock-holes in his face; big nosed, and speaking broad and loud.” As this was rather a caricature than a description of him, it has been supposed that it was drawn up with a view to favour his escape. He succeeded in reaching the Continent, where he travelled for three years, and devoted much of his attention to the monetary and banking affairs of the countries through which he passed. He stayed a few months in Amsterdam, and speculated to some extent in the funds. His mornings were devoted to the study of finance and the principles of trade, and his evenings to the gaming-house. It is generally believed that he returned to Edinburgh in the year 1700. It is certain that he published in that city his *Proposals and Reasons for constituting a Council of Trade*. This pamphlet did not excite much attention.

In a short time afterwards he published a project for establishing what he called a Land-bank,² the notes issued by which were never to exceed the value of the entire lands of the state, upon ordinary interest, or were to be equal in value to the land, with the right to enter into possession at a certain time. The project excited a good deal of discussion in the Scottish Parliament, and a motion for the establishment of such a bank was brought forward by a neutral party, called the Squadrone, whom Law had interested in his favour. The Parliament ultimately passed a resolution to the effect, that, to establish any kind of paper credit, so as to force it to pass, was an improper expedient for the nation.

Upon the failure of this project, and of his efforts to procure a pardon for the murder of Mr. Wilson, Law withdrew to the Continent, and resumed his old habits of gaming. For fourteen years he continued to roam about, in Flanders, Holland, Germany, Hungary, Italy, and France. He soon became intimately acquainted with the extent of the trade and resources of each, and daily more confirmed in his opinion that no country could prosper

without a paper currency. During the whole of this time he appears to have chiefly supported himself by successful play. At every gambling-house of note in the capitals of Europe he was known and appreciated as one better skilled in the intricacies of chance than any other man of the day. It is stated in the *Biographie Universelle* that he was expelled, first from Venice, and afterwards from Genoa, by the magistrates, who thought him a visitor too dangerous for the youth of those cities. During his residence in Paris he rendered himself obnoxious to D'Argenson, the lieutenant-general of the police, by whom he was ordered to quit the capital. This did not take place, however, before he had made the acquaintance, in the saloons, of the Duke de Vendôme, the Prince de Conti, and of the gay Duke of Orleans, the latter of whom was destined afterwards to exercise so much influence over his fate. The Duke of Orleans was pleased with the vivacity and good sense of the Scottish adventurer, while the latter was no less pleased with the wit and amiability of a prince who promised to become his patron. They were often thrown into each other's society, and Law seized every opportunity to instil his financial doctrines into the mind of one whose proximity to the throne pointed him out as destined, at no very distant date, to play an important part in the government.

THE REGENT OF FRANCE.

Shortly before the death of Louis XIV., or, as some say, in 1708, Law proposed a scheme of finance to Desmaretz, the comptroller. Louis is reported to have inquired whether the projector were a Catholic, and on

being answered in the negative, to have declined having any thing to do with him.³

It was after this repulse that he visited Italy. His mind being still occupied with schemes of finance, he proposed to Victor Amadeus, duke of Savoy, to establish his land-bank in that country. The duke replied that his dominions were too circumscribed for the execution of so great a project, and that he was by far too poor a potentate to be ruined. He advised him, however, to try the king of France once more; for he was sure, if he knew any thing of the French character, that the people would be delighted with a plan, not only so new, but so plausible.

Louis XIV. died in 1715, and the heir to the throne being an infant only seven years of age, the Duke of Orleans assumed the reins of government, as regent, during his minority. Law now found himself in a more favourable position. The tide in his affairs had come, which, taken at the flood, was to waft him on to fortune. The regent was his friend, already acquainted with his theory and pretensions, and inclined, moreover, to aid him in any efforts to restore the wounded credit of France, bowed down to the earth by the extravagance of the long reign of Louis XIV.

Hardly was that monarch laid in his grave ere the popular hatred, suppressed so long, burst forth against his memory. He who, during his life, had been flattered with an excess of adulation, to which history scarcely offers a parallel, was now cursed as a tyrant, a bigot, and a plunderer. His statues were pelted and disfigured; his effigies torn down, amid the execrations of the populace, and his name rendered synonymous with selfishness and oppression. The glory of his arms was forgotten, and nothing was remembered but his reverses, his extravagance, and his cruelty.

The finances of the country were in a state of the utmost disorder. A profuse and corrupt monarch, whose profuseness and corruption were imitated by almost every functionary, from the highest to the lowest grade, had brought France to the verge of ruin. The national debt amounted to

3000 millions of livres, the revenue to 145 millions, and the expenses of government to 142 millions per annum; leaving only three millions to pay the interest upon 3000 millions. The first care of the regent was to discover a remedy for an evil of such magnitude, and a council was early summoned to take the matter into consideration. The Duke de St. Simon was of opinion that nothing could save the country from revolution but a remedy at once bold and dangerous. He advised the regent to convoke the states-general, and declare a national bankruptcy. The Duke de Noailles, a man of accommodating principles, an accomplished courtier, and totally averse from giving himself any trouble or annoyance that ingenuity could escape from, opposed the project of St. Simon with all his influence. He represented the expedient as alike dishonest and ruinous. The regent was of the same opinion, and this desperate remedy fell to the ground.

The measures ultimately adopted, though they promised fair, only aggravated the evil. The first, and most dishonest measure was of no advantage to the state. A recoinage was ordered, by which the currency was depreciated one-fifth; those who took a thousand pieces of gold or silver to the mint received back an amount of coin of the same nominal value, but only four-fifths of the weight of metal. By this contrivance the treasury gained seventy-two millions of livres, and all the commercial operations of the country were disordered. A trifling diminution of the taxes silenced the clamours of the people, and for the slight present advantage the great prospective evil was forgotten.

A Chamber of Justice was next instituted to inquire into the malversations of the loan-contractors and the farmers of the revenues. Tax-collectors are never very popular in any country, but those of France at this period deserved all the odium with which they were loaded. As soon as these farmers-general, with all their hosts of subordinate agents, called *maltôtiers*,⁴ were called to account for their misdeeds, the most extravagant joy took possession of the nation. The Chamber of Justice, instituted chiefly for this purpose, was endowed with very extensive

powers. It was composed of the presidents and councils of the parliament, the judges of the Courts of Aid and of Requests, and the officers of the Chamber of Account, under the general presidency of the minister of finance. Informers were encouraged to give evidence against the offenders by the promise of one-fifth part of the fines and confiscations. A tenth of all concealed effects belonging to the guilty was promised to such as should furnish the means of discovering them.

The promulgation of the edict constituting this court caused a degree of consternation among those principally concerned, which can only be accounted for on the supposition that their peculation had been enormous. But they met with no sympathy. The proceedings against them justified their terror. The Bastille was soon unable to contain the prisoners that were sent to it, and the gaols all over the country teemed with guilty or suspected persons. An order was issued to all innkeepers and postmasters to refuse horses to such as endeavoured to seek safety in flight; and all persons were forbidden, under heavy fines, to harbour them or favour their evasion. Some were condemned to the pillory, others to the galleys, and the least guilty to fine and imprisonment. One only, Samuel Bernard, a rich banker and farmer-general of a province remote from the capital, was sentenced to death. So great had been the illegal profits of this man,—looked upon as the tyrant and oppressor of his district,—that he offered six millions of livres, or 250,000*l.* sterling, to be allowed to escape.

His bribe was refused, and he suffered the penalty of death. Others, perhaps more guilty, were more fortunate. Confiscation, owing to the concealment of their treasures by the delinquents, often produced less money than a fine. The severity of the government relaxed, and fines, under the denomination of taxes, were indiscriminately levied upon all offenders; but so corrupt was every department of the administration, that the country benefited but little by the sums which thus flowed into the treasury. Courtiers and courtiers' wives and mistresses came in for the chief share of the spoils. One contractor had been taxed, in proportion to

his wealth and guilt, at the sum of twelve millions of livres. The Count * * *,
a man of some weight in the government, called upon him, and offered to procure a remission of the fine if he would give him a hundred thousand crowns. “Vous êtes trop tard, mon ami,” replied the financier; “I have already made a bargain with your wife for fifty thousand.”⁵

About a hundred and eighty millions of livres were levied in this manner, of which eighty were applied in payment of the debts contracted by the government. The remainder found its way into the pockets of the courtiers. Madame de Maintenon, writing on this subject, says,—“We hear every day of some new grant of the regent. The people murmur very much at this mode of employing the money taken from the speculators.” The people, who, after the first burst of their resentment is over, generally express a sympathy for the weak, were indignant that so much severity should be used to so little purpose. They did not see the justice of robbing one set of rogues to fatten another. In a few months all the more guilty had been brought to punishment, and the Chamber of Justice looked for victims in humbler walks of life. Charges of fraud and extortion were brought against tradesmen of good character in consequence of the great inducements held out to common informers. They were compelled to lay open their affairs before this tribunal in order to establish their innocence. The voice of complaint resounded from every side; and at the expiration of a year the government found it advisable to discontinue further proceedings. The Chamber of Justice was suppressed, and a general amnesty granted to all against whom no charges had yet been preferred.

In the midst of this financial confusion Law appeared upon the scene. No man felt more deeply than the regent the deplorable state of the country, but no man could be more averse from putting his shoulders manfully to the wheel. He disliked business; he signed official documents without proper examination, and trusted to others what he should have undertaken himself. The cares inseparable from his high office were burdensome to him. He saw that something was necessary to be done; but he lacked the

energy to do it, and had not virtue enough to sacrifice his ease and his pleasures in the attempt. No wonder that, with this character, he listened favourably to the mighty projects, so easy of execution, of the clever adventurer whom he had formerly known, and whose talents he appreciated.

When Law presented himself at court he was most cordially received. He offered two memorials to the regent, in which he set forth the evils that had befallen France, owing to an insufficient currency, at different times depreciated. He asserted that a metallic currency, unaided by a paper money, was wholly inadequate to the wants of a commercial country, and particularly cited the examples of Great Britain and Holland to shew the advantages of paper. He used many sound arguments on the subject of credit, and proposed as a means of restoring that of France, then at so low an ebb among the nations, that he should be allowed to set up a bank, which should have the management of the royal revenues, and issue notes both on that and on landed security. He further proposed that this bank should be administered in the king's name, but subject to the control of commissioners to be named by the States-General.

While these memorials were under consideration, Law translated into French his essay on money and trade, and used every means to extend through the nation his renown as a financier. He soon became talked of. The confidants of the regent spread abroad his praise, and every one expected great things of Monsieur Lass.⁶

On the 5th of May, 1716, a royal edict was published, by which Law was authorised, in conjunction with his brother, to establish a bank under the name of Law and Company, the notes of which should be received in payment of the taxes. The capital was fixed at six millions of livres, in twelve thousand shares of five hundred livres each, purchasable one fourth in specie, and the remainder in *billets d'état*. It was not thought expedient to grant him the whole of the privileges prayed for in his memorials until experience should have shewn their safety and advantage.

Law was now on the high road to fortune. The study of thirty years was brought to guide him in the management of his bank. He made all his notes payable at sight, and in the coin current at the time they were issued. This last was a master-stroke of policy, and immediately rendered his notes more valuable than the precious metals. The latter were constantly liable to depreciation by the unwise tampering of the government. A thousand livres of silver might be worth their nominal value one day, and be reduced one-sixth the next, but a note of Law's bank retained its original value. He publicly declared at the same time, that a banker deserved death if he made issues without having sufficient security to answer all demands. The consequence was, that his notes advanced rapidly in public estimation, and were received at one per cent more than specie. It was not long before the trade of the country felt the benefit. Languishing commerce began to lift up her head; the taxes were paid with greater regularity and less murmuring; and a degree of confidence was established that could not fail, if it continued, to become still more advantageous. In the course of a year, Law's notes rose to fifteen per cent premium, while the *billets d'état*, or notes issued by the government as security for the debts contracted by the extravagant Louis XIV., were at a discount of no less than seventy-eight and a half per cent. The comparison was too great in favour of Law not to attract the attention of the whole kingdom, and his credit extended itself day by day. Branches of his bank were almost simultaneously established at Lyons, Rochelle, Tours, Amiens, and Orleans.

The regent appears to have been utterly astonished at his success, and gradually to have conceived the idea that paper, which could so aid a metallic currency, could entirely supersede it. Upon this fundamental error he afterwards acted. In the mean time, Law commenced the famous project which has handed his name down to posterity. He proposed to the regent (who could refuse him nothing) to establish a company that should have the exclusive privilege of trading to the great river Mississippi and the province of Louisiana, on its western bank. The country was supposed to

abound in the precious metals; and the company, supported by the profits of their exclusive commerce, were to be the sole farmers of the taxes and sole coiners of money. Letters patent were issued, incorporating the company, in August 1717. The capital was divided into two hundred thousand shares of five hundred livres each, the whole of which might be paid in *billets d'état*, at their nominal value, although worth no more than a hundred and sixty livres in the market.

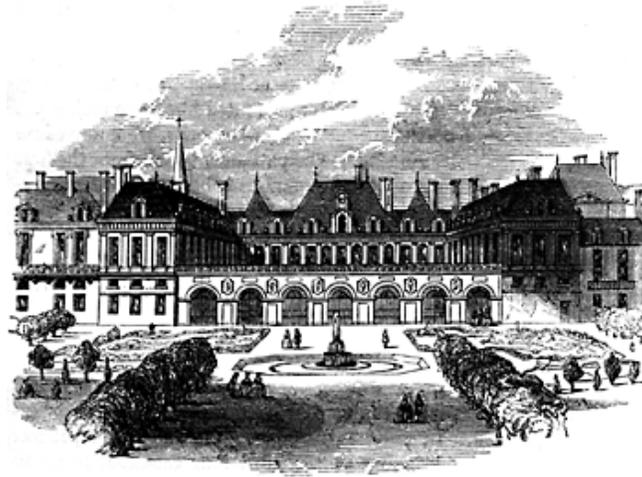

It was now that the frenzy of speculating began to seize upon the nation. Law's bank had effected so much good, that any promises for the future which he thought proper to make were readily believed. The regent every day conferred new privileges upon the fortunate projector. The bank obtained the monopoly of the sale of tobacco, the sole right of refining of gold and silver, and was finally erected into the Royal Bank of France. Amid the intoxication of success, both Law and the regent forgot the maxim so loudly proclaimed by the former, that a banker deserved death who made issues of paper without the necessary funds to provide for them. As soon as the bank, from a private, became a public institution, the regent caused a fabrication of notes to the amount of one thousand millions of livres. This was the first departure from sound principles, and one for which Law is not justly blameable. While the affairs of the bank were under his control, the issues had never exceeded sixty millions. Whether Law opposed the inordinate increase is not known; but as it took place as soon as the bank was made a royal establishment, it is but fair to lay the blame of the change of system upon the regent.

Law found that he lived under a despotic government; but he was not yet aware of the pernicious influence which such a government could exercise upon so delicate a framework as that of credit. He discovered it afterwards to his cost, but in the meantime suffered himself to be impelled by the regent into courses which his own reason must have disapproved. With a weakness most culpable, he lent his aid in inundating the country with paper money, which, based upon no solid foundation, was sure to fall,

sooner or later. The extraordinary present fortune dazzled his eyes, and prevented him from seeing the evil day that would burst over his head, when once, from any cause or other, the alarm was sounded. The parliament were from the first jealous of his influence as a foreigner, and had, besides, their misgivings as to the safety of his projects. As his influence extended, their animosity increased. D'Aguesseau, the chancellor, was unceremoniously dismissed by the regent for his opposition to the vast increase of paper money, and the constant depreciation of the gold and silver coin of the realm. This only served to augment the enmity of the parliament, and when D'Argenson, a man devoted to the interests of the regent, was appointed to the vacant chancellorship, and made at the same time minister of finance, they became more violent than ever. The first measure of the new minister caused a further depreciation of the coin. In order to extinguish the *billets d'état*, it was ordered that persons bringing to the mint four thousand livres in specie and one thousand livres in *billets d'état*, should receive back coin to the amount of five thousand livres. D'Argenson plumed himself mightily upon thus creating five thousand new and smaller livres out of the four thousand old and larger ones, being too ignorant of the true principles of trade and credit to be aware of the immense injury he was inflicting upon both.

The parliament saw at once the impolicy and danger of such a system, and made repeated remonstrances to the regent. The latter refused to entertain their petitions, when the parliament, by a bold and very unusual stretch of authority, commanded that no money should be received in payment but that of the old standard. The regent summoned a *lit de justice*, and annulled the decree. The parliament resisted, and issued another. Again the regent exercised his privilege, and annulled it, till the parliament, stung to fiercer opposition, passed another decree, dated August 12th, 1718, by which they forbade the bank of Law to have any concern, either direct or indirect, in the administration of the revenue; and prohibited all

foreigners, under heavy penalties, from interfering, either in their own names, or in that of others, in the management of the finances of the state. The parliament considered Law to be the author of all the evil, and some of the councillors, in the virulence of their enmity, proposed that he should be brought to trial, and, if found guilty, be hung at the gates of the Palais de Justice.

PALAIS ROYAL FROM THE GARDEN.

Law, in great alarm, fled to the Palais Royal, and threw himself on the protection of the regent, praying that measures might be taken to reduce the parliament to obedience. The regent had nothing so much at heart, both on that account and because of the disputes that had arisen relative to the legitimation of the Duke of Maine and the Count of Thoulouse, the sons of the late king. The parliament was ultimately overawed by the arrest of their president and two of the councillors, who were sent to distant prisons.

Thus the first cloud upon Law's prospects blew over: freed from apprehension of personal danger, he devoted his attention to his famous Mississippi project, the shares of which were rapidly rising, in spite of the parliament. At the commencement of the year 1719, an edict was published, granting to the Mississippi Company the exclusive privilege of trading to the East Indies, China, and the South Seas, and to all the possessions of the French East India Company, established by Colbert. The Company, in

consequence of this great increase of their business, assumed, as more appropriate, the title of Company of the Indies, and created fifty thousand new shares. The prospects now held out by Law were most magnificent. He promised a yearly dividend of two hundred livres upon each share of five hundred, which, as the shares were paid for in *billets d'état* at their nominal value, but worth only 100 livres, was at the rate of about 120 per cent profit.

LAW'S HOUSE; RUE DE QUINCAMPOIX.

The public enthusiasm, which had been so long rising, could not resist a vision so splendid. At least three hundred thousand applications were made for the fifty thousand new shares, and Law's house in the Rue de Quincampoix was beset from morning to night by the eager applicants. As it was impossible to satisfy them all, it was several weeks before a list of the fortunate new stockholders could be made out, during which time the public impatience rose to a pitch of frenzy. Dukes, marquises, counts, with their duchesses, marchionesses, and countesses, waited in the streets for hours every day before Mr. Law's door to know the result. At last, to avoid

the jostling of the plebeian crowd, which, to the number of thousands, filled the whole thoroughfare, they took apartments in the adjoining houses, that they might be continually near the temple whence the new Plutus was diffusing wealth. Every day the value of the old shares increased, and the fresh applications, induced by the golden dreams of the whole nation, became so numerous that it was deemed advisable to create no less than three hundred thousand new shares, at five thousand livres each, in order that the regent might take advantage of the popular enthusiasm to pay off the national debt. For this purpose, the sum of fifteen hundred millions of livres was necessary. Such was the eagerness of the nation, that thrice the sum would have been subscribed if the government had authorised it.

Law was now at the zenith of his prosperity, and the people were rapidly approaching the zenith of their infatuation. The highest and the lowest classes were alike filled with a vision of boundless wealth. There was not a person of note among the aristocracy, with the exception of the Duke of St. Simon and Marshal Villars, who was not engaged in buying or selling stock. People of every age and sex and condition in life speculated in the rise and fall of the Mississippi bonds. The Rue de Quincampoix was the grand resort of the jobbers, and it being a narrow, inconvenient street, accidents continually occurred in it, from the tremendous pressure of the crowd. Houses in it, worth, in ordinary times, a thousand livres of yearly rent, yielded as much as twelve or sixteen thousand. A cobbler, who had a stall in it, gained about two hundred livres a day by letting it out, and furnishing writing materials to brokers and their clients. The story goes, that a hunchbacked man who stood in the street gained considerable sums by lending his hump as a writing-desk to the eager speculators! The great concourse of persons who assembled to do business brought a still greater concourse of spectators. These again drew all the thieves and immoral characters of Paris to the spot, and constant riots and disturbances took

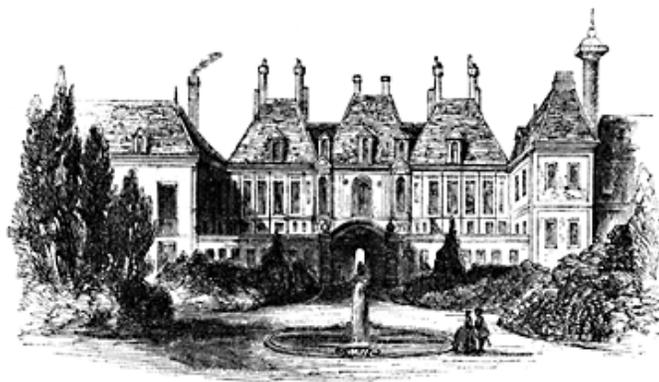

place. At nightfall, it was often found necessary to send a troop of soldiers to clear the street.

THE HUNCHBACK.

Law, finding the inconvenience of his residence, removed to the Place Vendôme, whither the crowd of *agoteurs* followed him. That spacious square soon became as thronged as the Rue de Quincampoix: from morning to night it presented the appearance of a fair. Booths and tents were erected for the transaction of business and the sale of refreshments, and gamblers with their roulette tables stationed themselves in the very middle of the place, and reaped a golden, or rather a paper, harvest from the throng. The boulevards and public gardens were forsaken; parties of pleasure took their walks in preference in the Place Vendôme, which became the fashionable lounge of the idle, as well as the general rendezvous of the busy. The noise was so great all day, that the chancellor, whose court was situated in the square, complained to the regent and the municipality, that he could not hear the advocates. Law, when applied to, expressed his willingness to aid in the removal of the nuisance, and for this

purpose entered into a treaty with the Prince de Carignan for the Hôtel de Soissons, which had a garden of several acres in the rear. A bargain was concluded, by which Law became the purchaser of the hotel at an enormous price, the prince reserving to himself the magnificent gardens as a new source of profit. They contained some fine statues and several fountains, and were altogether laid out with much taste. As soon as Law was installed in his new abode, an edict was published, forbidding all persons to buy or sell stock any where but in the gardens of the Hôtel de Soissons. In the midst, among the trees, about five hundred small tents and pavilions were erected, for the convenience of the stock-jobbers. Their various colours, the gay ribands and banners which floated from them, the busy crowds which passed continually in and out—the incessant hum of voices, the noise, the music, and the strange mixture of business and pleasure on the countenances of the throng, all combined to give the place an air of enchantment that quite enraptured the Parisians. The Prince de Carignan made enormous profits while the delusion lasted. Each tent was let at the rate of five hundred livres a month; and, as there were at least five hundred of them, his monthly revenue from this source alone must have amounted to 250,000 livres, or upwards of 10,000^{l.} sterling.

HOTEL DE SOISSONS.

The honest old soldier, Marshal Villars, was so vexed to see the folly which had smitten his countrymen, that he never could speak with temper on the subject. Passing one day through the Place Vendôme in his carriage,

the choleric gentleman was so annoyed at the infatuation of the people, that he abruptly ordered his coachman to stop, and, putting his head out of the carriage window, harangued them for full half an hour on their “disgusting avarice.” This was not a very wise proceeding on his part. Hisses and shouts of laughter resounded from every side, and jokes without number were aimed at him. There being at last strong symptoms that something more tangible was flying through the air in the direction of his head, the marshal was glad to drive on. He never again repeated the experiment.

Two sober, quiet, and philosophic men of letters, M. de la Motte and the Abbé Terrason, congratulated each other, that they, at least, were free from this strange infatuation. A few days afterwards, as the worthy abbé was coming out of the Hôtel de Soissons, whither he had gone to buy shares in the Mississippi, whom should he see but his friend La Motte entering for the same purpose. “Ha!” said the abbé smiling, “is that *you*?” “Yes,” said La Motte, pushing past him as fast as he was able; “and can that be *you*?” The next time the two scholars met, they talked of philosophy, of science, and of religion, but neither had courage for a long time to breathe one syllable about the Mississippi. At last, when it was mentioned, they agreed that a man ought never to swear against his doing any one thing, and that there was no sort of extravagance of which even a wise man was not capable.

During this time, Law, the new Plutus, had become all at once the most important personage of the state. The ante-chambers of the regent were forsaken by the courtiers, Peers, judges, and bishops thronged to the Hôtel de Soissons; officers of the army and navy, ladies of title and fashion, and every one to whom hereditary rank or public employ gave a claim to precedence, were to be found waiting in his ante-chambers to beg for a portion of his India stock. Law was so pestered that he was unable to see one-tenth part of the applicants, and every manœuvre that ingenuity could suggest was employed to gain access to him. Peers, whose dignity would have been outraged if the regent had made them wait half an hour for an

interview, were content to wait six hours for the chance of seeing Monsieur Law. Enormous fees were paid to his servants, if they would merely announce their names. Ladies of rank employed the blandishments of their smiles for the same object; but many of them came day after day for a fortnight before they could obtain an audience. When Law accepted an invitation, he was sometimes so surrounded by ladies, all asking to have their names put down in his lists as shareholders in the new stock, that, in spite of his well-known and habitual gallantry, he was obliged to tear himself away *par force*. The most ludicrous stratagems were employed to have an opportunity of speaking to him. One lady, who had striven in vain during several days, gave up in despair all attempts to see him at his own house, but ordered her coachman to keep a strict watch whenever she was out in her carriage, and if he saw Mr. Law coming, to drive against a post and upset her. The coachman promised obedience, and for three days the lady was driven incessantly through the town, praying inwardly for the opportunity to be overturned. At last she espied Mr. Law, and, pulling the string, called out to the coachman, "Upset us now! for God's sake, upset us now!" The coachman drove against a post, the lady screamed, the coach was overturned, and Law, who had seen the *accident*, hastened to the spot to render assistance. The cunning dame was led into the Hôtel de Soissons, where she soon thought it advisable to recover from her fright, and, after apologising to Mr. Law, confessed her stratagem. Law smiled, and entered the lady in his books as the purchaser of a quantity of India stock. Another story is told of a Madame de Boucha, who, knowing that Mr. Law was at dinner at a certain house, proceeded thither in her carriage, and gave the alarm of fire. The company started from table, and Law among the rest; but, seeing one lady making all haste into the house towards him, while every body else was scampering away, he suspected the trick, and ran off in another direction.

Many other anecdotes are related, which even though they may be a little exaggerated, are nevertheless worth preserving, as shewing the spirit of that singular period.⁷ The regent was one day mentioning, in the presence of D'Argenson, the Abbé Dubois, and some other persons, that he was desirous of deputing some lady, of the rank at least of a duchess, to attend upon his daughter at Modena; "but," added he, "I do not exactly know where to find one." "No!" replied one, in affected surprise; "I can tell you where to find every duchess in France: you have only to go to Mr. Law's; you will see them every one in his ante-chamber."

M. de Chirac, a celebrated physician, had bought stock at an unlucky period, and was very anxious to sell out. Stock, however, continued to fall for two or three days, much to his alarm. His mind was filled with the subject, when he was suddenly called upon to attend a lady who imagined herself unwell. He arrived, was shewn up stairs, and felt the lady's pulse. "It falls! it falls! good God! it falls continually!" said he musingly, while the lady looked up in his face all anxiety for his opinion. "Oh, M. de Chirac," said she, starting to her feet and ringing the bell for assistance; "I am dying! I am dying! it falls! it falls! it falls!" "What falls?" inquired the doctor

in amazement. "My pulse! my pulse!" said the lady; "I must be dying." "Calm your apprehensions, my dear madam," said M. de Chirac; "I was speaking of the stocks. The truth is, I have been a great loser, and my mind is so disturbed, I hardly know what I have been saying."

The price of shares sometimes rose ten or twenty per cent in the course of a few hours, and many persons in the humbler walks of life, who had risen poor in the morning, went to bed in affluence. An extensive holder of stock, being taken ill, sent his servant to sell two hundred and fifty shares, at eight thousand livres each, the price at which they were then quoted. The servant went, and, on his arrival in the Jardin de Soissons, found that in the interval the price had risen to ten thousand livres. The difference of two thousand livres on the two hundred and fifty shares, amounting to 500,000 livres, or 20,000*l.* sterling, he very coolly transferred to his own use, and giving the remainder to his master, set out the same evening for another country. Law's coachman in a very short time made money enough to set up a carriage of his own, and requested permission to leave his service. Law, who esteemed the man, begged of him as a favour, that he would endeavour, before he went, to find a substitute as good as himself. The coachman consented, and in the evening brought two of his former comrades, telling Mr. Law to choose between them, and he would take the other. Cookmaids and footmen were now and then as lucky, and, in the full-blown pride of their easily-acquired wealth, made the most ridiculous mistakes. Preserving the language and manners of their old, with the finery of their new station, they afforded continual subjects for the pity of the sensible, the contempt of the sober, and the laughter of every body. But the folly and meanness of the higher ranks of society were still more disgusting. One instance alone, related by the Duke de St. Simon, will shew the unworthy avarice which infected the whole of society. A man of the name of André, without character or education, had, by a series of well-timed speculations in Mississippi bonds, gained enormous wealth in an incredibly short space of time. As St. Simon expresses it, "he had amassed

mountains of gold.” As he became rich, he grew ashamed of the lowness of his birth, and anxious above all things to be allied to nobility. He had a daughter, an infant only three years of age, and he opened a negotiation with the aristocratic and needy family of D’Oyse, that this child should, upon certain conditions, marry a member of that house. The Marquis D’Oyse, to his shame, consented, and promised to marry her himself on her attaining the age of twelve, if the father would pay him down the sum of a hundred thousand crowns, and twenty thousand livres every year until the celebration of the marriage. The marquis was himself in his thirty-third year. This scandalous bargain was duly signed and sealed, the stockjobber furthermore agreeing to settle upon his daughter, on the marriage-day, a fortune of several millions. The Duke of Brancas, the head of the family, was present throughout the negotiation, and shared in all the profits. St. Simon, who treats the matter with the levity becoming what he thought so good a joke, adds, “that people did not spare their animadversions on this beautiful marriage,” and further informs us, “that the project fell to the ground some months afterwards by the overthrow of Law, and the ruin of the ambitious Monsieur André.” It would appear, however, that the noble family never had the honesty to return the hundred thousand crowns.

Amid events like these, which, humiliating though they be, partake largely of the ludicrous, others occurred of a more serious nature. Robberies in the streets were of daily occurrence, in consequence of the immense sums, in paper, which people carried about with them. Assassinations were also frequent. One case in particular fixed the attention of the whole of France, not only on account of the enormity of the offence, but of the rank and high connexions of the criminal.

The Count d'Horn, a younger brother of the Prince d'Horn, and related to the noble families of D'Aremberg, De Ligne, and De Montmorency, was a young man of dissipated character, extravagant to a degree, and unprincipled as he was extravagant. In connexion with two other young men as reckless as himself, named Mille, a Piedmontese captain, and one Destampes, or Lestang, a Fleming, he formed a design to rob a very rich broker, who was known, unfortunately for himself, to carry great sums about his person. The count pretended a desire to purchase of him a number of shares in the Company of the Indies, and for that purpose appointed to meet him in a *cabaret*, or low public-house, in the neighbourhood of the

Place Vendôme. The unsuspecting broker was punctual to his appointment; so were the Count d'Horn and his two associates, whom he introduced as his particular friends. After a few moments' conversation, the Count d'Horn suddenly sprang upon his victim, and stabbed him three times in the breast with a poniard. The man fell heavily to the ground, and, while the count was employed in rifling his portfolio of bonds in the Mississippi and Indian schemes to the amount of one hundred thousand crowns, Mille, the Piedmontese, stabbed the unfortunate broker again and again, to make sure of his death, But the broker did not fall without a struggle, and his cries brought the people of the *cabaret* to his assistance. Lestang, the other assassin, who had been set to keep watch at a staircase, sprang from a window and escaped; but Mille and the Count d'Horn were seized in the very act.

This crime, committed in open day, and in so public a place as a *cabaret*, filled Paris with consternation. The trial of the assassins commenced on the following day; and the evidence being so clear, they were both found guilty, and condemned, to be broken alive on the wheel. The noble relatives of the Count d'Horn absolutely blocked up the ante-chambers of the regent, praying for mercy on the misguided youth, and alleging that he was insane. The regent avoided them as long as possible, being determined that, in a case so atrocious, justice should take its course. But the importunity of these influential suitors was not to be overcome so silently; and they at last forced themselves into the presence of the regent, and prayed him to save their house the shame of a public execution. They hinted that the Princes d'Horn were allied to the illustrious family of Orleans; and added, that the regent himself would be disgraced if a kinsman

of his should die by the hands of a common executioner. The regent, to his credit, was proof against all their solicitations, and replied to their last argument in the words of Corneille:

“Le crime fait la honte, et non pas l’échafaud:”

adding, that whatever shame there might be in the punishment he would very willingly share with the other relatives. Day after day they renewed their entreaties, but always with the same result. At last they thought, that if they could interest the Duke de St. Simon in their favour—a man, for whom the regent felt sincere esteem—they might succeed in their object. The duke, a thorough aristocrat, was as shocked as they were that a noble assassin should die by the same death as a plebeian felon, and represented to the regent the impolicy of making enemies of so numerous, wealthy, and powerful a family. He urged, too, that in Germany, where the family of D’Aremberg had large possessions, it was the law, that no relative of a person broken on the wheel could succeed to any public office or employ until a whole generation had passed away. For this reason, he thought the punishment of the guilty count might be transmuted into beheading, which was considered all over Europe as much less infamous. The regent was moved by this argument, and was about to consent, when Law, who felt peculiarly interested in the fate of the murdered man, confirmed him in his former resolution to let the law take its course.

The relatives of D’Horn were now reduced to the last extremity. The Prince de Robec Montmorency, despairing of other methods, found means to penetrate into the dungeon of the criminal, and offering him a cup of poison, implored him to save them from disgrace. The Count d’Horn turned away his head, and refused to

take it. Montmorency pressed him once more; and losing all patience at his continued refusal, turned on his heel, and exclaiming, "Die, then, as thou wilt, mean-spirited wretch! thou art fit only to perish by the hands of the hangman!" left him to his fate.

D'Horn himself petitioned the regent that he might be beheaded; but Law, who exercised more influence over his mind than any other person, with the exception of the notorious Abbé Dubois, his tutor, insisted that he could not in justice succumb to the self-interested views of the D'Horns. The regent had from the first been of the same opinion; and within six days after the commission of their crime, D'Horn and Mille were broken on the wheel in the Place de Grève. The other assassin, Lestang, was never apprehended.

This prompt and severe justice was highly pleasing to the populace of Paris. Even M. de Quincampoix, as they called Law, came in for a share of their approbation for having induced the regent to shew no favour to a patrician. But the number of robberies and assassinations did not diminish; no sympathy was shewn for rich jobbers when they were plundered. The general laxity of public morals, conspicuous enough before, was rendered still more so by its rapid pervasion of the middle classes, who had hitherto remained comparatively pure between the open vices of the class above and the hidden crimes of the class below them. The pernicious love of gambling diffused itself through society, and bore all public and nearly all private virtue before it.

For a time, while confidence lasted, an impetus was given to trade which could not fail to be beneficial. In Paris especially the good results were felt. Strangers flocked into the capital from every part, bent not only upon making money, but on spending it. The Duchess

of Orleans, mother of the regent, computes the increase of the population during this time, from the great influx of strangers from all parts of the world, at 305,000 souls. The housekeepers were obliged to make up beds in garrets, kitchens, and even stables, for the accommodation of lodgers; and the town was so full of carriages and vehicles of every description, that they were obliged, in the principal streets, to drive at a foot-pace for fear of accidents. The looms of the country worked with unusual activity to supply rich laces, silks, broad-cloth, and velvets, which being paid for in abundant paper, increased in price four-fold. Provisions shared the general advance. Bread, meat, and vegetables were sold at prices greater than had ever before been known; while the wages of labour rose in exactly the same proportion. The artisan who formerly gained fifteen sous per diem now gained sixty. New houses were built in every direction; an illusory prosperity shone over the land, and so dazzled the eyes of the whole nation, that none could see the dark cloud on the horizon announcing the storm that was too rapidly approaching.

Law himself, the magician whose wand had wrought so surprising a change, shared, of course, in the general prosperity. His wife and daughter were courted by the highest nobility, and their alliance sought by the heirs of ducal and princely houses. He bought two splendid estates in different parts of France, and entered into a negotiation with the family of the Duke de Sully for the purchase of the marquisate of Rosny. His religion being an obstacle to his advancement, the regent promised, if he would publicly conform to the Catholic faith, to make him comptroller-general of the finances. Law, who had no more real religion than any other professed

gambler, readily agreed, and was confirmed by the Abbé de Tencin in the cathedral of Melun, in presence of a great crowd of spectators⁸. On the following day he was elected honorary churchwarden of the parish of St. Roch, upon which occasion he made it a present of the sum of five hundred thousand livres. His charities, always magnificent, were not always so ostentatious. He gave away great sums privately, and no tale of real distress ever reached his ears in vain.

At this time he was by far the most influential person of the state. The Duke of Orleans had so much confidence in his sagacity and the success of his plans, that he always consulted him upon every matter of moment. He was by no means unduly elevated by his prosperity, but remained the same simple, affable, sensible man that he had shewn himself in adversity. His gallantry, which was always delightful to the fair objects of it, was of a nature so kind, so gentlemanly, and so respectful, that not even a lover could have taken offence at it. If upon any occasion he shewed any symptoms of haughtiness, it was to the cringing nobles who lavished their adulation upon him till it became fulsome. He often took pleasure in seeing how long he could make them dance attendance upon him for a single favour. To such of his own countrymen as by chance visited Paris, and sought an interview with him, he was, on the contrary, all politeness and attention. When Archibald Campbell, Earl of Islay, and afterwards Duke of Argyle, called upon him in the Place Vendôme, he had to pass through an ante-chamber crowded with persons of the first distinction, all anxious to see the great financier, and have their names put down as first on the list of some new subscription. Law himself was quietly sitting in his library, writing a

letter to the gardener at his paternal estate of Lauriston about the planting of some cabbages! The earl stayed for a considerable time, played a game of piquet with his countryman, and left him, charmed with his ease, good sense, and good breeding.

LAW AS ATLAS.⁹

Among the nobles who, by means of the public credulity at this time, gained sums sufficient to repair their ruined fortunes, may be mentioned the names of the Dukes de Bourbon, de Guiche, de la Force,¹⁰ de Chaulnes, and d'Antin; the Marechal d'Estrées; the Princes de Rohan, de Poix, and de Léon. The Duke de Bourbon, son of Louis XIV. by Madame de Montespan, was peculiarly fortunate in his speculations in Mississippi paper. He rebuilt the royal residence of Chantilly in a style of unwonted magnificence; and being passionately fond of horses, he erected a range of stables, which were long renowned throughout Europe, and imported a hundred and fifty of the finest racers from England to improve the breed in France. He bought a large extent of country in Picardy, and became possessed of nearly all the valuable lands lying between the Oise and the Somme.

When fortunes such as these were gained, it is no wonder that Law should have been almost worshipped by the mercurial population. Never was monarch more flattered than he was. All the small poets

and *littérateurs* of the day poured floods of adulation upon him. According to them, he was the saviour of the country, the tutelary divinity of France; wit was in all his words, goodness in all his looks, and wisdom in all his actions. So great a crowd followed his carriage whenever he went abroad, that the regent sent him a troop of horse as his permanent escort to clear the streets before him.

It was remarked at this time that Paris had never before been so full of objects of elegance and luxury. Statues, pictures, and tapestries were imported in great quantities from foreign countries, and found a ready market. All those pretty trifles in the way of furniture and ornament which the French excel in manufacturing were no longer the exclusive playthings of the aristocracy, but were to be found in abundance in the houses of traders and the middle classes in general. Jewellery of the most costly description was brought to Paris as the most favourable mart; among the rest, the famous diamond bought by the regent, and called by his name, and which long adorned the crown of France. It was purchased for the sum of two millions of livres, under circumstances which shew that the regent was not so great a gainer as some of his subjects by the impetus which trade had received. When the diamond was first offered to him, he refused to buy it, although he desired above all things to possess it, alleging as his reason, that his duty to the country he governed would not allow him to spend so large a sum of the public money for a mere jewel. This valid and honourable excuse threw all the ladies of the court into alarm, and nothing was heard for some days but expressions of regret that so rare a gem should be allowed to go out of France, no private individual being rich enough to buy it. The regent was continually importuned about it, but all in

vain, until the Duke de St. Simon, who with all his ability was something of a twaddler, undertook the weighty business. His entreaties being seconded by Law, the good-natured regent gave his consent, leaving to Law's ingenuity to find the means to pay for it. The owner took security for the payment of the sum of two millions of livres within a stated period, receiving in the mean time the interest of five per cent upon that amount, and being allowed, besides, all the valuable clippings of the gem. St. Simon, in his *Memoirs*, relates with no little complacency his share in this transaction. After describing the diamond to be as large as a greengage, of a form nearly round, perfectly white, and without flaw, and weighing more than five hundred grains, he concludes with a chuckle, by telling the world "that he takes great credit to himself for having induced the regent to make so illustrious a purchase." In other words, he was proud that he had induced him to sacrifice his duty, and buy a bauble for himself at an extravagant price out of the public money.

Thus the system continued to flourish till the commencement of the year 1720. The warnings of the parliament, that too great a creation of paper money would, sooner or later, bring the country to bankruptcy, were disregarded. The regent, who knew nothing whatever of the philosophy of finance, thought that a system which had produced such good effects could never be carried to excess. If five hundred millions of paper had been of such advantage, five hundred millions additional would be of still greater advantage. This was the grand error of the regent, and which Law did not attempt to dispel. The extraordinary avidity of the people kept up the delusion; and the higher the price of Indian and Mississippi stock, the more

billets de banque were issued to keep pace with it. The edifice thus reared might not unaptly be compared to the gorgeous palace erected by Potemkin, that princely barbarian of Russia, to surprise and please his imperial mistress: huge blocks of ice were piled one upon another; ionic pillars, of chastest workmanship, in ice, formed a noble portico; and a dome, of the same material, shone in the sun, which had just strength enough to gild, but not to melt it. It glittered afar, like a palace of crystals and diamonds; but there came one warm breeze from the south, and the stately building dissolved away, till none were able even to gather up the fragments. So with Law and his paper system. No sooner did the breath of popular mistrust blow steadily upon it, than it fell to ruins, and none could raise it up again.

The first slight alarm that was occasioned was early in 1720. The Prince de Conti, offended that Law should have denied him fresh shares in India stock, at his own price, sent to his bank to demand payment in specie of so enormous a quantity of notes, that three wagons were required for its transport. Law complained to the regent, and urged on his attention the mischief that would be done, if such an example found many imitators. The regent was but too well aware of it, and, sending for the Prince de Conti, ordered him, under penalty of his high displeasure, to refund to the bank two-thirds of the specie which he had withdrawn from it. The prince was forced to obey the despotic mandate. Happily for Law's credit, De Conti was an unpopular man: every body condemned his meanness and cupidity, and agreed that Law had been hardly treated. It is strange, however, that so narrow an escape should not have made both Law and the regent more anxious to restrict their issues. Others were soon found who imitated, from motives of distrust, the example which had been

set by De Conti in revenge. The more acute stockjobbers imagined justly that prices could not continue to rise for ever. Bourdon and La Richardière, renowned for their extensive operations in the funds, quietly and in small quantities at a time, converted their notes into specie, and sent it away to foreign countries. They also bought as much as they could conveniently carry of plate and expensive jewellery, and sent it secretly away to England or to Holland. Vermalet, a jobber, who sniffed the coming storm, procured gold and silver coin to the amount of nearly a million of livres, which he packed in a farmer's cart, and covered over with hay and cow-dung. He then disguised himself in the dirty smock-frock, or *blouse*, of a peasant, and drove his precious load in safety into Belgium. From thence he soon found means to transport it to Amsterdam.

Hitherto no difficulty had been experienced by any class in procuring specie for their wants. But this system could not long be carried on without causing a scarcity. The voice of complaint was heard on every side, and inquiries being instituted, the cause was soon discovered. The council debated long on the remedies to be taken, and Law, being called on for his advice, was of opinion, that an edict should be published, depreciating the value of coin five per cent below that of paper. The edict was published accordingly; but failing of its intended effect, was followed by another, in which the depreciation was increased to ten per cent. The payments of the bank were at the same time restricted to one hundred livres in gold, and ten in silver. All these measures were nugatory to restore confidence in the paper, though the restriction of cash payments within limits so extremely narrow kept up the credit of the bank.

LUCIFER'S NEW ROW-BARGE.¹¹

Notwithstanding every effort to the contrary, the precious metals continued to be conveyed to England and Holland. The little coin that was left in the country was carefully treasured, or hidden until the scarcity became so great, that the operations of trade could no longer be carried on. In this emergency, Law hazarded the bold experiment of forbidding the use of specie altogether. In February 1720 an edict was published, which, instead of restoring the credit of the paper, as was intended, destroyed it irrecoverably, and drove the country to the very brink of revolution. By this famous edict it was forbidden to any person whatever to have more than five hundred livres (20*l.*) of coin in his possession, under pain of a heavy fine, and confiscation of the sums found. It was also forbidden to buy up jewellery, plate, and precious stones, and informers were encouraged

to make search for offenders, by the promise of one-half the amount they might discover. The whole country sent up a cry of distress at this unheard-of tyranny. The most odious persecution daily took place. The privacy of families was violated by the intrusion of informers and their agents. The most virtuous and honest were denounced for the crime of having been seen with a *louis d'or* in their possession. Servants betrayed their masters, one citizen became a spy upon his neighbour, and arrests and confiscations so multiplied, that the courts found a difficulty in getting through the immense increase of business thus occasioned. It was sufficient for an informer to say that he suspected any person of concealing money in his house, and immediately a search-warrant was granted. Lord Stair, the English ambassador, said, that it was now impossible to doubt of the sincerity of Law's conversion to the Catholic religion; he had established the *inquisition*, after having given abundant evidence of his faith in *transubstantiation*, by turning so much gold into paper.

Every epithet that popular hatred could suggest was showered upon the regent and the unhappy Law. Coin, to any amount above five hundred livres, was an illegal tender, and nobody would take paper if he could help it. No one knew to-day what his notes would be worth to-morrow. "Never," says Duclos, in his *Secret Memoirs of the Regency*, "was seen a more capricious government—never was a more frantic tyranny exercised by hands less firm. It is inconceivable to those who were witnesses of the horrors of those times, and who look back upon them now as on a dream, that a sudden revolution did not break out—that Law and the regent did not perish by a tragical death. They were both held in horror, but the people

confined themselves to complaints; a sombre and timid despair, a stupid consternation, had seized upon all, and men's minds were too vile even to be capable of a courageous crime." It would appear that, a one time, a movement of the people was organised. Seditious writings were posted up against the walls, and were sent, in hand-bills, to the houses of the most conspicuous people. One of them, given in the *Mémoires de la Régence*, was to the following effect:—"Sir and madam,—This is to give you notice that a St. Bartholomew's Day will be enacted again on Saturday and Sunday, if affairs do not alter. You are desired not to stir out, nor you, nor your servants. God preserve you from the flames! Give notice to your neighbours. Dated, Saturday, May 25th, 1720." The immense number of spies with which the city was infested rendered the people mistrustful of one another, and beyond some trifling disturbances made in the evening by an insignificant group, which was soon dispersed, the peace of the capital was not compromised.

The value of shares in the Louisiana, or Mississippi stock, had fallen very rapidly, and few indeed were found to believe the tales that had once been told of the immense wealth of that region. A last

effort was therefore tried to restore the public confidence in the Mississippi project. For this purpose, a general conscription of all the poor wretches in Paris was made by order of government. Upwards of six thousand of the very refuse of the population were impressed, as if in time of war, and were provided with clothes and tools to be embarked for New Orleans, to work in the gold mines alleged to abound there. They were paraded day after day through the streets with their pikes and shovels, and then sent off in small detachments to the out-ports to be shipped for America. Two-thirds of them never reached their destination, but dispersed themselves over the country, sold their tools for what they could get, and returned to their old course of life. In less than three weeks afterwards, one-half of them were to be found again in Paris. The manœuvre, however, caused a trifling advance in Mississippi stock. Many persons of superabundant gullibility believed that operations had begun in earnest in the new Golconda, and that gold and silver ingots would again be found in France.

In a constitutional monarchy some surer means would have been found for the restoration of public credit. In England, at a subsequent period, when a similar delusion had brought on similar distress, how different were the measures taken to repair the evil; but in France, unfortunately, the remedy was left to the authors of the mischief. The arbitrary will of the regent, which endeavoured to extricate the country, only plunged it deeper into the mire. All payments were ordered to be made in paper, and between the 1st of February and the end of May, notes were fabricated to the amount of upwards of 1500 millions of livres, or 60,000,000*l.* sterling. But the alarm once sounded, no art could make the people feel the slightest

confidence in paper which was not exchangeable into metal. M. Lambert, the president of the parliament of Paris, told the regent to his face that he would rather have a hundred thousand livres in gold or silver than five millions in the notes of his bank. When such was the general feeling, the superabundant issues of paper but increased the evil, by rendering still more enormous the disparity between the amount of specie and notes in circulation. Coin, which it was the object of the regent to depreciate, rose in value on every fresh attempt to diminish it. In February, it was judged advisable that the Royal Bank should be incorporated with the Company of the Indies. An edict to that effect was published and registered by the parliament. The state remained the guarantee for the notes of the bank, and no more were to be issued without an order in council. All the profits of the bank, since the time it had been taken out of Law's hands and made a national institution, were given over by the regent to the Company of the Indies. This measure had the effect of raising for a short time the value of the Louisiana and other shares of the company, but it failed in placing public credit on any permanent basis.

A council of state was held in the beginning of May, at which Law, D'Argenson (his colleague in the administration of the finances), and all the ministers were present. It was then computed that the total amount of notes in circulation was 2600 millions of livres, while the coin in the country was not quite equal to half that amount. It was evident to the majority of the council that some plan must be adopted to equalise the currency. Some proposed that the notes should be reduced to the value of the specie, while others proposed that the nominal value of the specie should be raised till it was on an

equality with the paper. Law is said to have opposed both these projects, but failing in suggesting any other, it was agreed that the notes should be depreciated one half. On the 21st of May, an edict was accordingly issued, by which it was decreed that the shares of the Company of the Indies, and the notes of the bank, should gradually diminish in value, till at the end of a year they should only pass current for one-half of their nominal worth. The parliament refused to register the edict—the greatest outcry was excited, and the state of the country became so alarming, that, as the only means of preserving tranquillity, the council of the regency was obliged to stultify its own proceedings, by publishing within seven days another edict, restoring the notes to their original value.

On the same day (the 27th of May) the bank stopped payment in specie. Law and D'Argenson were both dismissed from the ministry. The weak, vacillating, and cowardly regent threw the blame of all the mischief upon Law, who, upon presenting himself at the Palais Royal, was refused admittance. At nightfall, however, he was sent for, and admitted into the palace by a secret door,¹² when the regent endeavoured to console him, and made all manner of excuses for the severity with which in public he had been compelled to treat him. So capricious was his conduct, that, two days afterwards, he took him publicly to the opera, where he sat in the royal box alongside of the regent, who treated him with marked consideration in face of all the people. But such was the hatred against Law that the experiment had well nigh proved fatal to him. The mob assailed his carriage with stones just as he was entering his own door; and if the coachman had not made a sudden jerk into the court-yard, and the domestics closed the gate immediately, he would, in all probability, have been dragged

out and torn to pieces. On the following day, his wife and daughter were also assailed by the mob as they were returning in their carriage from the races. When the regent was informed of these occurrences he sent Law a strong detachment of Swiss guards, who were stationed night and day in the court of his residence. The public indignation at last increased so much, that Law, finding his own house, even with this guard, insecure, took refuge in the Palais Royal, in the apartments of the regent.

The Chancellor, D'Aguesseau, who had been dismissed in 1718 for his opposition to the projects of Law, was now recalled to aid in the restoration of credit. The regent acknowledged too late, that he had treated with unjustifiable harshness and mistrust one of the ablest, and perhaps the sole honest public man of that corrupt period. He had retired ever since his disgrace to his country house at Fresnes, where, in the midst of severe but delightful philosophic studies, he had forgotten the intrigues of an unworthy court. Law himself, and the Chevalier de Conflans, a gentleman of the regent's household, were despatched in a post-chaise with orders to bring the ex-chancellor to Paris along with them. D'Aguesseau consented to render what assistance he could, contrary to the advice of his friends, who did not approve that he should accept any recal to office of which Law was the bearer. On his arrival in Paris, five counsellors of the parliament were admitted to confer with the Commissary of Finance; and on the 1st of June an order was published abolishing the law which made it criminal to amass coin to the amount of more than five hundred livres. Every one was permitted to have as much specie as he pleased. In order that the bank-notes might be withdrawn, twenty-five millions of new notes were created, on the

security of the revenues of the city of Paris, at two-and-a-half per cent. The bank-notes withdrawn were publicly burned in front of the Hôtel de Ville. The new notes were principally of the value of ten livres each; and on the 10th of June the bank was re-opened, with a sufficiency of silver coin to give in change for them.

D'AGUESSEAU.

These measures were productive of considerable advantage. All the population of Paris hastened to the bank to get coin for their small notes; and silver becoming scarce, they were paid in copper. Very few complained that this was too heavy, although poor fellows might be continually seen toiling and sweating along the streets, laden with more than they could comfortably carry, in the shape of change for fifty livres. The crowds around the bank were so great, that hardly a day passed that some one was not pressed to death. On the 9th of July, the multitude was so dense and clamorous that the guards stationed at the entrance of the Mazarin Gardens closed the gate and refused to admit any more. The crowd became incensed, and flung stones through the railings upon the soldiers. The latter, incensed in their turn, threatened to fire upon the people. At that instant one of them was hit by a stone, and, taking up his piece, he fired into the crowd. One man fell dead immediately, and another was severely wounded. It was every instant expected that a general attack would

have been commenced upon the bank; but the gates of the Mazarin Gardens being opened to the crowd, who saw a whole troop of soldiers, with their bayonets fixed ready to receive them, they contented themselves by giving vent to their indignation in groans and hisses.

Eight days afterwards the concourse of people was so tremendous that fifteen persons were squeezed to death at the doors of the bank. The people were so indignant that they took three of the bodies on stretchers before them, and proceeded, to the number of seven or eight thousand, to the gardens of the Palais Royal, that they might shew the regent the misfortunes that he and Law had brought upon the country. Law's coachman, who was sitting at the box of his master's carriage, in the court-yard of the palace, happened to have more zeal than discretion, and, not liking that the mob should abuse his master, he said, loud enough to be overheard by several persons, that they were all blackguards, and deserved to be hanged. The mob immediately set upon him, and thinking that Law was in the carriage, broke it to pieces. The imprudent coachman narrowly escaped with his life. No further mischief was done; a body of troops making their appearance, the crowd quietly dispersed, after an assurance had been given by the regent that the three bodies they had brought to shew him should be decently buried at his own expense. The parliament was sitting at the time of this uproar, and the president took upon himself to go out and see what was the matter. On his return he informed the councillors that Law's carriage had been broken by the mob. All the members rose simultaneously, and expressed their joy by a loud shout, while one man, more zealous

in his hatred than the rest, exclaimed, “*And Law himself, is he torn to pieces?*”¹³

Much, undoubtedly, depended on the credit of the Company of the Indies, which was answerable for so great a sum to the nation. It was therefore suggested in the council of the ministry, that any privileges which could be granted to enable it to fulfil its engagements, would be productive of the best results. With this end in view, it was proposed that the exclusive privilege of all maritime commerce should be secured to it, and an edict to that effect was published. But it was unfortunately forgotten that by such a measure all the merchants of the country would be ruined. The idea of such an immense privilege was generally scouted by the nation, and petition on petition was presented to the parliament that they would refuse to register the decree. They refused accordingly, and the regent, remarking that they did nothing but fan the flame of sedition, exiled them to Blois. At the intercession of D’Aguesseau, the place of banishment was changed to Pontoise, and thither accordingly the councillors repaired, determined to set the regent at defiance. They made every arrangement for rendering their temporary exile as agreeable as possible. The president gave the most elegant suppers, to which he invited all the gayest and wittiest company of Paris. Every night there was a concert and ball for the ladies. The usually grave and solemn judges and councillors joined in cards and other diversions, leading for several weeks a life of the most extravagant pleasure, for no other purpose than to shew the regent of how little consequence they deemed their banishment, and that, when they willed it, they could make Pontoise a pleasanter residence than Paris.

Of all the nations in the world the French are the most renowned for singing over their grievances. Of that country it has been remarked with some truth, that its whole history may be traced in its songs. When Law, by the utter failure of his best-laid plans, rendered himself obnoxious, satire of course seized hold upon him; and while caricatures of his person appeared in all the shops, the streets resounded with songs, in which neither he nor the regent was spared. Many of these songs were far from decent; and one of them in particular counselled the application of all his notes to the most ignoble use to which paper can be applied. But the following, preserved in the letters of the Duchess of Orleans, was the best and the most popular, and was to be heard for months in all the *carrefours* in Paris. The application of the chorus is happy enough:

Aussitôt que Lass arriva
Dans notre bonne ville,
Monsieur le Régent publia
Que Lass serait utile
Pour rétablir la nation.

La faridondaine! la faridondon!

Mais il nous a tous enrichi,

Biribi!

A la façon de Barbari,

Mon ami!

Ce parpaillot, pour attirer
Tout l'argent de la France,
Songea d'abord à s'assurer

De notre confiance.
Il fit son abjuration,
La faridondaine! la faridondon!
Mais le fourbe s'est converti,
Biribi!
A la façon de Barbari,
Mon ami!

Lass, le fils aîné de Satan
Nous met tous à l'aumône,
Il nous a pris tout notre argent
Et n'en rend à personne.
Mais le Régent, humain et bon,
La faridondaine! la faridondon!
Nous rendra ce qu'on nous a pris,
Biribi!
A la façon de Barbari,
Mon ami!

The following epigram is of the same date:

Lundi, j'achetai des actions;
Mardi, je gagnai des millions;
Mercredi, j'arrangeai mon ménage,
Jeudi, je pris un équipage,
Vendredi, je m'en fus au bal,
Et Samedi, à l'hôpital.

Among the caricatures that were abundantly published, and that shewed as plainly as graver matters, that the nation had awakened to a sense of its folly, was one, a fac-simile of which is preserved in the *Mémoires de la Régence*. It was thus described by its author: “The ‘Goddess of Shares,’ in her triumphal car, driven by the Goddess of Folly. Those who are drawing the car are impersonations of the Mississippi, with his wooden leg, the South Sea, the Bank of England, the Company of the West of Senegal, and of various assurances. Lest the car should not roll fast enough, the agents of these companies, known by their long fox-tails and their cunning looks, turn round the spokes of the wheels, upon which are marked the names of the several stocks and their value, sometimes high and sometimes low, according to the turns of the wheel. Upon the ground are the merchandise, day-books and ledgers of legitimate commerce, crushed under the chariot of Folly. Behind is an immense crowd of persons, of all ages, sexes, and conditions, clamoring after Fortune, and fighting with each other to get a portion of the shares which she distributes so bountifully among them. In the clouds sits a demon, blowing bubbles of soap, which are also the objects of the admiration and cupidity of the crowd, who jump upon one another’s backs to reach them ere they burst. Right in the pathway of the car, and blocking up the passage, stands a large building, with three doors, through one of which it must pass, if it proceeds farther, and all the crowd along with it. Over the first door are the words, ‘*Hôpital des Foux*,’ over the second, ‘*Hôpital des Malades*,’ and over the third, ‘*Hôpital des Gueux*.’” Another caricature represented Law sitting in a large cauldron, boiling over the flames of popular madness, surrounded by an impetuous multitude, who were pouring all their

gold and silver into it, and receiving gladly in exchange the bits of paper which he distributed among them by handfuls.

While this excitement lasted, Law took good care not to expose himself unguarded in the streets. Shut up in the apartments of the regent, he was secure from all attack; and whenever he ventured abroad, it was either *incognito*, or in one of the royal carriages, with a powerful escort. An amusing anecdote is recorded of the detestation in which he was held by the people, and the ill-treatment he would have met had he fallen into their hands. A gentleman of the name of Boursel was passing in his carriage down the Rue St. Antoine, when his farther progress was stayed by a hackney-coach that had blocked up the road. M. Boursel's servant called impatiently to the hackney-coachman to get out of the way, and, on his refusal, struck him a blow on the face. A crowd was soon drawn together by the disturbance, and M. Boursel got out of the carriage to restore order. The hackney-coachman, imagining that he had now another assailant, bethought him of an expedient to rid himself of both, and called out as loudly as he was able, "Help! help! murder! murder! Here are Law and his servant going to kill me! Help! help!" At this cry the people came out of their shops, armed with sticks and other weapons, while the mob gathered stones to inflict summary vengeance upon the supposed financier. Happily for M. Boursel and his servant, the door of the church of the Jesuits stood wide open, and, seeing the fearful odds against them, they rushed towards it with all speed. They reached the altar, pursued by the people, and would have been ill-treated even there, if, finding the door open leading to the sacristy, they had not sprang through, and closed it after them. The mob were then persuaded to leave the church by the

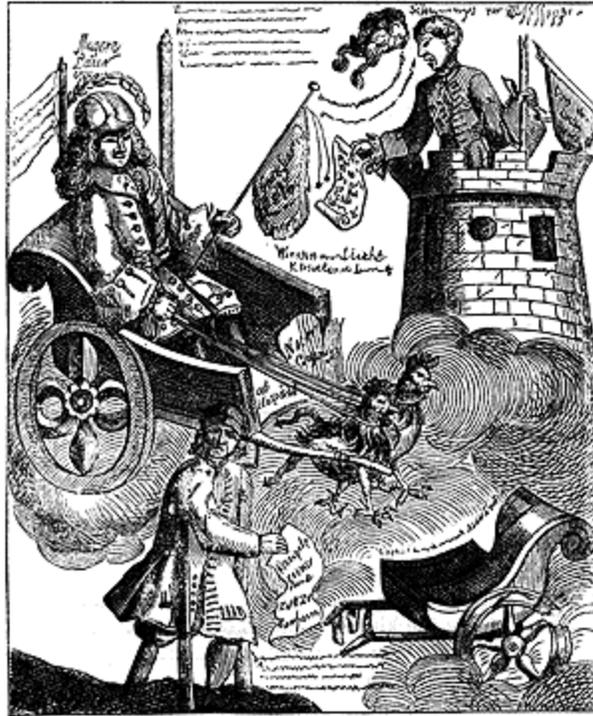

alarmed and indignant priests, and finding M. Boursel's carriage still in the streets, they vented their ill-will against it, and did it considerable damage.

The twenty-five millions secured on the municipal revenues of the city of Paris, bearing so low an interest as two and a half per cent, were not very popular among the large holders of Mississippi stock. The conversion of the securities was, therefore, a work of considerable difficulty; for many preferred to retain the falling paper of Law's Company, in the hope that a favourable turn might take place. On the 15th of August, with a view to hasten the conversion, an edict was passed, declaring that all notes for sums between one thousand and ten thousand livres, should not pass current, except for the purchase of annuities and bank accounts, or for the payment of instalments still due on the shares of the company.

In October following another edict was passed, depriving these notes of all value whatever after the month of November next ensuing. The management of the mint, the farming of the revenue, and all the other advantages and privileges of the India, or Mississippi Company, were taken from them, and they were reduced to a mere private company. This was the death-blow to the whole system, which had now got into the hands of its enemies. Law had lost all influence in the Council of Finance, and the company, being despoiled of its immunities, could no longer hold out the shadow of a prospect of being able to fulfil its engagements. All those suspected of illegal profits at the time the public delusion was at its height, were sought out and amerced in heavy fines. It was previously ordered that a list of the original proprietors should be made out, and that such persons as still retained their shares should place them in

deposit with the company, and that those who had neglected to complete the shares for which they had put down their names, should now purchase them of the company, at the rate of 13,500 livres for each share of 500 livres. Rather than submit to pay this enormous sum for stock which was actually at a discount, the shareholders packed up all their portable effects, and endeavoured to find a refuge in foreign countries. Orders were immediately issued to the authorities at the ports and frontiers, to apprehend all travellers who sought to leave the kingdom, and keep them in custody, until it was ascertained whether they had any plate or jewellery with them, or were concerned in the late stock-jobbing. Against such few as escaped, the punishment of death was recorded, while the most arbitrary proceedings were instituted against those who remained.

Law himself, in a moment of despair, determined to leave a country where his life was no longer secure. He at first only demanded permission to retire from Paris to one of his country-seats—a permission which the regent cheerfully granted. The latter was much affected at the unhappy turn affairs had taken, but his faith continued unmoved in the truth and efficacy of Law's financial system. His eyes were opened to his own errors; and during the few remaining years of his life he constantly longed for an opportunity of again establishing the system upon a securer basis. At Law's last interview with the prince, he is reported to have said,—“I confess that I have committed many faults. I committed them because I am a man, and all men are liable to error; but I declare to you most solemnly that none of them proceeded from wicked or dishonest motives, and that nothing of the kind will be found in the whole course of my conduct.”

LAW IN A CAR DRAWN BY COCKS. ¹⁴

Two or three days after his departure the regent sent him a very kind letter, permitting him to leave the kingdom whenever he pleased, and stating that he had ordered his passports to be made ready. He at the same time offered him any sum of money he might require. Law respectfully declined the money, and set out for Brussels in a post-chaise belonging to Madame de Prie, the mistress of the Duke of Bourbon, escorted by six horse-guards. From thence he proceeded to Venice, where he remained for some months, the object of the greatest curiosity to the people, who believed him to be the possessor of enormous wealth. No opinion, however, could be more erroneous. With more generosity than could have been

expected from a man who during the greatest part of his life had been a professed gambler, he had refused to enrich himself at the expense of a ruined nation. During the height of the popular frenzy for Mississippi stock, he had never doubted of the final success of his projects in making France the richest and most powerful nation of Europe. He invested all his gains in the purchase of landed property in France—a sure proof of his own belief in the stability of his schemes. He had hoarded no plate or jewellery, and sent no money, like the dishonest jobbers, to foreign countries. His all, with the exception of one diamond, worth about five or six thousand pounds sterling, was invested in the French soil; and when he left that country, he left it almost a beggar. This fact alone ought to rescue his memory from the charge of knavery, so often and so unjustly brought against him.

As soon as his departure was known, all his estates and his valuable library were confiscated. Among the rest, an annuity of 200,000 livres (8000*l.* sterling) on the lives of his wife and children, which had been purchased for five millions of livres, was forfeited, notwithstanding that a special edict, drawn up for the purpose in the days of his prosperity, had expressly declared that it should never be confiscated for any cause whatever. Great discontent existed among the people that Law had been suffered to escape. The mob and the parliament would have been pleased to have seen him hanged. The few who had not suffered by the commercial revolution rejoiced that the *quack* had left the country; but all those (and they were by far the most numerous class) whose fortunes were implicated regretted that his intimate knowledge of the distress of the country, and of the

causes that had led to it, had not been rendered more available in discovering a remedy.

At a meeting of the Council of Finance and the General Council of the Regency, documents were laid upon the table, from which it appeared that the amount of notes in circulation was 2700 millions. The regent was called upon to explain how it happened that there was a discrepancy between the dates at which these issues were made and those of the edicts by which they were authorised. He might have safely taken the whole blame upon himself, but he preferred that an absent man should bear a share of it; and he therefore stated that Law, upon his own authority, had issued 1200 millions of notes at different times, and that he (the regent), seeing that the thing had been irrevocably done, had screened Law by antedating the decrees of the council which authorised the augmentation. It would have been more to his credit if he had told the whole truth while he was about it, and acknowledged that it was mainly through his extravagance and impatience that Law had been induced to overstep the bounds of safe speculation. It was also ascertained that the national debt, on the 1st of January 1721, amounted to upwards of 3100 millions of livres, or more than 124,000,000*l.* sterling, the interest upon which was 3,196,000*l.* A commission, or *visa*, was forthwith appointed to examine into all the securities of the state creditors, who were to be divided into five classes; the first four comprising those who had purchased their securities with real effects, and, the latter comprising those who could give no proofs that the transactions they had entered into were real and *bonâ fide*. The securities of the latter were ordered to be destroyed, while those of the first four classes were subjected to a

most rigid and jealous scrutiny. The result of the labours of the *visa*, was a report, in which they counselled the reduction of the interest upon these securities to fifty-six millions of livres. They justified, this, advice by a statement of the various acts of speculation and extortion which they had discovered; and an edict to that effect was accordingly published and duly registered by the parliaments of the kingdom.

D'ARGENSON.

Another tribunal was afterwards established, under the title of the *Chambre de l'Arsenal*, which took cognisance of all the malversations committed in the financial departments of the government, during the late unhappy period. A Master of Requests, named Falhonet, together with the Abbé Clement, and two clerks in their employ, had been concerned in divers acts of speculation to the amount of upwards of a million of livres. The first two were sentenced to be beheaded, and the latter to be hanged; but their punishment was afterwards commuted into imprisonment for life in the Bastille. Numerous other acts of dishonesty were discovered, and punished, by fine and imprisonment.

D'Argenson shared with Law and the regent the unpopularity which had alighted upon all those concerned in the Mississippi

madness. He was dismissed from his post of Chancellor to make room for D'Aguesseau; but he retained the title of Keeper of the Seals, and was allowed to attend the councils whenever he pleased. He thought it better, however, to withdraw from Paris, and live for a time a life of seclusion at his country-seat. But he was not formed for retirement; and becoming moody and discontented, he aggravated a disease under which he had long laboured, and died in less than a twelve-month. The populace of Paris so detested him, that they carried their hatred even to his grave. As his funeral procession passed to the church of St. Nicholas du Chardonneret, the burying-place of his family, it was beset by a riotous mob, and his two sons, who were following as chief mourners, were obliged to drive as fast as they were able down a by-street to escape personal violence.

As regards Law, he for some time entertained a hope that he should be recalled to France, to aid in establishing its credit upon a firmer basis. The death of the regent in 1723, who expired suddenly as he was sitting by the fireside conversing with his mistress, the Duchess de Phalaris, deprived him of that hope, and he was reduced to lead his former life of gambling. He was more than once obliged to pawn his diamond, the sole remnant of his vast wealth, but successful play generally enabled him to redeem it. Being persecuted by his creditors at Rome, he proceeded to Copenhagen, where he received permission from the English ministry to reside in his native country, his pardon for the murder of Mr. Wilson having been sent over to him in 1719. He was brought over in the admiral's ship—a circumstance which gave occasion for a short debate in the House of Lords. Earl Coningsby complained that a man who had renounced both his country and his religion, should have been treated with such

honour, and expressed his belief that his presence in England, at a time when the people were so bewildered by the nefarious practices of the South-Sea directors, would be attended with no little danger. He gave notice of a motion on the subject; but it was allowed to drop, no other member of the House having the slightest participation in his lordship's fears. Law remained for about four years in England, and then proceeded to Venice, where he died in 1729, in very embarrassed circumstances. The following epitaph was written at the time:

“Ci gît cet Ecosais célèbre,
Ce calculateur sans égal,
Qui, par les règles de l'algèbre,
A mis la France à l'hôpital.”

His brother, William Law, who had been concerned with him in the administration both of the bank and the Louisiana Company, was imprisoned in the Bastille for alleged malversation, but no guilt was ever proved against him. He was liberated after fifteen months, and became the founder of a family, which is still known in France under the title of Marquises of Lauriston.

NECK OR NOTHING. ¹⁵

In the next chapter will be found an account of the madness which infected the people of England at the same time, and under very similar circumstances, but which, thanks to the energies and good sense of a constitutional government, was attended with results far less disastrous than those which were seen in France.

SOUTH-SEA HOUSE.

THE SOUTH-SEA BUBBLE.

At length corruption, like a general flood,
Did deluge all; and avarice creeping on,
Spread, like a low-born mist, and hid the sun.
Statesmen and patriots plied alike the stocks,
Peeress and butler shared alike the box;
And judges jobbed, and bishops bit the town,
And mighty dukes packed cards for half-a-crown:
Britain was sunk in lucre's sordid charms.—*Pope.*

THE South-Sea Company was originated by the celebrated Harley Earl of Oxford, in the year 1711, with the view of restoring public credit, which had suffered by the dismissal of the Whig ministry, and of providing for the discharge of the army and navy debentures, and other parts of the floating debt, amounting to nearly ten millions sterling. A company of merchants, at that time without a name, took this debt upon themselves, and the government agreed to secure them for a certain period the interest of six per cent. To provide for this interest, amounting to 600,000*l.* per annum, the duties upon wines, vinegar, India goods, wrought silks, tobacco, whale-fins, and some other articles, were rendered permanent. The monopoly of the trade to the South Seas was granted, and the company, being incorporated by act of parliament, assumed the title by which it has ever since been known. The minister took great credit to himself for his share in this transaction, and the scheme was always called by his flatterers “the Earl of Oxford’s masterpiece.”

HARLEY EARL OF OXFORD

Even at this early period of its history the most visionary ideas were formed by the company and the public of the immense riches of the eastern coast of South America. Every body had heard of the gold and silver mines of Peru and Mexico; every one believed them to be inexhaustible, and that it was only necessary to send the manufactures of England to the coast to be repaid a hundred fold in gold and silver ingots by the natives. A report, industriously spread, that Spain was willing to concede four ports on the coasts of Chili and Peru for the purposes of traffic, increased the general confidence, and for many years the South-Sea Company's stock was in high favour.

Philip V. of Spain, however, never had any intention of admitting the English to a free trade in the ports of Spanish America. Negotiations were set on foot, but their only result was the *assiento* contract, or the privilege of supplying the colonies with negroes for thirty years, and of sending once a year a vessel, limited both as to tonnage and value of cargo, to trade with Mexico, Peru, or Chili. The latter permission was only granted upon the hard condition, that the King of Spain should enjoy one-fourth of the profits, and a tax of five per cent on the remainder. This was a great disappointment to the Earl of Oxford and his party, who were reminded much oftener than they found agreeable of the

“Parturiunt montes, nascitur ridiculus mus.”

But the public confidence in the South-Sea Company was not shaken. The Earl of Oxford declared that Spain would permit two ships, in addition to the annual ship, to carry out merchandise during the first year; and a list was published, in which all the ports and harbours of these coasts were pompously set forth as open to the trade of Great Britain. The first voyage of the annual ship was not made till the year 1717, and in the following year the trade was suppressed by the rupture with Spain.

The king's speech, at the opening of the session of 1717, made pointed allusion to the state of public credit, and recommended that proper measures should be taken to reduce the national debt. The two great monetary corporations, the South-Sea Company and the Bank of England, made proposals to parliament on the 20th of May ensuing. The South-Sea Company prayed that their capital stock of ten millions might be increased to twelve, by subscription or otherwise, and offered to accept five per cent instead of six upon the whole amount. The bank made proposals equally advantageous. The house debated for some time, and finally three acts were passed, called the South-Sea Act, the Bank Act, and the General Fund Act. By the first, the proposals of the South-Sea Company were accepted, and that body held itself ready to advance the sum of two millions towards discharging the principal and interest of the debt due by the state for the four lottery funds, of the ninth and tenth years of Queen Anne. By the second act, the bank received a lower rate of interest for the sum of 1,775,027*l.* 15*s.* due to it by the state, and agreed to deliver up to be cancelled as many exchequer bills as amounted to two millions sterling, and to accept of an annuity of one hundred thousand pounds, being after the rate of five per cent, the whole redeemable at one year's notice. They were further required to be ready to advance, in case of need, a sum not exceeding 2,500,000*l.* upon the same terms of five per cent interest, redeemable by parliament. The General Fund Act recited the various deficiencies, which were to be made good by the aids derived from the foregoing sources.

The name of the South-Sea Company was thus continually before the public. Though their trade with the South American States produced little or no augmentation of their revenues, they continued to flourish as a monetary corporation. Their stock was in high request, and the directors, buoyed up with success, began to think of new means for extending their influence. The Mississippi scheme of John Law, which so dazzled and captivated the French people, inspired them with an idea that they could carry on the same game in England. The anticipated failure of his plans did not divert them from their intention. Wise in their own conceit, they imagined they could avoid his faults, carry on their schemes for ever, and stretch the cord of credit to its extremest tension, without causing it to snap asunder.

It was while Law's plan was at its greatest height of popularity, while people were crowding in thousands to the Rue Quincampoix, and ruining themselves with frantic eagerness, that the South-Sea directors laid before parliament their famous plan for paying off the national debt. Visions of boundless wealth floated before the fascinated eyes of the people in the two most celebrated countries of Europe. The English commenced their career of extravagance somewhat later than the French; but as soon as the delirium seized them, they were determined not to be outdone. Upon the 22d of January, 1720, the House of Commons resolved itself into a committee of the whole house, to take into consideration that part of the king's speech at the opening of the session which related to the public debts, and the proposal of the South-Sea Company towards the redemption and sinking of the same. The proposal set forth at great length, and under several heads, the debts of the state, amounting to 30,981,712*l.*, which the company were anxious to take upon themselves, upon consideration of five per cent per annum, secured to them until Midsummer 1727; after which time, the whole was to become redeemable at the pleasure of the legislature, and the interest to be reduced to four per cent. The proposal was received with great favour; but the Bank of England had many friends

in the House of Commons, who were desirous that that body should share in the advantages that were likely to accrue. On behalf of this corporation it was represented, that they had performed great and eminent services to the state in the most difficult times, and deserved, at least, that if any advantage was to be made by public bargains of this nature, they should be preferred before a company that had never done any thing for the nation. The further consideration of the matter was accordingly postponed for five days. In the mean time, a plan was drawn up by the governors of the bank. The South-Sea Company, afraid that the bank might offer still more advantageous terms to the government than themselves, reconsidered their former proposal, and made some alterations in it, which they hoped would render it more acceptable. The principal change was a stipulation that the government might redeem these debts at the expiration of four years, instead of seven, as at first suggested. The bank resolved not to be outbidden in this singular auction, and the governors also reconsidered their first proposal, and sent in a new one.

Thus, each corporation having made two proposals, the house began to deliberate. Mr. Robert Walpole was the chief speaker in favour of the bank, and Mr. Aislabie, the Chancellor of the Exchequer, the principal advocate on behalf of the South-Sea Company. It was resolved, on the 2d of February, that the proposals of the latter were most advantageous to the country. They were accordingly received, and leave was given to bring in a bill to that effect.

Exchange Alley was in a fever of excitement. The company's stock, which had been at a hundred and thirty the previous day, gradually rose to three hundred, and continued to rise with the most astonishing rapidity during the whole time that the bill in its several stages was under discussion. Mr. Walpole was almost the only statesman in the House who spoke out boldly against it. He warned them, in eloquent and solemn language, of the evils that would ensue. It countenanced, he said, "the dangerous practice of stock-jobbing, and would divert the genius of the nation from trade and

industry. It would hold out a dangerous lure to decoy the unwary to their ruin, by making them part with the earnings of their labour for a prospect of imaginary wealth. The great principle of the project was an evil of first-rate magnitude; it was to raise artificially the value of the stock, by exciting and keeping up a general infatuation, and by promising dividends out of funds which could never be adequate to the purpose.” In a prophetic spirit he added, that if the plan succeeded, the directors would become masters of the government, form a new and absolute aristocracy in the kingdom, and control the resolutions of the legislature. If it failed, which he was convinced it would, the result would bring general discontent and ruin upon the country. Such would be the delusion, that when the evil day came, as come it would, the people would start up, as from a dream, and ask themselves if these things could have been true. All his eloquence was in vain. He was looked upon as a false prophet, or compared to the hoarse raven, croaking omens of evil. His friends, however, compared him to Cassandra, predicting evils which would only be believed when they came home to men’s hearths, and stared them in the face at their own boards. Although, in former times, the house had listened with the utmost attention to every word that fell from his lips, the benches became deserted when it was known that he would speak on the South-Sea question.

SIR ROBERT WALPOLE

The bill was two months in its progress through the House of Commons. During this time every exertion was made by the directors and their friends, and more especially by the chairman, the noted Sir John Blunt, to

raise the price of the stock. The most extravagant rumours were in circulation. Treaties between England and Spain were spoken of, whereby the latter was to grant a free trade to all her colonies; and the rich produce of the mines of Potosi-la-Paz was to be brought to England until silver should become almost as plentiful as iron. For cotton and woollen goods, with which we could supply them in abundance, the dwellers in Mexico were to empty their golden mines. The company of merchants trading to the South Seas would be the richest the world ever saw, and every hundred pounds invested in it would produce hundreds per annum to the stockholder. At last the stock was raised by these means to near four hundred; but, after fluctuating a good deal, settled at three hundred and thirty, at which price it remained when the bill passed the Commons by a majority of 172 against 55.

In the House of Lords the bill was hurried through all its stages with unexampled rapidity. On the 4th of April it was read a first time; on the 5th, it was read a second time; on the 6th, it was committed; and on the 7th, was read a third time and passed.

Several peers spoke warmly against the scheme; but their warnings fell upon dull, cold ears. A speculating frenzy had seized them as well as the plebeians. Lord North and Grey said the bill was unjust in its nature, and might prove fatal in its consequences, being calculated to enrich the few and impoverish the many. The Duke of Wharton followed; but, as he only retailed at second-hand the arguments so eloquently stated by Walpole in the Lower House, he was not listened to with even the same attention that had been bestowed upon Lord North and Grey. Earl Cowper followed on the same side, and compared the bill to the famous horse of the siege of Troy. Like that, it was ushered in and received with great pomp and acclamations of joy, but bore within it treachery and destruction. The Earl of Sunderland endeavoured to answer all objections; and on the question being put, there appeared only seventeen peers against, and eighty-three in

favour of the project. The very same day on which it passed the Lords, it received the royal assent, and became the law of the land.

It seemed at that time as if the whole nation had turned stockjobbers. Exchange Alley was every day blocked up by crowds, and Cornhill was impassable for the number of carriages. Every body came to purchase stock. "Every fool aspired to be a knave." In the words of a ballad published at the time, and sung about the streets,¹⁶

"Then stars and garters did appear
Among the meaner rabble;
To buy and sell, to see and hear
The Jews and Gentiles squabble.

The greatest ladies thither came,
And plied in chariots daily,
Or pawned their jewels for a sum
To venture in the Alley."

The inordinate thirst of gain that had afflicted all ranks of society was not to be slaked even in the South Sea. Other schemes, of the most extravagant kind, were started. The share-lists were speedily filled up, and an enormous traffic carried on in shares, while, of course, every means were resorted to to raise them to an artificial value in the market.

CORNHILL, 1720.

Contrary to all expectation, South-Sea stock fell when the bill received the royal assent. On the 7th of April the shares were quoted at three hundred and ten, and on the following day at two hundred and ninety. Already the directors had tasted the profits of their scheme, and it was not likely that they should quietly allow the stock to find its natural level without an effort to raise it. Immediately their busy emissaries were set to work. Every person interested in the success of the project endeavoured to draw a knot of listeners around him, to whom he expatiated on the treasures of the South American seas. Exchange Alley was crowded with attentive groups. One rumour alone, asserted with the utmost confidence, had an immediate effect upon the stock. It was said that Earl Stanhope had received overtures in France from the Spanish government to exchange Gibraltar and Port Mahon for some places on the coast of Peru, for the security and enlargement of the trade in the South Seas. Instead of one annual ship trading to those ports, and allowing the king of Spain twenty-five per cent out of the profits, the company might build and charter as many ships as they pleased, and pay no per centage whatever to any foreign potentate.

“Visions of ingots danced before their eyes,”

and stock rose rapidly. On the 12th of April, five days after the bill had become law, the directors opened their books for a subscription of a million, at the rate of 300*l.* for every 100*l.* capital. Such was the concourse of persons of all ranks, that this first subscription was found to amount to above two millions of original stock. It was to be paid at five payments, of 60*l.* each for every 100*l.* In a few days the stock advanced to three hundred and forty, and the subscriptions were sold for double the price of the first payment. To raise the stock still higher, it was declared, in a general court of directors, on the 21st of April, that the midsummer dividend should be ten per cent, and that all subscriptions should be entitled to the same. These resolutions answering the end designed, the directors, to improve the infatuation of the monied men, opened their books for a second subscription of a million, at four hundred per cent. Such was the frantic eagerness of people of every class to speculate in these funds, that in the course of a few hours no less than a million and a half was subscribed at that rate.

In the mean time, innumerable joint-stock companies started up every where. They soon received the name of Bubbles, the most appropriate that imagination could devise. The populace are often most happy in the nicknames they employ. None could be more apt than that of Bubbles. Some of them lasted for a week or a fortnight, and were no more heard of, while others could not even live out that short span of existence. Every evening produced new schemes, and every morning new projects. The highest of the aristocracy were as eager in this hot pursuit of gain as the most plodding jobber in Cornhill. The Prince of Wales became governor of one company, and is said to have cleared 40,000*l.* by his speculations.¹⁷ The Duke of Bridgewater started a scheme for the improvement of London and Westminster, and the Duke of Chandos another. There were nearly a hundred different projects, each more extravagant and deceptive than the other, To use the words of the *Political State*, they were “set on foot and promoted by crafty knaves, then pursued by multitudes of covetous fools,

and at last appeared to be, in effect, what their vulgar appellation denoted them to be—bubbles and mere cheats.” It was computed that near one million and a half sterling was won and lost by these unwarrantable practices, to the impoverishment of many a fool, and the enriching of many a rogue.

Some of these schemes were plausible enough, and, had they been undertaken at a time when the public mind was unexcited, might have been pursued with advantage to all concerned. But they were established merely with the view of raising the shares in the market. The projectors took the first opportunity of a rise to sell out, and next morning the scheme was at an end. Maitland, in his *History of London*, gravely informs us, that one of the projects which received great encouragement, was for the establishment of a company “to make deal boards out of saw-dust.” This is no doubt intended as a joke; but there is abundance of evidence to shew that dozens of schemes, hardly a whit more reasonable, lived their little day, ruining hundreds ere they fell. One of them was for a wheel for perpetual motion—capital one million; another was “for encouraging the breed of horses in England, and improving of glebe and church lands, and repairing and rebuilding parsonage and vicarage houses.” Why the clergy, who were so mainly interested in the latter clause, should have taken so much interest in the first, is only to be explained on the supposition that the scheme was projected by a knot of the fox-hunting parsons, once so common in England. The shares of this company were rapidly subscribed for. But the most absurd and preposterous of all, and which shewed, more completely than any other, the utter madness of the people, was one started by an unknown adventurer, entitled “*A company for carrying on an undertaking of great advantage, but nobody to know what it is.*” Were not the fact stated by scores of credible witnesses, it would be impossible to believe that any person could have been duped by such a project. The man of genius who essayed this bold and successful inroad upon public credulity, merely stated in his prospectus that the required capital was half

a million, in five thousand shares of 100*l.* each, deposit 2*l.* per share. Each subscriber, paying his deposit, would be entitled to 100*l.* per annum per share. How this immense profit was to be obtained, he did not condescend to inform them at that time, but promised that in a month full particulars should be duly announced, and a call made for the remaining 98*l.* of the subscription. Next morning, at nine o'clock, this great man opened an office in Cornhill. Crowds of people beset his door, and when he shut up at three o'clock, he found that no less than one thousand shares had been subscribed for, and the deposits paid. He was thus, in five hours, the winner of 2000*l.* He was philosopher enough to be contented with his venture, and set off the same evening for the Continent. He was never heard of again.

Well might Swift exclaim, comparing Change Alley to a gulf in the South Sea:

“Subscribers here by thousands float,
And jostle one another down,
Each paddling in his leaky boat,
And here they fish for gold and drown.

Now buried in the depths below,
Now mounted up to heaven again,
They reel and stagger to and fro,
At their wit's end, like drunken men.

Meantime, secure on Garraway cliffs,
A savage race, by shipwrecks fed,
Lie waiting for the foundered skiffs,
And strip the bodies of the dead.”

Another fraud that was very successful was that of the “Globe *Permits*,” as they were called. They were nothing more than square pieces of playing-cards, on which was the impression of a seal, in wax, bearing the sign of the Globe Tavern, in the neighbourhood of Exchange Alley, with the inscription of “Sail-Cloth Permits.” The possessors enjoyed no other advantage from them than permission to subscribe at some future time to a new sail-cloth manufactory, projected by one who was then known to be a man of fortune, but who was afterwards involved in the speculation and punishment of the South-Sea directors. These permits sold for as much as sixty guineas in the Alley.

Persons of distinction, of both sexes, were deeply engaged in all these bubbles; those of the male sex going to taverns and coffee-houses to meet their brokers, and the ladies resorting for the same purpose to the shops of milliners and haberdashers. But it did not follow that all these people believed in the feasibility of the schemes to which they subscribed; it was enough for their purpose that their shares would, by stock-jobbing arts, be soon raised to a premium, when they got rid of them with all expedition to the really credulous. So great was the confusion of the crowd in the alley, that shares in the same bubble were known to have been sold at the same instant ten per cent higher at one end of the alley than at the other. Sensible men beheld the extraordinary infatuation of the people with sorrow and alarm. There were some both in and out of parliament who foresaw clearly the ruin that was impending. Mr. Walpole did not cease his gloomy forebodings. His fears were shared by all the thinking few, and impressed most forcibly upon the government. On the 11th of June, the day the parliament rose, the king published a proclamation, declaring that all these unlawful projects should be deemed public nuisances, and prosecuted accordingly, and forbidding any broker, under a penalty of five hundred pounds, from buying or selling any shares in them. Notwithstanding this proclamation, roguish speculators still carried them on, and the deluded people still encouraged them. On the 12th of July, an

order of the Lords Justices assembled in privy council was published, dismissing all the petitions that had been presented for patents and charters, and dissolving all the bubble companies. The following copy of their lordships' order, containing a list of all these nefarious projects, will not be deemed uninteresting at the present time, when, at periodic intervals, there is but too much tendency in the public mind to indulge in similar practices:

“At the Council Chamber, Whitehall, the 12th day of July,
1720. Present, their Excellencies the Lords Justices in
Council.

“Their Excellencies the Lords Justices, in council, taking into consideration the many inconveniences arising to the public from several projects set on foot for raising of joint-stock for various purposes, and that a great many of his majesty's subjects have been drawn in to part with their money on pretence of assurances that their petitions for patents and charters to enable them to carry on the same would be granted: to prevent such impositions, their excellencies this day ordered the said several petitions, together with such reports from the Board of Trade, and from his majesty's attorney and solicitor-general, as had been obtained thereon, to be laid before them; and after mature consideration thereof, were pleased, by advice of his majesty's privy council, to order that the said petitions be dismissed, which are as follow:

“1. Petition of several persons, praying letters patent for carrying on a fishing trade by the name of the Grand Fishery of Great Britain.

“2. Petition of the Company of the Royal Fishery of England, praying letters patent for such further powers as will effectually contribute to carry on the said fishery.

“3. Petition of George James, on behalf of himself and divers persons of distinction concerned in a national fishery, praying letters patent of incorporation, to enable them to carry on the same.

“4. Petition of several merchants, traders, and others, whose names are thereunto subscribed, praying to be incorporated for reviving and carrying on a whale fishery to Greenland and elsewhere.

“5. Petition of Sir John Lambert and others thereto subscribing, on behalf of themselves and a great number of merchants, praying to be incorporated for carrying on a Greenland trade, and particularly a whale fishery in Davis’s Straits.

“6. Another petition for a Greenland trade.

“7. Petition of several merchants, gentlemen, and citizens, praying to be incorporated for buying and building of ships to let or freight.

“8. Petition of Samuel Antrim and others, praying for letters patent for sowing hemp and flax.

“9. Petition of several merchants, masters of ships, sail-makers, and manufacturers of sail-cloth, praying a charter of incorporation, to enable them to carry on and promote the said manufactory by a joint-stock.

“10. Petition of Thomas Boyd and several hundred merchants, owners and masters of ships, sail-makers, weavers, and other traders, praying a charter of incorporation, empowering them to borrow money for purchasing lands, in order to the manufacturing sail-cloth and fine holland.

“11. Petition on behalf of several persons interested in a patent granted by the late King William and Queen Mary for the making of linen and sail-cloth, praying that no charter may be granted to any persons whatsoever for making sail-cloth, but that the privilege now enjoyed by them may be confirmed, and likewise an additional power to carry on the cotton and cotton-silk manufactures.

“12. Petition of several citizens, merchants, and traders in London, and others, subscribers to a British stock for a general insurance from fire in any part of England, praying to be incorporated for carrying on the said undertaking.

“13. Petition of several of his majesty’s loyal subjects of the city of London and other parts of Great Britain, praying to be incorporated for carrying on a general insurance from losses by fire within the kingdom of England.

“14. Petition of Thomas Surges and others his majesty’s subjects thereto subscribing, in behalf of themselves and others, subscribers to a fund of 1,200,000*l.* for carrying on a trade to his majesty’s German dominions, praying to be incorporated by the name of the Harburg Company.

“15. Petition of Edward Jones, a dealer in timber, on behalf of himself and others, praying to be incorporated for the importation of timber from Germany.

“16. Petition of several merchants of London, praying a charter of incorporation for carrying on a salt-work.

“17. Petition of Captain Macphedris of London, merchant, on behalf of himself and several merchants, clothiers, hatters, dyers, and other traders, praying a charter of incorporation empowering them to raise a sufficient sum of money to purchase lands for planting and rearing a wood called madder, for the use of dyers.

“18. Petition of Joseph Galendo of London, snuff-maker, praying a patent for his invention to prepare and cure Virginia tobacco for snuff in Virginia, and making it into the same in all his majesty’s dominions.”

List of Bubbles.

The following Bubble-Companies were by the same order declared to be illegal, and abolished accordingly:

1. For the importation of Swedish iron.
2. For supplying London with sea-coal. Capital, three millions.
3. For building and rebuilding houses throughout all England Capital, three millions.
4. For making of muslin.
5. For carrying on and improving the British alum-works.
6. For effectually settling the island of Blanco and Sal Tartagus.
7. For supplying the town of Deal with fresh water.
8. For the importation of Flanders lace.
9. For improvement of lands in Great Britain. Capital, four millions.
10. For encouraging the breed of horses in England, and improving of glebe and church lands, and for repairing and rebuilding parsonage and vicarage houses.
11. For making of iron and steel in Great Britain,
12. For improving the land in the county of Flint. Capital, one million.
13. For purchasing lands to build on. Capital, two millions.
14. For trading in hair.
15. For erecting salt-works in Holy Island. Capital, two millions.
16. For buying and selling estates, and lending money on mortgage.
17. For carrying on an undertaking of great advantage; but nobody to know what it is.
18. For paving the streets of London. Capital, two millions.
19. For furnishing funerals to any part of Great Britain.
20. For buying and selling lands and lending money at interest. Capital, five millions.
21. For carrying on the royal fishery of Great Britain. Capital, ten millions.
22. For assuring of seamen's wages.
23. For erecting loan-offices for the assistance and encouragement of the industrious. Capital, two millions.

24. For purchasing and improving leaseable lands. Capital, four millions.
25. For importing pitch and tar, and other naval stores, from North Britain and America.
26. For the clothing, felt, and pantile trade.
27. For purchasing and improving a manor and royalty in Essex.
28. For insuring of horses. Capital, two millions.
29. For exporting the woollen manufacture, and importing copper, brass, and iron. Capital, four millions.
30. For a grand dispensary. Capital, three millions.
31. For erecting mills and purchasing lead-mines. Capital, two millions.
32. For improving the art of making soap.
33. For a settlement on the island of Santa Cruz.
34. For sinking pits and smelting lead ore in Derbyshire.
35. For making glass bottles and other glass.
36. For a wheel for perpetual motion. Capital, one million.
37. For improving of gardens.
38. For insuring and increasing children's fortunes.
39. For entering and loading goods at the Custom-house, and for negotiating business for merchants.
40. For carrying on a woollen manufacture in the North of England.
41. For importing walnut-trees from Virginia, Capital, two millions.
42. For making Manchester stuffs of thread and cotton.
43. For making Joppa and Castile soap.
44. For improving the wrought-iron and steel manufactures of this kingdom. Capital four millions.
45. For dealing in lace, hollands, cambrics, lawns, &c. Capital, two millions.
46. For trading in and improving certain commodities of the produce of this kingdom, &c. Capital three millions.
47. For supplying the London markets with cattle.
48. For making looking-glasses, coach-glasses, &c. Capital, two millions.

49. For working the tin and lead mines in Cornwall and Derbyshire.
50. For making rape-oil.
51. For importing beaver fur. Capital, two millions.
52. For making pasteboard and packing-paper.
53. For importing of oils and other materials used in the woollen manufacture.
54. For improving and increasing the silk manufactures.
55. For lending money on stock, annuities, tallies, &c.
56. For paying pensions to widows and others, at a small discount. Capital, two millions.
57. For improving malt liquors. Capital, four millions.
58. For a grand American fishery.
59. For purchasing and improving the fenny lands in Lincolnshire. Capital, two millions.
60. For improving the paper manufacture of Great Britain.
61. The Bottomry Company.
62. For drying malt by hot air.
63. For carrying on a trade in the river Oronooko.
64. For the more effectual making of baize, in Colchester and other parts of Great Britain.
65. For buying of naval stores, supplying the victualling, and paying the wages of the workmen.
66. For employing poor artificers, and furnishing merchants and others with watches.
67. For improvement of tillage and the breed of cattle.
68. Another for the improvement of our breed in horses.
69. Another for a horse-insurance.
70. For carrying on the corn trade of Great Britain.
71. For insuring to all masters and mistresses the losses they may sustain by servants. Capital, three millions.
72. For erecting houses or hospitals for taking in and maintaining illegitimate children. Capital, two millions.

73. For bleaching coarse sugars, without the use of fire or loss of substance.
74. For building turnpikes and wharfs in Great Britain.
75. For insuring from thefts and robberies.
76. For extracting silver from lead.
77. For making china and delft ware. Capital, one million.
78. For importing tobacco, and exporting it again to Sweden and the north of Europe. Capital, four millions.
79. For making iron with pit coal.
80. For furnishing the cities of London and Westminster with hay and straw. Capital, three millions.
81. For a sail and packing-cloth manufactory in Ireland.
82. For taking up ballast.
83. For buying and fitting out ships to suppress pirates.
84. For the importation of timber from Wales. Capital, two millions.
85. For rock-salt.
86. For the transmutation of quicksilver into a malleable fine metal.

CHANGE-ALLEY.¹⁸

Besides these bubbles, many others sprang up daily, in spite of the condemnation of the government and the ridicule of the still sane portion of the public. The print-shops teemed with caricatures, and the newspapers with epigrams and satires, upon the prevalent folly. An ingenious cardmaker published a pack of South-Sea playing-cards, which are now extremely rare, each card containing, besides the usual figures, of a very small size, in one corner, a caricature of a bubble-company, with appropriate verses underneath. One of the most famous bubbles was "Puckle's Machine Company," for discharging round and square cannon-balls and bullets, and making a total revolution in the art of war. Its pretensions to public favour were thus summed up on the eight of spades:

"A rare invention to destroy the crowd
Of fools at home instead of fools abroad.
Fear not, my friends, this terrible machine,
They're only wounded who have shares therein."

TREE CARICATURE¹⁹

The nine of hearts was a caricature of the English Copper and Brass Company, with the following epigram:

“The headlong-fool that wants to be a swopper
 Of gold and silver coin for English copper,
 May, in Change Alley, prove himself an ass,
 And give rich metal for adultrate brass.”

The eight of diamonds celebrated the company for the colonisation of Acadia, with this doggrel:

“He that is rich and wants to fool away
 A good round sum in North America,
 Let him subscribe himself a headlong sharer,
 And asses’ ears shall honour him or bearer.”

And in a similar style every card of the pack exposed some knavish scheme, and ridiculed the persons who were its dupes. It was computed that the total amount of the sums proposed for carrying on these projects was upwards of three hundred millions sterling.

MERCHANT'S GATEWAY

It is time, however, to return to the great South-Sea gulf, that swallowed the fortunes of so many thousands of the avaricious and the credulous. On the 29th of May, the stock had risen as high as five hundred, and about two-thirds of the government annuitants had exchanged the securities of the state for those of the South-Sea company. During the whole of the month of May the stock continued to rise, and on the 28th it was quoted at five hundred and fifty. In four days after this it took a prodigious leap, rising suddenly from five hundred and fifty to eight hundred and ninety. It was now the general opinion that the stock could rise no higher, and many persons took that opportunity of selling out, with a view of realising their profits. Many noblemen and persons in the train of the king, and about to accompany him to Hanover, were also anxious to sell out. So many sellers, and so few buyers, appeared in the Alley on the 3d of June, that the stock fell at once from eight hundred and ninety to six hundred and forty. The directors were alarmed, and gave their agents orders to buy. Their efforts

succeeded. Towards evening, confidence was restored, and the stock advanced to seven hundred and fifty. It continued at this price, with some slight fluctuation, until the company closed their books on the 22d of June.

It would be needless and uninteresting to detail the various arts employed by the directors to keep up the price of stock. It will be sufficient to state that it finally rose to one thousand per cent. It was quoted at this price in, the commencement of August. The bubble was then full-blown, and began to quiver and shake preparatory to its bursting.

Many of the government annuitants expressed dissatisfaction against the directors. They accused them of partiality in making out the lists for shares in each subscription. Further uneasiness was occasioned by its being generally known that Sir John Blunt the chairman, and some others, had sold out. During the whole of the month of August the stock fell, and on the 2d of September it was quoted at seven hundred only.

The state of things now became alarming. To prevent, if possible, the utter extinction of public confidence in their proceedings, the directors summoned a general court of the whole corporation, to meet in Merchant Tailors' Hall on the 8th of September. By nine o'clock in the morning, the room was filled to suffocation; Cheapside was blocked up by a crowd unable to gain admittance, and the greatest excitement prevailed. The directors and their friends mustered in great numbers. Sir John Fellowes, the sub-governor, was called to the chair. He acquainted the assembly with the cause of their meeting; read to them the several resolutions of the court of directors, and gave them an account of their proceedings; of the taking in the redeemable and unredeemable funds, and of the subscriptions in money. Mr. Secretary Craggs then made a short speech, wherein he commended the conduct of the directors, and urged that nothing could more effectually contribute to the bringing this scheme to perfection than union among themselves. He concluded with a motion for thanking the court of directors for their prudent and skilful management, and for desiring them to proceed in such manner as they should think most proper

for the interest and advantage of the corporation. Mr. Hungerford, who had rendered himself very conspicuous in the House of Commons for his zeal in behalf of the South-Sea company, and who was shrewdly suspected to have been a considerable gainer by knowing the right time to sell out, was very magniloquent on this occasion. He said that he had seen the rise and fall, the decay and resurrection of many communities of this nature, but that, in his opinion, none had ever performed such wonderful things in so short a time as the South-Sea company. They had done more than the crown, the pulpit, or the bench could do. They had reconciled all parties in one common interest; they had laid asleep, if not wholly extinguished, all the domestic jars and animosities of the nation. By the rise of their stock, monied men had vastly increased their fortunes; country gentlemen had seen the value of their lands doubled and trebled in their hands. They had at the same time done good to the Church, not a few of the reverend clergy having got great sums by the project. In short, they had enriched the whole nation, and he hoped they had not forgotten themselves. There was some hissing at the latter part of this speech, which for the extravagance of its eulogy was not far removed from satire; but the directors and their friends, and all the winners in the room, applauded vehemently. The Duke of Portland spoke in a similar strain, and expressed his great wonder why any body should be dissatisfied; of course, he was a winner by his speculations, and in a condition similar to that of the fat alderman in *Joe Miller's Jests*, who, whenever he had eaten a good dinner, folded his hands upon his paunch, and expressed his doubts whether there could be a hungry man in the world.

MR. SECRETARY CRAGGS.

Several resolutions were passed at this meeting, but they had no effect upon the public. Upon the very same evening the stock fell to six hundred and forty, and on the morrow to five hundred and forty. Day after day it continued to fall, until it was as low as four hundred. In a letter dated September 13th, from Mr. Broderick, M.P., to Lord Chancellor Middleton, and published in Coxe's *Walpole*, the former says: "Various are the conjectures why the South-Sea directors have suffered the cloud to break so early. I made no doubt but they would do so when they found it to their advantage. They have stretched credit so far beyond what it would bear, that specie proves insufficient to support it. Their most considerable men have drawn out, securing themselves by the losses of the deluded, thoughtless numbers, whose understandings have been overruled by avarice and the hope of making mountains out of mole-hills. Thousands of families will be reduced to beggary. The consternation is inexpressible—the rage beyond description, and the case altogether so desperate, that I do not see any plan or scheme so much as thought of for averting the blow, so that I cannot pretend to guess what is next to be done." Ten days afterwards, the stock still falling, he writes: "The company have yet come to no determination, for they are in such a wood that they know not which way to turn. By several gentlemen lately come to town, I perceive the very name of a South-Sea-man grows abominable in every country. A great many goldsmiths are already run off, and more will daily. I question whether one-third, nay, one-fourth of them can stand it. From the very beginning, I

founded my judgment of the whole affair upon the unquestionable maxim, that ten millions (which is more than our running cash) could not circulate two hundred millions, beyond which our paper credit extended. That, therefore, whenever that should become doubtful, be the cause what it would, our noble state machine must inevitably fall to the ground.”

On the 12th of September, at the earnest solicitation of Mr. Secretary Craggs, several conferences were held between the directors of the South Sea and the directors of the Bank. A report which was circulated, that the latter had agreed to circulate six millions of the South-Sea company's bonds, caused the stock to rise to six hundred and seventy; but in the afternoon, as soon as the report was known to be groundless, the stock fell again to five hundred and eighty; the next day to five hundred and seventy, and so gradually to four hundred.²⁰

The ministry were seriously alarmed at the aspect of affairs. The directors could not appear in the streets without being insulted; dangerous riots were every moment apprehended. Despatches were sent off to the king at Hanover, praying his immediate return. Mr. Walpole, who was staying at his country seat, was sent for, that he might employ his known influence with the directors of the Bank of England to induce them to accept the proposal made by the South-Sea company for circulating a number of their bonds.

The Bank was very unwilling to mix itself up with the affairs of the company; it dreaded being involved in calamities which it could not relieve, and received all overtures with visible reluctance. But the universal voice of the nation called upon it to come to the rescue. Every person of note in commercial politics was called in to advise in the emergency. A rough draft of a contract drawn up by Mr. Walpole was ultimately adopted as the basis of further negotiations, and the public alarm abated a little.

On the following day, the 20th of September, a general court of the South-Sea company was held at Merchant Tailors' Hall, in which resolutions were carried, empowering the directors to agree with the Bank

of England, or any other persons, to circulate the company's bonds, or make any other agreement with the Bank which they should think proper. One of the speakers, a Mr. Pulteney, said it was most surprising to see the extraordinary panic which had seized upon the people. Men were running to and fro in alarm and terror, their imaginations filled with some great calamity, the form and dimensions of which nobody knew:

“Black it stood as night—
Fierce as ten furies—terrible as hell.”

At a general court of the Bank of England held two days afterwards, the governor informed them of the several meetings that had been held on the affairs of the South-Sea company, adding that the directors had not yet thought fit to come to any decision upon the matter. A resolution was then proposed, and carried without a dissentient voice, empowering the directors to agree with those of the South Sea to circulate their bonds, to what sum, and upon what terms, and for what time, they might think proper.

Thus both parties were at liberty to act as they might judge best for the public interest. Books were opened at the Bank for a subscription of three millions for the support of public credit, on the usual terms of 15*l.* per cent deposit, 3*l.* per cent premium, and 5*l.* per cent interest. So great was the concourse of people in the early part of the morning, all eagerly bringing their money, that it was thought the subscription would be filled that day; but before noon, the tide turned. In spite of all that could be done to prevent it, the South-Sea company's stock fell rapidly. Their bonds were in such discredit, that a run commenced upon the most eminent goldsmiths and bankers, some of whom, having lent out great sums upon South-Sea stock, were obliged to shut up their shops and abscond. The Sword-blade

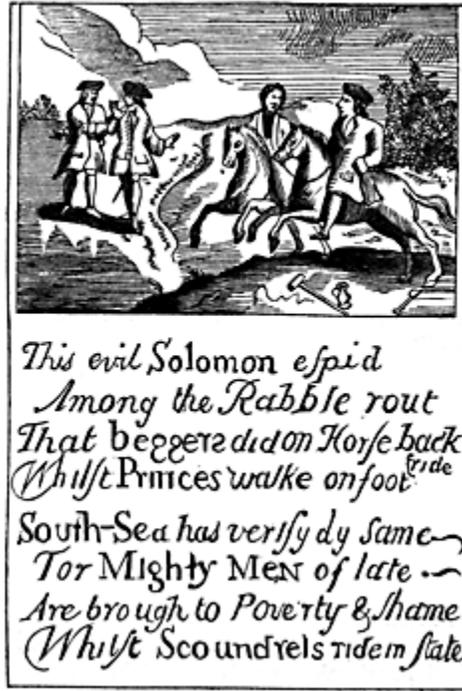

company, who had hitherto been the chief cashiers of the South-Sea company, stopped payment. This being looked upon as but the beginning of evil, occasioned a great run upon the Bank, who were now obliged to pay out money much faster than they had received it upon the subscription in the morning. The day succeeding was a holiday (the 29th of September), and the Bank had a little breathing time. They bore up against the storm; but their former rivals, the South-Sea company, were wrecked upon it. Their stock fell to one hundred and fifty, and gradually, after various fluctuations, to one hundred and thirty-five.

The Bank, finding they were not able to restore public confidence, and stem the tide of ruin, without running the risk of being swept away with those they intended to save, declined to carry out the agreement into which they had partially entered. They were under no obligation whatever to continue; for the so-called Bank contract was nothing more than the rough draught of an agreement, in which blanks had been left for several important particulars, and which contained no penalty for their secession. “And thus,” to use the words of the Parliamentary History, “were seen, in the space of eight months, the rise, progress, and fall of that mighty fabric, which, being wound up by mysterious springs to a wonderful height, had fixed the eyes and expectations of all Europe, but whose foundation, being fraud, illusion, credulity, and infatuation, fell to the ground as soon as the artful management of its directors was discovered.”

In the hey-day of its blood, during the progress of this dangerous delusion, the manners of the nation became sensibly corrupted. The parliamentary inquiry, set on foot to discover the delinquents, disclosed scenes of infamy, disgraceful alike to the morals of the

offenders and the intellects of the people among whom they had arisen. It is a deeply interesting study to investigate all the evils that were the result. Nations, like individuals, cannot become desperate gamblers with impunity. Punishment is sure to overtake them sooner or later. A celebrated writer²¹ is quite wrong when he says, “that such an era as this is the most unfavourable for a historian; that no reader of sentiment and imagination can be entertained or interested by a detail of transactions such as these, which admit of no warmth, no colouring, no embellishment; a detail of which only serves to exhibit an inanimate picture of tasteless vice and mean degeneracy.” On the contrary,—and Smollett might have discovered it, if he had been in the humour,—the subject is capable of inspiring as much interest as even a novelist can desire. Is there no warmth in the despair of a plundered people?—no life and animation in the picture which might be drawn of the woes of hundreds of impoverished and ruined families? of the wealthy of yesterday become the beggars of to-day? of the powerful and influential changed into exiles and outcasts, and the voice of self-reproach and imprecation resounding from every corner of the land? Is it a dull or uninteresting picture to see a whole people shaking suddenly off the trammels of reason, and running wild after a golden vision, refusing obstinately to believe that it is not real, till, like a deluded hind running after an *ignis fatuus*, they are plunged into a quagmire? But in this false spirit has history too often been written. The intrigues of unworthy courtiers to gain the favour of still more unworthy kings, or the records of murderous battles and sieges, have been dilated on, and told over and over again, with all the eloquence of style and all the charms of fancy; while the circumstances which have most deeply affected the morals and

welfare of the people have been passed over with but slight notice, as dry and dull, and capable of neither warmth nor colouring.

CARICATURE. ²²

During the progress of this famous bubble, England presented a singular spectacle. The public mind was in a state of unwholesome fermentation. Men were no longer satisfied with the slow but sure profits of cautious industry. The hope of boundless wealth for the morrow made them heedless and extravagant for to-day. A luxury, till then unheard-of, was introduced, bringing in its train a corresponding laxity of morals. The over-bearing insolence of ignorant men, who had arisen to sudden wealth by successful gambling, made men of true gentility of mind and manners blush that gold should have power to raise the unworthy in the scale of society. The haughtiness of some of these “cyphering cits,” as they were termed by Sir Richard Steele, was remembered against them in

the day of their adversity. In the parliamentary inquiry, many of the directors suffered more for their insolence than for their speculation. One of them, who, in the full-blown pride of an ignorant rich man, had said that he would feed his horse upon gold, was reduced almost to bread and water for himself; every haughty look, every overbearing speech, was set down, and repaid them a hundredfold in poverty and humiliation.

The state of matters all over the country was so alarming, that George I. shortened his intended stay in Hanover, and returned in all haste to England. He arrived on the 11th of November, and parliament was summoned to meet on the 8th of December. In the mean time, public meetings were held in every considerable town of the empire, at which petitions were adopted, praying the vengeance of the legislature upon the South-Sea directors, who, by their fraudulent practices, had brought the nation to the brink of ruin. Nobody seemed to imagine that the nation itself was as culpable as the South-Sea company. Nobody blamed the credulity and avarice of the people,—the degrading lust of gain, which had swallowed up every nobler quality in the national character, or the infatuation which had made the multitude run their heads with such frantic eagerness into the net held out for them by scheming projectors. These things were never mentioned. The people were a simple, honest, hard-working people, ruined by a gang of robbers, who were to be hanged, drawn, and quartered without mercy.

This was the almost unanimous feeling of the country. The two Houses of Parliament were not more reasonable. Before the guilt of the South-Sea directors was known, punishment was the only cry. The king, in his speech from the throne, expressed his hope that they

would remember that all their prudence, temper, and resolution were necessary to find out and apply the proper remedy for their misfortunes. In the debate on the answer to the address, several speakers indulged in the most violent invectives against the directors of the South-Sea project. The Lord Molesworth was particularly vehement. "It had been said by some, that there was no law to punish the directors of the South-Sea company, who were justly looked upon as the authors of the present misfortunes of the state. In his opinion, they ought upon this occasion to follow the example of the ancient Romans, who, having no law against parricide, because their legislators supposed no son could be so unnaturally wicked as to embrue his hands in his father's blood, made a law to punish this heinous crime as soon as it was committed. They adjudged the guilty wretch to be sown in a sack, and thrown alive into the Tiber. He looked upon the contrivers and executors of the villanous South-Sea scheme as the parricides of their country, and should be satisfied to see them tied in like manner in sacks, and thrown into the Thames." Other members spoke with as much want of temper and discretion. Mr. Walpole was more moderate. He recommended that their first care should be to restore public credit. "If the city of London were on fire, all wise men would aid in extinguishing the flames, and preventing the spread of the conflagration, before they inquired after the incendiaries. Public credit had received a dangerous wound, and lay bleeding, and they ought to apply a speedy remedy to it. It was time enough to punish the assassin afterwards." On the 9th of December an address, in answer to his majesty's speech, was agreed upon, after an amendment, which was carried without a division, that words should be added expressive of the determination of the

house not only to seek a remedy for the national distresses, but to punish the authors of them.

BRITANNIA STRIPT BY A SOUTH-SEA DIRECTOR.²³

The inquiry proceeded rapidly. The directors were ordered to lay before the house a full account of all their proceedings. Resolutions were passed to the effect that the calamity was mainly owing to the vile arts of stock-jobbers, and that nothing could tend more to the reestablishment of public credit than a law to prevent this infamous practice. Mr. Walpole then rose, and said, that “as he had previously hinted, he had spent some time upon a scheme for restoring public credit, but that the execution of it depending upon a position which had been laid down as fundamental, he thought it proper, before he opened out his scheme, to be informed whether he might rely upon that foundation. It was, whether the subscription of public debts and encumbrances, money subscriptions, and other contracts, made with the South-Sea company, should remain in the present state?” This question occasioned an animated debate. It was finally agreed, by a

majority of 259 against 117, that all these contracts should remain in their present state, unless altered for the relief of the proprietors by a general court of the South-Sea company, or set aside by due course of law. On the following day, Mr. Walpole laid before a committee of the whole house his scheme for the restoration of public credit, which was, in substance, to engraft nine millions of South-Sea stock into the Bank of England, and the same sum into the East India company, upon certain conditions. The plan was favourably received by the house. After some few objections, it was ordered that proposals should be received from the two great corporations. They were both unwilling to lend their aid, and the plan met with a warm but fruitless opposition at the general courts summoned for the purpose of deliberating upon it. They, however, ultimately agreed upon the terms on which they would consent to circulate the South-Sea bonds, and their report being presented to the committee, a bill was brought in under the superintendence of Mr. Walpole, and safely carried through both Houses of Parliament.

A bill was at the same time brought in for restraining the South-Sea directors, governor, sub-governor, treasurer, cashier, and clerks from leaving the kingdom for a twelvemonth, and for discovering their estates and effects, and preventing them from transporting or alienating the same. All the most influential members of the House supported the bill. Mr. Shippen, seeing Mr. Secretary Craggs in his place, and believing the injurious rumours that were afloat of that minister's conduct in the South-Sea business, determined to touch him to the quick. He said, he was glad to see a British House of Commons resuming its pristine vigour and spirit, and acting with so much unanimity for the public good. It was necessary to secure the

persons and estates of the South-Sea directors and their officers; “but,” he added, looking fixedly at Mr. Craggs as he spoke, “there were other men in high station, whom, in time, he would not be afraid to name, who were no less guilty than the directors.” Mr. Craggs arose in great wrath, and said, that if the innuendo were directed against him, he was ready to give satisfaction to any man who questioned him, either in the House or out of it. Loud cries of order immediately arose on every side. In the midst of the uproar, Lord Molesworth got up, and expressed his wonder at the boldness of Mr. Craggs in challenging the whole House of Commons. He, Lord Molesworth, though somewhat old, past sixty, would answer Mr. Craggs whatever he had to say in the House, and he trusted there were plenty of young men beside him, who would not be afraid to look Mr. Craggs in the face out of the House. The cries of order again resounded from every side; the members arose simultaneously; every body seemed to be vociferating at once. The speaker in vain called order. The confusion lasted several minutes, during which Lord Molesworth and Mr. Craggs were almost the only members who kept their seats. At last, the call for Mr. Craggs became so violent, that he thought proper to submit to the universal feeling of the House, and explain his unparliamentary expression. He said, that by giving satisfaction to the impugnors of his conduct in that House, he did not mean that he would fight, but that he would explain his conduct. Here the matter ended, and the House proceeded to debate in what manner they should conduct their inquiry into the affairs of the South-Sea company, whether in a grand or a select committee. Ultimately, a secret committee of thirteen was appointed, with power to send for persons, papers, and records.

The Lords were as zealous and as hasty as the Commons. The Bishop of Rochester said the scheme had been like a pestilence. The Duke of Wharton said the House ought to shew no respect of persons; that, for his part, he would give up the dearest friend he had, if he had been engaged in the project. The nation had been plundered in a most shameful and flagrant manner, and he would go as far as any body in the punishment of the offenders. Lord Stanhope said, that every farthing possessed by the criminals, whether directors or not directors, ought to be confiscated, to make good the public losses.

During all this time the public excitement was extreme. We learn from Coxe's *Walpole*, that the very name of a South-Sea director was thought to be synonymous with every species of fraud and villany. Petitions from counties, cities, and boroughs, in all parts of the kingdom, were presented, crying for the justice due to an injured nation and the punishment of the villanous peculators. Those moderate men, who would not go to extreme lengths, even in the punishment of the guilty, were accused of being accomplices, were exposed to repeated insults and virulent invectives, and devoted, both in anonymous letters and public writings, to the speedy vengeance of an injured people. The accusations against Mr. Aislabie, Chancellor of the Exchequer, and Mr. Craggs, another member of the ministry, were so loud, that the House of Lords resolved to proceed at once into the investigation concerning them. It was ordered, on the 21st of January, that all brokers concerned in the South-Sea scheme should lay before the House an account of the stock or subscriptions bought or sold by them for any of the officers of the Treasury or Exchequer, or in trust for any of them, since Michaelmas

1719. When this account was delivered, it appeared that large quantities of stock had been transferred to the use of Mr. Aislabie. Five of the South-Sea directors, including Mr. Edward Gibbon, the grandfather of the celebrated historian, were ordered into the custody of the black rod. Upon a motion made by Earl Stanhope, it was unanimously resolved, that the taking in or giving credit for stock without a valuable consideration actually paid or sufficiently secured; or the purchasing stock by any director or agent of the South-Sea company, for the use or benefit of any member of the administration, or any member of either House of Parliament, during such time as the South-Sea bill was yet pending in parliament, was a notorious and dangerous corruption. Another resolution was passed a few days afterwards, to the effect that several of the directors and officers of the company having, in a clandestine manner, sold their own stock to the company, had been guilty of a notorious fraud and breach of trust, and had thereby mainly caused the unhappy turn of affairs that had so much affected public credit. Mr. Aislabie resigned his office as Chancellor of the Exchequer, and absented himself from parliament, until the formal inquiry into his individual guilt was brought under the consideration of the legislature.

In the mean time, Knight, the treasurer of the company, and who was entrusted with all the dangerous secrets of the dishonest directors, packed up his books and documents, and made his escape from the country. He embarked in disguise, in a small boat on the river, and proceeding to a vessel hired for the purpose, was safely conveyed to Calais. The Committee of Secrecy informed the House of the circumstance, when it was resolved unanimously that two

addresses should be presented to the king; the first praying that he would issue a proclamation offering a reward for the apprehension of Knight; and the second, that he would give immediate orders to stop the ports, and to take effectual care of the coasts, to prevent the said Knight, or any other officers of the South-Sea company, from escaping out of the kingdom. The ink was hardly dry upon these addresses before they were carried to the king by Mr. Methuen, deputed by the House for that purpose. The same evening a royal proclamation was issued, offering a reward of two thousand pounds for the apprehension of Knight. The Commons ordered the doors of the House to be locked, and the keys to be placed on the table. General Ross, one of the members of the Committee of Secrecy, acquainted them that they had already discovered a train of the deepest villany and fraud that hell had ever contrived to ruin a nation, which in due time they would lay before the House. In the mean time, in order to a further discovery, the Committee thought it highly necessary to secure the persons of some of the directors and principal South-Sea officers, and to seize their papers. A motion to this effect having been made, was carried unanimously. Sir Robert Chaplin, Sir Theodore Janssen, Mr. Sawbridge, and Mr. F. Eyles, members of the House, and directors of the South-Sea company, were summoned to appear in their places, and answer for their corrupt practices. Sir Theodore Janssen and Mr. Sawbridge answered to their names, and endeavoured to exculpate themselves. The House heard them patiently, and then ordered them to withdraw. A motion was then made, and carried *nemine contradicente*, that they had been guilty of a notorious breach of trust—had occasioned much loss to great numbers of his majesty's

subjects, and had highly prejudiced the public credit. It was then ordered that, for their offence, they should be expelled the House, and taken into the custody of the serjeant-at-arms. Sir Robert Chaplin and Mr. Eyles, attending in their places four days afterwards, were also expelled the House. It was resolved at the same time to address the king to give directions to his ministers at foreign courts to make application for Knight, that he might be delivered up to the English authorities, in case he took refuge in any of their dominions. The king at once agreed, and messengers were despatched to all parts of the continent the same night.

Among the directors taken into custody was Sir John Blunt, the man whom popular opinion has generally accused of having been the original author and father of the scheme. This man, we are informed by Pope, in his epistle to Allen Lord Bathurst, was a dissenter, of a most religious deportment, and professed to be a great believer.²⁴ He constantly declaimed against the luxury and corruption of the age, the partiality of parliaments, and the misery of party spirit. He was particularly eloquent against avarice in great and noble persons. He was originally a scrivener, and afterwards became, not only a director, but the most active manager of the South-Sea company. Whether it was during his career in this capacity that he first began to declaim against the avarice of the great, we are not informed. He certainly must have seen enough of it to justify his severest anathema; but if the preacher had himself been free from the vice he condemned, his declamations would have had a better effect. He was brought up in custody to the bar of the House of Lords, and underwent a long examination. He refused to answer several important questions. He said he had been examined already by a

committee of the House of Commons, and as he did not remember his answers, and might contradict himself, he refused to answer before another tribunal. This declaration, in itself an indirect proof of guilt, occasioned some commotion in the House. He was again asked peremptorily whether he had ever sold any portion of the stock to any member of the administration, or any member of either House of Parliament, to facilitate the passing of the bill. He again declined to answer. He was anxious, he said, to treat the House with all possible respect, but he thought it hard to be compelled to accuse himself. After several ineffectual attempts to refresh his memory, he was directed to withdraw. A violent discussion ensued between the friends and opponents of the ministry. It was asserted that the administration were no strangers to the convenient taciturnity of Sir John Blunt. The Duke of Wharton made a reflection upon the Earl Stanhope, which the latter warmly resented. He spoke under great excitement, and with such vehemence as to cause a sudden determination of blood to the head. He felt himself so ill that he was obliged to leave the House and retire to his chamber. He was cupped immediately, and also let blood on the following morning, but with slight relief. The fatal result was not anticipated. Towards evening he became drowsy, and turning himself on his face, expired. The sudden death of this statesman caused great grief to the nation. George I. was exceedingly affected, and shut himself up for some hours in his closet, inconsolable for his loss.

Knight, the treasurer of the company, was apprehended at Tirlemont, near Liege, by one of the secretaries of Mr. Leathes, the British resident at Brussels, and lodged in the citadel of Antwerp. Repeated applications were made to the court of Austria to deliver

him up, but in vain. Knight threw himself upon the protection of the states of Brabant, and demanded to be tried in that country. It was a privilege granted to the states of Brabant by one of the articles of the *Joyeuse Entrée*, that every criminal apprehended in that country should be tried in that country. The states insisted on their privilege, and refused to deliver Knight to the British authorities. The latter did not cease their solicitations; but in the mean time, Knight escaped from the citadel.

BRABANT SCREEN. ²⁵

On the 16th of February the Committee of Secrecy made their first report to the House. They stated that their inquiry had been attended with numerous difficulties and embarrassments; every one they had examined had endeavoured, as far as in him lay, to defeat the ends of justice. In some of the books produced before them, false and fictitious entries had been made; in others, there were entries of money with blanks for the name of the stockholders. There were frequent erasures and alterations, and in some of the books leaves were torn out. They also found that some books of great importance had been destroyed altogether, and that some had been taken away or secreted. At the very entrance into their inquiry, they had

observed that the matters referred to them were of great variety and extent. Many persons had been entrusted with various parts in the execution of the law, and under colour thereof had acted in an unwarrantable manner, in disposing of the properties of many thousands of persons amounting to many millions of money. They discovered that, before the South-Sea Act was passed, there was an entry in the company's books of the sum of 1,259,325*l.*, upon account of stock stated to have been sold to the amount of 574,500*l.* This stock was all fictitious, and had been disposed of with a view to promote the passing of the bill. It was noted as sold on various days, and at various prices, from 150 to 325 per cent. Being surprised to see so large an account disposed of at a time when the company were not empowered to increase their capital, the Committee determined to investigate most carefully the whole transaction. The governor, sub-governor, and several directors were brought before them, and examined rigidly. They found that, at the time these entries were made, the company was not in possession of such a quantity of stock, having in their own right only a small quantity, not exceeding thirty thousand pounds at the utmost. Pursuing the inquiry, they found that this amount of stock was to be esteemed as taken in or holden by the company for the benefit of the pretended purchasers, although no mutual agreement was made for its delivery or acceptance at any certain time. No money was paid down, nor any deposit or security whatever given to the company by the supposed purchasers; so that if the stock had fallen, as might have been expected had the act not passed, they would have sustained no loss. If, on the contrary, the price of stock advanced (as it actually did by the success of the scheme), the difference by the advanced price was to be made good

to them. Accordingly, after the passing of the act, the account of stock was made up and adjusted with Mr. Knight, and the pretended purchasers were paid the difference out of the company's cash. This fictitious stock, which had been chiefly at the disposal of Sir John Blunt, Mr. Gibbon, and Mr. Knight, was distributed among several members of the government and their connexions, by way of bribe, to facilitate the passing of the bill. To the Earl of Sunderland was assigned 50,000*l.*; to the Duchess of Kendal, 10,000*l.*; to the Countess of Platen, 10,000*l.*; to her two nieces, 10,000*l.*; to Mr. Secretary Craggs, 30,000*l.*; to Mr. Charles Stanhope (one of the secretaries of the Treasury), 10,000*l.*; to the Sword-blade company, 50,000*l.* It also appeared that Mr. Stanhope had received the enormous sum of 250,000*l.* as the difference in the price of some stock, through the hands of Turner, Caswall, and Co., but that his name had been partly erased from their books, and altered to Stangape. Aislabie, the Chancellor of the Exchequer, had made profits still more abominable. He had an account with the same firm, who were also South-Sea directors, to the amount of 794,451*l.* He had, besides, advised the company to make their second subscription one million and a half, instead of a million, by their own authority, and without any warrant. The third subscription had been conducted in a manner as disgraceful. Mr. Aislabie's name was down for 70,000*l.*; Mr. Craggs, senior, for 659,000*l.*; the Earl of Sunderland's for 160,000*l.*; and Mr. Stanhope for 47,000*l.* This report was succeeded by six others, less important. At the end of the last, the committee declared, that the absence of Knight, who had been principally entrusted, prevented them from carrying on their inquiries.

The first report was ordered to be printed, and taken into consideration on the next day but one succeeding. After a very angry and animated debate, a series of resolutions were agreed to, condemnatory of the conduct of the directors, of the members of the parliament and of the administration concerned with them; and declaring that they ought, each and all, to make satisfaction out of their own estates for the injury they had done the public. Their practices were declared to be corrupt, infamous, and dangerous; and a bill was ordered to be brought in for the relief of the unhappy sufferers.

BONFIRES ON TOWER HILL

Mr. Charles Stanhope was the first person brought to account for his share in these transactions. He urged in his defence that, for some years past, he had lodged all the money he was possessed of in Mr. Knight's hands, and whatever stock Mr. Knight had taken in for him, he had paid a valuable consideration for it. As for the stock that had been bought for him by Turner, Caswall, and Co., he knew nothing about it. Whatever had been done in that matter was done

without his authority, and he could not be responsible for it. Turner and Co. took the latter charge upon themselves; but it was notorious to every unbiassed and unprejudiced person that Mr. Stanhope was a gainer of the 250,000*l.*, which lay in the hands of that firm to his credit. He was, however, acquitted by a majority of three only. The greatest exertions were made to screen him. Lord Stanhope, the son of the Earl of Chesterfield, went round to the wavering members, using all the eloquence he was possessed of to induce them either to vote for the acquittal, or to absent themselves from the House. Many weak-headed country gentlemen were led astray by his persuasions, and the result was as already stated. The acquittal caused the greatest discontent throughout the country. Mobs of a menacing character assembled in different parts of London; fears of riots were generally entertained, especially as the examination of a still greater delinquent was expected by many to have a similar termination. Mr. Aislabie, whose high office and deep responsibilities should have kept him honest, even had native principle been insufficient, was very justly regarded as perhaps the greatest criminal of all. His case was entered into on the day succeeding the acquittal of Mr. Stanhope. Great excitement prevailed, and the lobbies and avenues of the House were beset by crowds, impatient to know the result. The debate lasted the whole day. Mr. Aislabie found few friends: his guilt was so apparent and so heinous that nobody had courage to stand up in his favour. It was finally resolved, without a dissentient voice, that Mr. Aislabie had encouraged and promoted the destructive execution of the South-Sea scheme with a view to his own exorbitant profit, and had combined with the directors in their pernicious practices, to the ruin of the public trade and credit of the kingdom: that he should

for his offences be ignominiously expelled from the House of Commons, and committed a close prisoner to the Tower of London; that he should be restrained from going out of the kingdom for a whole year, or till the end of the next session of Parliament; and that he should make out a correct account of all his estate, in order that it might be applied to the relief of those who had suffered by his malpractices.

This verdict caused the greatest joy. Though it was delivered at half-past twelve at night, it soon spread over the city. Several persons illuminated their houses in token of their joy. On the following day, when Mr. Aislable was conveyed to the Tower, the mob assembled on Tower-hill with the intention of hooting and pelting him. Not succeeding in this, they kindled a large bonfire, and danced around it in the exuberance of their delight. Several bonfires were made in other places; London presented the appearance of a holiday, and people congratulated one another as if they had just escaped from some great calamity. The rage upon the acquittal of Mr. Stanhope had grown to such a height that none could tell where it would have ended, had Mr. Aislable met with the like indulgence.

To increase the public satisfaction, Sir George Caswall, of the firm of Turner, Caswall, and Co., was expelled from the House on the following day, committed to the Tower, and ordered to refund the sum of 250,000*l.*

EARL OF SUNDERLAND.

That part of the report of the Committee of Secrecy which related to the Earl of Sunderland was next taken into consideration. Every effort was made to clear his lordship from the imputation. As the case against him rested chiefly on the evidence extorted from Sir John Blunt, great pains were taken to make it appear that Sir John's word was not to be believed, especially in a matter affecting the honour of a peer and privy councillor. All the friends of the ministry rallied around the earl, it being generally reported that a verdict of guilty against him would bring a Tory ministry into power. He was eventually acquitted by a majority of 233 against 172; but the country was convinced of his guilt. The greatest indignation was every where expressed, and menacing mobs again assembled in London. Happily no disturbance took place.

This was the day on which Mr. Craggs the elder expired. The morrow had been appointed for the consideration of his case. It was very generally believed that he had poisoned himself. It appeared, however, that grief for the loss of his son, one of the secretaries of the Treasury, who had died five weeks previously of the small-pox, preyed much on his mind. For this son, dearly beloved, he had been amassing vast heaps of riches: he had been getting money, but not

honestly; and he for whose sake he had bartered his honour and sullied his fame was now no more. The dread of further exposure increased his trouble of mind, and ultimately brought on an apoplectic fit, in which he expired. He left a fortune of a million and a half, which was afterwards confiscated for the benefit of the sufferers by the unhappy delusion he had been so mainly instrumental in raising.

One by one the case of every director of the company was taken into consideration. A sum amounting to two millions and fourteen thousand pounds was confiscated from their estates towards repairing the mischief they had done, each man being allowed a certain residue in proportion to his conduct and circumstances, with which he might begin the world anew. Sir John Blunt was only allowed 5,000*l.* out of his fortune of upwards of 183,000*l.*; Sir John Fellows was allowed 10,000*l.* out of 243,000*l.*; Sir Theodore Janssen, 50,000*l.* out of 243,000*l.*; Mr. Edward Gibbon, 10,000*l.* out of 106,000*l.*; Sir John Lambert, 5000*l.* out of 72,000*l.* Others, less deeply involved, were treated with greater liberality. Gibbon, the historian, whose grandfather was the Mr. Edward Gibbon so severely mulcted, has given, in the *Memoirs of his Life and Writings*, an interesting account of the proceedings in parliament at this time. He owns that he is not an unprejudiced witness; but, as all the writers from which it is possible to extract any notice of the proceedings of these disastrous years were prejudiced on the other side, the statements of the great historian become of additional value. If only on the principle *audi alteram partem*, his opinion is entitled to consideration. "In the year 1716," he says, "my grandfather was elected one of the directors of the South-Sea company, and his books

exhibited the proof that before his acceptance of that fatal office, he had acquired an independent fortune of 60,000*l.* But his fortune was overwhelmed in the shipwreck of the year 1720, and the labours of thirty years were blasted in a single day. Of the use or abuse of the South-Sea scheme, of the guilt or innocence of my grandfather and his brother directors, I am neither a competent nor a disinterested judge. Yet the equity of modern times must condemn the violent and arbitrary proceedings, which would have disgraced the cause of justice, and rendered injustice still more odious. No sooner had the nation awakened from its golden dream, than a popular and even a parliamentary clamour demanded its victims; but it was acknowledged on all sides, that the directors, however guilty, could not be touched by any known laws of the land. The intemperate notions of Lord Molesworth were not literally acted on; but a bill of pains and penalties was introduced—a retro-active statute, to punish the offences which did not exist at the time they were committed. The legislature restrained the persons of the directors, imposed an exorbitant security for their appearance, and marked their character with a previous note of ignominy. They were compelled to deliver, upon oath, the strict value of their estates, and were disabled from making any transfer or alienation of any part of their property. Against a bill of pains and penalties, it is the common right of every subject to be heard by his counsel at the bar. They prayed to be heard. Their prayer was refused, and their oppressors, who required no evidence, would listen to no defence. It had been at first proposed, that one-eighth of their respective estates should be allowed for the future support of the directors; but it was especially urged that, in the various shades of opulence and guilt, such a proportion would be

too light for many, and for some might possibly be too heavy. The character and conduct of each man were separately weighed; but, instead of the calm solemnity of a judicial inquiry, the fortune and honour of thirty-three Englishmen were made the topics of hasty conversation, the sport of a lawless majority; and the basest member of the committee, by a malicious word or a silent vote, might indulge his general spleen or personal animosity. Injury was aggravated by insult, and insult was embittered by pleasantry. Allowances of 20*l.* or 1*s.* were facetiously moved. A vague report that a director had formerly been concerned in another project, by which some unknown persons had lost their money, was admitted as a proof of his actual guilt. One man was ruined because he had dropped a foolish speech, that his horses should feed upon gold; another, because he was grown so proud, that one day, at the Treasury, he had refused a civil answer to persons much above him. All were condemned, absent and unheard, in arbitrary fines and forfeitures, which swept away the greatest part of their substance. Such bold oppression can scarcely be shielded by the omnipotence of parliament. My grandfather could not expect to be treated with more lenity than his companions. His Tory principles and connexions rendered him obnoxious to the ruling powers. His name was reported in a suspicious secret. His well-known abilities could not plead the excuse of ignorance or error. In the first proceedings against the South-Sea directors, Mr. Gibbon was one of the first taken into custody, and in the final sentence the measure of his fine proclaimed him eminently guilty. The total estimate, which he delivered on oath to the House of Commons, amounted to 106,543*l.* 5*s.* 6*d.*, exclusive of antecedent settlements. Two different allowances

of 15,000*l.* and of 10,000*l.* were moved for Mr. Gibbon; but on the question being put, it was carried without a division for the smaller sum. On these ruins, with the skill and credit of which parliament had not been able to despoil him, my grandfather, at a mature age, erected the edifice of a new fortune. The labours of sixteen years were amply rewarded; and I have reason to believe that the second structure was not much inferior to the first.”

THE SOUTH-SEA BUBBLE.—CARICATURE BY HOGARTH.²⁶

The next consideration of the legislature, after the punishment of the directors, was to restore public credit. The scheme of Walpole had been found insufficient, and had fallen into disrepute. A computation was made of the whole capital stock of the South-Sea company at the end of the year 1720. It was found to amount to thirty-seven millions eight hundred thousand pounds, of which the stock allotted to all the proprietors only amounted to twenty-four millions five hundred thousand pounds. The remainder of thirteen millions three hundred thousand pounds belonged to the company in their corporate capacity, and was the profit they had made by the national delusion. Upwards of eight millions of this were taken from

the company, and divided among the proprietors and subscribers generally, making a dividend of about 33*l.* 6*s.* 8*d.* per cent. This was a great relief. It was further ordered, that such persons as had borrowed money from the South-Sea company upon stock actually transferred and pledged at the time of borrowing to or for the use of the company, should be free from all demands, upon payment of ten per cent of the sums so borrowed. They had lent about eleven millions in this manner, at a time when prices were unnaturally raised; and they now received back one million one hundred thousand, when prices had sunk to their ordinary level.

But it was a long time before public credit was thoroughly restored. Enterprise, like Icarus, had soared too high, and melted the wax of her wings; like Icarus, she had fallen into a sea, and learned, while floundering in its waves, that her proper element was the solid ground. She has never since attempted so high a flight.

In times of great commercial prosperity there has been a tendency to over-speculation on several occasions since then. The success of one project generally produces others of a similar kind. Popular imitativeness will always, in a trading nation, seize hold of such successes, and drag a community too anxious for profits into an abyss from which extrication is difficult. Bubble companies, of a kind similar to those engendered by the South-Sea project, lived their little day in the famous year of the panic, 1825. On that occasion, as in 1720, knavery gathered a rich harvest from cupidity, but both suffered when the day of reckoning came. The schemes of the year 1836 threatened, at one time, results as disastrous; but they were happily averted before it was too late.²⁷

BUBBLERS' ARMS—DESPAIR—FROM A PRINT IN THE COLLECTION OF E.
HAWKINS, ESQ.

CONRAD GESNER.

THE TULIPOMANIA.

Quis furor, ô cives!—*Lucan.*

THE tulip,—so named, it is said, from a Turkish word, signifying a turban,—was introduced into western Europe about the middle of the sixteenth century. Conrad Gesner, who claims the merit of having brought it into repute,—little dreaming of the commotion it was shortly afterwards to make in the world,—says that he first saw it in the year 1559, in a garden at Augsburg, belonging to the learned Counsellor Herwart, a man very famous in his day for his collection of rare exotics. The bulbs were sent to this gentleman by a friend at Constantinople, where the flower had long been a favourite. In the course of ten or eleven years after this period, tulips were much sought after by the wealthy, especially in Holland and Germany. Rich people at Amsterdam sent for the bulbs direct to Constantinople, and paid the most extravagant prices for them. The first roots planted in England were brought from Vienna in 1600. Until the year 1634 the tulip annually increased in reputation, until it was deemed a proof of bad taste in any man of fortune to be without a collection of them. Many learned men, including Pompeius de Angelis and the celebrated Lipsius of Leyden, the author of the treatise “*De Constantia*,” were passionately fond of tulips. The rage for possessing them soon caught the middle classes of society, and merchants and shopkeepers, even of moderate means, began to vie with each other in the rarity of these flowers and the preposterous prices they paid for them. A trader at Harlaem was known to pay one-half of his fortune for a single root, not with the design of selling it again at a profit, but to keep in his own conservatory for the admiration of his acquaintance.

One would suppose that there must have been some great virtue in this flower to have made it so valuable in the eyes of so prudent a people as the Dutch; but it has neither the beauty nor the perfume of the rose—hardly the beauty of the “sweet, sweet-pea;” neither is it as enduring as either. Cowley, it is true, is loud in its praise. He says—

“The tulip next appeared, all over gay,
But wanton, full of pride, and full of play;
The world can’t shew a dye but here has place;
Nay, by new mixtures, she can change her face;
Purple and gold are both beneath her care,
The richest needlework she loves to wear;
Her only study is to please the eye,
And to outshine the rest in finery.”

This, though not very poetical, is the description of a poet. Beckmann, in his *History of Inventions*, paints it with more fidelity, and in prose more pleasing than Cowley’s poetry. He says, “There are few plants which acquire, through accident, weakness, or disease, so many variegations as the tulip. When uncultivated, and in its natural state, it is almost of one colour, has large leaves, and an extraordinarily long stem. When it has been weakened by cultivation, it becomes more agreeable in the eyes of the florist. The petals are then paler, smaller, and more diversified in hue; and the leaves acquire a softer green colour. Thus this masterpiece of culture, the more beautiful it turns, grows so much the weaker, so that, with the greatest skill and most careful attention, it can scarcely be transplanted, or even kept alive.”

Many persons grow insensibly attached to that which gives them a great deal of trouble, as a mother often loves her sick and ever-ailing child better than her more healthy offspring. Upon the same principle we must account

for the unmerited encomia lavished upon these fragile blossoms. In 1634, the rage among the Dutch to possess them was so great that the ordinary industry of the country was neglected, and the population, even to its lowest dregs, embarked in the tulip trade. As the mania increased, prices augmented, until, in the year 1635, many persons were known to invest a fortune of 100,000 florins in the purchase of forty roots. It then became necessary to sell them by their weight in *perits*, a small weight less than a grain. A tulip of the species called *Admiral Liefken*, weighing 400 *perits*, was worth 4400 florins; an *Admiral Van der Eyck*, weighing 446 *perits*, was worth 1260 florins; a *Childer* of 106 *perits* was worth 1615 florins; a *Viceroy* of 400 *perits*, 3000 florins, and, most precious of all, a *Semper Augustus*, weighing 200 *perits*, was thought to be very cheap at 5500 florins. The latter was much sought after, and even an inferior bulb might command a price of 2000 florins. It is related that, at one time, early in 1636, there were only two roots of this description to be had in all Holland, and those not of the best. One was in the possession of a dealer in Amsterdam, and the other in Harlaem. So anxious were the speculators to obtain them, that one person offered the fee-simple of twelve acres of building-ground for the Harlaem tulip. That of Amsterdam was bought for 4600 florins, a new carriage, two grey horses, and a complete suit of harness. Hunting, an industrious author of that day, who wrote a folio volume of one thousand pages upon the tulipomania, has preserved the folio wing list of the various articles, and their value, which were delivered for one single root of the rare species called the *Viceroy*:

	florins.
Two lasts of wheat	448
Four lasts of rye	558
Four fat oxen	480
Eight fat swine	240
Twelve fat sheep	120
Two hogsheads of wine	70
Four tuns of beer	32
Two tuns of butter	192

One thousand lbs. of cheese	120
A complete bed	100
A suit of clothes	80
A silver drinking-cup	60
	<hr/>
	2500

People who had been absent from Holland, and whose chance it was to return when this folly was at its maximum, were sometimes led into awkward dilemmas by their ignorance. There is an amusing instance of the kind related in Blainville's *Travels*. A wealthy merchant, who prided himself not a little on his rare tulips, received upon one occasion a very valuable consignment of merchandise from the Levant. Intelligence of its arrival was brought him by a sailor, who presented himself for that purpose at the counting-house, bales of goods of every description. The merchant, to reward him for his news, munificently made him a present of a fine red herring for his breakfast. The sailor had, it appears, a great partiality for onions, and seeing a bulb very like an onion lying upon the counter of this liberal trader, and thinking it, no doubt, very much out of its place among silks and velvets, he slyly seized an opportunity and slipped it into his pocket, as a relish for his herring. He got clear off with his prize, and proceeded to the quay to eat his breakfast. Hardly was his back turned when the merchant missed his valuable *Semper Augustus*, worth three thousand florins, or about 280*l.* sterling. The whole establishment was instantly in an uproar; search was every where made for the precious root, but it was not to be found. Great was the merchant's distress of mind. The search was renewed, but again without success. At last some one thought of the sailor.

The unhappy merchant sprang into the street at the bare suggestion. His alarmed household followed him. The sailor, simple soul! had not thought of concealment. He was found quietly sitting on a coil of ropes, masticating the last morsel of his "onion". Little did he dream that he had been eating a breakfast whose cost might have regaled a whole ship's crew for a twelvemonth; or, as the plundered merchant himself expressed it, "might

have sumptuously feasted the Prince of Orange and the whole court of the Stadtholder.” Anthony caused pearls to be dissolved in wine to drink the health of Cleopatra; Sir Richard Whittington was as foolishly magnificent in an entertainment to King Henry V.; and Sir Thomas Gresham drank a diamond dissolved in wine to the health of Queen Elizabeth, when she opened the Royal Exchange; but the breakfast of this roguish Dutchman was as splendid as either. He had an advantage, too, over his wasteful predecessors: *their* gems did not improve the taste or the wholesomeness of *their* wine, while *his* tulip was quite delicious with his red herring. The most unfortunate part of the business for him was, that he remained in prison for some months on a charge of felony preferred against him by the merchant.

Another story is told of an English traveller, which is scarcely less ludicrous. This gentleman, an amateur botanist, happened to see a tulip-root lying in the conservatory of a wealthy Dutchman. Being ignorant of its quality, he took out his penknife, and peeled off its coats, with the view of making experiments upon it. When it was by this means reduced to half its size, he cut it into two equal sections, making all the time many learned remarks on the singular appearances of the unknown bulb. Suddenly, the owner pounced upon him, and, with fury in his eyes, asked him if he knew what he had been doing? “Peeling a most extraordinary onion,” replied the philosopher. “*Hundert tausend duyvel!*” said the Dutchman; “it’s an *Admiral Van der Eyck.*” “Thank you,” replied the traveller, taking out his note-book to make a memorandum of the same; “are these admirals common in your country?” “Death and the devil!” said the Dutchman, seizing the astonished man of science by the collar; “come before the syndic, and you shall see.” In spite of his remonstrances, the traveller was led through the streets followed by a mob of persons. When brought into the presence of the magistrate, he learned, to his consternation, that the root upon which he had been experimentalising was worth four thousand

florins; and, notwithstanding all he could urge in extenuation, he was lodged in prison until he found securities for the payment of this sum.

The demand for tulips of a rare species increased so much in the year 1636, that regular marts for their sale were established on the Stock Exchange of Amsterdam, in Rotterdam, Harlaem, Leyden, Alkmar, Hoorn, and other towns. Symptoms of gambling now became, for the first time, apparent. The stock-jobbers, ever on the alert for a new speculation, dealt largely in tulips, making use of all the means they so well knew how to employ, to cause fluctuations in prices. At first, as in all these gambling mania, confidence was at its height, and every body gained. The tulip-jobbers speculated in the rise and fall of the tulip stocks, and made large profits by buying when prices fell, and selling out when they rose. Many individuals grew suddenly rich. A golden bait hung temptingly out before the people, and one after the other, they rushed to the tulip-marts, like flies around a honey-pot. Every one imagined that the passion for tulips would last for ever, and that the wealthy from every part of the world would send to Holland, and pay whatever prices were asked for them. The riches of Europe would be concentrated on the shores of the Zuyder Zee, and poverty banished from the favoured clime of Holland. Nobles, citizens, farmers, mechanics, sea-men, footmen, maid-servants, even chimney-sweeps and old clothes-women, dabbled in tulips. People of all grades converted their property into cash, and invested it in flowers. Houses and lands were offered for sale at ruinously low prices, or assigned in payment of bargains made at the tulip-mart. Foreigners became smitten with the same frenzy, and money poured into Holland from all directions. The prices of the necessaries of life rose again by degrees: houses and lands, horses and carriages, and luxuries of every sort, rose in value with them, and for some months Holland seemed the very antechamber of Plutus. The operations of the trade became so extensive and so intricate, that it was found necessary to draw up a code of laws for the guidance of the dealers. Notaries and clerks were also appointed, who devoted themselves

exclusively to the interests of the trade. The designation of public notary was hardly known in some towns, that of tulip-notary usurping its place. In the smaller towns, where there was no exchange, the principal tavern was usually selected as the “show-place,” where high and low traded in tulips, and confirmed their bargains over sumptuous entertainments. These dinners were sometimes attended by two or three hundred persons, and large vases of tulips, in full bloom, were placed at regular intervals upon the tables and sideboards for their gratification during the repast.

At last, however, the more prudent began to see that this folly could not last for ever. Rich people no longer bought the flowers to keep them in their gardens, but to sell them again at cent per cent profit. It was seen that somebody must lose fearfully in the end. As this conviction spread, prices fell, and never rose again. Confidence was destroyed, and a universal panic seized upon the dealers. *A* had agreed to purchase ten *Semper Augustines* from *B*, at four thousand florins each, at six weeks after the signing of the contract. *B* was ready with the flowers at the appointed time; but the price had fallen to three or four hundred florins, and *A* refused either to pay the difference or receive the tulips. Defaulters were announced day after day in all the towns of Holland. Hundreds who, a few months previously, had begun to doubt that there was such a thing as poverty in the land, suddenly found themselves the possessors of a few bulbs, which nobody would buy, even though they offered them at one quarter of the sums they had paid for them. The cry of distress resounded every where, and each man accused his neighbour. The few who had contrived to enrich themselves hid their wealth from the knowledge of their fellow-citizens, and invested it in the English or other funds. Many who, for a brief season, had emerged from the humbler walks of life, were cast back into their original obscurity. Substantial merchants were reduced almost to beggary, and many a representative of a noble line saw the fortunes of his house ruined beyond redemption.

When the first alarm subsided, the tulip-holders in the several towns held public meetings to devise what measures, were best to be taken to restore public credit. It was generally agreed, that deputies should be sent from all parts to Amsterdam, to consult with the government upon some remedy for the evil. The government at first refused to interfere, but advised the tulip-holders to agree to some plan among themselves. Several meetings were held for this purpose; but no measure could be devised likely to give satisfaction to the deluded people, or repair even a slight portion of the mischief that had been done. The language of complaint and reproach was in every body's mouth, and all the meetings were of the most stormy character. At last, however, after much bickering and ill-will, it was agreed, at Amsterdam, by the assembled deputies, that all contracts made in the height of the mania, or prior to the month of November 1636, should be declared null and void, and that, in those made after that date, purchasers should be freed from their engagements, on paying ten per cent to the vendor. This decision gave no satisfaction. The vendors who had their tulips on hand were, of course, discontented, and those who had pledged themselves to purchase, thought themselves hardly treated. Tulips which had, at one time, been worth six thousand florins, were now to be procured for five hundred; so that the composition of ten per cent was one hundred florins more than the actual value. Actions for breach of contract were threatened in all the courts of the country; but the latter refused to take cognisance of gambling transactions.

The matter was finally referred to the Provincial Council at the Hague, and it was confidently expected that the wisdom of this body would invent some measure by which credit should be restored. Expectation was on the stretch for its decision, but it never came. The members continued to deliberate week after week, and at last, after thinking about it for three months, declared that they could offer no final decision until they had more information. They advised, however, that, in the mean time, every vendor should, in the presence of witnesses, offer the tulips *in natura* to

the purchaser for the sums agreed upon. If the latter refused to take them, they might be put up for sale by public auction, and the original contractor held responsible for the difference between the actual and the stipulated price. This was exactly the plan recommended by the deputies, and which was already shewn to be of no avail. There was no court in Holland which would enforce payment. The question was raised in Amsterdam, but the judges unanimously refused to interfere, on the ground that debts contracted in gambling were no debts in law.

Thus the matter rested. To find a remedy was beyond the power of the government. Those who were unlucky enough to have had stores of tulips on hand at the time of the sudden reaction were left to bear their ruin as philosophically as they could; those who had made profits were allowed to keep them; but the commerce of the country suffered a severe shock, from which it was many years ere it recovered.

The example of the Dutch was imitated to some extent in England. In the year 1636 tulips were publicly sold in the Exchange of London, and the jobbers exerted themselves to the utmost to raise them to the fictitious value they had acquired in Amsterdam. In Paris also the jobbers strove to create a tulipomania. In both cities they only partially succeeded. However, the force of example brought the flowers into great favour, and amongst a certain class of people tulips have ever since been prized more highly than any other flowers of the field. The Dutch are still notorious for their partiality to them, and continue to pay higher prices for them than any other people. As the rich Englishman boasts of his fine race-horses or his old pictures, so does the wealthy Dutchman vaunt him of his tulips.

In England, in our day, strange as it may appear, a tulip will produce more money than an oak. If one could be found, *rara in terris*, and black as the black swan of Juvenal, its price would equal that of a dozen acres of standing corn. In Scotland, towards the close of the seventeenth century, the highest price for tulips, according to the authority of a writer in the supplement to the third edition of the *Encyclopedia Britannica*, was ten

guineas. Their value appears to have diminished from that time till the year 1769, when the two most valuable species in England were the *Don Quevedo* and the *Valentinier*, the former of which was worth two guineas and the latter two guineas and a half. These prices appear to have been the minimum. In the year 1800, a common price was fifteen guineas for a single bulb. In 1835, a bulb of the species called the Miss Fanny Kemble was sold by public auction in London for seventy-five pounds. Still more remarkable was the price of a tulip in the possession of a gardener in the King's Road, Chelsea;—in his catalogues it was labelled at two hundred guineas.

THE ALCHEMISTS;

OR

Searchers for the Philosopher's Stone and the Water of Life.

Mercury (loquitur). The mischief a secret any of them know, above the consuming of coals and drawing of usquebaugh! howsoever they may pretend, under the specious names of Geber, Arnold, Lulli, or bombast of Hohenheim, to commit miracles in art, and treason against nature! As if the title of philosopher, that creature of glory, were to be fetched out of a furnace! I am their crude and their sublimate, their precipitate and their unctions; their male and their female, sometimes their hermaphrodite—what they list to style me! They will calcine you a grave matron, as it might be a mother of the maids, and spring up a young virgin out of her ashes, as fresh as a phoenix; lay you an old courtier on the coals, like a sausage or a bloat-herring, and, after they have broiled him enough, blow a soul into him with a pair of bellows! See, they begin to muster again, and draw their forces out against me! The genius of the place defend me!—BEN JONSON'S *Masque: Mercury vindicated from the Alchemists.*

DISSATISFACTION with his lot seems to be the characteristic of man in all ages and climates. So far, however, from being an evil, as at first might be supposed, it has been the great civiliser of our race; and has tended, more than any thing else, to raise us above the condition of the brutes. But the same discontent which has been the source of all improvement, has been the parent of no small progeny of follies and absurdities; to trace these latter is our present object. Vast as the subject appears, it is easily reducible within such limits as will make it comprehensive without being wearisome, and render its study both instructive and amusing.

Three causes especially have excited the discontent of mankind; and, by impelling us to seek for remedies for the irremediable, have bewildered us in a maze of madness and error. These are death, toil, and ignorance of the future—the doom of man upon this sphere, and for which he shews his antipathy by his love of life, his longing for abundance, and his craving curiosity to pierce the secrets of the days to come. The first has led many to imagine that they might find means to avoid death, or failing in this, that they might, nevertheless, so prolong existence as to reckon it by centuries instead of units. From this sprang the search, so long continued and still pursued, for the *elixir vitæ*, or *water of life*, which has led thousands to pretend to it and millions to believe in it. From the second sprang the search for the philosopher's stone, which was to create plenty by changing all metals into gold; and from the third, the false sciences of astrology, divination, and their divisions of necromancy, chiromancy, augury, with all their train of signs, portents, and omens.

In tracing the career of the erring philosophers, or the wilful cheats, who have encouraged or preyed upon the credulity of mankind, it will simplify and elucidate the subject, if we divide it into three classes: the first comprising alchemists, or those in general who have devoted themselves to the discovering of the philosopher's stone and the water of life; the second comprising astrologers, necromancers, sorcerers, geomancers, and all those who pretended to discover futurity; and the third consisting of the dealers in charms, amulets, philters, universal-panacea mongers, touchers for the evil, seventh sons of a seventh son, sympathetic powder compounders, homœopathists, animal magnetisers, and all the motley tribe of quacks, empirics, and charlatans.

But in narrating the career of such men, it will be found that many of them united several or all of the functions just mentioned; that the alchemist was a fortune-teller, or a necromancer—that he pretended to cure all maladies by touch or charm, and to work miracles of every kind. In the dark and early ages of European history this is more especially the case.

Even as we advance to more recent periods, we shall find great difficulty in separating the characters. The alchemist seldom confined himself strictly to his pretended science—the sorcerer and necromancer to theirs, or the medical charlatan to his. Beginning with alchemy, some confusion of these classes is unavoidable; but the ground will clear for us as we advance.

Let us not, in the pride of our superior knowledge, turn with contempt from the follies of our predecessors. The study of the errors into which great minds have fallen in the pursuit of truth can never be uninformative. As the man looks back to the days of his childhood and his youth, and recalls to his mind the strange notions and false opinions that swayed his actions at that time, that he may wonder at them; so should society, for its edification, look back to the opinions which governed the ages fled. He is but a superficial thinker who would despise and refuse to hear of them merely because they are absurd. No man is so wise but that he may learn some wisdom from his past errors, either of thought or action; and no society has made such advances as to be capable of no improvement from the retrospect of its past folly and credulity. And not only is such a study instructive: he who reads for amusement only will find no chapter in the annals of the human mind more amusing than this. It opens out the whole realm of fiction—the wild, the fantastic, and the wonderful, and all the immense variety of things “that are not, and cannot be; but that have been imagined and believed.”

For more than a thousand years the art of alchemy captivated many noble spirits, and was believed in by millions. Its origin is involved in obscurity. Some of its devotees have claimed for it an antiquity coeval with the creation of man himself, others, again, would trace it no further back than the time of Noah. Vincent de Beauvais argues, indeed, that all the antediluvians must have possessed a knowledge of alchemy; and

particularly cites Noah as having been acquainted with the *elixir vitæ*, or he could not have lived to so prodigious an age, and have begotten children when upwards of five hundred. Lenglet du Fresnoy, in his *History of the Hermetic Philosophy*, says, “Most of them pretended that Shem, or Chem, the son of Noah, was an adept in the art, and thought it highly probable that the words *chemistry* and *alchemy* are both derived from his name.” Others say, the art was derived from the Egyptians, amongst whom it was first founded by Hermes Trismegistus. Moses, who is looked upon as a first-rate alchemist, gained his knowledge in Egypt; but he kept it all to himself, and would not instruct the children of Israel in its mysteries. All the writers upon alchemy triumphantly cite the story of the golden calf, in the 32d chapter of Exodus, to prove that this great lawgiver was an adept, and could make or unmake gold at his pleasure. It is recorded, that Moses was so wrath with the Israelites for their idolatry, “that he took the calf which they had made, and burned it in the fire, and ground it to powder, and strewed it upon the water, and made the children of Israel drink of it.” This, say the alchemists, he never could have done had he not been in possession of the philosopher’s stone; by no other means could he have made the powder of gold float upon the water. But we must leave this knotty point for the consideration of the adepts in the art, if any such there be, and come to more modern periods of its history. The Jesuit, Father Martini, in his *Historia Sinica*, says, it was practised by the Chinese two thousand five hundred years before the birth of Christ; but his assertion, being unsupported, is worth nothing. It would appear, however, that pretenders to the art of making gold and silver existed in Rome in the first centuries after the Christian era, and that, when discovered, they were liable to punishment as knaves and impostors. At Constantinople, in the fourth century, the transmutation of metals was very generally believed in, and many of the Greek ecclesiastics wrote treatises upon the subject. Their names are preserved, and some notice of their works given, in the third volume of Lenglet du Fresnoy’s *History of the Hermetic Philosophy*. Their

notion appears to have been, that all metals were composed of two substances; the one, metallic earth; and the other, a red inflammable matter, which they called sulphur. The pure union of these substances formed gold; but other metals were mixed with and contaminated by various foreign ingredients. The object of the philosopher's stone was to dissolve or neutralise all these ingredients, by which iron, lead, copper, and all metals would be transmuted into the original gold. Many learned and clever men wasted their time, their health, and their energies, in this vain pursuit; but for several centuries it took no great hold upon the imagination of the people. The history of the delusion appears, in a manner, lost from this time till the eighth century, when it appeared amongst the Arabians. From this period it becomes easier to trace its progress. A master then appeared, who was long looked upon as the father of the science, and whose name is indissolubly connected with it.

GEBER.

Of this philosopher, who devoted his life to the study of alchymy, but few particulars are known. He is thought to have lived in the year 730. His true name was Abou Moussah Djafar, to which was added Al Sofi, or "The Wise," and he was born at Houran, in Mesopotamia.²⁸ Some have thought he was a Greek, others a Spaniard, and others a prince of Hindostan; but of all the mistakes which have been made respecting him, the most ludicrous was that made by the French translator of Sprenger's *History of Medicine*, who thought, from the sound of his name, that he was a German, and rendered it as the "Donnateur," or Giver. No details of his life are known; but it is asserted, that he wrote more than five hundred works upon the philosopher's stone and the water of life. He was a great enthusiast in his art, and compared the incredulous to little children shut up in a narrow room, without windows or aperture, who, because they saw nothing beyond, denied the existence of the great globe itself. He thought that a

preparation of gold would cure all maladies, not only in man, but in the inferior animals and plants. He also imagined that all the metals laboured under disease, with the exception of gold, which was the only one in perfect health. He affirmed, that the secret of the philosopher's stone had been more than once discovered; but that the ancient and wise men who had hit upon it would never, by word or writing, communicate it to men, because of their unworthiness and incredulity.²⁹ But the life of Geber, though spent in the pursuit of this vain chimera, was not altogether useless. He stumbled upon discoveries which he did not seek; and science is indebted to him for the first mention of corrosive sublimate, the red oxide of mercury, nitric acid, and the nitrate of silver.³⁰

For more than two hundred years after the death of Geber, the Arabian philosophers devoted themselves to the study of alchymy, joining with it that of astrology. Of these the most celebrated was

ALFARABI.

Alfarabi flourished at the commencement of the tenth century, and enjoyed the reputation of being one of the most learned men of his age. He spent his life in travelling from country to country, that he might gather the opinions of philosophers upon the great secrets of nature. No danger dismayed him; no toil wearied him of the pursuit. Many sovereigns endeavoured to retain him at their courts; but he refused to rest until he had discovered the great object of his life—the art of preserving it for centuries, and of making gold as much as he needed. This wandering mode of life at last proved fatal to him. He had been on a visit to Mecca, not so much for religious as for philosophical purposes, when, returning through Syria, he stopped at the court of the Sultan Seifeddoulet, who was renowned as the patron of learning. He presented himself in his travelling attire in the presence of that monarch and his courtiers; and, without invitation, coolly sat himself down on the sofa beside the prince. The

courtiers and wise men were indignant; and the sultan, who did not know the intruder, was at first inclined to follow their example. He turned to one of his officers, and ordered him to eject the presumptuous stranger from the room; but Alfarabi, without moving, dared them to lay hands upon him; and, turning himself calmly to the prince, remarked, that he did not know who was his guest, or he would treat him with honour, not with violence. The sultan, instead of being still further incensed, as many potentates would have been, admired his coolness; and, requesting him to sit still closer to him on the sofa, entered into a long conversation with him upon science and divine philosophy. All the court were charmed with the stranger. Questions for discussion were propounded, on all of which he shewed superior knowledge. He convinced every one who ventured to dispute with him; and spoke so eloquently upon the science of alchymy, that he was at once recognised as only second to the great Geber himself. One of the doctors present inquired whether a man who knew so many sciences was acquainted with music? Alfarabi made no reply, but merely requested that a lute should be brought him. The lute was brought; and he played such ravishing and tender melodies, that all the court were melted into tears. He then changed his theme, and played airs so sprightly, that he set the grave philosophers, sultan and all, dancing as fast as their legs could carry them. He then sobered them again by a mournful strain, and made them sob and sigh as if broken-hearted. The sultan, highly delighted with his powers, entreated him to stay, offering him every inducement that wealth, power, and dignity could supply; but the alchymist resolutely refused, it being decreed, he said, that he should never repose till he had discovered the philosopher's stone. He set out accordingly the same evening, and was murdered by some thieves in the deserts of Syria. His biographers give no further particulars of his life beyond mentioning that he wrote several valuable treatises on his art, all of which, however, have been lost. His death happened in the year 954.

AVICENNA.

Avicenna, whose real name was Ebn Cinna, another great alchemist, was born at Bokhara in 980. His reputation as a physician and a man skilled in all sciences was so great, that the Sultan Magdal Douleth resolved to try his powers in the great science of government. He was accordingly made Grand Vizier of that prince, and ruled the state with some advantage; but in a science still more difficult, he failed completely. He could not rule his own passions, but gave himself up to wine and women, and led a life of shameless debauchery. Amid the multifarious pursuits of business and pleasure, he nevertheless found time to write seven treatises upon the philosopher's stone, which were for many ages looked upon as of great value by pretenders to the art. It is rare that an eminent physician as Avicenna appears to have been, abandons himself to sensual gratification; but so completely did he become enthralled in the course of a few years, that he was dismissed from his high office, and died shortly afterwards of premature old age and a complication of maladies, brought on by debauchery. His death took place in the year 1036. After his time few philosophers of any note in Arabia are heard of as devoting themselves to the study of alchemy; but it began shortly afterwards to attract greater attention in Europe. Learned men in France, England, Spain, and Italy, expressed their belief in the science, and many devoted their whole energies to it. In the twelfth and thirteenth centuries especially, it was extensively pursued, and some of the brightest names of that age are connected with it. Among the most eminent of them are

ALBERTUS MAGNUS AND THOMAS AQUINAS.

The first of these philosophers was born in the year 1193, of a noble family at Lawingen, in the Duchy of Neuburg, on the Danube. For the first thirty years of his life he appeared remarkably dull and stupid, and it was feared by every one that no good could come of him. He entered a

Dominican monastery at an early age; but made so little progress in his studies, that he was more than once upon the point of abandoning them in despair, but he was endowed with extraordinary perseverance. As he advanced to middle age, his mind expanded, and he learned whatever he applied himself to with extreme facility. So remarkable a change was not in that age to be accounted for but by a miracle. It was asserted and believed that the Holy Virgin, touched with his great desire to become learned and famous, took pity upon his incapacity, and appeared to him in the cloister where he sat almost despairing, and asked him whether he wished to excel in philosophy or divinity. He chose philosophy, to the chagrin of the Virgin, who reproached him in mild and sorrowful accents that he had not made a better choice. She, however, granted his request, that he should become the most excellent philosopher of the age; but set this drawback to his pleasure, that he should relapse, when at the height of his fame, into his former incapacity and stupidity. Albertus never took the trouble to contradict the story, but prosecuted his studies with such unremitting zeal, that his reputation speedily spread over all Europe. In the year 1244, the celebrated Thomas Aquinas placed himself under his tuition. Many extraordinary stories are told of the master and his pupil. While they paid all due attention to other branches of science, they never neglected the pursuit of the philosopher's stone and the *elixir vitæ*. Although they discovered neither, it was believed that Albert had seized some portion of the secret of life, and found means to animate a brazen statue, upon the formation of which, under proper conjunctions of the planets, he had been occupied many years of his life. He and Thomas Aquinas completed it together, endowed it with the faculty of speech, and made it perform the functions of a domestic servant. In this capacity it was exceedingly useful; but, through some defect in the machinery, it chattered much more than was agreeable to either philosopher. Various remedies were tried to cure it of its garrulity, but in vain; and one day, Thomas Aquinas was so enraged at the noise it made when he was in the midst of a mathematical problem,

that he seized a ponderous hammer and smashed it to pieces.³¹ He was sorry afterwards for what he had done, and was reprov'd by his master for giving way to his anger, so unbecoming in a philosopher. They made no attempt to re-animate the statue.

ALBERTUS MAGNUS.

Such stories as these shew the spirit of the age. Every great man who attempted to study the secrets of nature was thought a magician; and it is not to be wondered at that, when philosophers themselves pretended to discover an elixir for conferring immortality, or a red stone which was to create boundless wealth, that popular opinion should have enhanced upon their pretensions, and have endowed them with powers still more miraculous. It was believed of Albertus Magnus that he could even change the course of the seasons, a feat which the many thought less difficult than the discovery of the grand elixir. Albertus was desirous of obtaining a piece of ground on which to build a monastery in the neighbourhood of Cologne. The ground belonged to William Count of Holland and King of the Romans, who for some reason or other did not wish to part with it. Albertus is reported to have gained it by the following extraordinary method: He invited the prince as he was passing through Cologne to a magnificent entertainment prepared for him and all his court. The prince accepted it, and repaired with a lordly retinue to the residence of the sage. It was in the midst of winter, the Rhine was frozen over, and the cold was so bitter, that the knights could not sit on horseback without running the risk of losing their toes by the frost. Great, therefore, was their surprise, on arriving at Albert's house, to find that the repast was spread in his garden, in which the snow had drifted to the depth of several feet. The earl in high

dudgeon remounted his steed, but Albert at last prevailed upon him to take his seat at the table. He had no sooner done so, than the dark clouds rolled away from the sky—a warm sun shone forth—the cold north wind veered suddenly round and blew a mild breeze from the south—the snows melted away—the ice was unbound upon the streams, and the trees put forth their green leaves and their fruit—flowers sprang up beneath their feet, while larks, nightingales, blackbirds, cuckoos, thrushes, and every sweet song-bird sang hymns from every tree. The earl and his attendants wondered greatly; but they ate their dinner, and in recompense for it, Albert got his piece of ground to build a convent on. He had not, however, shewn them all his power. Immediately that the repast was over, he gave the word, and dark clouds obscured the sun—the snow fell in large flakes—the singing-birds fell dead—the leaves dropped from the trees, and the winds blew so cold and howled so mournfully, that the guests wrapped themselves up in their thick cloaks, and retreated into the house to warm themselves at the blazing fire in Albert’s kitchen.³²

Thomas Aquinas also could work wonders as well as his master. It is related of him that he lodged in a street at Cologne, where he was much annoyed by the incessant clatter made by the horses’ hoofs, as they were led through it daily to exercise by their grooms. He had entreated the latter to select some other spot, where they might not disturb a philosopher; but the grooms turned a deaf ear to all his solicitations. In this emergency he had recourse to the aid of magic. He constructed a small horse of bronze, upon which he inscribed certain cabalistic characters, and buried it at midnight in the midst of the highway. The next morning a troop of grooms came riding along as usual; but the horses, as they arrived at the spot where the magic horse was buried, reared and plunged violently—their nostrils distended with terror—their manes grew erect, and the perspiration ran down their sides in streams. In vain the riders applied the spur—in vain they coaxed or threatened, the animals would not pass the spot. On the following day their success was no better. They were at length

compelled to seek another spot for their exercise, and Thomas Aquinas was left in peace.³³

Albertus Magnus was made Bishop of Ratisbon in 1259; but he occupied the see only four years, when he resigned, on the ground that its duties occupied too much of the time which he was anxious to devote to philosophy. He died in Cologne in 1280, at the advanced age of eighty-seven. The Dominican writers deny that he ever sought the philosopher's stone, but his treatise upon minerals sufficiently proves that he did.

ARTEPHIUS.

Artephius, a name noted in the annals of alchymy, was born in the early part of the twelfth century. He wrote two famous treatises; the one upon the philosopher's stone, and the other on the art of prolonging human life. In the latter he vaunts his great qualifications for instructing mankind on such a matter, as he was at that time in the thousand and twenty-fifth year of his age! He had many disciples who believed in his extreme age, and who attempted to prove that he was Apollonius of Tyana, who lived soon after the advent of Jesus Christ, and the particulars of whose life and pretended miracles have been so fully described by Philostratus. He took good care never to contradict a story which so much increased the power he was desirous of wielding over his fellow-mortals. On all convenient occasions, he boasted of it; and having an excellent memory, a fertile imagination, and a thorough knowledge of all existing history, he was never at a loss for an answer when questioned as to the personal appearance, the manners, or the character of the great men of antiquity. He also pretended to have found the philosopher's stone; and said that, in search of it, he had descended to hell, and seen the devil sitting on a throne of gold, with a legion of imps and fiends around him. His works on alchymy have been translated into French, and were published in Paris in 1609 or 1610.

ALAIN DE LISLE.

Contemporary with Albertus Magnus was Alain de Lisle of Flanders, who was named, from his great learning, the “universal doctor.” He was thought to possess a knowledge of all the sciences, and, like Artephius, to have discovered the *elixir vitæ*. He became one of the friars of the abbey of Citeaux, and died in 1298, aged about one hundred and ten years. It was said of him that he was at the point of death when in his fiftieth year, but that the fortunate discovery of the elixir enabled him to add sixty years to his existence. He wrote a commentary on the prophecies of Merlin.

ARNOLD DE VILLENEUVE.

This philosopher has left a much greater reputation. He was born in the year 1245, and studied medicine with great success in the university of Paris. He afterwards travelled for twenty years in Italy and Germany, where he made acquaintance with Pietro d’Apone, a man of a character akin to his own, and addicted to the same pursuits. As a physician, he was thought, in his own lifetime, to be the most able the world had ever seen. Like all the learned men of that day, he dabbled in astrology and alchymy, and was thought to have made immense quantities of gold from lead and copper. When Pietro d’Apone was arrested in Italy, and brought to trial as a sorcerer, a similar accusation was made against Arnold; but he managed to leave the country in time, and escape the fate of his unfortunate friend. He lost some credit by predicting the end of the world, but afterwards regained it. The time of his death is not exactly known; but it must have been prior to the year 1311, when Pope Clement V. wrote a circular letter to all the clergy of Europe who lived under his obedience, praying them to use their utmost efforts to discover the famous treatise of Arnold on *The Practice of Medicine*. The author had promised, during his lifetime, to make a present of the work to the Holy See, but died without fulfilling it.

ARNOLD DE VILLENEUVE.

In a very curious work by Monsieur Longeville Harcouet, entitled *The History of the Persons who have lived several centuries and then grown young again*, there is a receipt, said to have been given by Arnold de Villeneuve, by means of which any one might prolong his life for a few hundred years or so. In the first place, say Arnold and Monsieur Harcouet, “the person intending so to prolong his life must rub himself well, two or three times a week, with the juice or marrow of cassia (*moëlle de la casse*). Every night, upon going to bed, he must put upon his heart a plaster, composed of a certain quantity of oriental saffron, red rose-leaves, sandalwood, aloes, and amber, liquified in oil of roses and the best white wax. In the morning, he must take it off, and enclose it carefully in a leaden box till the next night, when it must be again applied. If he be of a sanguine temperament, he shall take sixteen chickens; if phlegmatic, twenty-five; and if melancholy, thirty, which he shall put into a yard where the air and the water are pure. Upon these he is to feed, eating one a day; but previously the chickens are to be fattened by a peculiar method, which will impregnate their flesh with the qualities that are to produce longevity in the eater. Being deprived of all other nourishment till they are almost dying of hunger, they are to be fed upon broth made of serpents and vinegar, which broth is to be thickened with wheat and bran.” Various ceremonies are to be performed in the cooking of this mess, which those may see in the book of M. Harcouet who are at all interested in the matter; and the

chickens are to be fed upon it for two months. They are then fit for table, and are to be washed down with moderate quantities of good white wine or claret. This regimen is to be followed regularly every seven years, and any one may live to be as old as Methuselah! It is right to state that M. Harcouet has but little authority for attributing this precious composition to Arnold of Villeneuve. It is not found in the collected works of that philosopher; but was first brought to light by a M. Poirier, at the commencement of the sixteenth century, who asserted that he had discovered it in MS. in the undoubted writing of Arnold.

PIETRO D'APONE.

This unlucky sage was born at Apone, near Padua, in the year 1250. Like his friend Arnold de Villeneuve, he was an eminent physician, and a pretender to the arts of astrology and alchymy. He practised for many years in Paris, and made great wealth by killing and curing, and telling fortunes. In an evil day for him, he returned to his own country, with the reputation of being a magician of the first order. It was universally believed that he had drawn seven evil spirits from the infernal regions, whom he kept enclosed in seven crystal vases until he required their services, when he sent them forth to the ends of the earth to execute his pleasure. One spirit excelled in philosophy; a second, in alchymy; a third, in astrology; a fourth, in physic; a fifth, in poetry; a sixth, in music; and the seventh, in painting: and whenever Pietro wished for information or instruction in any of these arts, he had only to go to his crystal vase and liberate the presiding spirit. Immediately all the secrets of the art were revealed to him; and he might, if it pleased him, excel Homer in poetry, Apelles in painting, or Pythagoras himself in philosophy. Although he could make gold out of brass, it was said of him that he was very sparing of his powers in that respect, and kept himself constantly supplied with money by other and less creditable means. Whenever he disbursed gold, he muttered a certain charm, known

only to himself, and next morning the gold was safe again in his own possession. The trader to whom he gave it might lock it in his strong box and have it guarded by a troop of soldiers, but the charmed metal flew back to its old master. Even if it were buried in the earth, or thrown into the sea, the dawn of the next morning would behold it in the pockets of Pietro. Few people, in consequence, liked to have dealings with such a personage, especially for gold. Some, bolder than the rest, thought that his power did not extend over silver; but, when they made the experiment, they found themselves mistaken. Bolts and bars could not restrain it, and it sometimes became invisible in their very hands, and was whisked through the air to the purse of the magician. He necessarily acquired a very bad character; and, having given utterance to some sentiments regarding religion which were the very reverse of orthodox, he was summoned before the tribunals of the Inquisition to answer for his crimes as a heretic and a sorcerer. He loudly protested his innocence, even upon the rack, where he suffered more torture than nature could support. He died in prison ere his trial was concluded, but was afterwards found guilty. His bones were ordered to be dug up and publicly burned. He was also burned in effigy in the streets of Padua.

RAYMOND LULLI.

RAYMOND LULLI.

While Arnold de Villeneuve and Pietro d'Apone flourished in France and Italy, a more celebrated adept than either appeared in Spain. This was Raymond Lulli, a name which stands in the first rank among the alchemists. Unlike many of his predecessors, he made no pretensions to astrology or necromancy; but, taking Geber for his model, studied intently the nature and composition of metals, without reference to charms, incantations, or any foolish ceremonies. It was not, however, till late in life that he commenced his study of the art. His early and middle age were spent in a different manner, and his whole history is romantic in the extreme. He was born of an illustrious family, in Majorca, in the year 1235. When that island was taken from the Saracens by James I. king of Aragon, in 1230, the father of Raymond, who was originally of Catalonia, settled there, and received a considerable appointment from the crown. Raymond married at an early age; and, being fond of pleasure, he left the solitudes of his native isle, and passed over with his bride into Spain. He was made Grand Seneschal at the court of King James, and led a gay life for several years. Faithless to his wife, he was always in the pursuit of some new beauty, till his heart was fixed at last by the lovely but unkind Ambrosia de Castello. This lady, like her admirer, was married; but, unlike him, was faithful to her vows, and treated all his solicitations with disdain. Raymond was so enamoured, that repulse only increased his flame; he lingered all night under her windows, wrote passionate verses in her praise, neglected his affairs, and made himself the butt of all the courtiers. One day, while watching under her lattice, he by chance caught sight of her bosom, as her neckerchief was blown aside by the wind. The fit of inspiration came over him, and he sat down and composed some tender stanzas upon the subject, and sent them to the lady. The fair Ambrosia had never before condescended to answer his letters; but she replied to this. She told him that she could never listen to his suit; that it was unbecoming in a wise man to fix his thoughts, as he had done, on any other than his God; and

entreated him to devote himself to a religious life, and conquer the unworthy passion which he had suffered to consume him. She, however, offered, if he wished it, to shew him the *fair* bosom which had so captivated him. Raymond was delighted. He thought the latter part of this epistle but ill corresponded with the former, and that Ambrosia, in spite of the good advice she gave him, had at last relented, and would make him as happy as he desired. He followed her about from place to place, entreating her to fulfil her promise: but still Ambrosia was cold, and implored him with tears to importune her no longer; for that she never could be his, and never would, if she were free to-morrow. "What means your letter, then?" said the despairing lover. "I will shew you!" replied Ambrosia, who immediately uncovered her bosom, and exposed to the eyes of her horror-stricken admirer a large cancer which had extended to both breasts. She saw that he was shocked; and, extending her hand to him, she prayed him once more to lead a religious life, and set his heart upon the Creator, and not upon the creature. He went home an altered man. He threw up, on the morrow, his valuable appointment at the court, separated from his wife, and took a farewell of his children, after dividing one-half of his ample fortune among them. The other half he shared among the poor. He then threw himself at the foot of a crucifix, and devoted himself to the service of God, vowing, as the most acceptable atonement for his errors, that he would employ the remainder of his days in the task of converting the Mussulmans to the Christian religion. In his dreams he saw Jesus Christ, who said to him, "Raymond! Raymond! follow me!" The vision was three times repeated, and Raymond was convinced that it was an intimation direct from heaven. Having put his affairs in order, he set out on a pilgrimage to the shrine of St. James of Compostello, and afterwards lived for ten years in solitude amid the mountains of Aranda. Here he learned the Arabic, to qualify himself for his mission of converting the Mahometans. He also studied various sciences, as taught in the works of the learned men of the East, and

first made acquaintance with the writings of Geber, which were destined to exercise so much influence over his future life.

At the end of this probation, and when he had entered his fortieth year, he emerged from his solitude into more active life. With some remains of his fortune, which had accumulated during his retirement, he founded a college for the study of Arabic, which was approved of by the pope, with many commendations upon his zeal and piety. At this time he narrowly escaped assassination from an Arabian youth whom he had taken into his service. Raymond had prayed to God, in some of his accesses of fanaticism, that he might suffer martyrdom in his holy cause. His servant had overheard him: and, being as great a fanatic as his master, he resolved to gratify his wish, and punish him, at the same time, for the curses which he incessantly launched against Mahomet and all who believed in him, by stabbing him to the heart. He therefore aimed a blow at his master as he sat one day at table; but the instinct of self-preservation being stronger than the desire of martyrdom, Raymond grappled with his antagonist, and overthrew him. He scorned to take his life himself; but handed him over to the authorities of the town, by whom he was afterwards found dead in his prison.

After this adventure Raymond travelled to Paris, where he resided for some time, and made the acquaintance of Arnold de Villeneuve. From him he probably received some encouragement to search for the philosopher's stone, as he began from that time forth to devote less of his attention to religious matters, and more to the study of alchymy. Still he never lost sight of the great object for which he lived—the conversion of the Mahometans—and proceeded to Rome, to communicate personally with Pope John XXI. on the best measures to be adopted for that end. The Pope gave him encouragement in words, but failed to associate any other persons with him in the enterprise which he meditated. Raymond, therefore, set out for Tunis alone, and was kindly received by many Arabian philosophers, who had heard of his fame as a professor of alchymy. If he had stuck to alchymy

while in their country, it would have been well for him; but he began cursing Mahomet, and got himself into trouble. While preaching the doctrines of Christianity in the great bazaar of Tunis, he was arrested and thrown into prison. He was shortly afterwards brought to trial, and sentenced to death. Some of his philosophic friends interceded hard for him, and he was pardoned upon condition that he left Africa immediately and never again set foot in it. If he was found there again, no matter what his object might be, or whatever length of time might intervene, his original sentence would be carried into execution. Raymond was not at all solicitous of martyrdom when it came to the point, whatever he might have been when there was no danger, and he gladly accepted his life upon these conditions, and left Tunis with the intention of proceeding to Rome. He afterwards changed his plan, and established himself at Milan, where, for a length of time, he practised alchemy, and some say astrology, with great success.

Most writers who believed in the secrets of alchemy, and who have noticed the life of Raymond Lulli, assert, that while in Milan, he received letters from Edward King of England, inviting him to settle in his states. They add that Lulli gladly accepted the invitation, and had apartments assigned for his use in the Tower of London, where he refined much gold; superintended the coinage of "rose-nobles," and made gold out of iron, quicksilver, lead, and pewter, to the amount of six millions. The writers in the *Biographie Universelle*, an excellent authority in general, deny that Raymond was ever in England, and say, that in all these stories of his wondrous powers as an alchemist, he has been mistaken for another Raymond, a Jew of Tarragona. Naudé, in his *Apologie*, says, simply, "that six millions were given by Raymond Lulli to King Edward, to make war against the Turks and other infidels:" not that he transmuted so much metal into gold; but, as he afterwards adds, that he advised Edward to lay a tax upon wool, which produced that amount. To shew that Raymond went to England, his admirers quote a work attributed to him, *De*

Transmutatione Animæ Metallorum, in which he expressly says that he was in England at the intercession of the king.³⁴ The hermetic writers are not agreed whether it was Edward I. or Edward II. who invited him over; but, by fixing the date of his journey in 1312, they make it appear that it was Edward II. Edmond Dickenson, in his work on the *Quintessences of the Philosophers*, says, that Raymond worked in Westminster Abbey, where, a long time after his departure, there was found in the cell which he had occupied a great quantity of golden dust, of which the architects made a great profit. In the biographical sketch of John Cremer, Abbot of Westminster, given by Lenglet, it is said that it was chiefly through his instrumentality that Raymond came to England. Cremer had been himself for thirty years occupied in the vain search for the philosopher's stone, when he accidentally met Raymond in Italy, and endeavoured to induce him to communicate his grand secret. Raymond told him that he must find it for himself, as all great alchymists had done before him. Cremer, on his return to England, spoke to King Edward in high terms of the wonderful attainments of the philosopher, and a letter of invitation was forthwith sent him. Robert Constantinus, in the *Nomenclator Scriptorum Medicorum*, published in 1515, says, that after a great deal of research, he found that Raymond Lulli resided for some time in London, and that he actually made gold, by means of the philosopher's stone, in the Tower; that he had seen the golden pieces of his coinage, which were still named in England the nobles of Raymond, or rose-nobles. Lulli himself appears to have boasted that he made gold; for, in his well-known *Testamentum*, he states that he converted no less than fifty thousand pounds weight of quicksilver, lead, and pewter into that metal.³⁵ It seems highly probable that the English king, believing in the extraordinary powers of the alchymist, invited him to England to make test of them, and that he was employed in refining gold and in coining. Camden, who is not credulous in matters like these, affords his countenance to the story of his coinage of nobles; and there is nothing at all wonderful in the fact of a man famous for his knowledge of metals

being employed in such a capacity. Raymond was, at this time, an old man, in his seventy-seventh year, and somewhat in his dotage. He was willing enough to have it believed that he had discovered the grand secret, and supported the rumour rather than contradicted it. He did not long remain in England, but returned to Rome to carry out the projects which were nearer to his heart than the profession of alchymy. He had proposed them to several successive popes with little or no success. The first was a plan for the introduction of the oriental languages into all the monasteries of Europe; the second, for the reduction into one of all the military orders, that, being united, they might move more efficaciously against the Saracens; and the third, that the sovereign pontiff should forbid the works of Averroes to be read in the schools, as being more favourable to Mahometanism than to Christianity. The pope did not receive the old man with much cordiality; and, after remaining for about two years in Rome, he proceeded once more to Africa, alone and unprotected, to preach the Gospel of Jesus. He landed at Bona in 1314, and so irritated the Mahometans by cursing their prophet, that they stoned him, and left him for dead on the sea-shore. He was found some hours afterwards by a party of Genoese merchants, who conveyed him on board their vessel, and sailed towards Majorca. The unfortunate man still breathed, but could not articulate. He lingered in this state for some days, and expired just as the vessel arrived within sight of his native shores. His body was conveyed with great pomp to the church of St. Eulalia, at Palma, where a public funeral was instituted in his honour. Miracles were afterwards said to have been worked at his tomb.

Thus ended the career of Raymond Lulli, one of the most extraordinary men of his age; and, with the exception of his last boast about the six millions of gold, the least inclined to quackery of any of the professors of alchymy. His writings were very numerous, and include nearly five hundred volumes, upon grammar, rhetoric, morals, theology, politics, civil and canon law, physics, metaphysics, astronomy, medicine, and chemistry.

ROGER BACON.

The powerful delusion of alchymy seized upon a mind still greater than that of Raymond Lulli. Roger Bacon firmly believed in the philosopher's stone, and spent much of his time in search of it. His example helped to render all the learned men of the time more convinced of its practicability, and more eager in the pursuit. He was born at Ilchester, in the county of Somerset, in the year 1214. He studied for some time in the University of Oxford, and afterwards in that of Paris, in which he received the degree of doctor of divinity. Returning to England in 1240, he became a monk of the order of St. Francis. He was by far the most learned man of his age; and his acquirements were so much above the comprehension of his contemporaries, that they could only account for them by supposing that he was indebted for them to the devil. Voltaire has not inaptly designated him "De l'or encrouté de toutes les ordures de son siècle;" but the crust of superstition that enveloped his powerful mind, though it may have dimmed, could not obscure the brightness of his genius. To him, and apparently to him only, among all the inquiring spirits of the time, were known the properties of the concave and convex lens. He also invented the magic lantern; that pretty plaything of modern days, which acquired for him a reputation that embittered his life. In a history of alchymy, the name of this great man cannot be omitted, although unlike many others of whom we shall have occasion to speak, he only made it secondary to other pursuits. The love of universal knowledge that filled his mind, would not allow him to neglect one branch of science, of which neither he nor the world could yet see the absurdity. He made ample amends for his time lost in this pursuit by his knowledge in physics and his acquaintance with astronomy. The telescope, burning-glasses, and gunpowder, are discoveries which may well carry his fame to the remotest time, and make the world blind to the one spot of folly—the diagnosis of the age in which he lived, and the circumstances by which he was surrounded. His treatise on the

Admirable Power of Art and Nature in the Production of the Philosopher's Stone was translated into French by Girard de Tormes, and published at Lyons in 1557. His *Mirror of Alchemy* was also published in French in the same year, and in Paris in 1612, with some additions from the works of Raymond Lulli. A complete list of all the published treatises upon the subject may be seen in Lenglet du Fresnoy.

POPE JOHN XXII.

This prelate is said to have been the friend and pupil of Arnold de Villeneuve, by whom he was instructed in all the secrets of alchemy. Tradition asserts of him, that he made great quantities of gold, and died as rich as Cræsus. He was born at Cahors, in the province of Guienne, in the year 1244. He was a very eloquent preacher, and soon reached high dignity in the Church. He wrote a work on the transmutation of metals, and had a famous laboratory at Avignon. He issued two bulls against the numerous pretenders to the art, who had sprung up in every part of Christendom; from which it might be inferred that he was himself free from the delusion. The alchemists claim him, however, as one of the most distinguished and successful professors of their art, and say that his bulls were not directed against the real adepts, but the false pretenders. They lay particular stress upon these words in his bull, "Spondent, quas non exhibent, divitias, *pauperes* alchymistæ." These, it is clear, they say, relate only to *poor* alchemists, and therefore false ones. He died in the year 1344, leaving in his coffers a sum of eighteen millions of florins. Popular belief alleged that he had made, and not amassed, this treasure; and alchemists complacently cite this as a proof that the philosopher's stone was not such a chimera as the incredulous pretended. They take it for granted that John really left this money, and ask by what possible means he could have accumulated it. Replying to their own question, they say triumphantly, "His book shews it was by alchemy, the secrets of which he learned from Arnold de Villeneuve

and Raymond Lulli. But he was as prudent as all other hermetic philosophers. Whoever would read his book to find out his secret, would employ all his labour in vain; the pope took good care not to divulge it." Unluckily for their own credit, all these gold-makers are in the same predicament; their great secret loses its worth most wonderfully in the telling, and therefore they keep it snugly to themselves. Perhaps they thought that, if everybody could transmute metals, gold would be so plentiful that it would be no longer valuable, and that some new art would be requisite to transmute it back again into steel and iron. If so, society is much indebted to them for their forbearance.

JEAN DE MEUNG.

All classes of men dabbled in the art at this time; the last mentioned was a pope, the one of whom we now speak was a poet. Jean de Meung, the celebrated author of the *Roman de la Rose*, was born in the year 1279 or 1280, and was a great personage at the courts of Louis X., Philip the Long, Charles IV., and Philip de Valois. His famous poem of the *Roman de la Rose*, which treats of every subject in vogue at that day, necessarily makes great mention of alchemy. Jean was a firm believer in the art, and wrote, besides his Roman, two shorter poems, the one entitled *The Remonstrance of Nature to the wandering Alchymist* and *The Reply of the Alchymist to Nature*. Poetry and alchemy were his delight, and priests and women were his abomination. A pleasant story is related of him and the ladies of the court of Charles IV. He had written the following libellous couplet upon the fair sex:

“Toutes êtes, serez, ou fûtes,
De fait ou de volonté, putains;
Et qui très bien vous chercherait,
Toutes putains vous trouverait.”³⁶

This naturally gave great offence; and being perceived one day in the king’s antechamber, by some ladies who were waiting for an audience, they resolved to punish him. To the number of ten or twelve, they armed themselves with canes and rods, and surrounding the unlucky poet, called upon the gentlemen present to strip him naked, that they might wreak just vengeance upon him, and lash him through the streets of the town. Some of the lords present were in no wise loath, and promised themselves great sport from his punishment. But Jean de Meung was unmoved by their threats, and stood up calmly in the midst of them, begging them to hear him first, and then, if not satisfied, they might do as they liked with him. Silence being restored, he stood upon a chair, and entered on his defence. He acknowledged that he was the author of the obnoxious verses, but denied that they bore reference to all womankind. He only meant to speak of the vicious and abandoned, whereas those whom he saw around him were patterns of virtue, loveliness, and modesty. If, however, any lady present thought herself aggrieved, he would consent to be stripped, and she might lash him till her arms

were wearied. It is added, that by this means Jean escaped his flogging, and that the wrath of the fair ones immediately subsided. The gentlemen present were, however, of opinion, that if every lady in the room whose character corresponded with the verses had taken him at his word; the poet would in all probability have been beaten to death. All his life long he evinced a great animosity towards the priesthood, and his famous poem abounds with passages reflecting upon their avarice, cruelty, and immorality. At his death he left a large box, filled with some weighty material, which he bequeathed to the Cordeliers, as a peace-offering, for the abuse he had lavished upon them. As his practice of alchemy was well known, it was thought the box was filled with gold and silver, and the Cordeliers congratulated each other on their rich acquisition. When it came to be opened, they found to their horror that it was filled only with *slates*, scratched with hieroglyphic and cabalistic characters. Indignant at the insult, they determined to refuse him Christian burial, on pretence that he was a sorcerer. He was, however, honourably buried in Paris, the whole court attending his funeral.

NICHOLAS FLAMEL.

The story of this alchemist, as handed down by tradition, and enshrined in the pages of Lenglet da Fresnoy, is not a little marvellous. He was born at Pontoise, of a poor but respectable family, at the end of the thirteenth, or beginning of the fourteenth century. Having no patrimony, he set out for Paris at an early age, to try his fortune as a public scribe. He had received a good education, was well skilled in the learned languages, and was an excellent penman. He soon procured occupation as a letter-writer and copyist,

and used to sit at the corner of the Rue de Marivaux, and practise his calling; but he hardly made profit enough to keep body and soul together. To mend his fortunes he tried poetry; but this was a more wretched occupation still. As a transcriber he had at least gained bread and cheese; but his rhymes were not worth a crust. He then tried painting with as little success; and as a last resource, began to search for the philosopher's stone and tell fortunes. This was a happier idea; he soon increased in substance, and had wherewithal to live comfortably. He therefore took unto himself his wife Petronella, and began to save money; but continued to all outward appearance as poor and miserable as before. In the course of a few years, he became desperately addicted to the study of alchymy, and thought of nothing but the philosopher's stone, the elixir of life, and the universal alkahest. In the year 1257, he bought by chance an old book for two florins, which soon became his sole study. It was written with a steel instrument upon the bark of trees, and contained twenty-one, or as he himself always expressed it, three times seven, leaves. The writing was very elegant and in the Latin language. Each seventh leaf contained a picture and no writing. On the first of these was a serpent swallowing rods; on the second, a cross with a serpent crucified; and on the third, the representation of a desert, in the midst of which was a fountain, with serpents crawling from side to side. It purported to be written by no less a personage than "Abraham, patriarch, Jew, prince, philosopher, priest, Levite, and astrologer;" and invoked curses upon any one who should cast eyes upon it, without being "a sacrificer or a scribe." Nicholas Flamel never thought it extraordinary that Abraham should have known Latin, and was convinced that the characters on his book had been

traced by the hands of that great patriarch himself. He was at first afraid to read it, after he became aware of the curse it contained; but he got over that difficulty by recollecting that, although he was not a sacrificer, he had practised as a scribe. As he read he was filled with admiration, and found that it was a perfect treatise upon the transmutation of metals. All the processes were clearly explained; the vessels, the retorts, the mixtures, and the proper times and seasons for experiment. But as ill-luck would have it, the possession of the philosopher's stone, or prime agent in the work, was presupposed. This was a difficulty which was not to be got over. It was like telling a starving man how to cook a beef-steak, instead of giving him the money to buy one. But Nicholas did not despair, and set about studying the hieroglyphics and allegorical representations with which the book abounded. He soon convinced himself that it had been one of the sacred books of the Jews, and that it was taken from the temple of Jerusalem on its destruction by Titus. The process of reasoning by which he arrived at this conclusion is not stated.

From some expression in the treatise, he learned that the allegorical drawings on the fourth and fifth leaves enshrined the secret of the philosopher's stone, without which all the fine Latin of the directions was utterly unavailing. He invited all the alchemists and learned men of Paris to come and examine them, but they all departed as wise as they came. Nobody could make any thing either of Nicholas or his pictures; and some even went so far as to say that his invaluable book was not worth a farthing. This was not to be borne; and Nicholas resolved to discover the great secret by himself, without troubling the philosophers. He found on the first page of the fourth leaf, the picture of Mercury attacked by an old man

resembling Saturn or Time. The latter had an hour-glass on his head, and in his hand a scythe, with which he aimed a blow at Mercury's feet. The reverse of the leaf represented a flower growing on a mountain top, shaken rudely by the wind, with a blue stalk, red and white blossoms, and leaves of pure gold. Around it were a great number of dragons and griffins. On the first page of the fifth leaf was a fine garden, in the midst of which was a rose-tree in full bloom, supported against the trunk of a gigantic oak. At the foot of this there bubbled up a fountain of milk-white water, which, forming a small stream, flowed through the garden, and was afterwards lost in the sands. On the second page was a king, with a sword in his hand, superintending a number of soldiers, who, in execution of his orders, were killing a great multitude of young children, spurning the prayers and tears of their mothers, who tried to save them from destruction. The blood of the children was carefully collected by another party of soldiers, and put into a large vessel, in which two allegorical figures of the sun and moon were bathing themselves.

For twenty-one years poor Nicholas wearied himself with the study of these pictures, but still he could make nothing of them. His wife Petronella at last persuaded him to find out some learned rabbi; but there was no rabbi in Paris learned enough to be of any service to him. The Jews met but small encouragement to fix their abode in France, and all the chiefs of that people were located in Spain. To Spain accordingly Nicholas Flamel repaired. He left his book in Paris, for fear, perhaps, that he might be robbed of it on the road; and telling his neighbours that he was going on a pilgrimage to the shrine of St. James of Compostello, he trudged on foot towards Madrid in search of a rabbi. He was absent two years in that country,

and made himself known to a great number of Jews, descendants of those who had been expelled from France in the reign of Philip Augustus. The believers in the philosopher's stone give the following account of his adventures: They say that at Leon he made the acquaintance of a converted Jew, named Cauches, a very learned physician, to whom he explained the title and nature of his little book. The doctor was transported with joy as soon as he heard it named, and immediately resolved to accompany Nicholas to Paris, that he might have a sight of it. The two set out together; the doctor on the way entertaining his companion with the history of his book, which, if the genuine book he thought it to be, from the description he had heard of it, was in the handwriting of Abraham himself, and had been in the possession of personages no less distinguished than Moses, Joshua, Solomon, and Esdras. It contained all the secrets of alchymy and of many other sciences, and was the most valuable book that had ever existed in this world. The doctor was himself no mean adept, and Nicholas profited greatly by his discourse, as in the garb of poor pilgrims they wended their way to Paris, convinced of their power to turn every old shovel in that capital into pure gold. But, unfortunately, when they reached Orleans, the doctor was taken dangerously ill. Nicholas watched by his bedside, and acted the double part of a physician and nurse to him; but he died after a few days, lamenting with his last breath that he had not lived long enough to see the precious volume. Nicholas rendered the last honours to his body; and with a sorrowful heart, and not one *sou* in his pocket, proceeded home to his wife Petronella. He immediately recommenced the study of his pictures; but for two whole years he was as far from understanding them as ever. At last, in the third year,

a glimmer of light stole over his understanding. He recalled some expression of his friend the doctor, which had hitherto escaped his memory, and he found that all his previous experiments had been conducted on a wrong basis. He recommenced them now with renewed energy, and at the end of the year had the satisfaction to see all his toils rewarded. On the 13th January 1382, says Lenglet, he made a projection on mercury, and had some very excellent silver. On the 25th April following, he converted a large quantity of mercury into gold, and the great secret was his.

Nicholas was now about eighty years of age, and still a hale and stout old man. His friends say that by a simultaneous discovery of the elixir of life, he found means to keep death at a distance for another quarter of a century; and that he died in 1415, at the age of 116. In this interval he made immense quantities of gold, though to all outward appearance he was as poor as a mouse. At an early period of his changed fortune, he had, like a worthy man, taken counsel with his old wife Petronella, as to the best use he could make of his wealth. Petronella replied, that as unfortunately they had no children, the best thing he could do, was to build hospitals and endow churches. Nicholas thought so too, especially when he began to find that his elixir could not keep off death, and that the grim foe was making rapid advances upon him. He richly endowed the church of St. Jacques de la Boucherie, near the Rue de Marivaux, where he had all his life resided, besides seven others in different parts of the kingdom. He also endowed fourteen hospitals, and built three chapels.

The fame of his great wealth and his munificent benefactions soon spread over all the country, and he was visited, among others, by the

celebrated doctors of that day, Jean Gerson, Jean de Courtecuisse, and Pierre d'Ailli. They found him in his humble apartment, meanly clad, and eating porridge out of an earthen vessel; and with regard to his secret, as impenetrable as all his predecessors in alchymy. His fame reached the ears of the king, Charles VI., who sent M. de Cramoisi, the Master of Requests, to find out whether Nicholas had indeed discovered the philosopher's stone. But M. de Cramoisi took nothing by his visit; all his attempts to sound the alchymist were unavailing, and he returned to his royal master no wiser than he came. It was in this year, 1414, that he lost his faithful Petronella. He did not long survive her, but died in the following year, and was buried with great pomp by the grateful priests of St. Jacques de la Boucherie.

The great wealth of Nicholas Flamel is undoubted, as the records of several churches and hospitals in France can testify. That he practised alchymy is equally certain, as he left behind several works upon the subject. Those who knew him well, and who were incredulous about the philosopher's stone, give a satisfactory solution of the secret of his wealth. They say that he was always a miser and a usurer; that his journey to Spain was undertaken with very different motives from those pretended by the alchymists; that, in fact, he went to collect debts due from Jews in that country to their brethren in Paris, and that he charged a commission of fully cent per cent in consideration of the difficulty of collecting and the dangers of the road; that when he possessed thousands, he lived upon almost nothing; and was the general money-lender, at enormous profits, to all the dissipated young men at the French court.

Among the works written by Nicholas Flamel on the subject of alchemy is *The Philosophic Summary*, a poem, reprinted in 1735, as an appendix to the third volume of the *Roman de la Rose*. He also wrote three treatises upon natural philosophy, and an alchymic allegory, entitled *Le Désir désiré*. Specimens of his writing, and a facsimile of the drawings in his book of Abraham, may be seen in Salmon's *Bibliothèque des Philosophes Chimiques*. The writer of the article *Flamel* in the *Biographie Universelle* says, that for a hundred years after the death of Flamel, many of the adepts believed that he was still alive, and that he would live for upwards of six hundred years. The house he formerly occupied, at the corner of the Rue de Marivaux, has been often taken by credulous speculators, and ransacked from top to bottom, in the hopes that gold might be found. A report was current in Paris, not long previous to the year 1816, that some lodgers had found in the cellars several jars filled with a dark-coloured ponderous matter. Upon the strength of the rumour, a believer in all the wondrous tales told of Nicholas Flamel bought the house, and nearly pulled it to pieces in ransacking the walls and wainscoting for hidden gold. He got nothing for his pains, however, and had a heavy bill to pay to restore his dilapidations.

GEORGE RIPLEY.

While alchymy was thus cultivated on the continent of Europe, it was not neglected in the isles of Britain. Since the time of Roger Bacon, it had fascinated the imagination of many ardent men in England. In the year 1404 an act of parliament was passed declaring the making of gold and silver to be felony. Great alarm was felt at that time lest any alchymist should succeed in his projects, and

perhaps bring ruin upon the state by furnishing boundless wealth to some designing tyrant, who would make use of it to enslave his country. This alarm appears to have soon subsided; for, in the year 1455, King Henry VI., by advice of his council and parliament, granted four successive patents and commissions to several knights, citizens of London, chemists, monks, mass-priests, and others, to find out the philosopher's stone and elixir, "to the great benefit," said the patent, "of the realm, and the enabling of the king to pay all the debts of the crown in real gold and silver." Prinn, in his *Aurum Reginae*, observes, as a note to this passage, that the king's reason for granting this patent to ecclesiastics was, that "they were such good artists in transubstantiating bread and wine in the eucharist, and therefore the more likely to be able to effect the transmutation of baser metals into better." No gold, of course, was ever made; and next year the king, doubting very much of the practicability of the thing, took further advice, and appointed a commission of ten learned men and persons of eminence to judge and certify to him whether the transmutation of metals were a thing practicable or no. It does not appear whether the commission ever made any report upon the subject.

In the succeeding reign an alchemist appeared who pretended to have discovered the secret. This was George Ripley, the canon of Bridlington, in Yorkshire. He studied for twenty years in the universities of Italy, and was a great favourite with Pope Innocent VIII., who made him one of his domestic chaplains, and master of the ceremonies in his household. Returning to England in 1477, he dedicated to King Edward IV. his famous work, *The Compound of Alchymy; or, the Twelve Gates leading to the Discovery of the*

Philosopher's Stone. These gates he described to be calcination, solution, separation, conjunction, putrefaction, congelation, cibation, sublimation, fermentation, exaltation, multiplication, and projection; to which he might have added botheration, the most important process of all. He was very rich, and allowed it to be believed that he could make gold out of iron. Fuller, in his *Worthies of England*, says that an English gentleman of good credit reported, that in his travels abroad he saw a record in the island of Malta which declared that Ripley gave yearly to the knights of that island, and of Rhodes, the enormous sum of one hundred thousand pounds sterling to enable them to carry on the war against the Turks. In his old age he became an anchorite near Boston, and wrote twenty-five volumes upon the subject of alchymy, the most important of which is the *Duodecim Portarum* already mentioned. Before he died, he seems to have acknowledged that he had mis-spent his life in this vain study, and requested that all men, when they met with any of his books, would burn them, or afford them no credit, as they had been written merely from his opinion, and not from proof; and that subsequent trial had made manifest to him that they were false and vain.³⁷

BASIL VALENTINE.

Germany also produced many famous alchymists in the fifteenth century, the chief of whom are Basil Valentine, Bernard of Trèves, and the Abbot Trithemius. Basil Valentine was born at Mayence, and was made prior of St. Peter's, at Erfurt, about the year 1414. It was known, during his life, that he diligently sought the philosopher's stone, and that he had written some works upon the process of transmutation. They were thought for many years to be lost, but

were, after his death, discovered enclosed in the stone-work of one of the pillars in the Abbey. They were twenty-one in number, and are fully set forth in the third volume of Lenglet's *History of the Hermetic Philosophy*. The alchemists asserted that heaven itself conspired to bring to light these extraordinary works; and that the pillar in which they were enclosed was miraculously shattered by a thunderbolt; and that as soon as the manuscripts were liberated, the pillar closed up again of its own accord!

BERNARD OF TREVES.

The life of this philosopher is a remarkable instance of talent and perseverance misapplied. In the search of his chimera nothing could daunt him. Repeated disappointment never diminished his hopes; and from the age of fourteen to that of eighty-five he was incessantly employed among the drugs and furnaces of his laboratory, wasting his life with the view of prolonging it, and reducing himself to beggary in the hopes of growing rich.

He was born at either Trèves or Padua in the year 1406. His father is said by some to have been a physician in the latter city, and by others to have been Count of the Marches of Trèves, and one of the most wealthy nobles of his country. At all events, whether noble or physician, he was a rich man, and left his son a magnificent estate. At the age of fourteen he first became enamoured of the science of alchemy, and read the Arabian authors in their own language. He himself has left a most interesting record of his labours and wanderings, from which the following particulars are chiefly extracted. The first book which fell into his hands was that of the Arabian philosopher Rhazes, from the reading of which he imagined

that he had discovered the means of augmenting gold a hundredfold. For four years he worked in his laboratory, with the book of Rhazes continually before him. At the end of that time, he found that he had spent no less than eight hundred crowns upon his experiment, and had got nothing but fire and smoke for his pains. He now began to lose confidence in Rhazes, and turned to the works of Geber. He studied him assiduously for two years; and being young, rich, and credulous, was beset by all the alchemists of the town, who kindly assisted him in spending his money. He did not lose his faith in Geber, or patience with his hungry assistants, until he had lost two thousand crowns—a very considerable sum in those days.

Among all the crowd of pretended men of science who surrounded him, there was but one as enthusiastic and as disinterested as himself. With this man, who was a monk of the order of St. Francis, he contracted an intimate friendship, and spent nearly all his time. Some obscure treatises of Rupecissa and Sacrobosco having fallen into their hands, they were persuaded, from reading them, that highly rectified spirits of wine was the universal alkahest, or dissolvent, which would aid them greatly in the process of transmutation. They rectified the alcohol thirty times, till they made it so strong as to burst the vessels which contained it. After they had worked three years, and spent three hundred crowns in the liquor, they discovered that they were on the wrong track. They next tried alum and copperas; but the great secret still escaped them. They afterwards imagined that there was a marvellous virtue in all excrement, especially the human, and actually employed more than two years in experimentalising upon it with mercury, salt, and molten lead! Again the adepts flocked around him from far and near

to aid him with their counsels. He received them all hospitably, and divided his wealth among them so generously and unhesitatingly, that they gave him the name of the "Good Trevisan," by which he is still often mentioned in works that treat on alchymy. For twelve years he led this life, making experiments every day upon some new substance, and praying to God night and morning that he might discover the secret of transmutation.

In this interval he lost his friend the monk, and was joined by a magistrate of the city of Trèves, as ardent as himself in the search. His new acquaintance imagined that the ocean was the mother of gold, and that sea-salt would change lead or iron into the precious metals. Bernard resolved to try; and, transporting his laboratory to a house on the shores of the Baltic, he worked upon salt for more than a year, melting it, sublimating it, crystallising it, and occasionally drinking it, for the sake of other experiments. Still the strange enthusiast was not wholly discouraged, and his failure in one trial only made him the more anxious to attempt another.

He was now approaching the age of fifty, and had as yet seen nothing of the world. He therefore determined to travel through Germany, Italy, France, and Spain. Wherever he stopped he made inquiries whether there were any alchymists in the neighbourhood. He invariably sought them out; and if they were poor, relieved, and if affluent, encouraged them. At Citeaux he became acquainted with one Geoffrey Leuvier, a monk of that place, who persuaded him that the essence of egg-shells was a valuable ingredient. He tried, therefore, what could be done; and was only prevented from wasting a year or two on the experiment by the opinions of an attorney, at Berghem, in Flanders, who said that the great secret resided in

vinegar and copperas. He was not convinced of the absurdity of this idea until he had nearly poisoned himself. He resided in France for about five years, when, hearing accidentally that one Master Henry, confessor to the Emperor Frederic III., had discovered the philosopher's stone, he set out for Germany to pay him a visit. He had, as usual, surrounded himself with a set of hungry dependants, several of whom determined to accompany him. He had not heart to refuse them, and he arrived at Vienna with five of them. Bernard sent a polite invitation to the confessor, and gave him a sumptuous entertainment, at which were present nearly all the alchemists of Vienna. Master Henry frankly confessed that he had not discovered the philosopher's stone, but that he had all his life been employed in searching for it, and would so continue till he found it, or died. This was a man after Bernard's own heart, and they vowed with each other an eternal friendship. It was resolved, at supper, that each alchemist present should contribute a certain sum towards raising forty-two marks of gold, which, in five days, it was confidently asserted by Master Henry, would increase, in his furnace, fivefold. Bernard, being the richest man, contributed the lion's share, ten marks of gold, Master Henry five, and the others one or two a-piece, except the dependants of Bernard, who were obliged to borrow their quota from their patron. The grand experiment was duly made; the golden marks were put into a crucible, with a quantity of salt, copperas, aquafortis, egg-shells, mercury, lead, and dung. The alchemists watched this precious mess with intense interest, expecting that it would agglomerate into one lump of pure gold. At the end of three weeks they gave up the trial, upon some excuse that the crucible was not strong enough, or that some necessary

ingredient was wanting. Whether any thief had put his hands into the crucible is not known, but it is alleged that the gold found therein at the close of the experiment was worth only sixteen marks, instead of the forty-two, which were put there at the beginning.

Bernard, though he made no gold at Vienna, made away with a very considerable quantity. He felt the loss so acutely, that he vowed to think no more of the philosopher's stone. This wise resolution he kept for two months; but he was miserable. He was in the condition of the gambler, who cannot resist the fascination of the game while he has a coin remaining, but plays on with the hope of retrieving former losses, till hope forsakes him, and he can live no longer. He returned once more to his beloved crucibles, and resolved to prosecute his journey in search of a philosopher who had discovered the secret, and would communicate it to so zealous and persevering an adept as himself. From Vienna he travelled to Rome, and from Rome to Madrid. Taking ship at Gibraltar, he proceeded to Messina; from Messina to Cyprus; from Cyprus to Greece; from Greece to Constantinople; and thence into Egypt, Palestine, and Persia. These wanderings occupied him about eight years. From Persia he made his way back to Messina, and from thence into France. He afterwards passed over into England, still in search of his great chimera; and this occupied four years more of his life. He was now growing both old and poor; for he was sixty-two years of age, and had been obliged to sell a great portion of his patrimony to provide for his expenses. His journey to Persia had cost upwards of thirteen thousand crowns, about one-half of which had been fairly melted in his all-devouring furnaces; the other half was lavished upon the sycophants that he made it his business to search out in every town he stopped at.

On his return to Trèves he found, to his sorrow, that, if not an actual beggar, he was not much better. His relatives looked upon him as a madman, and refused even to see him. Too proud to ask for favours from any one, and still confident that, some day or other, he would be the possessor of unbounded wealth, he made up his mind to retire to the island of Rhodes, where he might, in the mean time, hide his poverty from the eyes of the world. Here he might have lived unknown and happy; but, as ill luck would have it, he fell in with a monk as mad as himself upon the subject of transmutation. They were, however, both so poor that they could not afford to buy the proper materials to work with. They kept up each other's spirits by learned discourses on the hermetic philosophy, and in the reading of all the great authors who had written upon the subject. Thus did they nurse their folly, as the good wife of Tam O'Shanter did her wrath, "to keep it warm." After Bernard had resided about a year in Rhodes, a merchant, who knew his family, advanced him the sum of eight thousand florins, upon the security of the last-remaining acres of his formerly large estate. Once more provided with funds, he recommenced his labours with all the zeal and enthusiasm of a young man. For three years he hardly stepped out of his laboratory: he ate there, and slept there, and did not even give himself time to wash his hands and clean his beard, so intense was his application. It is melancholy to think that such wonderful perseverance should have been wasted in so vain a pursuit, and that energies so unconquerable should have had no worthier field to strive in. Even when he had fumed away his last coin, and had nothing left in prospective to keep his old age from starvation, hope never forsook him. He still dreamed of ultimate success, and sat down a grey-headed man of

eighty, to read over all the authors on the hermetic mysteries, from Geber to his own day, lest he should have misunderstood some process, which it was not yet too late to recommence. The alchymists say, that he succeeded at last, and discovered the secret of transmutation in his eighty-second year. They add that he lived three years afterwards to enjoy his wealth. He lived, it is true, to this great age, and made a valuable discovery—more valuable than gold or gems. He learned, as he himself informs us, just before he had attained his eighty-third year, that the great secret of philosophy was contentment with our lot. Happy would it have been for him if he had discovered it sooner, and before he became decrepit, a beggar, and an exile!

He died at Rhodes, in the year 1490, and all the alchymists of Europe sang elegies over him, and sounded his praise as the “good Trevisan.” He wrote several treatises upon his chimera, the chief of which are, the *Book of Chemistry*, the *Verbum dimissum*, and an essay *De Natura Ovi*.

TRITHEMIUS.

The name of this eminent man has become famous in the annals of alchymy, although he did but little to gain so questionable an honour. He was born in the year 1462, at the village of Trittheim, in the electorate of Trèves. His father was John Heidenberg, a vine-grower, in easy circumstances, who, dying when his son was but seven years old, left him to the care of his mother. The latter married again very shortly afterwards, and neglected the poor boy, the offspring of her first marriage. At the age of fifteen he did not even know his letters, and was, besides, half starved, and otherwise ill-

treated by his step-father; but the love of knowledge germinated in the breast of the unfortunate youth, and he learned to read at the house of a neighbour. His father-in-law set him to work in the vineyards, and thus occupied all his days; but the nights were his own. He often stole out unheeded, when all the household were fast asleep, poring over his studies in the fields, by the light of the moon; and thus taught himself Latin and the rudiments of Greek. He was subjected to so much ill-usage at home, in consequence of this love of study, that he determined to leave it. Demanding the patrimony which his father had left him, he proceeded to Trèves; and assuming the name of Trithemius, from that of his native village of Tritheim, lived there for some months under the tuition of eminent masters, by whom he was prepared for the university. At the age of twenty, he took it into his head that he should like to see his mother once more; and he set out on foot from the distant university for that purpose. On his arrival near Spannheim, late in the evening of a gloomy winter's day, it came on to snow so thickly, that he could not proceed onwards to the town. He therefore took refuge for the night in a neighbouring monastery; but the storm continued several days, the roads became impassable, and the hospitable monks would not hear of his departure. He was so pleased with them and their manner of life, that he suddenly resolved to fix his abode among them, and renounce the world. They were no less pleased with him, and gladly received him as a brother. In the course of two years, although still so young, he was unanimously elected their abbot. The financial affairs of the establishment had been greatly neglected, the walls of the building were falling into ruin, and every thing was in disorder. Trithemius, by his good management and regularity, introduced a

reform in every branch of expenditure. The monastery was repaired, and a yearly surplus, instead of a deficiency, rewarded him for his pains. He did not like to see the monks idle, or occupied solely between prayers for their business, and chess for their relaxation. He, therefore, set them to work to copy the writings of eminent authors. They laboured so assiduously, that, in the course of a few years, their library, which had contained only about forty volumes, was enriched with several hundred valuable manuscripts, comprising many of the classical Latin authors, besides the works of the early fathers, and the principal historians, and philosophers of more modern date. He retained the dignity of Abbot of Spannheim for twenty-one years, when the monks, tired of the severe discipline he maintained, revolted against him, and chose another abbot in his place. He was afterwards made Abbot of St. James, in Wurzburg, where he died in 1516.

During his learned leisure at Spannheim, he wrote several works upon the occult sciences, the chief of which are an essay on geomancy, or divination by means of lines and circles on the ground; another upon sorcery; a third upon alchymy; and a fourth upon the government of the world by its presiding angels, which was translated into English, and published by the famous William Lilly in 1647.

It has been alleged by the believers in the possibility of transmutation, that the prosperity of the abbey of Spannheim, while under his superintendence, was owing more to the philosopher's stone than to wise economy. Trithemius, in common with many other learned men, has been accused of magic; and a marvellous story is told of his having raised from the grave the form of Mary of

Burgundy, at the intercession of her widowed husband, the Emperor Maximilian. His work on steganographia, or cabalistic writing, was denounced to the Count Palatine, Frederic II., as magical and devilish; and it was by him taken from the shelves of his library and thrown into the fire. Trithemius is said to be the first writer who makes mention of the wonderful story of the devil and Dr. Faustus, the truth of which he firmly believed. He also recounts the freaks of a spirit named *Hudekin*, by whom he was at times tormented.³⁸

THE MARECHAL DE RAYS.

One of the greatest encouragers of alchymy in the fifteenth century was Gilles de Laval, Lord of Rays and a Marshal of France. His name and deeds are little known; but in the annals of crime and folly, they might claim the highest and worst pre-eminence. Fiction has never invented any thing wilder or more horrible than his career; and were not the details but too well authenticated by legal and other documents which admit no doubt, the lover of romance might easily imagine they were drawn to please him from the stores of the prolific brain, and not from the page of history.

He was born about the year 1420, of one of the noblest families of Brittany. His father dying when Gilles had attained his twentieth year, he came into uncontrolled possession, at that early age, of a fortune which the monarchs of France might have envied him. He was a near kinsman of the Montmorencys, the Roncys, and the Craons; possessed fifteen princely domains, and had an annual revenue of about three hundred thousand livres. Besides this, he was handsome, learned, and brave. He distinguished himself greatly in the wars of Charles VII., and was rewarded by that monarch with the

dignity of a marshal of France. But he was extravagant and magnificent in his style of living, and accustomed from his earliest years to the gratification of every wish and passion; and this, at last, led him from vice to vice and from crime to crime, till a blacker name than his is not to be found in any record of human iniquity.

In his castle of Champtocé he lived with all the splendour of an eastern caliph. He kept up a troop of two hundred horsemen to accompany him wherever he went; and his excursions for the purposes of hawking and hunting were the wonder of all the country around, so magnificent were the caparisons of his steeds and the dresses of his retainers. Day and night his castle was open all the year round to comers of every degree. He made it a rule to regale even the poorest beggar with wine and hippocrass. Every day an ox was roasted whole in his spacious kitchens, besides sheep, pigs, and poultry sufficient to feed five hundred persons. He was equally magnificent in his devotions. His private chapel at Champtocé was the most beautiful in France, and far surpassed any of those in the richly-endowed cathedrals of Notre Dame in Paris, of Amiens, of Beauvais, or of Rouen. It was hung with cloth of gold and rich velvet. All the chandeliers were of pure gold curiously inlaid with silver. The great crucifix over the altar was of solid silver, and the chalices and incense-burners were of pure gold. He had besides a fine organ, which he caused to be carried from one castle to another on the shoulders of six men, whenever he changed his residence. He kept up a choir of twenty-five young children of both sexes, who were instructed in singing by the first musicians of the day. The master of his chapel he called a bishop, who had under him his deans, arch-

deacons, and vicars, each receiving great salaries; the bishop four hundred crowns a year, and the rest in proportion.

He also maintained a whole troop of players, including ten dancing girls and as many ballad-singers, besides morris-dancers, jugglers, and mountebanks of every description. The theatre on which they performed was fitted up without any regard to expense, and they played mysteries or danced the morris-dance every evening for the amusement of himself and household, and such strangers as were sharing his prodigal hospitality.

At the age of twenty-three he married Catherine, the wealthy heiress of the house of Touars, for whom he refurnished his castle at an expense of a hundred thousand crowns. His marriage was the signal for new extravagance, and he launched out more madly than ever he had done before; sending for fine singers or celebrated dancers from foreign countries to amuse him and his spouse; and instituting tilts and tournaments in his great court-yard almost every week for all the knights and nobles of the province of Brittany. The Duke of Brittany's court was not half so splendid as that of the Maréchal de Rays. His utter disregard for wealth was so well known, that he was made to pay three times its value for every thing he purchased. His castle was filled with needy parasites and panderers to his pleasures, amongst whom he lavished rewards with an unsparing hand. But the ordinary round of sensual gratification ceased at last to afford him delight; he was observed to be more abstemious in the pleasures of the table, and to neglect the beautiful dancing girls who used formerly to occupy so much of his attention. He was sometimes gloomy and reserved, and there was an unnatural wildness in his eye which gave indications of incipient madness. Still

his discourse was as reasonable as ever, his urbanity to the guests that flocked from far and near to Champtocé suffered no diminution; and learned priests, when they conversed with him, thought to themselves that few of the nobles of France were so well informed as Gilles de Laval. But dark rumours spread gradually over the country; murder, and, if possible, still more atrocious deeds were hinted at; and it was remarked that many young children of both sexes suddenly disappeared, and were never afterwards heard of. One or two had been traced to the castle of Champtocé, and had never been seen to leave it; but no one dared to accuse openly so powerful a man as the Maréchal de Rays. Whenever the subject of the lost children was mentioned in his presence, he manifested the greatest astonishment at the mystery which involved their fate, and indignation against those who might be guilty of kidnapping them. Still the world was not wholly deceived; his name became as formidable to young children as that of the devouring ogre in fairy tales, and they were taught to go miles round, rather than pass under the turrets of Champtocé.

In the course of a few years, the reckless extravagance of the marshal drained him of all his funds, and he was obliged to put up some of his estates for sale. The Duke of Brittany entered into a treaty with him for the valuable seignory of Ingrande; but the heirs of Gilles implored the interference of Charles VII. to stay the sale. Charles immediately issued an edict, which was confirmed by the provincial Parliament of Brittany, forbidding him to alienate his paternal estates. Gilles had no alternative but to submit. He had nothing to support his extravagance but his allowance as a marshal of France, which did not cover the one-tenth of his expenses. A man

of his habits and character could not retrench his wasteful expenditure, and live reasonably; he could not dismiss without a pang his horsemen, his jesters, his morris-dancers, his choristers, and his parasites, or confine his hospitality to those who really needed it. Notwithstanding his diminished resources, he resolved to live as he had lived before, and turn alchymist, that he might make gold out of iron, and be still the wealthiest and most magnificent among the nobles of Brittany.

In pursuance of this determination, he sent to Paris, Italy, Germany, and Spain, inviting all the adepts in the science to visit him at Champtocé. The messengers he despatched on this mission were two of his most needy and unprincipled dependants, Gilles de Sillé and Roger de Bricqueville. The latter, the obsequious panderer to his most secret and abominable pleasures, he had entrusted with the education of his motherless daughter, a child but five years of age, with permission that he might marry her at the proper time to any person he chose, or to himself if he liked it better. This man entered into the new plans of his master with great zeal, and introduced to him one Prelati, an alchymist of Padua, and a physician of Poitou, who was addicted to the same pursuits.

The marshal caused a splendid laboratory to be fitted up for them, and the three commenced the search for the philosopher's stone. They were soon afterwards joined by another pretended philosopher, named Anthony Palermo, who aided in their operations for upwards of a year. They all fared sumptuously at the marshal's expense, draining him of the ready money he possessed, and leading him on from day to day with the hope that they would succeed in the object of their search. From time to time new aspirants from the remotest

parts of Europe arrived at his castle, and for months he had upwards of twenty alchemists at work, trying to transmute copper into gold; and wasting the gold which was still his own in drugs and elixirs.

But the Lord of Rays was not a man to abide patiently their lingering processes. Pleased with their comfortable quarters, they jogged on from day to day, and would have done so for years, had they been permitted. But he suddenly dismissed them all, with the exception of the Italian Prelati, and the physician of Poitou. These he retained to aid him to discover the secret of the philosopher's stone by a bolder method. The Poitousan had persuaded him that the devil was the great depository of that and all other secrets, and that he would raise him before Gilles, who might enter into any contract he pleased with him. Gilles expressed his readiness, and promised to give the devil any thing but his soul, or do any deed that the arch-enemy might impose upon him. Attended solely by the physician, he proceeded at midnight to a wild-looking place in a neighbouring forest; the physician drew a magic circle around them on the sward, and muttered for half an hour an invocation to the evil spirit to arise at his bidding, and disclose the secrets of alchemy. Gilles looked on with intense interest, and expected every moment to see the earth open, and deliver to his gaze the great enemy of mankind. At last the eyes of the physician became fixed, his hair stood on end, and he spoke, as if addressing the fiend. But Gilles saw nothing except his companion. At last the physician fell down on the sward as if insensible. Gilles looked calmly on to see the end. After a few minutes the physician arose, and asked him if he had not seen how angry the devil looked? Gilles replied that he had seen nothing; upon which his companion informed him that Beelzebub had appeared in

the form of a wild leopard, growled at him savagely, and said nothing; and that the reason why the marshal had neither seen nor heard him was, that he hesitated in his own mind as to devoting himself entirely to the service. De Rays owned that he had indeed misgivings, and inquired what was to be done to make the devil speak out, and unfold his secret? The physician replied, that some person must go to Spain and Africa to collect certain herbs which only grew in those countries, and offered to go himself, if De Rays would provide the necessary funds. De Rays at once consented; and the physician set out on the following day with all the gold that his dupe could spare him. The marshal never saw his face again.

But the eager Lord of Champtocé could not rest. Gold was necessary for his pleasures; and unless by supernatural aid, he had no means of procuring any further supplies. The physician was hardly twenty leagues on his journey, before Gilles resolved to make another effort to force the devil to divulge the art of gold-making. He went out alone for that purpose; but all his conjurations were of no effect. Beelzebub was obstinate, and would not appear. Determined to conquer him if he could, he unbosomed himself to the Italian alchemist, Prelati. The latter offered to undertake the business, upon condition that De Rays did not interfere in the conjurations, and consented besides to furnish him with all the charms and talismans that might be required. He was further to open a vein in his arm, and sign with his blood a contract that “he would work the devil’s will in all things,” and offer up to him a sacrifice of the heart, lungs, hands, eyes, and blood of a young child. The grasping monomaniac made no hesitation, but agreed at once to the disgusting terms proposed to him. On the following night, Prelati went out alone, and after having

been absent for three or four hours, returned to Gilles, who sat anxiously awaiting him. Prelati then informed him that he had seen the devil in the shape of a handsome youth of twenty. He further said, that the devil desired to be called *Barron* in all future invocations; and had shewn him a great number of ingots of pure gold, buried under a large oak in the neighbouring forest, all of which, and as many more as he desired, should become the property of the Maréchal de Rays if he remained firm, and broke no condition of the contract. Prelati further shewed him a small casket of black dust, which would turn iron into gold; but as the process was very troublesome, he advised that they should be contented with the ingots they found under the oak tree, and which would more than supply all the wants that the most extravagant imagination could desire. They were not, however, to attempt to look for the gold till a period of seven times seven weeks, or they would find nothing but slates and stones for their pains. Gilles expressed the utmost chagrin and disappointment, and at once said that he could not wait for so long a period; if the devil were not more, prompt Prelati might tell him that the Maréchal de Rays was not to be trifled with, and would decline all further communication with him. Prelati at last persuaded him to wait seven times seven days. They then went at midnight with picks and shovels to dig up the ground under the oak, where they found nothing to reward them but a great quantity of slates, marked with hieroglyphics. It was now Prelati's turn to be angry; and he loudly swore that the devil was nothing but a liar and a cheat. The marshal joined cordially in the opinion, but was easily persuaded by the cunning Italian to make one more trial. He promised at the same time that he would endeavour on the following night to discover the

reason why the devil had broken his word. He went out alone accordingly, and on his return informed his patron that he had seen Barron, who was exceedingly angry that they had not waited the proper time ere they looked for the ingots. Barron had also said, that the Maréchal de Rays could hardly expect any favours from him, at a time when he must know that he had been meditating a pilgrimage to the Holy Land to make atonement for his sins. The Italian had doubtless surmised this from some incautious expression of his patron, for de Rays frankly confessed that there were times when, sick of the world and all its pomps and vanities, he thought of devoting himself to the service of God.

In this manner the Italian lured on from month to month his credulous and guilty patron, extracting from him all the valuables he possessed, and only waiting a favourable opportunity to decamp with his plunder. But the day of retribution was at hand for both. Young girls and boys continued to disappear in the most mysterious manner; and the rumours against the owner of Champtocé grew so loud and distinct, that the Church was compelled to interfere. Representations were made by the Bishop of Nantes to the Duke of Brittany, that it would be a public scandal if the accusations against the Maréchal de Rays were not inquired into. He was arrested accordingly in his own castle, along with his accomplice Prelati, and thrown into a dungeon at Nantes to await his trial.

The judges appointed to try him were the Bishop of Nantes Chancellor of Brittany, the Vicar of the Inquisition in France, and the celebrated Pierre l'Hôpital, the President of the provincial Parliament. The offences laid to his charge were, sorcery, sodomy, and murder. Gilles, on the first day of his trial, conducted himself

with the utmost insolence. He braved the judges on the judgment-seat, calling them simoniacs and persons of impure life, and said he would rather be hanged by the neck like a dog without trial, than plead either guilty or not guilty before such contemptible miscreants. But his confidence forsook him as the trial proceeded, and he was found guilty on the clearest evidence of all the crimes laid to his charge. It was proved that he took insane pleasure in stabbing the victims of his lust and in observing the quivering of their flesh, and the fading lustre of their eyes as they expired. The confession of Prelati first made the judges acquainted with this horrid madness, and Gilles himself confirmed it before his death. Nearly a hundred children of the villagers around his two castles of Champtocé and Machecoue, had been missed within three years, the greater part, if not all, of whom were immolated to the lust or the cupidity of this monster. He imagined that he thus made the devil his friend, and that his recompense would be the secret of the philosopher's stone.

Gilles and Prelati were both condemned to be burned alive. At the place of execution they assumed the air of penitence and religion. Gilles tenderly embraced Prelati, saying, "*Farewell, friend Francis! In this world we shall never meet again; but let us place our hopes in God; we shall see each other in Paradise.*" Out of consideration for his high rank and connexions, the punishment of the marshal was so far mitigated, that he was not burned alive like Prelati. He was first strangled, and then thrown into the flames: his body, when half consumed, was given over to his relatives for interment, while that of the Italian was burned to ashes, and then scattered to the winds.³⁹

JACQUES CŒUR.

This remarkable pretender to the secret of the philosopher's stone was contemporary with the last mentioned. He was a great personage at the court of Charles VII., and in the events of his reign played a prominent part. From a very humble origin he rose to the highest honours of the state, and amassed enormous wealth by speculation and plunder of the country which he should have served. It was to hide his delinquencies in this respect, and to divert attention from the real source of his riches, that he boasted of having discovered the art of transmuting the inferior metals into gold and silver.

His father was a goldsmith in the city of Bourges; but so reduced in circumstances towards the latter years of his life, that he was unable to pay the necessary fees to procure his son's admission into the guild. Young Jacques became, however, a workman in the Royal Mint of Bourges, in 1428, and behaved himself so well, and shewed so much knowledge of metallurgy, that he attained rapid promotion in that establishment. He had also the good fortune to make the acquaintance of the fair Agnes Sorel, by whom he was patronised and much esteemed. Jacques had now three things in his favour—ability, perseverance, and the countenance of the king's mistress. Many a man succeeds with but one of these to help him forward; and it would have been strange indeed if Jacques Cœur, who had them all, should have languished in obscurity. While still a young man, he was made master of the mint, in which he had been a journeyman, and installed at the same time into the vacant office of grand treasurer of the royal household.

He possessed an extensive knowledge of finance, and turned it wonderfully to his own advantage, as soon as he became entrusted

with extensive funds. He speculated in articles of the first necessity, and made himself popular by buying up grain, honey, wines, and other produce, till there was a scarcity, when he sold it again at enormous profit. Strong in the royal favour, he did not hesitate to oppress the poor by continual acts of forestalling and monopoly. As there is no enemy so bitter as the estranged friend, so of all the tyrants and trampers upon the poor, there is none so fierce and reckless as the upstart that sprang from their ranks. The offensive pride of Jacques Cœur to his inferiors was the theme of indignant reproach in his own city, and his cringing humility to those above him was as much an object of contempt to the aristocrats into whose society he thrust himself. But Jacques did not care for the former, and to the latter he was blind. He continued his career till he became the richest man in France, and so useful to the king that no important enterprise was set on foot until he had been consulted. He was sent, in 1446, on an embassy to Genoa, and in the following year to Pope Nicholas V. In both these missions he acquitted himself to the satisfaction of his sovereign, and was rewarded with a lucrative appointment, in addition to those which he already held.

In the year 1449, the English in Normandy, deprived of their great general, the Duke of Bedford, broke the truce with the French king, and took possession of a small town belonging to the Duke of Brittany. This was the signal for the recommencement of a war, in which the French regained possession of nearly the whole province. The money for this war was advanced, for the most part, by Jacques Cœur. When Rouen yielded to the French, and Charles made his triumphal entry into that city, accompanied by Dunois and his most famous generals, Jacques was among the most brilliant of his

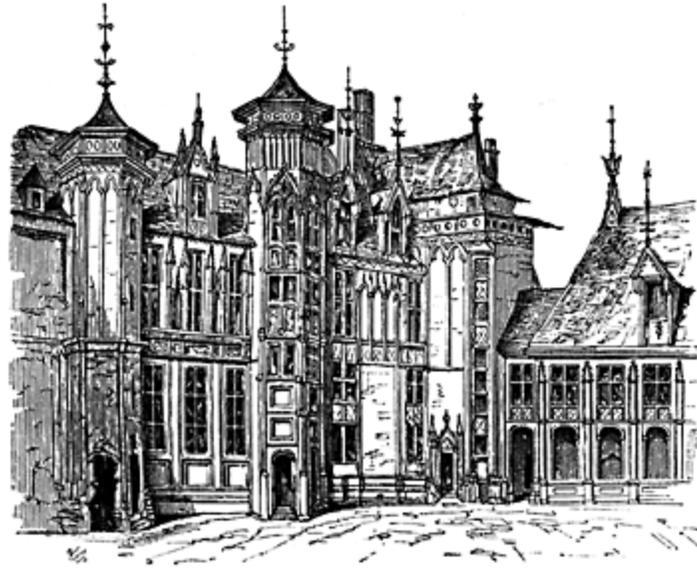

cortège. His chariot and horses vied with those of the king in the magnificence of their trappings; and his enemies said of him that he publicly boasted that he alone had driven out the English, and that the valour of the troops would have been nothing without his gold.

Dunois appears, also, to have been partly of the same opinion. Without disparaging the courage of the army, he acknowledged the utility of the able financier, by whose means they had been fed and paid, and constantly afforded him his powerful protection.

When peace returned, Jacques again devoted himself to commerce, and fitted up several galleys to trade with the Genoese. He also bought large estates in various parts of France; the chief of which were the baronies of St. Fargeau, Meneton, Salone, Maubranche, Meaune, St. Gerant de Vaux, and St. Aon de Boissy; the earldoms or counties of La Palisse, Champignelle, Beaumont, and Villeneuve la Genêt, and the marquisate of Toucy. He also procured for his son, Jean Cœur, who had chosen the Church for his profession, a post no less distinguished than that of Archbishop of Bourges.

Every body said that so much wealth could not have been honestly acquired; and both rich and poor longed for the day that should humble the pride of the man, whom the one class regarded as an upstart and the other as an oppressor. Jacques was somewhat alarmed at the rumours that were afloat respecting him, and of dark hints that he had debased the coin of the realm and forged the king's seal to an important document, by which he had defrauded the state of very considerable sums. To silence these rumours, he invited many alchemists from foreign countries to reside with him, and circulated a counter rumour, that he had discovered the secret of the

philosopher's stone. He also built a magnificent house in his native city, over the entrance of which he caused to be sculptured the emblems of that science. Some time afterwards he built another, no less splendid, at Montpellier, which he inscribed in a similar manner. He also wrote a treatise upon the hermetic philosophy, in which he pretended that he knew the secret of transmuting metals.

HOUSE OF JACQUES CŒUR, BOURGES.

But all these attempts to disguise his numerous acts of peculation proved unavailing; and he was arrested in 1452, and brought to trial on several charges. Upon one only, which the malice of his enemies invented to ruin him, was he acquitted; which was, that he had been accessory to the death, by poison, of his kind patroness, Agnes Sorel. Upon the others he was found guilty, and sentenced to be banished the kingdom, and to pay the enormous fine of four hundred thousand crowns. It was proved that he had forged the king's seal; that in his capacity of master of the mint of Bourges, he had debased, to a very great extent, the gold and silver coin of the realm; and that he had not hesitated to supply the Turks with arms and money to enable them to carry on war against their Christian neighbours, for which service he had received the most munificent recompenses.

Charles VII. was deeply grieved at his condemnation, and believed to the last that he was innocent. By his means the fine was reduced within a sum which Jacques Cœur could pay. After remaining for some time in prison, he was liberated, and left France with a large sum of money, part of which, it was alleged, was secretly paid him by Charles out of the produce of his confiscated estates. He retired to Cyprus, where he died about 1460, the richest and most conspicuous personage of the island.

The writers upon alchemy all claim Jacques Cœur as a member of their fraternity, and treat as false and libellous the more rational explanation of his wealth which the records of his trial afford. Pierre Borel, in his *Antiquités Gauloises*, maintains the opinion that Jacques was an honest man, and that he made his gold out of lead and copper by means of the philosopher's stone. The alchymic adepts in general were of the same opinion; but they found it difficult to persuade even his contemporaries of the fact. Posterity is still less likely to believe it.

INFERIOR ADEPTS OF THE FOURTEENTH AND FIFTEENTH CENTURIES.

Many other pretenders to the secrets of the philosopher's stone appeared in every country in Europe, during the fourteenth and fifteenth centuries. The possibility of transmutation was so generally admitted, that every chemist was more or less an alchemist. Germany, Holland, Italy, Spain, Poland, France, and England produced thousands of obscure adepts, who supported themselves, in the pursuit of their chimera, by the more profitable resources of astrology and divination. The monarchs of Europe were no less persuaded than their subjects of the possibility of discovering the

philosopher's stone. Henry VI. and Edward IV. of England encouraged alchemy. In Germany, the Emperors Maximilian, Rudolph, and Frederic II. devoted much of their attention to it; and every inferior potentate within their dominions imitated their example. It was a common practice in Germany, among the nobles and petty sovereigns, to invite an alchemist to take up his residence among them, that they might confine him in a dungeon till he made gold enough to pay millions for his ransom. Many poor wretches suffered perpetual imprisonment in consequence. A similar fate appears to have been intended by Edward II. for Raymond Lulli, who, upon the pretence that he was thereby honoured, was accommodated with apartments in the Tower of London. He found out in time the trick that was about to be played him, and managed to make his escape; some of his biographers say, by jumping into the Thames, and swimming to a vessel that lay waiting to receive him. In the sixteenth century, the same system was pursued, as will be shewn more fully in the life of Seton the Cosmopolite.

The following is a catalogue of the chief authors upon alchemy, who flourished during this epoch, and whose lives and adventures are either unknown or are unworthy of more detailed notice. John Dowston, an Englishman, lived in 1315, and wrote two treatises on the philosopher's stone. Richard, or, as some call him, Robert, also an Englishman, lived in 1330, and wrote a work entitled *Correctorium Alchymiaë*, which was much esteemed till the time of Paracelsus. In the same year lived Peter of Lombardy, who wrote what he called a *Complete Treatise upon the Hermetic Science*, an abridgment of which was afterwards published by Lacini, a monk of Calabria. In 1330 the most famous alchemist of Paris was one

Odomare, whose work, *De Practica Magistri*, was for a long time a hand-book among the brethren of the science. John de Rupecissa, a French monk of the order of St. Francis, flourished in 1357, and pretended to be a prophet as well as an alchymist. Some of his prophecies were so disagreeable to Pope Innocent VI., that the pontiff determined to put a stop to them, by locking up the prophet in the dungeons of the Vatican. It is generally believed that he died there, though there is no evidence of the fact. His chief works are, the *Book of Light*, the *Five Essences*, the *Heaven of Philosophers*, and his grand work, *De Confectione Lapidis*. He was not thought a shining light among the adepts. Ortholani was another pretender, of whom nothing is known, but that he exercised the arts of alchymy and astrology at Paris, shortly before the time of Nicholas Flamel. His work on the practice of alchymy was written in that city in 1358. Isaac of Holland wrote, it is supposed, about this time; and his son also devoted himself to the science. Nothing worth repeating is known of their lives. Boerhaave speaks with commendation of many passages in their works, and Paracelsus esteemed them highly: the chief are, *De Triplici Ordine Elixiris et Lapidis Theoria*, printed at Berne in 1608; and *Mineralia Opera, seu de Lapide Philosophico*, printed at Middleburg in 1600. They also wrote eight other works upon the same subject. Koffstky, a Pole, wrote an alchymical treatise, entitled *The Tincture of Minerals*, about the year 1488. In this list of authors a royal name must not be forgotten. Charles VI. of France, one of the most credulous princes of the day, whose court absolutely swarmed with alchymists, conjurers, astrologers, and quacks of every description, made several attempts to discover the philosopher's stone, and thought he knew so much about it, that he determined to

enlighten the world with a treatise; it is called the *Royal Work of Charles VI. of France, and the Treasure of Philosophy*. It is said to be the original from which Nicholas Flamel took the idea of his *Désir désiré*. Lenglet du Fresnoy says it is very allegorical, and utterly incomprehensible. For a more complete list of the hermetic philosophers of the fourteenth and fifteenth centuries, the reader is referred to the third volume of Lenglet's History, already quoted.

PROGRESS OF THE INFATUATION DURING THE
SIXTEENTH AND SEVENTEENTH CENTURIES.—
PRESENT STATE OF THE SCIENCE.

During the sixteenth and seventeenth centuries, the search for the philosopher's stone was continued by thousands of the enthusiastic and the credulous; but a great change was introduced during this period. The eminent men who devoted themselves to the study totally changed its aspect, and referred to the possession of their wondrous stone and elixir, not only the conversion of the base into the precious metals, but the solution of all the difficulties of other sciences. They pretended that by its means man would be brought into closer communion with his Maker; that disease and sorrow would be banished from the world; and that "the millions of spiritual beings who walk the earth unseen" would be rendered visible, and become the friends, companions, and instructors of mankind. In the seventeenth century more especially, these poetical and fantastic doctrines excited the notice of Europe; and from Germany, where they had been first disseminated by Rosencreutz, spread into France

and England, and ran away with the sound judgment of many clever but too enthusiastic searchers for the truth. Paracelsus, Dee, and many others of less note, were captivated by the grace and beauty of the new mythology, which was arising to adorn the literature of Europe. Most of the alchemists of the sixteenth century, although ignorant of the Rosicrucians as a sect, were, in some degree, tinctured with their fanciful tenets: but before we speak more fully of these poetical visionaries, it will be necessary to resume the history of the hermetic folly, and trace the gradual change that stole over the dreams of the adepts. It will be seen that the infatuation increased rather than diminished as the world grew older.

AUGURELLO.

Among the alchemists who were born in the fifteenth, and distinguished themselves in the sixteenth century, the first in point of date is John Aurelio Augurello. He was born at Rimini in 1441, and became professor of the *belles lettres* at Venice and Trevisa. He was early convinced of the truth of the hermetic science, and used to pray to God that he might be happy enough to discover the philosopher's stone. He was continually surrounded by the paraphernalia of chemistry, and expended all his wealth in the purchase of drugs and metals. He was also a poet, but of less merit than pretensions. His *Chrysopeia*, in which he pretended to teach the art of making gold, he dedicated to Pope Leo X., in the hope that the pontiff would reward him handsomely for the compliment; but the pope was too good a judge of poetry to be pleased with the worse than mediocrity of his poem, and too good a philosopher to approve of the strange doctrines which it inculcated; he was, therefore, far from gratified at

the dedication. It is said, that when Augurello applied to him for a reward, the pope, with great ceremony and much apparent kindness and cordiality, drew an empty purse from his pocket, and presented it to the alchemist, saying, that since he was able to make gold, the most appropriate present that could be made him, was a purse to put it in. This scurvy reward was all that the poor alchemist ever got either for his poetry or his alchemy. He died in a state of extreme poverty, in the eighty-third year of his age.

CORNELIUS AGRIPPA.

This alchemist has left a distinguished reputation. The most extraordinary tales were told and believed of his powers. He could turn iron into gold by his mere word. All the spirits of the air and demons of the earth were under his command, and bound to obey him in everything. He could raise from the dead the forms of the great men of other days, and make them appear, “in their habit as they lived,” to the gaze of the curious who had courage enough to abide their presence.

CORNELIUS AGRIPPA.

He was born at Cologne in 1486, and began at an early age the study of chemistry and philosophy. By some means or other, which have never been very clearly explained, he managed to impress his contemporaries with a great idea of his wonderful attainments. At the early age of twenty, so great was his reputation as an alchymist, that the principal adepts of Paris wrote to Cologne, inviting him to settle in France, and aid them with his experience in discovering the philosopher's stone. Honours poured upon him in thick succession; and he was highly esteemed by all the learned men of his time. Melancthon speaks of him with respect and commendation. Erasmus also bears testimony in his favour; and the general voice of his age proclaimed him a light of literature and an ornament to philosophy. Some men, by dint of excessive egotism, manage to persuade their contemporaries that they are very great men indeed: they publish their acquirements so loudly in people's ears, and keep up their own praises so incessantly, that the world's applause is actually taken by storm. Such seems to have been the case with Agrippa. He called himself a sublime theologian, an excellent jurisconsult, an able physician, a great philosopher, and a successful alchymist. The world at last took him at his word; and thought that a man who talked so big, must have some merit to recommend him,—that it was, indeed, a great trumpet which sounded so obstreperous a blast. He was made secretary to the Emperor Maximilian, who conferred upon him the title of chevalier, and gave him the honorary command of a regiment. He afterwards became professor of Hebrew and the *belles lettres* at the University of Dôle, in France; but quarrelling with the Franciscan monks upon some knotty points of divinity, he was obliged to quit the town. He took refuge in London, where he taught Hebrew and

cast nativities, for about a year. From London he proceeded to Pavia, and gave lectures upon the writings, real or supposed, of Hermes Trismegistus; and might have lived there in peace and honour, had he not again quarrelled with the clergy. By their means his position became so disagreeable that he was glad to accept an offer made him by the magistracy of Metz, to become their syndic and advocate-general. Here, again, his love of disputation made him enemies: the theological wiseacres of that city asserted that St. Ann had three husbands, in which opinion they were confirmed by the popular belief of the day. Agrippa needlessly ran foul of this opinion, or prejudice as he called it, and thereby lost much of his influence. Another dispute, more creditable to his character, occurred soon after, and sank him for ever in the estimation of the Metzians. Humanely taking the part of a young girl who was accused of witchcraft, his enemies asserted that he was himself a sorcerer, and raised such a storm over his head, that he was forced to fly the city. After this he became physician to Louisa de Savoy, mother of King Francis I. This lady was curious to know the future, and required her physician to cast her nativity. Agrippa replied that he would not encourage such idle curiosity. The result was, he lost her confidence, and was forthwith dismissed. If it had been through his belief in the worthlessness of astrology, that he had made his answer, we might admire his honest and fearless independence; but when it is known that, at the very same time, he was in the constant habit of divination and fortune-telling, and that he was predicting splendid success, in all his undertakings, to the Constable of Bourbon, we can only wonder at his thus estranging a powerful friend through mere petulance and perversity.

He was about this time invited, both by Henry VIII. of England, and Margaret of Austria, governess of the Low Countries, to fix his residence in their dominions. He chose the service of the latter, by whose influence he was made historiographer to the Emperor Charles V. Unfortunately for Agrippa, he never had stability enough to remain long in one position, and offended his patrons by his restlessness and presumption. After the death of Margaret he was imprisoned at Brussels, on a charge of sorcery. He was released after a year; and quitting the country, experienced many vicissitudes. He died in great poverty in 1534, aged forty-eight years.

While in the service of Margaret of Austria, he resided principally at Louvain, in which city he wrote his famous work on the *Vanity and Nothingness of Human Knowledge*. He also wrote to please his royal mistress, a treatise upon the *Superiority of the Female Sex*, which he dedicated to her in token of his gratitude for the favours she had heaped upon him. The reputation he left behind him in these provinces was any thing but favourable. A great number of the marvellous tales that are told of him relate to this period of his life. It was said, that the gold which he paid to the traders with whom he dealt, always looked remarkably bright, but invariably turned into pieces of slate and stone in the course of four-and-twenty hours. Of this spurious gold he was believed to have made large quantities by the aid of the devil, who, it would appear from this, had but a very superficial knowledge of alchymy, and much less than the Maréchal de Rays gave him credit for. The Jesuit Delrio, in his book on magic and sorcery, relates a still more extraordinary story of him. One day, Agrippa left his house at Louvain, and intending to be absent for some time, gave the key of his study to his wife, with strict orders

that no one should enter it during his absence. The lady herself, strange as it may appear, had no curiosity to pry into her husband's secrets, and never once thought of entering the forbidden room; but a young student, who had been accommodated with an attic in the philosopher's house, burned with a fierce desire to examine the study; hoping, perchance, that he might purloin some book or implement which would instruct him in the art of transmuting metals. The youth, being handsome, eloquent, and, above all, highly complimentary to the charms of the lady, she was persuaded without much difficulty to lend him the key, but gave him strict orders not to remove any thing. The student promised implicit obedience, and entered Agrippa's study. The first object that caught his attention was a large *grimoire*, or book of spells, which lay open on the philosopher's desk. He sat himself down immediately and began to read. At the first word he uttered, he fancied he heard a knock at the door. He listened, but all was silent. Thinking that his imagination had deceived him, he read on, when immediately a louder knock was heard, which so terrified him, that he started to his feet. He tried to say "Come in," but his tongue refused its office, and he could not articulate a sound. He fixed his eyes upon the door, which, slowly opening, disclosed a stranger of majestic form, but scowling features, who demanded sternly, why he was summoned? "I did not summon you," said the trembling student. "You did!" said the stranger, advancing angrily; "and the demons are not to be invoked in vain." The student could make no reply; and the demon, enraged that one of the uninitiated should have summoned him out of mere presumption, seized him by the throat and strangled him. When Agrippa returned, a few days afterwards, he found his house beset

with devils. Some of them were sitting on the chimney-pots, kicking up their legs in the air; while others were playing at leapfrog on the very edge of the parapet. His study was so filled with them, that he found it difficult to make his way to his desk. When, at last, he had elbowed his way through them, he found his book open, and the student lying dead upon the floor. He saw immediately how the mischief had been done; and dismissing all the inferior imps, asked the principal demon how he could have been so rash as to kill the young man. The demon replied, that he had been needlessly invoked by an insulting youth, and could do no less than kill him for his presumption. Agrippa reprimanded him severely, and ordered him immediately to reanimate the dead body, and walk about with it in the market-place for the whole of the afternoon. The demon did so; the student revived, and putting his arm through that of his unearthly murderer, walked very lovingly with him in sight of all the people. At sunset, the body fell down again, cold and lifeless as before, and was carried by the crowd to the hospital, it being the general opinion that he had expired in a fit of apoplexy. His conductor immediately disappeared. When the body was examined, marks of strangulation were found on the neck, and prints of the long claws of the demon on various parts of it. These appearances, together with a story, which soon obtained currency, that the companion of the young man had vanished in a cloud of flame and smoke, opened people's eyes to the truth. The magistrates of Louvain instituted inquiries, and the result was, that Agrippa was obliged to quit the town.

Other authors besides Delrio relate similar stories of this philosopher. The world in those days was always willing enough to

believe in tales of magic and sorcery; and when, as in Agrippa's case, the alleged magician gave himself out for such, and claimed credit for the wonders he worked, it is not surprising that the age should have allowed his pretensions. It was dangerous boasting, which sometimes led to the stake or the gallows, and therefore was thought to be not without foundation. Paulus Jovius, in his *Eulogia Doctorum Virorum*, says, that the devil, in the shape of a large black dog, attended Agrippa wherever he went. Thomas Nash, in his *Adventures of Jack Wilton*, relates, that, at the request of Lord Surrey, Erasmus, and some other learned men, Agrippa called up from the grave many of the great philosophers of antiquity; among others, Tully, whom he caused to re-deliver his celebrated oration for Roscius. He also shewed Lord Surrey, when in Germany, an exact resemblance in a glass of his mistress, the fair Geraldine. She was represented on a couch weeping for the absence of her lover. Lord Surrey made a note of the exact time at which he saw this vision, and ascertained afterwards that his mistress was actually so employed at the very minute. To Thomas Lord Cromwell, Agrippa represented King Henry VIII. hunting in Windsor Park, with the principal lords of his court; and to please the Emperor Charles V. he summoned King David and King Solomon from the tomb.

Naudé, in his "*Apology for the great Men who have been falsely suspected of Magic*," takes a great deal of pains to clear Agrippa from the imputations cast upon him by Delrio, Paulus Jovius, and other such ignorant and prejudiced scribblers. Such stories demanded refutation in the days of Naudé, but they may now be safely left to decay in their own absurdity. That they should have attached, however, to the memory of a man who claimed the power of making

iron obey him when he told it to become gold, and who wrote such a work as that upon magic, which goes by his name, is not at all surprising.

PARACELSUS.

This philosopher, called by Naudé “the zenith and rising sun of all the alchymists,” was born at Einsiedeln, near Zurich, in the year 1493. His true name was Hohenheim; to which, as he himself informs us, were prefixed the baptismal names of Aureolus Theophrastus Bombastes Paracelsus. The last of these he chose for his common designation while he was yet a boy; and rendered it, before he died, one of the most famous in the annals of his time. His father, who was a physician, educated his son for the same pursuit. The latter was an apt scholar, and made great progress. By chance the work of Isaac Hollandus fell into his hands, and from that time he became smitten with the mania of the philosopher’s stone. All his thoughts henceforth were devoted to metallurgy; and he travelled into Sweden that he might visit the mines of that country, and examine the ores while they yet lay in the bowels of the earth. He also visited Trithemius at the monastery of Spannheim, and obtained instructions from him in the science of alchymy. Continuing his travels, he proceeded through Prussia and Austria into Turkey, Egypt, and Tartary, and thence returning to Constantinople, learned, as he boasted, the art of transmutation, and became possessed of the *elixir vitæ*. He then established himself as a physician in his native Switzerland at Zurich, and commenced writing works upon alchymy and medicine, which immediately fixed the attention of Europe. Their great obscurity was no impediment to their fame; for the less

the author was understood, the more the demonologists, fanatics, and philosopher's-stone hunters seemed to appreciate him. His fame as a physician kept pace with that which he enjoyed as an alchemist, owing to his having effected some happy cures by means of mercury and opium,—drugs unceremoniously condemned by his professional brethren. In the year 1526, he was chosen professor of physics and natural philosophy in the University of Basle, where his lectures attracted vast numbers of students. He denounced the writings of all former physicians as tending to mislead; and publicly burned the works of Galen and Avicenna, as quacks and impostors. He exclaimed, in presence of the admiring and half-bewildered crowd, who assembled to witness the ceremony, that there was more knowledge in his shoe-strings than in the writings of these physicians. Continuing in the same strain, he said, all the Universities in the world were full of ignorant quacks; but that he, Paracelsus, overflowed with wisdom. “You will all follow my new system,” said he, with furious gesticulations, “Avicenna, Galen, Rhazis, Montagnana, Memé,—you will all follow me, ye professors of Paris, Montpellier, Germany, Cologne, and Vienna! and all ye that dwell on the Rhine and the Danube,—ye that inhabit the isles of the sea; and ye also, Italians, Dalmatians, Athenians, Arabians, Jews,—ye will all follow my doctrines, for I am the monarch of medicine!”

PARACELSUS.

But he did not long enjoy the esteem of the good citizens of Basle. It is said that he indulged in wine so freely, as not unfrequently to be seen in the streets in a state of intoxication. This was ruinous for a physician, and his good fame decreased rapidly. His ill fame increased in still greater proportion, especially when he assumed the airs of a sorcerer. He boasted of the legions of spirits at his command; and of one especially, which he kept imprisoned in the hilt of his sword. Wetteras, who lived twenty-seven months in his service, relates that he often threatened to invoke a whole army of demons, and shew him the great authority which he could exercise over them. He let it be believed that the spirit in his sword had custody of the elixir of life, by means of which he could make any one live to be as old as the antediluvians. He also boasted that he had a spirit at his command, called "Azoth," whom he kept imprisoned in a jewel; and in many of the old portraits he is represented with a jewel, inscribed with the word "Azoth, in his hand."

If a sober prophet has little honour in his own country, a drunken one has still less. Paracelsus found it at last convenient to quit Basle, and establish himself at Strasbourg. The immediate cause of this change of residence was as follows. A citizen lay at the point of death, and was given over by all the physicians of the town. As a last resource Paracelsus was called in, to whom the sick man promised a magnificent recompense, if, by his means, he were cured. Paracelsus gave him two small pills, which the man took, and rapidly recovered. When he was quite well, Paracelsus sent for his fee; but the citizen had no great opinion of the value of a cure which had been so speedily effected. He had no notion of paying a handful of gold for

two pills, although they had saved his life, and he refused to pay more than the usual fee for a single visit. Paracelsus brought an action against him, and lost it. This result so exasperated him, that he left Basle in high dudgeon. He resumed his wandering life, and travelled in Germany and Hungary, supporting himself as he went on the credulity and infatuation of all classes of society. He cast nativities—told fortunes—aided those who had money to throw away upon the experiment, to find the philosopher's stone—prescribed remedies for cows and pigs, and aided in the recovery of stolen goods. After residing successively at Nuremburg, Augsburg, Vienna, and Mindelheim, he retired in the year 1541 to Saltzbourg, and died in a state of abject poverty in the hospital of that town.

If this strange charlatan found hundreds of admirers during his life, he found thousands after his death. A sect of Paracelsists sprang up in France and Germany, to perpetuate the extravagant doctrines of their founder upon all the sciences, and upon alchemy in particular. The chief leaders were Bodenstein and Dorneus. The following is a summary of his doctrine, founded upon the supposed existence of the philosopher's stone; it is worth preserving from its very absurdity, and is altogether unparalleled in the history of philosophy. First of all, he maintained that the contemplation of the perfection of the Deity sufficed to procure all wisdom and knowledge; that the Bible was the key to the theory of all diseases, and that it was necessary to search into the Apocalypse to know the signification of magic medicine. The man who blindly obeyed the will of God, and who succeeded in identifying himself with the celestial intelligences, possessed the philosopher's stone—he could cure all diseases, and prolong life to as many centuries as he pleased; it being

by the very same means that Adam and the antediluvian patriarchs prolonged theirs. Life was an emanation from the stars—the sun governed the heart, and the moon the brain. Jupiter governed the liver, Saturn the gall, Mercury the lungs, Mars the bile, and Venus the loins. In the stomach of every human being there dwelt a demon, or intelligence, that was a sort of alchemist in his way, and mixed, in their due proportions, in his crucible, the various aliments that were sent into that grand laboratory, the belly.⁴⁰ He was proud of the title of magician, and boasted that he kept up a regular correspondence with Galen from hell; and that he often summoned Avicenna from the same regions to dispute with him on the false notions he had promulgated respecting alchymy, and especially regarding potable gold and the elixir of life. He imagined that gold could cure ossification of the heart, and, in fact, all diseases, if it were gold which had been transmuted from an inferior metal by means of the philosopher's stone, and if it were applied under certain conjunctions of the planets. The mere list of the works in which he advances these frantic imaginings, which he called a doctrine, would occupy several pages.

GEORGE AGRICOLA.

This alchemist was born in the province of Misnia, in 1494. His real name was *Bauer*, meaning a husbandman, which, in accordance with the common fashion of his age, he latinised into Agricola. From his early youth, he delighted in the visions of the hermetic science. Ere he was sixteen, he longed for the great elixir which was to make him live for seven hundred years, and for the stone which was to procure him wealth to cheer him in his multiplicity of days. He

published a small treatise upon the subject at Cologne, in 1531, which obtained him the patronage of the celebrated Maurice duke of Saxony. After practising for some years as a physician at Joachimsthal, in Bohemia, he was employed by Maurice as superintendent of the silver mines of Chemnitz. He led a happy life among the miners, making various experiments in alchemy while deep in the bowels of the earth. He acquired a great knowledge of metals, and gradually got rid of his extravagant notions about the philosopher's stone. The miners had no faith in alchemy; and they converted him to their way of thinking, not only in that but in other respects. From their legends, he became firmly convinced that the bowels of the earth were inhabited by good and evil spirits, and that firedamp and other explosions sprang from no other causes than the mischievous propensities of the latter. He died in the year 1555, leaving behind him the reputation of a very able and intelligent man.

DENIS ZACHAIRE.

Autobiography, written by a wise man who was once a fool, is not only the most instructive, but the most delightful of reading. Denis Zachaire, an alchemist of the sixteenth century, has performed this task, and left a record of his folly and infatuation in pursuit of the philosopher's stone, which well repays perusal. He was born in the year 1510, of an ancient family in Guienne, and was early sent to the university of Bordeaux, under the care of a tutor to direct his studies. Unfortunately his tutor was a searcher for the grand elixir, and soon rendered his pupil as mad as himself upon the subject. With this introduction, we will allow Denis Zachaire to speak for himself, and continue his narrative in his own words: "I received from home,"

says he, “the sum of two hundred crowns for the expenses of myself and master; but before the end of the year, all our money went away in the smoke of our furnaces. My master, at the same time, died of a fever, brought on by the parching heat of our laboratory, from which he seldom or never stirred, and which was scarcely less hot than the arsenal of Venice. His death was the more unfortunate for me, as my parents took the opportunity of reducing my allowance, and sending me only sufficient for my board and lodging, instead of the sum I required to continue my operations in alchemy.

“To meet this difficulty and get out of leading-strings, I returned home at the age of twenty-five, and mortgaged part of my property for four hundred crowns. This sum was necessary to perform an operation of the science, which had been communicated to me by an Italian at Toulouse, and who, as he said, had proved its efficacy. I retained this man in my service, that we might see the end of the experiment. I then, by means of strong distillations, tried to calcinate gold and silver; but all my labour was in vain. The weight of the gold I drew out of my furnace was diminished by one-half since I put it in, and my four hundred crowns were very soon reduced to two hundred and thirty. I gave twenty of these to my Italian, in order that he might travel to Milan, where the author of the receipt resided, and ask him the explanation of some passages which we thought obscure. I remained at Toulouse all the winter, in the hope of his return; but I might have remained there till this day if I had waited for him, for I never saw his face again.

“In the succeeding summer there was a great plague, which forced me to quit the town. I did not, however, lose sight of my

work. I went to Cahors, where I remained six months, and made the acquaintance of an old man, who was commonly known to the people as ‘the Philosopher;’ a name which, in country places, is often bestowed upon people whose only merit is, that they are less ignorant than their neighbours. I shewed him my collection of alchymical receipts, and asked his opinion upon them. He picked out ten or twelve of them, merely saying that they were better than the others. When the plague ceased, I returned to Toulouse, and recommenced my experiments in search of the stone. I worked to such effect that my four hundred crowns were reduced to one hundred and seventy.

“That I might continue my work on a safer method, I made acquaintance, in 1537, with a certain abbé who resided in the neighbourhood. He was smitten with the same mania as myself, and told me that one of his friends, who had followed to Rome in the retinue of the Cardinal d’Armagnac, had sent him from that city a new receipt which could not fail to transmute iron and copper, but which would cost two hundred crowns. I provided half this money, and the abbé the rest; and we began to operate at our joint expense. As we required spirits of wine for our experiment, I bought a tun of excellent *vin de Gaillac*. I extracted the spirit, and rectified it several times. We took a quantity of this, into which we put four marks of silver and one of gold that had been undergoing the process of calcination for a month. We put this mixture cleverly into a sort of horn-shaped vessel, with another to serve as a retort; and placed the whole apparatus upon our furnace to produce congelation. This experiment lasted a year; but, not to remain idle, we amused

ourselves with many other less important operations. We drew quite as much profit from these as from our great work.

“The whole of the year 1537 passed over without producing any change whatever; in fact we might have waited till doomsday for the congelation of our spirits of wine. However, we made a projection with it upon some heated quicksilver; but all was in vain. Judge of our chagrin, especially of that of the abbé, who had already boasted to all the monks of his monastery, that they had only to bring the large pump which stood in a corner of the cloister, and he would convert it into gold: but this ill luck did not prevent us from persevering. I once more mortgaged my paternal lands for four hundred crowns, the whole of which I determined to devote to a renewal of my search for the great secret. The abbé contributed the same sum; and with these eight hundred crowns I proceeded to Paris, a city more abounding with alchemists than any other in the world, resolved never to leave it until I had either found the philosopher’s stone or spent all my money. This journey gave the greatest offence to all my relations and friends, who, imagining that I was fitted to be a great lawyer, were anxious that I should establish myself in that profession. For the sake of quietness, I pretended, at last, that such was my object.

“After travelling for fifteen days, I arrived in Paris on the 9th of January 1539. I remained for a month almost unknown; but I had no sooner begun to frequent the amateurs of the science, and visited the shops of the furnace-makers, than I had the acquaintance of more than a hundred operative alchemists, each of whom had a different theory and a different mode of working.

Some of them preferred cementation; others sought the universal alkahest or dissolvent; and some of them boasted the great efficacy of the essence of emery. Some of them endeavoured to extract mercury from other metals, to fix it afterwards; and, in order that each of us should be thoroughly acquainted with the proceedings of the others, we agreed to meet somewhere every night and report progress. We met sometimes at the house of one, and sometimes in the garret of another; not only on week days, but on Sundays and the great festivals of the Church. 'Ah!' one used to say, 'if I had the means of recommencing this experiment, I should do something.' 'Yes,' said another, 'if my crucible had not cracked, I should have succeeded before now;' while a third exclaimed, with a sigh, 'If I had but had a round copper vessel of sufficient strength, I would have fixed mercury with silver.' There was not one among them who had not some excuse for his failure; but I was deaf to all their speeches. I did not want to part with my money to any of them, remembering how often I had been the dupe of such promises.

"A Greek at last presented himself; and with him I worked a long time uselessly upon nails made of cinnabar or vermilion. I was also acquainted with a foreign gentleman newly arrived in Paris, and often accompanied him to the shops of the goldsmiths to sell pieces of gold and silver, the produce, as he said, of his experiments. I stuck closely to him for a long time, in the hope that he would impart his secret. He refused for a long time, but acceded at last on my earnest entreaty, and I found that it was nothing more than an ingenious trick. I did not fail to inform my

friend the abbé, whom I had left at Toulouse, of all my adventures; and sent him, among other matters, a relation of the trick by which this gentleman pretended to turn lead into gold. The abbé still imagined that I should succeed at last, and advised me to remain another year in Paris, where I had made so good a beginning. I remained there three years; but, notwithstanding all my efforts, I had no more success than I had had elsewhere.

“I had just got to the end of my money, when I received a letter from the abbé, telling me to leave every thing, and join him immediately at Toulouse. I went accordingly, and found that he had received letters from the king of Navarre (grandfather of Henry IV.). This prince was a great lover of philosophy, full of curiosity, and had written to the abbé that I should visit him at Pau; and that he would give me three or four thousand crowns if I would communicate the secret I had learned from the foreign gentleman. The abbé’s ears were so tickled with the four thousand crowns, that he let me have no peace night or day until he had fairly seen me on the road to Pau. I arrived at that place in the month of May 1542. I worked away, and succeeded, according to the receipt I had obtained. When I had finished to the satisfaction of the king, he gave me the reward that I expected. Although he was willing enough to do me further service, he was dissuaded from it by the lords of his court; even by many of those who had been most anxious that I should come. He sent me then about my business, with many thanks; saying, that if there was any thing in his kingdom which he could give me—such as the produce of confiscations or

the like—he should be most happy. I thought I might stay long enough for these prospective confiscations, and never get them at last; and I therefore determined to go back to my friend the abbé.

“I learned that, on the road between Pau and Toulouse, there resided a monk who was very skilful in all matters of natural philosophy. On my return, I paid him a visit. He pitied me very much, and advised me, with much warmth and kindness of expression, not to amuse myself any longer with such experiments as these, which were all false and sophistical; but that I should read the good books of the old philosophers, where I might not only find the true matter of the science of alchymy, but learn also the exact order of operations which ought to be followed. I very much approved of this wise advice; but before I acted upon it, I went back to my abbé of Toulouse, to give him an account of the eight hundred crowns which we had had in common, and, at the same time, share with him such reward as I had received from the king of Navarre. If he was little satisfied with the relation of my adventures since our first separation, he appeared still less satisfied when I told him I had formed a resolution to renounce the search for the philosopher’s stone. The reason was that he thought me a good artist. Of our eight hundred crowns, there remained but one hundred and seventy-six. When I quitted the abbé, I went to my own house with the intention of remaining there, till I had read all the old philosophers, and of then proceeding to Paris.

“I arrived in Paris on the day after All Saints, of the year 1546, and devoted another year to the assiduous study of great

authors. Among others, the *Turba Philosophorum* of the Good Trevisan, the *Remonstrance of Nature to the Wandering Alchymist*, by Jean de Meung, and several others of the best books; but, as I had no right principles, I did not well know what course to follow.

“At last I left my solitude, not to see my former acquaintances, the adepts and operators, but to frequent the society of true philosophers. Among them I fell into still greater uncertainties; being, in fact, completely bewildered by the variety of operations which they shewed me. Spurred on, nevertheless, by a sort of frenzy or inspiration, I threw myself into the works of Raymond Lulli and of Arnold de Villeneuve. The reading of these, and the reflections I made upon them, occupied me for another year, when I finally determined on the course I should adopt. I was obliged to wait, however, until I had mortgaged another very considerable portion of my patrimony. This business was not settled until the beginning of Lent, 1549, when I commenced my operations. I laid in a stock of all that was necessary, and began to work the day after Easter. It was not, however, without some disquietude and opposition from my friends who came about me; one asking me what I was going to do, and whether I had not already spent money enough upon such follies? Another assured me that, if I bought so much charcoal, I should strengthen the suspicion already existing, that I was a coiner of base money. Another advised me to purchase some place in the magistracy, as I was already a Doctor of Laws. My relations spoke in terms still more annoying to me, and even threatened that, if I continued to make such a fool of myself, they would

send a posse of police-officers into my house, and break all my furnaces and crucibles into atoms. I was wearied almost to death by this continued persecution; but I found comfort in my work and in the progress of my experiment, to which I was very attentive, and which went on bravely from day to day. About this time, there was a dreadful plague in Paris, which interrupted all intercourse between man and man, and left me as much to myself as I could desire. I soon had the satisfaction to remark the progress and succession of the three colours which, according to the philosophers, always prognosticate the approaching perfection of the work. I observed them distinctly, one after the other; and next year, being Easter Sunday, 1550, I made the great trial. Some common quicksilver, which I put into a small crucible on the fire, was, in less than an hour, converted into very good gold. You may judge how great was my joy, but I took care not to boast of it. I returned thanks to God for the favour he had shewn me, and prayed that I might only be permitted to make such use of it as would redound to his glory.

“On the following day, I went towards Toulouse to find, the abbé, in accordance with a mutual promise, that we should communicate our discoveries to each other. On my way, I called in to see the sage monk who had assisted me with his counsels; but I had the sorrow to learn that they were both dead. After this, I would not return to my own home, but retired to another place, to await one of my relations whom I had left in charge of my estate. I gave him orders to sell all that belonged to me, as well movable as immovable—to pay my debts with the proceeds, and divide all the rest among those in any way related to me who

might stand in need of it, in order that they might enjoy some share of the good fortune which had befallen me. There was a great deal of talk in the neighbourhood about my precipitate retreat; the wisest of my acquaintance imagining that, broken down and ruined by my mad expenses, I sold my little remaining property, that I might go and hide my shame in distant countries.

“My relative already spoken of rejoined me on the 1st of July, after having performed all the business I had entrusted him with. We took our departure together, to seek a land of liberty. We first retired to Lausanne, in Switzerland, when, after remaining there for some time, we resolved to pass the remainder of our days in some of the most celebrated cities of Germany, living quietly and without splendour.”

Thus ends the story of Denis Zacheire, as written by himself. He has not been so candid at its conclusion as at its commencement, and has left the world in doubt as to his real motives for pretending that he had discovered the philosopher’s stone. It seems probable that the sentence he puts into the mouths of his wisest acquaintances was the true reason of his retreat; that he was, in fact, reduced to poverty, and hid his shame in foreign countries. Nothing further is known of his life, and his real name has never yet been discovered. He wrote a work on alchymy, entitled *The true Natural Philosophy of Metals*.

DR. DEE AND EDWARD KELLY.

John Dee and Edward Kelly claim to be mentioned together, having been so long associated in the same pursuits, and undergone

so many strange vicissitudes in each other's society. Dee was altogether a wonderful man, and had he lived in an age when folly and superstition were less rife, he would, with the same powers which he enjoyed, have left behind him a bright and enduring reputation. He was born in London in the year 1527, and very early manifested a love for study. At the age of fifteen he was sent to Cambridge, and delighted so much in his books, that he passed regularly eighteen hours every day among them. Of the other six, he devoted four to sleep and two for refreshment. Such intense application did not injure his health, and could not fail to make him one of the first scholars of his time. Unfortunately, however, he quitted the mathematics and the pursuits of true philosophy, to indulge in the unprofitable reveries of the occult sciences. He studied alchymy, astrology, and magic, and thereby rendered himself obnoxious to the authorities at Cambridge. To avoid persecution, he was at last obliged to retire to the university of Louvain; the rumours of sorcery that were current respecting him rendering his longer stay in England not altogether without danger. He found at Louvain many kindred spirits who had known Cornelius Agrippa while he resided among them, and by whom he was constantly entertained with the wondrous deeds of that great master of the hermetic mysteries. From their conversation he received much encouragement to continue the search for the philosopher's stone, which soon began to occupy nearly all his thoughts.

DR. DEE.

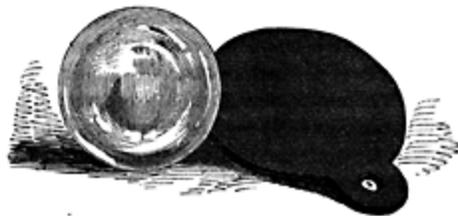

He did not long remain on the Continent, but returned to England in 1551, being at that time in the twenty-fourth year of his age. By the influence of his friend Sir John Cheek, he was kindly received at the court of King Edward VI., and rewarded (it is difficult to say for what) with a pension of one hundred crowns. He continued for several years to practise in London as an astrologer; casting nativities, telling fortunes, and pointing out lucky and unlucky days. During the reign of Queen Mary he got into trouble, being suspected of heresy, and charged with attempting Mary's life by means of enchantments. He was tried for the latter offence, and acquitted; but was retained in prison on the former charge, and left to the tender mercies of Bishop Bonner. He had a very narrow escape from being burned in Smithfield, but he somehow or other contrived to persuade that fierce bigot that his orthodoxy was unimpeachable, and was set at liberty in 1555.

On the accession of Elizabeth, a brighter day dawned upon him. During her retirement at Woodstock, her servants appear to have consulted him as to the time of Mary's death, which circumstance no

doubt first gave rise to the serious charge for which he was brought to trial. They now came to consult him more openly as to the fortunes of their mistress; and Robert Dudley, the celebrated Earl of Leicester, was sent by command of the Queen herself to know the most auspicious day for her coronation. So great was the favour he enjoyed, that, some years afterwards, Elizabeth condescended to pay him a visit at his house in Mortlake, to view his museum of curiosities, and when he was ill, sent her own physician to attend upon him.

Astrology was the means whereby he lived, and he continued to practise it with great assiduity; but his heart was in alchemy. The philosopher's stone and the elixir of life haunted his daily thoughts and his nightly dreams. The Talmudic mysteries, which he had also deeply studied, impressed him with the belief, that he might hold converse with spirits and angels, and learn from them all the mysteries of the universe. Holding the same idea as the then obscure sect of the Rosicrucians, some of whom he had perhaps encountered in his travels in Germany, he imagined that, by means of the philosopher's stone, he could summon these kindly spirits at his will. By dint of continually brooding upon the subject, his imagination became so diseased, that he at last persuaded himself that an angel appeared to him, and promised to be his friend and companion as long as he lived. He relates that, one day, in November 1582, while he was engaged in fervent prayer, the window of his museum looking towards the west suddenly glowed with a dazzling light, in the midst of which, in all his glory, stood the great angel Uriel. Awe and wonder rendered him speechless; but the angel smiling graciously upon him, gave him a crystal, of a convex form, and told him that

whenever he wished to hold converse with the beings of another sphere, he had only to gaze intently upon it, and they would appear in the crystal, and unveil to him all the secrets of futurity.⁴¹ Thus saying, the angel disappeared. Dee found from experience of the crystal that it was necessary that all the faculties of the soul should be concentrated upon it, otherwise the spirits did not appear. He also found that he could never recollect the conversations he had with the angels. He therefore determined to communicate the secret to another person, who might converse with the spirit while he (Dee) sat in another part of the room, and took down in writing the revelations which they made.

SHEW-STONE OF DR. DEE, IN THE BRITISH MUSEUM.

He had at this time in his service, as his assistant, one Edward Kelly, who, like himself, was crazy upon the subject of the philosopher's stone. There was this difference, however, between them, that, while Dee was more of an enthusiast than an impostor, Kelly was more of an impostor than an enthusiast. In early life he was a notary, and had the misfortune to lose both his ears for forgery. This mutilation, degrading enough in any man, was destructive to a philosopher; Kelly, therefore, lest his wisdom should suffer in the world's opinion, wore a black skull-cap, which, fitting close to his head, and descending over both his cheeks, not only concealed his loss, but gave him a very solemn and oracular

appearance. So well did he keep his secret, that even Dee, with whom he lived so many years, appears never to have discovered it. Kelly, with this character, was just the man to carry on any piece of roguery for his own advantage, or to nurture the delusions of his master for the same purpose. No sooner did Dee inform him of the visit he had received from the glorious Uriel, than Kelly expressed such a fervour of belief, that Dee's heart glowed with delight. He set about consulting his crystal forthwith, and on the 2d of December, 1581, the spirits appeared, and held a very extraordinary discourse with Kelly, which Dee took down in writing. The curious reader may see this farrago of nonsense among the Harleian Mss. in the British Museum. The later consultations were published in a folio volume, in 1659, by Dr. Meric Casaubon, under the title of *A true and faithful Relation of what passed between Dr. John Dee and some Spirits; tending, had it succeeded, to a general Alteration of most States and Kingdoms in the World.*⁴²

The fame of these wondrous colloquies soon spread over the country, and even reached the Continent. Dee at the same time pretended to be in possession of the *elixir vitæ*, which he stated he had found among the ruins of Glastonbury Abbey, in Somersetshire. People flocked from far and near to his house at Mortlake to have their nativities cast, in preference to visiting astrologers of less renown. They also longed to see a man who, according to his own account, would never die. Altogether, he carried on a very profitable trade, but spent so much in drugs and metals to work out some peculiar process of transmutation, that he never became rich.

About this time there came into England a wealthy polish nobleman, named Albert Laski, Count Palatine of Siradz. His object

was principally, he said, to visit the court of Queen Elizabeth, the fame of whose glory and magnificence had reached him in distant Poland. Elizabeth received this flattering stranger with the most splendid hospitality, and appointed her favourite Leicester to shew him all that was worth seeing in England. He visited all the curiosities of London and Westminster, and from thence proceeded to Oxford and Cambridge, that he might converse with some of the great scholars whose writings shed lustre upon the land of their birth. He was very much disappointed at not finding Dr. Dee among them, and told the Earl of Leicester that he would not have gone to Oxford if he had known that Dee was not there. The earl promised to introduce him to the great alchymist on their return to London, and the Pole was satisfied. A few days afterwards, the earl and Laski being in the antechamber of the Queen, awaiting an audience of her majesty, Dr. Dee arrived on the same errand, and was introduced to the Pole.⁴³ An interesting conversation ensued, which ended by the stranger inviting himself to dine with the astrologer at his house at Mortlake. Dee returned home in some tribulation, for he found he had not money enough, without pawning his plate, to entertain Count Laski and his retinue in a manner becoming their dignity. In this emergency he sent off an express to the Earl of Leicester, stating frankly the embarrassment he laboured under, and praying his good offices in representing the matter to her majesty. Elizabeth immediately sent him a present of twenty pounds.

On the appointed day Count Laski came, attended by a numerous retinue, and expressed such open and warm admiration of the wonderful attainments of his host, that Dee turned over in his own mind how he could bind irretrievably to his interests a man who

seemed so well inclined to become his friend. Long acquaintance with Kelly had imbued him with all the roguery of that personage, and he resolved to make the Pole pay dearly for his dinner. He found out before many days that he possessed great estates in his own country, as well as great influence, but that an extravagant disposition had reduced him to temporary embarrassment. He also discovered that he was a firm believer in the philosopher's stone and the water of life. He was therefore just the man upon whom an adventurer might fasten himself. Kelly thought so too; and both of them set to work to weave a web, in the meshes of which they might firmly entangle the rich and credulous stranger. They went very cautiously about it; first throwing out obscure hints of the stone and the elixir, and finally of the spirits, by means of whom they could turn over the pages of the book of futurity, and read the awful secrets inscribed therein. Laski eagerly implored that he might be admitted to one of their mysterious interviews with Uriel and the angels; but they knew human nature too well to accede at once to the request. To the count's entreaties they only replied by hints of the difficulty or impropriety of summoning the spirits in the presence of a stranger, or of one who might perchance have no other motive than the gratification of a vain curiosity; but they only meant to whet the edge of his appetite by this delay, and would have been sorry indeed if the count had been discouraged. To shew how exclusively the thoughts both of Dee and Kelly were fixed upon their dupe at this time, it is only necessary to read the introduction to their first interview with the spirits, related in the volume of Dr. Casaubon. The entry made by Dee, under the date of the 25th of May, 1583, says, that when the spirit appeared to them, "I [John Dee] and E. K. [Edward Kelly] sat

together, conversing of that noble Polonian Albertus Laski, his great honour here with us obtained, and of his great liking among all sorts of the people.” No doubt they were discussing how they might make the most of the “noble Polonian,” and concocting the fine story with which they afterwards excited his curiosity, and drew him firmly within their toils. “Suddenly,” says Dee, as they were thus employed, “there seemed to come out of the oratory a spiritual creature, like a pretty girl of seven or nine years of age, attired on her head, with her hair rolled up before and hanging down behind, with a gown of silk, of changeable red and green, and with a train. She seemed to play up and down, and seemed to go in and out behind the books; and as she seemed to go between them, the books displaced themselves, and made way for her.”

With such tales as these they lured on the Pole from day to day, and at last persuaded him to be a witness of their mysteries. Whether they played off any optical delusions upon him, or whether, by the force of a strong imagination, he deluded himself, does not appear, but certain it is that he became a complete tool in their hands, and consented to do whatever they wished him. Kelly, at these interviews, placed himself at a certain distance from the wondrous crystal, and gazed intently upon it, while Dee took his place in a corner, ready to set down the prophecies as they were uttered by the spirits. In this manner they prophesied to the Pole that he should become the fortunate possessor of the philosopher’s stone; that he should live for centuries, and be chosen King of Poland, in which capacity he should gain many great victories over the Saracens, and make his name illustrious over all the earth. For this purpose it was necessary, however, that Laski should leave England, and take them with him,

together with their wives and families; that he should treat them all sumptuously, and allow them to want for nothing. Laski at once consented; and very shortly afterwards they were all on the road to Poland.

It took them upwards of four months to reach the count's estates in the neighbourhood of Cracow. In the mean time, they led a pleasant life, and spent money with an unsparing hand. When once established in the count's palace, they commenced the great hermetic operation of transmuting iron into gold. Laski provided them with all necessary materials, and aided them himself with his knowledge of alchymy; but, somehow or other, the experiment always failed at the very moment it ought to have succeeded, and they were obliged to recommence operations on a grander scale. But the hopes of Laski were not easily extinguished. Already, in idea, the possessor of countless millions, he was not to be cast down for fear of present expenses. He thus continued from day to day, and from month to month, till he was at last obliged to sell a portion of his deeply-mortgaged estates to find aliment for the hungry crucibles of Dee and Kelly, and the no less hungry stomachs of their wives and families. It was not till ruin stared him in the face that he awoke from his dream of infatuation, too happy, even then, to find that he had escaped utter beggary. Thus restored to his senses, his first thought was how to rid himself of his expensive visitors. Not wishing to quarrel with them, he proposed that they should proceed to Prague, well furnished with letters of recommendation to the Emperor Rudolph. Our alchymists too plainly saw that nothing more was to be made of the almost destitute Count Laski. Without hesitation, therefore, they accepted the proposal, and set out forthwith to the imperial residence. They

had no difficulty, on their arrival at Prague, in obtaining an audience of the emperor. They found him willing enough to believe that such a thing as the philosopher's stone existed, and flattered themselves that they had made a favourable impression upon him; but, from some cause or other—perhaps the look of low cunning and quackery upon the face of Kelly—the emperor conceived no very high opinion of their abilities. He allowed them, however, to remain for some months at Prague, feeding themselves upon the hope that he would employ them; but the more he saw of them, the less he liked them; and, when the pope's nuncio represented to him that he ought not to countenance such heretic magicians, he gave orders that they should quit his dominions within four-and-twenty hours. It was fortunate for them that so little time was given them; for, had they remained six hours longer, the nuncio had received orders to procure a perpetual dungeon or the stake for them.

Not knowing well whither to direct their steps, they resolved to return to Cracow, where they had still a few friends; but, by this time, the funds they had drawn from Laski were almost exhausted, and they were many days obliged to go dinnerless and supperless. They had great difficulty to keep their poverty a secret from the world; but they managed to bear privation without murmuring, from a conviction that if the fact were known, it would militate very much against their pretensions. Nobody would believe that they were possessors of the philosopher's stone, if it were once suspected that they did not know how to procure bread for their subsistence. They still gained a little by casting nativities, and kept starvation at arm's length, till a new dupe, rich enough for their purposes, dropped into their toils, in the shape of a royal personage. Having procured an

introduction to Stephen king of Poland, they predicted to him that the Emperor Rudolph would shortly be assassinated, and that the Germans would look to Poland for his successor. As this prediction was not precise enough to satisfy the king, they tried their crystal again, and a spirit appeared who told them that the new sovereign of Germany would be Stephen of Poland. Stephen was credulous enough to believe them, and was once present when Kelly held his mystic conversations with the shadows of his crystal. He also appears to have furnished them with money to carry on their experiments in alchemy; but he grew tired, at last, of their broken promises and their constant drains upon his pocket, and was on the point of discarding them with disgrace, when they met with another dupe, to whom they eagerly transferred their services. This was Count Rosenberg, a nobleman of large estates at Trebona in Bohemia. So comfortable did they find themselves in the palace of this munificent patron, that they remained nearly four years with him, faring sumptuously, and having an almost unlimited command of his money. The count was more ambitious than avaricious: he had wealth enough, and did not care for the philosopher's stone on account of the gold, but of the length of days it would bring him. They had their predictions, accordingly, all ready framed to suit his character. They prophesied that he should be chosen king of Poland; and promised, moreover, that he should live for five hundred years to enjoy his dignity, provided always that he found them sufficient money to carry on their experiments.

But now, while fortune smiled upon them, while they revelled in the rewards of successful villany, retributive justice came upon them in a shape they had not anticipated. Jealousy and mistrust sprang up

between the two confederates, and led to such violent and frequent quarrels, that Dee was in constant fear of exposure. Kelly imagined himself a much greater personage than Dee; measuring, most likely, by the standard of impudent roguery; and was displeased that on all occasions, and from all persons, Dee received the greater share of honour and consideration. He often threatened to leave Dee to shift for himself; and the latter, who had degenerated into the mere tool of his more daring associate, was distressed beyond measure at the prospect of his desertion. His mind was so deeply imbued with superstition, that he believed the rhapsodies of Kelly to be, in a great measure, derived from his intercourse with angels; and he knew not where, in the whole world, to look for a man of depth and wisdom enough to succeed him. As their quarrels every day became more and more frequent, Dee wrote letters to Queen Elizabeth to secure a favourable reception on his return to England, whither he intended to proceed if Kelly forsook him. He also sent her a round piece of silver, which he pretended he had made of a portion of brass cut out of a warming-pan. He afterwards sent her the warming-pan also, that she might convince herself that the piece of silver corresponded exactly with the hole which was cut into the brass. While thus preparing for the worst, his chief desire was to remain in Bohemia with Count Rosenberg, who treated him well, and reposed much confidence in him. Neither had Kelly any great objection to remain; but a new passion had taken possession of his breast, and he was laying deep schemes to gratify it. His own wife was ill-favoured and ill-natured; Dee's was comely and agreeable; and he longed to make an exchange of partners without exciting the jealousy or shocking the morality of Dee. This was a difficult matter; but to a man like Kelly,

who was as deficient in rectitude and right feeling as he was full of impudence and ingenuity, the difficulty was not insurmountable. He had also deeply studied the character and the foibles of Dee; and he took his measures accordingly. The next time they consulted the spirits, Kelly pretended to be shocked at their language, and refused to tell Dee what they had said. Dee insisted, and was informed that they were henceforth to have their wives in common. Dee, a little startled, inquired whether the spirits might not mean that they were to live in common harmony and good-will? Kelly tried again, with apparent reluctance, and said the spirits insisted upon the literal interpretation. The poor fanatic Dee resigned himself to their will; but it suited Kelly's purpose to appear coy a little longer. He declared that the spirits must be spirits not of good, but of evil; and refused to consult them any more. He thereupon took his departure, saying that he would never return.

Dee, thus left to himself, was in sore trouble and distress of mind. He knew not on whom to fix as the successor to Kelly for consulting the spirits; but at last chose his son Arthur, a boy of eight years of age. He consecrated him to this service with great ceremony, and impressed upon the child's mind the dignified and awful nature of the duties he was called upon to perform; but the poor boy had neither the imagination, the faith, nor the artifice of Kelly. He looked intently upon the crystal as he was told; but could see nothing and hear nothing. At last, when his eyes ached, he said he could see a vague indistinct shadow, but nothing more. Dee was in despair. The deception had been carried on so long, that he was never so happy as when he fancied he was holding converse with superior beings; and he cursed the day that had put estrangement between him and his

dear friend Kelly. This was exactly what Kelly had foreseen; and, when he thought the doctor had grieved sufficiently for his absence, he returned unexpectedly, and entered the room where the little Arthur was in vain endeavouring to distinguish something in the crystal. Dee, in entering this circumstance in his journal, ascribes this sudden return to a “miraculous fortune” and a “divine fate;” and goes on to record that Kelly immediately saw the spirits which had remained invisible to little Arthur. One of these spirits reiterated the previous command, that they should have their wives in common. Kelly bowed his head and submitted; and Dee, in all humility, consented to the arrangement.

This was the extreme depth of the wretched man’s degradation. In this manner they continued to live for three or four months, when, new quarrels breaking out, they separated once more. This time their separation was final. Kelly, taking the *elixir* which he had found in Glastonbury Abbey, proceeded to Prague, forgetful of the abrupt mode in which he had previously been expelled from that city. Almost immediately after his arrival, he was seized by order of the Emperor Rudolph, and thrown into prison. He was released after some months’ confinement, and continued for five years to lead a vagabond life in Germany, telling fortunes at one place, and pretending to make gold at another. He was a second time thrown into prison, on a charge of heresy and sorcery; and he then resolved, if ever he obtained his liberty, to return to England. He soon discovered that there was no prospect of this, and that his imprisonment was likely to be for life. He twisted his bed-clothes into a rope, one stormy night in February 1595, and let himself down from the window of his dungeon, situated at the top of a very high

tower. Being a corpulent man, the rope gave way, and he was precipitated to the ground. He broke two of his ribs and both his legs; and was otherwise so much injured, that he expired a few days afterwards.

Dee, for a while, had more prosperous fortune. The warming-pan he had sent to Queen Elizabeth was not without effect. He was rewarded soon after Kelly had left him with an invitation to return to England. His pride, which had been sorely humbled, sprang up again to its pristine dimensions, and he set out from Bohemia with a train of attendants becoming an ambassador. How he procured the money does not appear, unless from the liberality of the rich Bohemian Rosenberg, or perhaps from his plunder. He travelled with three coaches for himself and family, and three wagons to carry his baggage. Each coach had four horses, and the whole train was protected by a guard of four and twenty soldiers. This statement may be doubted; but it is on the authority of Dee himself, who made it on oath before the commissioners appointed by Elizabeth to inquire into his circumstances. On his arrival in England he had an audience of the queen, who received him kindly as far as words went, and gave orders that he should not be molested in his pursuits of chemistry and philosophy. A man who boasted of the power to turn baser metals into gold, could not, thought Elizabeth, be in want of money; and she therefore gave him no more substantial marks of her approbation than her countenance and protection.

Thrown thus unexpectedly upon his own resources, Dee began in earnest the search for the philosopher's stone. He worked incessantly among his furnaces, retorts, and crucibles, and almost poisoned himself with deleterious fumes. He also consulted his miraculous

crystal; but the spirits appeared not to him. He tried one Bartholomew to supply the place of the invaluable Kelly; but he being a man of some little probity, and of no imagination at all, the spirits would not hold any communication with him. Dee then tried another pretender to philosophy, of the name of Hickman, but had no better fortune. The crystal had lost its power since the departure of its great high priest. From this quarter, then, Dee could get no information on the stone or elixir of the alchemists, and all his efforts to discover them by other means were not only fruitless but expensive. He was soon reduced to great distress, and wrote piteous letters to the queen praying relief. He represented that, after he left England with Count Laski, the mob had pillaged his house at Mortlake, accusing him of being a necromancer and a wizard; and had broken all his furniture, burned his library, consisting of four thousand rare volumes, and destroyed all the philosophical instruments and curiosities in his museum. For this damage he claimed compensation; and furthermore stated, that, as he had come to England by the queen's command, she ought to pay the expenses of his journey. Elizabeth sent him small sums of money at various times; but Dee still continuing his complaints, a commission was appointed to inquire into his circumstances. He finally obtained a small appointment as Chancellor of St. Paul's cathedral, which he exchanged, in 1595, for the wardenship of the college at Manchester. He remained in this capacity till 1602 or 1603, when, his strength and intellect beginning to fail him, he was compelled to resign. He retired to his old dwelling at Mortlake, in a state not far removed from actual want, supporting himself as a common fortune-teller, and being often obliged to sell or pawn his books to procure a dinner. James I. was often applied to on

his behalf, but he refused to do any thing for him. It may be said to the discredit of this king, that the only reward he would grant the indefatigable Stowe, in his days of old age and want, was the royal permission to beg; but no one will blame him for neglecting such a quack as John Dee. He died in 1608, in the eighty-first year of his age, and was buried at Mortlake.

THE COSMOPOLITE.

Many disputes have arisen as to the real name of the alchemist who wrote several works under the above designation. The general opinion is that he was a Scotsman named Seton, and that by a fate very common to alchemists who boasted too loudly of their powers of transmutation, he ended his days miserably in a dungeon, into which he was thrown by a German potentate until he made a million of gold to pay his ransom. By some he has been confounded with Michael Sendivog, or Sendivogius, a Pole, a professor of the same art, who made a great noise in Europe at the commencement of the seventeenth century. Lenglet du Fresnoy, who is in general well informed with respect to the alchemists, inclines to the belief that these personages were distinct; and gives the following particulars of the Cosmopolite, extracted from George Morhoff, in his *Epistola ad Langelottum*, and other writers.

About the year 1600, one Jacob Haussen, a Dutch pilot, was shipwrecked on the coast of Scotland. A gentleman, named Alexander Seton, put off in a boat, and saved him from drowning, and afterwards entertained him hospitably for many weeks at his house on the shore. Haussen saw that he was addicted to the pursuits of chemistry, but no conversation on the subject passed between

them at the time. About a year and a half afterwards, Haussen being then at home at Enkhuysen, in Holland, received a visit from his former host. He endeavoured to repay the kindness that had been shewn him; and so great a friendship arose between them that Seton, on his departure, offered to make him acquainted with the great secret of the philosopher's stone. In his presence the Scotsman transmuted a great quantity of base metal into pure gold, and gave it him as a mark of his esteem. Seton then took leave of his friend, and travelled into Germany. At Dresden he made no secret of his wonderful powers, having, it is said, performed transmutation successfully before a great assemblage of the learned men of that city. The circumstance coming to the ears of the Duke or Elector of Saxony, he gave orders for the arrest of the alchymist. He caused him to be imprisoned in a high tower, and set a guard of forty men to watch that he did not escape, and that no strangers were admitted to his presence. The unfortunate Seton received several visits from the elector, who used every art of persuasion to make him divulge his secret. Seton obstinately refused either to communicate his secret, or to make any gold for the tyrant; on which he was stretched upon the rack, to see if the argument of torture would render him more tractable. The result was still the same; neither hope of reward nor fear of anguish could shake him. For several months he remained in prison, subjected alternately to a sedative and a violent regimen, till his health broke, and he wasted away almost to a skeleton.

There happened at that time to be in Dresden a learned Pole, named Michael Sendivogius, who had wasted a good deal of his time and substance in the unprofitable pursuits of alchymy. He was touched with pity for the hard fate, and admiration for the intrepidity

of Seton; and determined, if possible, to aid him in escaping from the clutch of his oppressor. He requested the elector's permission to see the alchymist, and obtained it with some difficulty. He found him in a state of great wretchedness, shut up from the light of day in a noisome dungeon, and with no better couch or fare than those allotted to the worst of criminals. Seton listened eagerly to the proposal of escape, and promised the generous Pole that he would make him richer than an eastern monarch if by his means he were liberated. Sendivogius immediately commenced operations; he sold some property which he possessed near Cracow, and with the proceeds led a merry life at Dresden. He gave the most elegant suppers, to which he regularly invited the officers of the guard, and especially those who did duty at the prison of the alchymist. He insinuated himself at last into their confidence, and obtained free ingress to his friend as often as he pleased; pretending that he was using his utmost endeavours to conquer his obstinacy and worm his secret out of him. When their project was ripe, a day was fixed upon for the grand attempt; and Sendivogius was ready with a post-chariot to convey him with all speed into Poland. By drugging some wine which he presented to the guards of the prison, he rendered them so drowsy that he easily found means to scale a wall unobserved, with Seton, and effect his escape. Seton's wife was in the chariot awaiting him, having safely in her possession a small packet of a black powder, which was, in fact, the philosopher's stone, or ingredient for the transmutation of iron and copper into gold. They all arrived in safety at Cracow; but the frame of Seton was so wasted by torture of body and starvation, to say nothing of the anguish of mind he had endured, that he did not long survive. He died in Cracow, in 1603 or

1604, and was buried under the cathedral church of that city. Such is the story related of the author of the various works which bear the name of the Cosmopolite. A list of them may be found in the third volume of the *History of the Hermetic Philosophy*.

SENDIVOGIUS.

On the death of Seton, Sendivogius married his widow, hoping to learn from her some of the secrets of her deceased lord in the art of transmutation. The ounce of black powder stood him, however, in better service; for the alchymists say, that by its means he converted great quantities of quicksilver into the purest gold. It is also said that he performed this experiment successfully before the Emperor Rudolph II., at Prague; and that the emperor, to commemorate the circumstance, caused a marble tablet to be affixed to the wall of the room in which it was performed, bearing this inscription, “Faciât hoc quispiam alius, quod fecit Sendivogius Polonus.” M. Desnoyers, secretary to the Princess Mary of Gonzaga, Queen of Poland, writing from Warsaw in 1651, says that he saw this tablet, which existed at that time, and was often visited by the curious.

The after-life of Sendivogius is related in a Latin memoir of him by one Brodowski, his steward; and is inserted by Pierre Borel in his *Treasure of Gaulish Antiquities*. The Emperor Rudolph, according to this authority, was so well pleased with his success, that he made him one of his councillors of state, and invited him to fill a station in the royal household and inhabit the palace. But Sendivogius loved his liberty, and refused to become a courtier. He preferred to reside on his own patrimonial estate of Gravarna, where, for many years, he exercised a princely hospitality. His philosophic powder, which, his

steward says, was red, and not black, he kept in a little box of gold; and with one grain of it he could make five hundred ducats, or a thousand rix-dollars. He generally made his projection upon quicksilver. When he travelled, he gave this box to his steward, who hung it round his neck by a gold chain next his skin. But the greatest part of the powder he used to hide in a secret place cut into the step of his chariot. He thought that, if attacked at any time by robbers, they would not search such a place as that. When he anticipated any danger, he would dress himself in his valet's clothes, and, mounting the coach-box, put the valet inside. He was induced to take these precautions, because it was no secret that he possessed the philosopher's stone; and many unprincipled adventurers were on the watch for an opportunity to plunder him. A German prince, whose name Brodowski has not thought fit to chronicle, served him a scurvy trick, which ever afterwards put him on his guard. This prince went on his knees to Sendivogius, and entreated him in the most pressing terms to satisfy his curiosity, by converting some quicksilver into gold before him. Sendivogius, wearied by his importunity, consented, upon a promise of inviolable secrecy. After his departure, the prince called a German alchymist, named Muhlenfels, who resided in his house, and told him all that had been done. Muhlenfels entreated that he might have a dozen mounted horsemen at his command, that he might instantly ride after the philosopher, and either rob him of all his powder, or force from him the secret of making it. The prince desired nothing better; Muhlenfels, being provided with twelve men well mounted and armed, pursued Sendivogius in hot haste. He came up with him at a lonely inn by the road-side, just as he was sitting down to dinner. He at first endeavoured to persuade him to

divulge the secret; but finding this of no avail, he caused his accomplices to strip the unfortunate Sendivogius and tie him naked to one of the pillars of the house. He then took from him his golden box, containing a small quantity of the powder; a manuscript book on the philosopher's stone; a golden medal, with its chain, presented to him by the Emperor Rudolph; and a rich cap, ornamented with diamonds, of the value of one hundred thousand rix-dollars. With this booty he decamped, leaving Sendivogius still naked and firmly bound to the pillar. His servants had been treated in a similar manner; but the people of the inn released them all as soon as the robbers were out of sight.

Sendivogius proceeded to Prague, and made his complaint to the emperor. An express was instantly sent off to the prince, with orders that he should deliver up Muhlenfels and all his plunder. The prince, fearful of the emperor's wrath, caused three large gallows to be erected in his court-yard; on the highest of which he hanged Muhlenfels, with another thief on each side of him. He thus propitiated the emperor, and got rid of an ugly witness against himself. He sent back, at the same time, the bejewelled hat, the medal and chain, and the treatise upon the philosopher's stone, which had been stolen from Sendivogius. As regarded the powder, he said he had not seen it, and knew nothing about it.

This adventure made Sendivogius more prudent; he would no longer perform the process of transmutation before any strangers, however highly recommended. He pretended also to be very poor; and sometimes lay in bed for weeks together, that people might believe he was suffering from some dangerous malady, and could not therefore, by any possibility, be the owner of the philosopher's stone.

He would occasionally coin false money, and pass it off as gold; preferring to be esteemed a cheat rather than a successful alchemist.

Many other extraordinary tales are told of this personage by his steward Brodowski, but they are not worth repeating. He died in 1636, aged upwards of eighty, and was buried in his own chapel at Gravarna. Several works upon alchemy have been published under his name.

THE ROSICRUCIANS.

It was during the time of the last-mentioned author that the sect of the Rosicrucians first began to create a sensation in Europe. The influence which they exercised upon opinion during their brief career, and the permanent impression which they have left upon European literature, claim for them especial notice. Before their time, alchemy was but a grovelling delusion; and theirs is the merit of having spiritualised and refined it. They also enlarged its sphere, and supposed the possession of the philosopher's stone to be, not only the means of wealth, but of health and happiness, and the instrument by which man could command the services of superior beings, control the elements to his will, defy the obstructions of time and space, and acquire the most intimate knowledge of all the secrets of the universe. Wild and visionary as they were, they were not without their uses; if it were only for having purged the superstitions of Europe of the dark and disgusting forms with which the monks had peopled it, and substituted, in their stead, a race of mild, graceful, and beneficent beings.

They are said to have derived their name from Christian Rosencreutz, or "Rose-cross," a German philosopher, who travelled

in the Holy Land towards the close of the fourteenth century. While dangerously ill at a place called Damcar, he was visited by some learned Arabs, who claimed him as their brother in science, and unfolded to him, by inspiration, all the secrets of his past life, both of thought and of action. They restored him to health by means of the philosopher's stone, and afterwards instructed him in all their mysteries. He returned to Europe in 1401, being then only twenty-three years of age; and drew a chosen number of his friends around him, whom he initiated into the new science, and bound by solemn oaths to keep it secret for a century. He is said to have lived eighty-three years after this period, and to have died in 1484.

Many have denied the existence of such a personage as Rosencreutz, and have fixed the origin of this sect at a much later epoch. The first dawning of it, they say, is to be found in the theories of Paracelsus and the dreams of Dr. Dee, who, without intending it, became the actual, though never the recognised founders of the Rosicrucian philosophy. It is now difficult, and indeed impossible, to determine whether Dee and Paracelsus obtained their ideas from the then obscure and unknown Rosicrucians, or whether the Rosicrucians did but follow and improve upon them. Certain it is, that their existence was never suspected till the year 1605, when they began to excite attention in Germany. No sooner were their doctrines promulgated, than all the visionaries, Paracelsists, and alchemists, flocked around their standard, and vaunted Rosencreutz as the new regenerator of the human race. Michael Mayer, a celebrated physician of that day, and who had impaired his health and wasted his fortune in searching for the philosopher's stone, drew up a report of the tenets and ordinances of the new fraternity, which was

published at Cologne, in the year 1615. They asserted, in the first place, “that the meditations of their founders surpassed every thing that had ever been imagined since the creation of the world, without even excepting the revelations of the Deity; that they were destined to accomplish the general peace and regeneration of man before the end of the world arrived; that they possessed all wisdom and piety in a supreme degree; that they possessed all the graces of nature, and could distribute them among the rest of mankind according to their pleasure; that they were subject to neither hunger, nor thirst, nor disease, nor old age, nor to any other inconvenience of nature; that they knew by inspiration, and at the first glance, every one who was worthy to be admitted into their society; that they had the same knowledge then which they would have possessed if they had lived from the beginning of the world, and had been always acquiring it; that they had a volume in which they could read all that ever was or ever would be written in other books till the end of time; that they could force to, and retain in their service the most powerful spirits and demons; that, by the virtue of their songs, they could attract pearls and precious stones from the depths of the sea or the bowels of the earth; that God had covered them with a thick cloud, by means of which they could shelter themselves from the malignity of their enemies, and that they could thus render themselves invisible from all eyes; that the first eight brethren of the ‘Rose-cross’ had power to cure all maladies; that, by means of the fraternity, the triple diadem of the pope would be reduced into dust; that they only admitted two sacraments, with the ceremonies of the primitive Church, renewed by them; that they recognised the Fourth Monarchy and the Emperor of the Romans as their chief and the chief of all Christians; that they

would provide him with more gold, their treasures being inexhaustible, than the King of Spain had ever drawn from the golden regions of Eastern and Western Ind.” This was their confession of faith. Their rules of conduct were six in number, and as follow:

First. That, in their travels, they should gratuitously cure all diseases.

Secondly. That they should always dress in conformity to the fashion of the country in which they resided.

Thirdly. That they should, once every year, meet together in the place appointed by the fraternity, or send in writing an available excuse.

Fourthly. That every brother, whenever he felt inclined to die, should choose a person worthy to succeed him.

Fifthly. That the words “Rose-cross” should be the marks by which they should recognise each other.

Sixthly. That their fraternity should be kept secret for six times twenty years.

They asserted that these laws had been found inscribed in a golden book in the tomb of Rosencreutz, and that the six times twenty years from his death expired in 1604. They were consequently called upon from that time forth to promulgate their doctrine for the welfare of mankind⁴⁴.

For eight years these enthusiasts made converts in Germany, but they excited little or no attention in other parts of Europe. At last they made their appearance in Paris, and threw all the learned, all the credulous, and all the lovers of the marvellous into commotion. In the beginning of March 1623, the good folks of that city, when

they arose one morning, were surprised to find all their walls placarded with the following singular manifesto:

“We, the deputies of the principal College of the Brethren of the Rose-cross, have taken up our abode, visible and invisible, in this city, by the grace of the Most High, towards whom are turned the hearts of the just. We shew and teach without books or signs, and speak all sorts of languages in the countries where we dwell, to draw mankind, our fellows, from error and from death.”

For a long time this strange placard was the sole topic of conversation in all public places. Some few wondered, but the greater number only laughed at it. In the course of a few weeks two books were published, which raised the first alarm respecting this mysterious society, whose dwelling-place no one knew, and no members of which had ever been seen. The first was called a history of *The frightful Compacts entered into between the Devil and the pretended ‘Invisibles;’ with their damnable Instructions, the deplorable Ruin of their Disciples, and their miserable end.* The other was called an *Examination of the new and unknown Cabala of the Brethren of the Rose-cross, who have lately inhabited the City of Paris; with the History of their Manners, the Wonders worked by them, and many other particulars.*

These books sold rapidly. Every one was anxious to know something of this dreadful and secret brotherhood. The *badauds* of Paris were so alarmed that they daily expected to see the arch-enemy walking *in propria persona* among them. It was said in these volumes that the Rosicrucian society consisted of six-and-thirty

persons in all, who had renounced their baptism and hope of resurrection. That it was not by means of good angels, as they pretended, that they worked their prodigies; but that it was the devil who gave them power to transport themselves from one end of the world to the other with the rapidity of thought; to speak all languages; to have their purses always full of money, however much they might spend; to be invisible, and penetrate into the most secret places, in spite of fastenings of bolts and bars; and to be able to tell the past and future. These thirty-six brethren were divided into bands or companies: six of them only had been sent on the mission to Paris, six to Italy, six to Spain, six to Germany, four to Sweden, and two into Switzerland, two into Flanders, two into Lorraine, and two into Franche Comté. It was generally believed that the missionaries to France resided somewhere in the Marais du Temple. That quarter of Paris soon acquired a bad name, and people were afraid to take houses in it, lest they should be turned out by the six invisibles of the Rose-cross. It was believed by the populace, and by many others whose education should have taught them better, that persons of a mysterious aspect used to visit the inns and hotels of Paris, and eat of the best meats and drink of the best wines, and then suddenly melt away into thin air when the landlord came with the reckoning. That gentle maidens, who went to bed alone, often awoke in the night and found men in bed with them, of shape more beautiful than the Grecian Apollo, who immediately became invisible when an alarm was raised. It was also said that many persons found large heaps of gold in their houses without knowing from whence they came. All Paris was in alarm. No man thought himself secure of his goods, no maiden of her virginity, or wife of her chastity, while

these Rosicrucians were abroad. In the midst of the commotion, a second placard was issued to the following effect:

“If any one desires to see the brethren of the Rose-cross from curiosity only, he will never communicate with us. But if his will really induces him to inscribe his name in the register of our brotherhood, we, who can judge of the thoughts of all men, will convince him of the truth of our promises. For this reason we do not publish to the world the place of our abode. Thought alone, in unison with the sincere will of those who desire to know us, is sufficient to make us known to them, and them to us.”

Though the existence of such a society as that of the Rose-cross was problematical, it was quite evident that somebody or other was concerned in the promulgation of these placards, which were stuck up on every wall in Paris. The police endeavoured in vain to find out the offenders, and their want of success only served to increase the perplexity of the public. The Church very soon took up the question; and the Abbé Gaultier, a Jesuit, wrote a book to prove that, by their enmity to the pope, they could be no other than disciples of Luther, sent to promulgate his heresy. Their very name, he added, proved that they were heretics; a *cross* surmounted by a *rose* being the heraldic device of the arch-heretic Luther. One Garasse said they were a confraternity of drunken impostors; and that their name was derived from the garland of roses, in the form of a cross, hung over the tables of taverns in Germany as the emblem of secrecy, and from whence was derived the common saying, when one man communicated a secret to another, that it was said “under the rose.”

Others interpreted the letters F. R. C. to mean, not Brethren of the Rose-cross, but *Fratres Roris Cocti*, or Brothers of Boiled Dew; and explained this appellation by alleging that they collected large quantities of morning dew, and boiled it, in order to extract a very valuable ingredient in the composition of the philosopher's stone and the water of life.

The fraternity thus attacked defended themselves as well as they were able. They denied that they used magic of any kind, or that they consulted the devil. They said they were all happy; that they had lived more than a century, and expected to live many centuries more; and that the intimate knowledge which they possessed of all nature was communicated to them by God himself as a reward for their piety and utter devotion to his service. Those were in error who derived their name from a cross of roses, or called them drunkards. To set the world right on the first point, they reiterated that they derived their name from Christian Rosencreutz, their founder; and to answer the latter charge, they repeated that they knew not what thirst was, and had higher pleasures than those of the palate. They did not desire to meddle with the politics or religion of any man or set of men, although they could not help denying the supremacy of the pope, and looking upon him as a tyrant. Many slanders, they said, had been repeated respecting them, the most unjust of which was, that they indulged in carnal appetites, and, under the cloak of their invisibility, crept into the chambers of beautiful maidens. They asserted, on the contrary, that the first vow they took on entering the society was a vow of chastity, and that any one among them who transgressed in that particular would immediately lose all the advantages he enjoyed, and be exposed once more to hunger, woe,

disease, and death, like other men. So strongly did they feel on the subject of chastity, that they attributed the fall of Adam solely to his want of this virtue. Besides defending themselves in this manner, they entered into a further confession of their faith. They discarded for ever all the old tales of sorcery and witchcraft, and communion with the devil. They said there were no such horrid, unnatural, and disgusting beings as the incubi and succubi, and the innumerable grotesque imps that men had believed in for so many ages. Man was not surrounded with enemies like these, but with myriads of beautiful and beneficent beings, all anxious to do him service. The air was peopled with sylphs, the water with undines or naiads, the bowels of the earth with gnomes, and the fire with salamanders. All these beings were the friends of man, and desired nothing so much as that men should purge themselves of all uncleanness, and thus be enabled to see and converse with them. They possessed great power, and were unrestrained by the barriers of space or the obstructions of matter. But man was in one particular their superior. He had an immortal soul, and they had not. They might, however, become sharers in man's immortality if they could inspire one of that race with the passion of love towards them. Hence it was the constant endeavour of the female spirits to captivate the admiration of men, and of the male gnomes, sylphs, salamanders, and undines to be beloved by a woman. The object of this passion, in returning their love, imparted a portion of that celestial fire, the soul; and from that time forth the beloved became equal to the lover, and both, when their allotted course was run, entered together into the mansions of felicity. These spirits, they said, watched constantly over mankind by night and day. Dreams, omens, and presentiments were all their

works, and the means by which they gave warning of the approach of danger. But though so well inclined to befriend man for their own sakes, the want of a soul rendered them at times capricious and revengeful; they took offence on slight causes, and heaped injuries instead of benefits on the heads of those who extinguished the light of reason that was in them by gluttony, debauchery, and other appetites of the body.

The excitement produced in Paris by the placards of the brotherhood and the attacks of the clergy wore itself away after a few months. The stories circulated about them became at last too absurd even for that age of absurdity, and men began to laugh once more at those invisible gentlemen and their fantastic doctrines. Gabriel Naudé at that conjuncture brought out his *Avis à la France sur les Frères de la Rose-croix*, in which he very successfully exposed the folly of the new sect. This work, though not well written, was well timed. It quite extinguished the Rosicrucians of France; and after that year little more was heard of them. Swindlers in different parts of the country assumed the name at times to cloak their depredations; and now and then one of them was caught and hanged for his too great ingenuity in enticing pearls and precious stones from the pockets of other people into his own, or for passing off lumps of gilded brass for pure gold, made by the agency of the philosopher's stone. With these exceptions, oblivion shrouded them.

The doctrine was not confined to a sphere so narrow as France alone; it still nourished in Germany, and drew many converts in England. The latter countries produced two great masters in the persons of Jacob Böhmen and Robert Fludd—pretended philosophers, of whom it is difficult to say which was the more

absurd and extravagant. It would appear that the sect was divided into two classes—the brothers *Roseæ Crucis*, who devoted themselves to the wonders of this sublunary sphere, and the brothers *Aureæ Crucis*, who were wholly occupied in the contemplation of things divine. Fludd belonged to the first class, and Böhmen to the second. Fludd may be called the father of the English Rosicrucians, and as such merits a conspicuous niche in the temple of Folly.

He was born in the year 1574 at Milgate, in Kent, and was the son of Sir Thomas Fludd, Treasurer of War to Queen Elizabeth. He was originally intended for the army; but he was too fond of study, and of a disposition too quiet and retiring, to shine in that sphere. His father would not therefore press him to adopt a course of life for which he was unsuited, and encouraged him in the study of medicine, for which he early manifested a partiality. At the age of twenty-five he proceeded to the continent; and being fond of the abstruse, the marvellous, and the incomprehensible, he became an ardent disciple of the school of Paracelsus, whom he looked upon as the regenerator not only of medicine, but of philosophy. He remained six years in Italy, France, and Germany, storing his mind with fantastic notions, and seeking the society of enthusiasts and visionaries. On his return to England in 1605, he received the degree of Doctor of Medicine from the University of Oxford, and began to practise as a physician in London.

He soon made himself conspicuous. He latinised his name from Robert Fludd into Robertus à Fluctibus, and began the promulgation of many strange doctrines. He avowed his belief in the philosopher's stone, the water of life, and the universal alkahest; and maintained that there were but two principles of all things,—which were,

condensation, the boreal or northern virtue; and rarefaction, the southern or austral virtue. A number of demons, he said, ruled over the human frame, whom he arranged in their places in a rhomboid. Every disease had its peculiar demon who produced it, which demon could only be combated by the aid of the demon whose place was directly opposite to his in the rhomboidal figure. Of his medical notions we shall have further occasion to speak in another part of this book, when we consider him in his character as one of the first founders of the magnetic delusion, and its offshoot, animal magnetism, which has created so much sensation in our own day.

As if the doctrines already mentioned were not wild enough, he joined the Rosicrucians as soon as they began to make a sensation in Europe, and succeeded in raising himself to high consideration among them. The fraternity having been violently attacked by several German authors, and among others by Libavius, Fludd volunteered a reply, and published, in 1616, his defence of the Rosicrucian philosophy, under the title of the *Apologia compendiaria Fraternitatem de Rosea-cruce suspicionis et infamiæ maculis aspersam abluens*. This work immediately procured him great renown upon the Continent, and he was henceforth looked upon as one of the high-priests of the sect. Of so much importance was he considered, that Keppler and Gassendi thought it necessary to refute him; and the latter wrote a complete examination of his doctrine. Mersenne also, the friend of Descartes, and who had defended that philosopher when accused of having joined the Rosicrucians, attacked Dr. à Fluctibus, as he preferred to be called, and shewed the absurdity of the brothers of the Rose-cross in general, and of Dr. à Fluctibus in particular. Fluctibus wrote a long reply, in which he

called Mersenne an ignorant calumniator, and reiterated that alchemy was a profitable science, and the Rosicrucians worthy to be the regenerators of the world. This book was published at Frankfort, and was entitled *Summum Bonum, quod est Magiæ, Cabalæ, Alchimiæ, Fratrum, Roseæ-Crucis verorum, et adversus Mersenum Calumniatorem*. Besides this, he wrote several other works upon alchemy, a second answer to Libavius upon the Rosicrucians, and many medical works. He died in London in 1637.

After his time there was some diminution of the sect in England. They excited but little attention, and made no effort to bring themselves into notice. Occasionally some obscure and almost incomprehensible work made its appearance, to shew the world that the folly was not extinguished. Eugenius Philalethes, a noted alchemist, who has veiled his real name under this assumed one, translated *The Fame and Confession of the Brethren of the Rosie Cross*, which was published in London in 1652. A few years afterwards, another enthusiast, named John Heydon, wrote two works on the subject: the one entitled *The Wise Man's Crown, or the Glory of the Rosie Cross*; and the other, *The Holy Guide, leading the way to unite Art and Nature with the Rosie Crosse uncovered*. Neither of these attracted much notice. A third book was somewhat more successful; it was called *A new Method of Rosicrucian Physic; by John Heydon, the servant of God and the Secretary of Nature*. A few extracts will shew the ideas of the English Rosicrucians about this period. Its author was an attorney, "practising (to use his own words) at Westminster Hall all term times as long as he lived, and in the vacations devoting himself to alchymical and Rosicrucian meditation." In his preface, called by him an Apologue for an

Epilogue, he enlightens the public upon the true history and tenets of his sect. Moses, Elias, and Ezekiel were, he says, the most ancient masters of the Rosicrucian philosophy. Those few then existing in England and the rest of Europe, were as the eyes and ears of the great king of the universe, seeing and hearing all things; seraphically illuminated; companions of the holy company of unbodied souls and immortal angels; turning themselves, Proteus-like, into any shape, and having the power of working miracles. The most pious and abstracted brethren could slack the plague in cities, silence the violent winds and tempests, calm the rage of the sea and rivers, walk in the air, frustrate the malicious aspect of witches, cure all diseases, and turn all metals into gold. He had known in his time two famous brethren of the Rosie Cross, named Walfourd and Williams, who had worked miracles in his sight, and taught him many excellent predictions of astrology and earthquakes. “I desired one of these to tell me,” says he, “whether my complexion were capable of the society of my good genius. ‘When I see you again,’ said he (which was when he pleased to come to me, for I knew not where to go to him), ‘I will tell you.’ When I saw him afterwards, he said, ‘You should pray to God; for a good and holy man can offer no greater or more acceptable service to God than the oblation of himself—his soul.’ He said also, that the good genii were the benign eyes of God, running to and fro in the world, and with love and pity beholding the innocent endeavours of harmless and single-hearted men, ever ready to do them good and to help them.”

Heydon held devoutly true that dogma of the Rosicrucians which said that neither eating nor drinking was necessary to men. He maintained that any one might exist in the same manner as that

singular people dwelling near the source of the Ganges, of whom mention was made in the travels of his namesake, Sir Christopher Heydon, who had no mouths, and therefore could not eat, but lived by the breath of their nostrils; except when they took a far journey, and then they mended their diet with the smell of flowers. He said that in really pure air “there was a fine foreign fatness,” with which it was sprinkled by the sunbeams, and which was quite sufficient for the nourishment of the generality of mankind. Those who had enormous appetites, he had no objection to see take animal food, since they could not do without it; but he obstinately insisted that there was no necessity why they should *eat* it. If they put a plaster of nicely-cooked meat upon their epigastrium, it would be sufficient for the wants of the most robust and voracious! They would by that means let in no diseases, as they did at the broad and common gate, the mouth, as any one might see by example of drink; for all the while a man sat in water, he was never athirst. He had known, he said, many Rosicrucians, who by applying wine in this manner, had fasted for years together. In fact, quoth Heydon, we may easily fast all our life, though it be three hundred years, without any kind of meat, and so cut off all danger of disease.

This “sage philosopher” further informed his wondering contemporaries that the chiefs of the doctrine always carried about with them to their place of meeting their symbol, called the R. C. which was an ebony cross, flourished and decked with roses of gold; the cross typifying Christ’s sufferings upon the cross for our sins, and the roses of gold the glory and beauty of his Resurrection. This symbol was carried alternately to Mecca, Mount Calvary, Mount Sinai, Haran, and to three other places, which must have been in

mid-air, called *Cascle*, *Apamia* and *Chaulateau Virissa Caunuch*, where the Rosicrucian brethren met when they pleased, and made resolution of all their actions. They always took their pleasures in one of these places, where they resolved all questions of whatsoever had been done, was done, or should be done in the world, from the beginning to the end thereof. “And these,” he concludes, “are the men called Rosicrucians!”

Towards the end of the seventeenth century, more rational ideas took possession of the sect, which still continued to boast of a few members. They appear to have considered that contentment was the true philosopher’s stone, and to have abandoned the insane search for a mere phantom of the imagination. Addison, in *The Spectator*,⁴⁵ gives an account of his conversation with a Rosicrucian; from which it may be inferred that the sect had grown wiser in their deeds, though in their talk they were as foolish as ever. “I was once,” says he, “engaged in discourse with a Rosicrucian about the great secret. He talked of the secret as of a spirit which lived within an emerald, and converted every thing that was near it to the highest perfection that it was capable of. ‘It gives a lustre,’ says he, ‘to the sun, and water to the diamond. It irradiates every metal, and enriches lead with all the properties of gold. It heightens smoke into flame, flame into light, and light into glory.’ He further added, ‘that a single ray of it dissipates pain and care and melancholy from the person on whom it falls. In short,’ says he, ‘its presence naturally changes every place into a kind of heaven.’ After he had gone on for some time in this unintelligible cant, I found that he jumbled natural and moral ideas together into the same discourse, and that his great secret was nothing else but content.”

JACOB BÖHMEN.

It is now time to speak of Jacob Böhmen, who thought he could discover the secret of the transmutation of metals in the Bible, and who invented a strange heterogeneous doctrine of mingled alchymy and religion, and founded upon it the sect of the Aurea-crucians. He was born at Görlitz, in Upper Lusatia, in 1575, and followed till his thirtieth year the occupation of a shoemaker. In this obscurity he remained, with the character of a visionary and a man of unsettled mind, until the promulgation of the Rosicrucian philosophy in his part of Germany, toward the year 1607 or 1608. From that time he began to neglect his leather, and buried his brain under the rubbish of metaphysics. The works of Paracelsus fell into his hands; and these, with the reveries of the Rosicrucians, so completely engrossed his attention, that he abandoned his trade altogether, sinking, at the same time, from a state of comparative independence into poverty and destitution. But he was nothing daunted by the miseries and privations of the flesh; his mind was fixed upon the beings of another sphere, and in thought he was already the new apostle of the human race. In the year 1612, after a meditation of four years, he published his first work, entitled *Aurora, or the Rising of the Sun*; embodying the ridiculous notions of Paracelsus, and worse confounding the confusion of that writer. The philosopher's stone might, he contended, be discovered by a diligent search of the Old and New Testaments, and more especially of the Apocalypse, which alone contained all the secrets of alchymy. He contended that the divine grace operated by the same rules, and followed the same methods, that the divine providence observed in the natural world; and that the minds of men were purged from their vices and corruptions in

the very same manner that metals were purified from their dross, namely, by fire.

Besides the sylphs, gnomes, undines, and salamanders, he acknowledged various ranks and orders of demons. He pretended to invisibility and absolute chastity. He also said that, if it pleased him, he could abstain for years from meat and drink, and all the necessities of the body. It is needless, however, to pursue his follies any further. He was reprimanded for writing this work by the magistrates of Görlitz, and commanded to leave the pen alone and stick to his wax, that his family might not become chargeable to the parish. He neglected this good advice, and continued his studies; burning minerals and purifying metals one day, and mystifying the Word of God on the next. He afterwards wrote three other works, as sublimely ridiculous as the first. The one was entitled *Metallurgia*, and has the slight merit of being the least obscure of his compositions. Another was called *The Temporal Mirror of Eternity*; and the last his *Theosophy revealed*, full of allegories and metaphors,

“All strange and geason,
Devoid of sense and ordinary reason.”

Böhmen died in 1624, leaving behind him a considerable number of admiring disciples. Many of them became, during the seventeenth century, as distinguished for absurdity as their master; amongst whom may be mentioned Gifftheil, Wendenhagen, John Jacob Zimmermann, and Abraham Frankenberg. Their heresy rendered them obnoxious to the Church of Rome; and many of them suffered long imprisonment and torture for their faith. One, named Kuhlmann, was burned alive at Moscow, in 1684, on a charge of sorcery. Böhmen's works were translated into English, and published, many years afterwards, by an enthusiast named William Law.

MORMIUS.

Peter Mormius, a notorious alchymist and contemporary of Böhmen, endeavoured, in 1630, to introduce the Rosicrucian philosophy into Holland. He applied to the States-General to grant him a public audience, that he might explain the tenets of the sect, and disclose a plan for rendering Holland the happiest and richest country on the earth, by means of the philosopher's stone and the service of the elementary spirits. The States-General wisely resolved

to have nothing to do with him. He thereupon determined to shame them by printing his book, which he did at Leyden the same year. It was entitled *The Book of the most Hidden Secrets of Nature*, and was divided into three parts; the first treating of “perpetual motion;” the second of the “transmutation of metals;” and the third of the “universal medicine.” He also published some German works upon the Rosicrucian philosophy, at Frankfort, in 1617.

Poetry and romance are deeply indebted to the Rosicrucians for many a graceful creation. The literature of England, France, and Germany contains hundreds of sweet fictions, whose machinery has been borrowed from their day-dreams. The “delicate Ariel” of Shakspeare stands pre-eminent among the number. From the same source Pope drew the airy tenants of Belinda’s dressing-room, in his charming *Rape of the Lock*; and La Motte Fouqué, the beautiful and capricious water-nymph Undine, around whom he has thrown more grace and loveliness, and for whose imaginary woes he has excited more sympathy, than ever were bestowed on a supernatural being. Sir Walter Scott also endowed the White Lady of Avenel with many of the attributes of the undines or water-sprites. German romance and lyrical poetry teem with allusions to sylphs, gnomes, undines, and salamanders; and the French have not been behind in substituting them, in works of fiction, for the more cumbrous mythology of Greece and Rome. The sylphs, more especially, have been the favourites of the bards, and have become so familiar to the popular mind as to be, in a manner, confounded with that other race of ideal beings, the fairies, who can boast of an antiquity much more venerable in the annals of superstition. Having these obligations to

the Rosicrucians, no lover of poetry can wish, however absurd they were, that such a sect of philosophers had never existed.

BORRI.

Just at the time that Michael Mayer was making known to the world the existence of such a body as the Rosicrucians, there was born in Italy a man who was afterwards destined to become the most conspicuous member of the fraternity. The alchymic mania never called forth the ingenuity of a more consummate or more successful impostor than Joseph Francis Borri. He was born in 1616, according to some authorities, and in 1627 according to others, at Milan; where his father, the Signor Branda Borri, practised as a physician. At the age of sixteen Joseph was sent to finish his education at the Jesuits' college in Rome, where he distinguished himself by his extraordinary memory. He learned every thing to which he applied himself with the utmost ease. In the most voluminous works no fact was too minute for his retention, and no study was so abstruse but that he could master it; but any advantages he might have derived from this facility were neutralised by his ungovernable passions and his love of turmoil and debauchery. He was involved in continual difficulty, as well with the heads of the college as with the police of Rome, and acquired so bad a character that years could not remove it. By the aid of his friends he established himself as a physician in Rome, and also obtained some situation in the pope's household. In one of his fits of studiousness he grew enamoured of alchymy, and determined to devote his energies to the discovery of the philosopher's stone. Of unfortunate propensities he had quite sufficient, besides this, to bring him to poverty. His pleasures were as expensive as his studies,

and both were of a nature to destroy his health and ruin his fair fame. At the age of thirty-seven he found that he could not live by the practice of medicine, and began to look about for some other employment. He became, in 1653, private secretary to the Marquis di Mirogli, the minister of the Archduke of Innsprück at the court of Rome. He continued in this capacity for two years; leading, however, the same abandoned life as heretofore, frequenting the society of gamblers, debauchees, and loose women, involving himself in disgraceful street quarrels, and alienating the patrons who were desirous to befriend him.

All at once a sudden change was observed in his conduct. The abandoned rake put on the outward sedateness of a philosopher; the scoffing sinner proclaimed that he had forsaken his evil ways, and would live thenceforth a model of virtue. To his friends this reformation was as pleasing as it was unexpected; and Borri gave obscure hints that it had been brought about by some miraculous manifestation of a superior power. He pretended that he held converse with beneficent spirits; that the secrets of God and nature were revealed to him; and that he had obtained possession of the philosopher's stone. Like his predecessor, Jacob Böhmen, he mixed up religious questions with his philosophical jargon, and took measures for declaring himself the founder of a new sect. This, at Rome itself, and in the very palace of the pope, was a hazardous proceeding; and Borri just awoke to a sense of it in time to save himself from the dungeons of the Castle of St. Angelo. He fled to Innsprück, where he remained about a year, and then returned to his native city of Milan.

INNSBRUCK.

The reputation of his great sanctity had gone before him; and he found many persons ready to attach themselves to his fortunes. All who were desirous of entering into the new communion took an oath of poverty, and relinquished their possessions for the general good of the fraternity. Borri told them that he had received from the archangel Michael a heavenly sword, upon the hilt of which were engraven the names of the seven celestial intelligences. "Whoever shall refuse," said he, "to enter into my new sheepfold shall be destroyed by the papal armies, of whom God has predestined me to be the chief. To those who follow me all joy shall be granted. I shall soon bring my chemical studies to a happy conclusion, by the discovery of the philosopher's stone, and by this means we shall all have as much gold as we desire. I am assured of the aid of the angelic

hosts, and more especially of the archangel Michael's. When I began to walk in the way of the spirit, I had a vision of the night, and was assured by an angelic voice that I should become a prophet. In sign of it I saw a palm-tree, surrounded with all the glory of paradise. The angels come to me whenever I call, and reveal to me all the secrets of the universe. The sylphs and elementary spirits obey me, and fly to the uttermost ends of the world to serve me, and those whom I delight to honour." By force of continually repeating such stories as these, Borri soon found himself at the head of a very considerable number of adherents. As he figures in these pages as an alchymist, and not as a religious sectarian, it will be unnecessary to repeat the doctrines which he taught with regard to some of the dogmas of the Church of Rome, and which exposed him to the fierce resentment of the papal authority. They were to the full as ridiculous as his philosophical pretensions. As the number of his followers increased, he appears to have cherished the idea of becoming one day a new Mahomet, and of founding, in his native city of Milan, a monarchy and religion of which he should be the king and the prophet. He had taken measures, in the year 1658, for seizing the guards at all the gates of that city, and formally declaring himself the monarch of the Milanese. Just as he thought the plan ripe for execution, it was discovered. Twenty of his followers were arrested, and he himself managed, with the utmost difficulty, to escape to the neutral territory of Switzerland, where the papal displeasure could not reach him.

The trial of his followers commenced forthwith, and the whole of them were sentenced to various terms of imprisonment. Borri's trial proceeded in his absence, and lasted for upwards of two years. He

was condemned to death as a heretic and sorcerer in 1661, and was burned in effigy in Rome by the common hangman.

Borri, in the mean time, lived quietly in Switzerland, indulging himself in railing at the Inquisition and its proceedings. He afterwards went to Strasbourg, intending to fix his residence in that town. He was received with great cordiality, as a man persecuted for his religious opinions, and withal a great alchemist. He found that sphere too narrow for his aspiring genius, and retired in the same year to the more wealthy city of Amsterdam. He there hired a magnificent house, established an equipage which eclipsed in brilliancy those of the richest merchants, and assumed the title of Excellency. Where he got the money to live in this expensive style was long a secret: the adepts in alchymy easily explained it, after their fashion. Sensible people were of opinion that he had come by it in a less wonderful manner; for it was remembered that among his unfortunate disciples in Milan, there were many rich men, who, in conformity with one of the fundamental rules of the sect, had given up all their earthly wealth into the hands of their founder. In whatever manner the money was obtained, Borri spent it in Holland with an unsparing hand, and was looked up to by the people with no little respect and veneration. He performed several able cures, and increased his reputation so much that he was vaunted as a prodigy. He continued diligently the operations of alchymy, and was in daily expectation that he should succeed in turning the inferior metals into gold. This hope never abandoned him, even in the worst extremity of his fortunes; and in his prosperity it led him into the most foolish expenses: but he could not long continue to live so magnificently upon the funds he had brought from Italy; and the philosopher's

stone, though it promised all for the wants of the morrow, never brought any thing for the necessities of to-day. He was obliged in a few months to retrench, by giving up his large house, his gilded coach and valuable blood-horses, his liveried domestics, and his luxurious entertainments. With this diminution of splendour came a diminution of renown. His cures did not appear so miraculous, when he went out on foot to perform them, as they had seemed when “his Excellency” had driven to a poor man’s door in his carriage with six horses. He sank from a prodigy into an ordinary man. His great friends shewed him the cold shoulder, and his humble flatterers carried their incense to some other shrine. Borri now thought it high time to change his quarters. With this view he borrowed money wherever he could get it, and succeeded in obtaining two hundred thousand florins from a merchant named De Meer, to aid, as he said, in discovering the water of life. He also obtained six diamonds of great value, on pretence that he could remove the flaws from them without diminishing their weight. With this booty he stole away secretly by night, and proceeded to Hamburgh.

On his arrival in that city, he found the celebrated Christina, the ex-queen of Sweden. He procured an introduction to her, and requested her patronage in his endeavour to discover the philosopher’s stone. She gave him some encouragement; but Borri, fearing that the merchants of Amsterdam, who had connexions in Hamburgh, might expose his delinquencies if he remained in the latter city, passed over to Copenhagen, and sought the protection of Frederick III., the king of Denmark.

This prince was a firm believer in the transmutation of metals. Being in want of money, he readily listened to the plans of an

adventurer who had both eloquence and ability to recommend him. He provided Borri with the means to make experiments, and took a great interest in the progress of his operations. He expected every month to possess riches that would buy Peru; and, when he was disappointed, accepted patiently the excuses of Borri, who, upon every failure, was always ready with some plausible explanation. He became in time much attached to him; and defended him from the jealous attacks of his courtiers, and the indignation of those who were grieved to see their monarch the easy dupe of a charlatan. Borri endeavoured, by every means in his power, to find aliment for this good opinion. His knowledge of medicine was useful to him in this respect, and often stood between him and disgrace. He lived six years in this manner at the court of Frederick; but that monarch dying in 1670 he was left without a protector.

As he had made more enemies than friends in Copenhagen, and had nothing to hope from the succeeding sovereign, he sought an asylum in another country. He went first to Saxony; but met so little encouragement, and encountered so much danger from the emissaries of the Inquisition, that he did not remain there many months. Anticipating nothing but persecution in every country that acknowledged the spiritual authority of the pope, he appears to have taken the resolution to dwell in Turkey, and turn Mussulman. On his arrival at the Hungarian frontier, on his way to Constantinople, he was arrested on suspicion of being concerned in the conspiracy of the Counts Nadasdi and Frangipani, which had just been discovered. In vain he protested his innocence, and divulged his real name and profession. He was detained in prison, and a letter despatched to the Emperor Leopold, to know what should be done with him. The star

of his fortunes was on the decline. The letter reached Leopold at an unlucky moment. The pope's nuncio was closeted with his majesty; and he no sooner heard the name of Joseph Francis Borri, than he demanded him as a prisoner of the Holy See. The request was complied with; and Borri, closely manacled, was sent under an escort of soldiers to the prison of the Inquisition at Rome. He was too much of an impostor to be deeply tinged with fanaticism, and was not unwilling to make a public recantation of his heresies, if he could thereby save his life. When the proposition was made to him, he accepted it with eagerness. His punishment was to be commuted into the hardly less severe one of perpetual imprisonment; but he was too happy to escape the clutch of the executioner at any price, and he made the *amende honorable* in face of the assembled multitudes of Rome on the 27th of October 1672. He was then transferred to the prisons of the Castle of St. Angelo, where he remained till his death, twenty-three years afterwards. It is said that, towards the close of his life, considerable indulgence was granted him; that he was allowed to have a laboratory, and to cheer the solitude of his dungeon by searching for the philosopher's stone. Queen Christina, during her residence at Rome, frequently visited the old man, to converse with him upon chemistry and the doctrines of the Rosicrucians. She even obtained permission that he should leave his prison occasionally for a day or two, and reside in her palace, she being responsible for his return to captivity. She encouraged him to search for the great secret of the alchemists, and provided him with money for the purpose. It may well be supposed that Borri benefited most by this acquaintance, and that Christina got nothing but experience. It is not sure that she gained even that; for until her dying day she was

convinced of the possibility of finding the philosopher's stone, and ready to assist any adventurer either zealous or impudent enough to pretend to it.

After Borri had been about eleven years in confinement, a small volume was published at Cologne, entitled *The Key of the Cabinet of the Chevalier Joseph Francis Borri, in which are contained many curious Letters upon Chemistry and other Sciences, written by him, together with a Memoir of his Life*. This book contained a complete exposition of the Rosicrucian philosophy, and afforded materials to the Abbé de Villars for his interesting *Count de Gabalis*, which excited so much attention at the close of the seventeenth century.

Borri lingered in the prison of St. Angelo till 1695, when he died, in his eightieth year. Besides *The Key of the Cabinet*, written originally in Copenhagen, in 1666, for the edification of King Frederick III., he published a work upon alchemy and the secret sciences, under the title of *The Mission of Romulus to the Romans*.

INFERIOR ALCHEMISTS OF THE SEVENTEENTH CENTURY.

Besides the pretenders to the philosopher's stone whose lives have been already narrated, this and the preceding century produced a great number of writers, who inundated literature with their books upon the subject. In fact, most of the learned men of that age had some faith in it. Van Helmont, Borrichius, Kircher, Boerhaave, and a score of others, though not professed alchemists, were fond of the science, and countenanced its professors. Helvetius, the grandfather of the celebrated philosopher of the same name, asserts that he saw an inferior metal turned into gold by a stranger, at the Hague, in 1666. He says, that, sitting one day in his study, a man, who was

dressed as a respectable burgher of North Holland, and very modest and simple in his appearance, called upon him, with the intention of dispelling his doubts relative to the philosopher's stone. He asked Helvetius if he thought he should know that rare gem if he saw it. To which Helvetius replied, that he certainly should not. The burgher immediately drew from his pocket a small ivory box, containing three pieces of metal, of the colour of brimstone, and extremely heavy; and assured Helvetius, that of them he could make as much as twenty tons of gold. Helvetius informs us, that he examined them very attentively; and seeing that they were very brittle, he took the opportunity to scrape off a small portion with his thumb-nail. He then returned them to the stranger, with an entreaty that he would perform the process of transmutation before him. The stranger replied, that he was not allowed to do so, and went away. After his departure, Helvetius procured a crucible and a portion of lead, into which, when in a state of fusion, he threw the stolen grain from the philosopher's stone. He was disappointed to find that the grain evaporated altogether, leaving the lead in its original state.

Some weeks afterwards, when he had almost forgotten the subject, he received another visit from the stranger. He again entreated him to explain the processes by which he pretended to transmute lead. The stranger at last consented, and informed him, that one grain was sufficient; but that it was necessary to envelope it in a ball of wax before throwing it on the molten metal; otherwise its extreme volatility would cause it to go off in vapour. They tried the experiment, and succeeded to their heart's content. Helvetius repeated the experiment alone, and converted six ounces of lead into very pure gold.

The fame of this event spread all over the Hague, and all the notable persons of the town flocked to the study of Helvetius to convince themselves of the fact. Helvetius performed the experiment again, in the presence of the Prince of Orange, and several times afterwards, until he exhausted the whole of the powder he had received from the stranger, from whom it is necessary to state, he never received another visit; nor did he ever discover his name or condition. In the following year, Helvetius published his *Golden Calf*,⁴⁶ in which he detailed the above circumstances.

About the same time, the celebrated Father Kircher published his *Subterranean World*, in which he called the alchemists a congregation of knaves and impostors, and their science a delusion. He admitted that he had himself been a diligent labourer in the field, and had only come to this conclusion after mature consideration and repeated fruitless experiments. All the alchemists were in arms immediately, to refute this formidable antagonist. One Solomon de Blauenstein was the first to grapple with him, and attempted to convict him of wilful misrepresentation, by recalling to his memory the transmutations by Sendivogius, before the Emperor Frederick III. and the Elector of Mayence, all performed within a recent period. Zwelfer and Glauber also entered into the dispute, and attributed the enmity of Father Kircher to spite and jealousy against adepts who had been more successful than himself.

It was also pretended that Gustavus Adolphus transmuted a quantity of quicksilver into pure gold. The learned Borrichius relates, that he saw coins which had been struck of this gold; and Lenglet du Fresnoy deposes to the same circumstance. In the *Travels of Monconis* the story is told in the following manner: “A merchant of

Lubeck, who carried on but little trade, but who knew how to change lead into very good gold, gave the King of Sweden a lingot which he had made, weighing at least one hundred pounds. The king immediately caused it to be coined into ducats; and because he knew positively that its origin was such as had been stated to him, he had his own arms graven upon the one side, and emblematical figures of Mercury and Venus on the other. I (continued Monconis) have one of these ducats in my possession; and was credibly informed that, after the death of the Lubeck merchant, who had never appeared very rich, a sum of no less than one million seven hundred thousand crowns was found in his coffers.”⁴⁷

Such stories as these, confidently related by men high in station, tended to keep up the infatuation of the alchymists in every country of Europe. It is astonishing to see the number of works which were written upon the subject during the seventeenth century alone, and the number of clever men who sacrificed themselves to the delusion. Gabriel de Castaigne, a monk of the order of St. Francis, attracted so much notice in the reign of Louis XIII., that that monarch secured him in his household, and made him his Grand Almoner. He pretended to find the elixir of life, and Louis expected by his means to have enjoyed the crown for a century. Van Helmont also pretended to have once performed with success the process of transmuting quicksilver, and was in consequence invited by the Emperor Rudolph II. to fix his residence at the court of Vienna. Glauber, the inventor of the salts which still bear his name, and who practised as a physician at Amsterdam about the middle of the seventeenth century, established a public school in that city for the study of alchymy, and gave lectures himself upon the science. John

Joachim Becher of Spire acquired great reputation at the same period, and was convinced that much gold might be made out of flint-stones by a peculiar process, and the aid of that grand and incomprehensible substance the philosopher's stone. He made a proposition to the Emperor Leopold of Austria to aid him in these experiments; but the hope of success was too remote, and the present expense too great, to tempt that monarch, and he therefore gave Becher much of his praise, but none of his money. Becher afterwards tried the States-General of Holland with no better success.

With regard to the innumerable tricks by which impostors persuaded the world that they had succeeded in making gold, and of which so many stories were current about this period, a very satisfactory report was read by M. Geoffroy the elder, at the sitting of the Royal Academy of Sciences at Paris, on the 15th of April, 1722. As it relates principally to the alchymic cheats of the sixteenth and seventeenth centuries, the following abridgment of it may not be out of place in this portion of our history. The instances of successful transmutation were so numerous, and apparently so well authenticated, that nothing short of so able an exposure as that of M. Geoffroy could disabuse the public mind. The trick to which they oftenest had recourse was to use a double-bottomed crucible, the under surface being of iron or copper, and the upper one of wax, painted to resemble the same metal. Between the two they placed as much gold or silver dust as was necessary for their purpose. They then put in their lead, quicksilver, or other ingredients, and placed their pot upon the fire. Of course, when the experiment was concluded, they never failed to find a lump of gold at the bottom. The

same result was produced in many other ways. Some of them used a hollow wand, filled with gold or silver dust, and stopped at the ends with wax or butter. With this they stirred the boiling metal in their crucibles, taking care to accompany the operation with many ceremonies, to divert attention from the real purpose of the manœuvre. They also drilled holes in lumps of lead, into which they poured molten gold, and carefully closed the aperture with the original metal. Sometimes they washed a piece of gold with quicksilver. When in this state, they found no difficulty in palming it off upon the uninitiated as an inferior metal, and very easily transmuted it into fine sonorous gold again with the aid of a little aquafortis.

Others imposed by means of nails, half iron and half gold or silver. They pretended that they really transmuted the precious half from iron, by dipping it in a strong alcohol. M. Geoffroy produced several of these nails to the Academy of Sciences, and shewed how nicely the two parts were soldered together. The golden or silver half was painted black to resemble iron, and the colour immediately disappeared when the nail was dipped into aquafortis. A nail of this description was, for a long time, in the cabinet of the Grand Duke of Tuscany. Such also, said M. Geoffroy, was the knife presented by a monk to Queen Elizabeth of England; the blade of which was half gold and half steel. Nothing at one time was more common than to see coins, half gold and half silver, which had been operated upon by alchemists, for the same purposes of trickery. In fact, says M. Geoffroy, in concluding his long report, there is every reason to believe that all the famous histories which have been handed down to us about the transmutation of metals into gold or silver, by means of

the powder of projection or philosophical elixirs, are founded upon some successful deception of the kind above narrated. These pretended philosophers invariably disappeared after the first or second experiment, or their powders or elixirs have failed to produce their effect, either because attention being excited they have found no opportunity to renew the trick without being discovered, or because they have not had sufficient gold dust for more than one trial.

The disinterestedness of these would-be philosophers looked, at first sight, extremely imposing. Instances were not rare in which they generously abandoned all the profits of their transmutations—even the honour of the discovery. But this apparent disinterestedness was one of the most cunning of their manœuvres. It served to keep up the popular expectation; it seemed to shew the possibility of discovering the philosopher's stone, and provided the means of future advantages, which they were never slow to lay hold of—such as entrances into royal households, maintenance at the public expense, and gifts from ambitious potentates, too greedy after the gold they so easily promised.

It now only remains to trace the progress of the delusion from the commencement of the eighteenth century until the present day. It will be seen that, until a very recent period, there were but slight signs of a return to reason.

JEAN DELISLE.

In the year 1705, there was much talk in France of a blacksmith, named Delisle, who had discovered the philosopher's stone, and who went about the country turning lead into gold. He was a native of

Provence, from which place his fame soon spread to the capital. His early life is involved in obscurity; but Lenglet du Fresnoy has industriously collected some particulars of his later career, which possess considerable interest. He was a man without any education, and had been servant in his youth to an alchymist, from whom he learned many of the tricks of the fraternity. The name of his master has never been discovered; but it is pretended that he rendered himself in some manner obnoxious to the government of Louis XIV., and was obliged, in consequence, to take refuge in Switzerland. Delisle accompanied him as far as Savoy, and there, it is said, set upon him in a solitary mountain-pass, and murdered and robbed him. He then disguised himself as a pilgrim, and returned to France. At a lonely inn, by the road-side, where he stopped for the night, he became acquainted with a woman, named Aluys; and so sudden a passion was enkindled betwixt them, that she consented to leave all, follow him, and share his good or evil fortune wherever he went. They lived together for five or six years in Provence, without exciting any attention, apparently possessed of a decent independence. At last, in 1706, it was given out that he was the possessor of the philosopher's stone; and people from far and near came flocking to his residence, at the Château de la Palu, at Sylanez, near Barjaumont, to witness the wealth he could make out of pumps and fire-shovels. The following account of his operations is given in a letter addressed by M. de Cerisy, the Prior of Châteauneuf, in the Diocese of Riez, in Provence, to the Vicar of St. Jacques du Hautpas, at Paris, and dated the 18th of November, 1706:

“I have something to relate to you, my dear cousin, which will be interesting to you and your friends. The philosopher's stone,

which so many persons have looked upon as a chimera, is at last found. It is a man named Delisle, of the parish of Sylanez, and residing within a quarter of a league of me, that has discovered this great secret. He turns lead into gold, and iron into silver, by merely heating these metals red hot, and pouring upon them in that state some oil and powder he is possessed of; so that it would not be impossible for any man to make a million a day, if he had sufficient of this wondrous mixture. Some of the pale gold which he had made in this manner, he sent to the jewellers of Lyons, to have their opinion on its quality. He also sold twenty pounds weight of it to a merchant of Digne, named Taxis. All the jewellers say they never saw such fine gold in their lives. He makes nails, part gold, part iron, and part silver. He promised to give me one of them, in a long conversation which I had with him the other day, by order of the Bishop of Senés, who saw his operations with his own eyes, and detailed all the circumstances to me.

“The Baron and Baroness de Rheinwald shewed me a lingot of gold made out of pewter before their eyes by M. Delisle. My brother-in-law Sauveur, who has wasted fifty years of his life in this great study, brought me the other day a nail which he had seen changed into gold by Delisle, and fully convinced me that all his previous experiments were founded on an erroneous principle. This excellent workman received, a short time ago, a very kind letter from the superintendent of the royal household, which I read. He offered to use all his influence with the ministers to prevent any attempts upon his liberty, which has twice been attacked by the agents of government. It is believed

that the oil he makes use of, is gold or silver reduced to that state. He leaves it for a long time exposed to the rays of the sun. He told me that it generally took him six months to make all his preparations. I told him that, apparently, the king wanted to see him. He replied that he could not exercise his art in every place, as a certain climate and temperature were absolutely necessary to his success. The truth is, that this man appears to have no ambition. He only keeps two horses and two men-servants. Besides, he loves his liberty, has no politeness, and speaks very bad French; but his judgment seems to be solid. He was formerly no more than a blacksmith, but excelled in that trade without having been taught it. All the great lords and seigneurs from far and near come to visit him, and pay such court to him, that it seems more like idolatry than any thing else. Happy would France be if this man would discover his secret to the king, to whom the superintendent has already sent some lingots! But the happiness is too great to be hoped for; for I fear that the workman and his secret will expire together. There is no doubt that this discovery will make a great noise in the kingdom, unless the character of the man, which I have just depicted to you, prevent it. At all events, posterity will hear of him.”

In another letter to the same person, dated the 27th of January 1707, M. de Cerisy says, “My dear cousin, I spoke to you in my last letter of the famous alchymist of Provence, M. Delisle. A good deal of that was only hearsay, but now I am enabled to speak from my own experience. I have in my possession a nail, half iron and half silver, which I made myself. That great and admirable workman also bestowed a still greater privilege upon me—he allowed me turn a

piece of lead which I had brought with me into pure gold, by means of his wonderful oil and powder. All the country have their eyes upon this gentleman; some deny loudly, others are incredulous; but those who have seen acknowledge the truth. I have read the passport that has been sent to him from court, with orders that he should present himself at Paris early in the spring. He told me that he would go willingly, and that it was himself who fixed the spring for his departure; as he wanted to collect his materials, in order that, immediately on his introduction to the king, he might make an experiment worthy of his majesty, by converting a large quantity of lead into the finest gold. I sincerely hope that he will not allow his secret to die with him, but that he will communicate it to the king. As I had the honour to dine with him on Thursday last, the 20th of this month, being seated at his side, I told him in a whisper that he could, if he liked, humble all the enemies of France. He did not deny it, but began to smile. In fact, this man is the miracle of art. Sometimes he employs the oil and powder mixed, sometimes the powder only; but in so small a quantity that, when the lingot which I made was rubbed all over with it, it did not shew at all.”

This soft-headed priest was by no means the only person in the neighbourhood who lost his wits in hopes of the boundless wealth held out by this clever impostor. Another priest, named De Lions, a chanter in the cathedral of Grenoble, writing on the 30th January 1707, says: “M. Mesnard, the curate of Montier, has written to me, stating that there is a man, about thirty-five years of age, named Delisle, who turns lead and iron into gold and silver; and that this transmutation is so veritable and so true, that the goldsmiths affirm that his gold and silver are the purest and finest they ever saw. For

five years this man was looked upon as a madman or a cheat; but the public mind is now disabused with respect to him. He now resides with M. de la Palu, at the château of the same name. M. de la Palu is not very easy in his circumstances, and wants money to portion his daughters, who have remained single till middle age, no man being willing to take them without a dowry. M. Delisle has promised to make them the richest girls in the province before he goes to court, having been sent for by the king. He has asked for a little time before his departure, in order that he may collect powder enough to make several quintals of gold before the eyes of his majesty, to whom he intends to present them. The principal matter of his wonderful powder is composed of simples, principally the herbs *Lunaria major* and *minor*. There is a good deal of the first planted by him in the gardens of La Palu; and he gets the other from the mountains that stretch about two leagues from Montier. What I tell you now is not a mere story invented for your diversion: M. Mesnard can bring forward many witnesses to its truth; among others, the Bishop of Senés, who saw these surprising operations performed; and M. de Cerisy, whom you know well. Delisle transmutes his metals in public. He rubs the lead or iron with his powder, and puts it over burning charcoal. In a short time it changes colour; the lead becomes yellow, and is found to be converted into excellent gold; the iron becomes white, and is found to be pure silver. Delisle is altogether an illiterate person. M. de St. Auban endeavoured to teach him to read and write, but he profited very little by his lessons. He is unpolite, fantastic, and a dreamer, and acts by fits and starts.”

Delisle, it would appear, was afraid of venturing to Paris. He knew that his sleight of hand would be too narrowly watched in the royal

presence; and upon some pretence or other he delayed the journey for more than two years. Desmarets, the Minister of Finance to Louis XIV., thinking the “philosopher” dreaded foul play, twice sent him a safe conduct under the king’s seal; but Delisle still refused. Upon this, Desmarets wrote to the Bishop of Senés for his real opinion as to these famous transmutations. The following was the answer of that prelate:

“Copy of a report addressed to M. Desmarets,
Comptroller-General of the Finances to His Majesty
Louis XIV., by the Bishop of Senés, dated March 1709.

“SIR,—A twelvemonth ago, or a little more, I expressed to you my joy at hearing of your elevation to the ministry; I have now the honour to write you my opinion of the Sieur Delisle, who has been working at the transmutation of metals in my diocese. I have, during the last two years, spoken of him several times to the Count de Pontchartrain, because he asked me; but I have not written to you, sir, or to M. de Chamillart, because you neither of you requested my opinion upon the subject. Now, however, that you have given me to understand that you wish to know my sentiments on the matter, I will unfold myself to you in all sincerity, for the interests of the king and the glory of your ministry.

“There are two things about the Sieur Delisle which, in my opinion, should be examined without prejudice: the one relates to his secret; the other, to his person; that is to say, whether his transmutations are real, and whether his conduct has been

regular. As regards the secret of the philosopher's stone, I deemed it impossible, for a long time; and for more than three years I was more mistrustful of the pretensions of this Sieur Delisle than of any other person. During this period I afforded him no countenance; I even aided a person, who was highly recommended to me by an influential family of this province, to prosecute Delisle for some offence or other which it was alleged he had committed. But this person, in his anger against him, having told me that he had himself been several times the bearer of gold and silver to the goldsmiths of Nice, Aix, and Avignon, which had been transmuted by Delisle from lead and iron, I began to waver a little in my opinions respecting him. I afterwards met Delisle at the house of one of my friends. To please me, the family asked Delisle to operate before me, to which he immediately consented. I offered him some iron nails, which he changed into silver in the chimney-place before six or seven credible witnesses. I took the nails thus transmuted, and sent them by my almoner to Imbert, the jeweller of Aix, who, having subjected them to the necessary trial, returned them to me, saying they were very good silver. Still, however, I was not quite satisfied. M. de Pontchartrain having hinted to me, two years previously, that I should do a thing agreeable to his majesty if I examined into this business of Delisle, I resolved to do so now. I therefore summoned the alchemist to come to me at Castellane. He came; and I had him escorted by eight or ten vigilant men, to whom I had given notice to watch his hands strictly. Before all of us he changed two pieces of lead into gold and silver. I sent them both to M. de Pontchartrain; and he

afterwards informed me by a letter, now lying before me, that he had shewn them to the most experienced goldsmiths of Paris, who unanimously pronounced them to be gold and silver of the very purest quality, and without alloy. My former bad opinion of Delisle was now indeed shaken. It was much more so when he performed transmutation five or six times before me at Senés, and made me perform it myself before him without his putting his hand to any thing. You have seen, sir, the letter of my nephew, the Père Berard, of the Oratoire at Paris, on the experiment that he performed at Castellane, and the truth of which I hereby attest. Another nephew of mine, the Sieur Bourget, who was here three weeks ago, performed the same experiment in my presence, and will detail all the circumstances to you personally at Paris. A hundred persons in my diocese have been witnesses of these things. I confess to you, sir, that, after the testimony of so many spectators and so many goldsmiths, and after the repeatedly successful experiments that I saw performed, all my prejudices vanished. My reason was convinced by my eyes; and the phantoms of impossibility which I had conjured up were dissipated by the work of my own hands.

“It now only remains for me to speak to you on the subject of his person and conduct. Three suspicions have been excited against him: the first, that he was implicated in some criminal proceeding at Cisteron, and that he falsified the coin of the realm; the second, that the king sent him two safe-conducts without effect; and the third, that he still delays going to court to operate before the king. You may see, sir, that I do not hide or avoid any thing. As regards the business at Cisteron, the Sieur

Delisle has repeatedly assured me that there was nothing against him which could reasonably draw him within the pale of justice, and that he had never carried on any calling injurious to the king's service. It was true that, six or seven years ago, he had been to Cisteron to gather herbs necessary for his powder, and that he had lodged at the house of one Pelouse, whom he thought an honest man. Pelouse was accused of clipping Louis-d'ors; and as he had lodged with him, he was suspected of being his accomplice. This mere suspicion, without any proof whatever, had caused him to be condemned for contumacy; a common case enough with judges, who always proceed with much rigour against those who are absent. During my own sojourn at Aix, it was well known that a man, named André Aluys, had spread about reports injurious to the character of Delisle, because he hoped thereby to avoid paying him a sum of forty *Louis* that he owed him. But permit me, sir, to go further, and to add that, even if there were well-founded suspicions against Delisle, we should look with some little indulgence on the faults of a man who possesses a secret so useful to the state. As regards the two safe-conducts sent him by the king, I think I can answer certainly that it was through no fault of his that he paid so little attention to them. His year, strictly speaking, consists only of the four summer months; and when by any means he is prevented from making the proper use of them, he loses a whole year. Thus the first safe-conduct became useless by the irruption of the Duke of Savoy in 1707 and the second had hardly been obtained, at the end of June 1708, when the said Delisle was insulted by a party of armed men, pretending to act

under the authority of the Count de Grignan, to whom he wrote several letters of complaint, without receiving any answer, or promise that his safety would be attended to. What I have now told you, sir, removes the third objection, and is the reason why, at the present time, he cannot go to Paris to the king, in fulfilment of his promises made two years ago. Two, or even three, summers have been lost to him, owing to the continual inquietude he has laboured under. He has, in consequence, been unable to work, and has not collected a sufficient quantity of his oil and powder, or brought what he has got to the necessary degree of perfection. For this reason also he could not give the Sieur de Bourget the portion he promised him for your inspection. If the other day he changed some lead into gold with a few grains of his powder, they were assuredly all he had; for he told me that such was the fact long before he knew my nephew was coming. Even if he had preserved this small quantity to operate before the king, I am sure that, on second thoughts, he would never have adventured with so little; because the slightest obstacles in the metals (their being too hard or too soft, which is only discovered in operating,) would have caused him to be looked upon as an impostor, if, in case his first powder had proved ineffectual, he had not been possessed of more to renew the experiment and surmount the difficulty.

“Permit me, sir, in conclusion, to repeat, that such an artist as this should not be driven to the last extremity, nor forced to seek an asylum offered to him in other countries, but which he has despised, as much from his own inclinations as from the advice I have given him. You risk nothing in giving him a little time, and

in hurrying him you may lose a great deal. The genuineness of his gold can no longer be doubted, after the testimony of so many jewellers of Aix, Lyons, and Paris in its favour. As it is not his fault that the previous safe-conducts sent to him have been of no service, it will be necessary to send him another; for the success of which I will be answerable, if you will confide the matter to me, and trust to my zeal for the service of his majesty, to whom I pray you to communicate this letter, that I may be spared the just reproaches he might one day heap upon me if he remained ignorant of the facts I have now written to you. Assure him, if you please, that, if you send me such a safe-conduct, I will oblige the Sieur Delisle to depose with me such precious pledges of his fidelity as shall enable me to be responsible myself to the king. These are my sentiments, and I submit them to your superior knowledge; and have the honour to remain, with much respect, &c.

“? JOHN BISHOP OF SENES.

“To M. Desmarets, Minister of State, and Comptroller-General of the Finances, at Paris.”

That Delisle was no ordinary impostor, but a man of consummate cunning and address, is very evident from this letter. The bishop was fairly taken in by his clever legerdemain, and when once his first distrust was conquered, appeared as anxious to deceive himself as even Delisle could have wished. His faith was so abundant that he made the case of his *protégé* his own, and would not suffer the breath of suspicion to be directed against him. Both Louis and his

minister appear to have been dazzled by the brilliant hopes he had excited, and a third pass, or safe-conduct, was immediately sent to the alchemist, with a command from the king that he should forthwith present himself at Versailles, and make public trial of his oil and powder. But this did not suit the plans of Delisle. In the provinces he was regarded as a man of no small importance; the servile flattery that awaited him wherever he went was so grateful to his mind that he could not willingly relinquish it, and run upon certain detection at the court of the monarch. Upon one pretext or another he delayed his journey, notwithstanding the earnest solicitations of his good friend the bishop. The latter had given his word to the minister, and pledged his honour that he would induce Delisle to go, and he began to be alarmed when he found he could not subdue the obstinacy of that individual. For more than two years he continued to remonstrate with him, and was always met by some excuse, that there was not sufficient powder, or that it had not been long enough exposed to the rays of the sun. At last his patience was exhausted; and fearful that he might suffer in the royal estimation by longer delay, he wrote to the king for a *lettre de cachet*, in virtue of which the alchemist was seized at the castle of La Palu, in the month of June 1711, and carried off to be imprisoned in the Bastille.

The gendarmes were aware that their prisoner was supposed to be the lucky possessor of the philosopher's stone, and on the road they conspired to rob and murder him. One of them pretended to be touched with pity for the misfortunes of the philosopher, and offered to give him an opportunity of escape whenever he could divert the attention of his companions. Delisle was profuse in his thanks, little dreaming of the snare that was laid for him. His treacherous friend

gave notice of the success of the stratagem so far; and it was agreed that Delisle should be allowed to struggle with and overthrow one of them while the rest were at some distance. They were then to pursue him and shoot him through the heart; and after robbing the corpse of the philosopher's stone, convey it to Paris on a cart, and tell M. Desmarets that the prisoner had attempted to escape, and would have succeeded if they had not fired after him and shot him through the body. At a convenient place the scheme was executed. On a given signal from the friendly gendarme, Delisle fled, while another gendarme took aim and shot him through the thigh. Some peasants arriving at the instant, they were prevented from killing him as they intended, and he was transported to Paris, maimed and bleeding. He was thrown into a dungeon in the Bastille, and obstinately tore away the bandages which the surgeons applied to his wound. He never afterwards rose from his bed.

The Bishop of Senés visited him in prison, and promised him his liberty if he would transmute a certain quantity of lead into gold before the king. The unhappy man had no longer the means of carrying on the deception; he had no gold, and no double-bottomed crucible or hollow wand to conceal it in, even if he had. He would not, however, confess that he was an impostor; but merely said he did not know how to make the powder of projection, but had received a quantity from an Italian philosopher, and had used it all in his various transmutations in Provence. He lingered for seven or eight months in the Bastille, and died from the effects of his wound, in the forty-first year of his age.

ALBERT ALUYS.

This pretender to the philosopher's stone was the son, by a former husband, of the woman Aluys, with whom Delisle became acquainted at the commencement of his career, in the cabaret by the road-side, and whom he afterwards married. Delisle performed the part of a father towards him, and thought he could shew no stronger proof of his regard, than by giving him the necessary instructions to carry on the deception which had raised himself to such a pitch of greatness. The young Aluys was an apt scholar, and soon mastered all the jargon of the alchemists. He discoursed learnedly upon projections, cimentations, sublimations, the elixir of life, and the universal alkahest; and on the death of Delisle gave out that the secret of that great adept had been communicated to him, and to him only. His mother aided in the fraud, with the hope they might both fasten themselves, in the true alchymical fashion, upon some rich dupe, who would entertain them magnificently while the operation was in progress. The fate of Delisle was no inducement for them to stop in France. The Provençals, it is true, entertained as high an opinion as ever of his skill, and were well inclined to believe the tales of the young adept on whom his mantle had fallen; but the dungeons of the Bastille were yawning for their prey, and Aluys and his mother decamped with all convenient expedition. They travelled about the Continent for several years, sponging upon credulous rich men, and now and then performing successful transmutations by the aid of double-bottomed crucibles and the like. In the year 1726, Aluys, without his mother, who appears to have died in the interval, was at Vienna, where he introduced himself to the Duke de Richelieu, at that time ambassador from the court of France. He completely deceived this nobleman; he turned lead into gold (apparently) on

several occasions, and even made the ambassador himself turn an iron nail into a silver one. The duke afterwards boasted to Lenglet du Fresnoy of his achievements as an alchemist, and regretted that he had not been able to discover the secret of the precious powder by which he performed them.

Aluys soon found that, although he might make a dupe of the Duke de Richelieu, he could not get any money from him. On the contrary, the duke expected all his pokers and fire-shovels to be made silver, and all his pewter utensils gold; and thought the honour of his acquaintance was reward sufficient for a *roturier*, who could not want wealth since he possessed so invaluable a secret. Aluys, seeing that so much was expected of him, bade adieu to his excellency, and proceeded to Bohemia accompanied by a pupil, and by a young girl who had fallen in love with him in Vienna. Some noblemen in Bohemia received him kindly, and entertained him at their houses for months at a time. It was his usual practice to pretend that he possessed only a few grains of his powder, with which he would operate in any house where he intended to fix his quarters for the season. He would make the proprietor the present of a piece of gold thus transmuted, and promise him millions, if he could only be provided with leisure to gather his *lunaria major* and *minor* on their mountain-tops, and board, lodging, and loose cash for himself, his wife, and his pupil, in the interval.

He exhausted in this manner the patience of some dozen of people, when, thinking that there was less danger for him in France under the young king Louis XV. than under his old and morose predecessor, he returned to Provence. On his arrival at Aix, he presented himself before M. le Bret, the president of the province, a

gentleman who was much attached to the pursuits of alchymy, and had great hopes of being himself able to find the philosopher's stone. M. le Bret, contrary to his expectation, received him very coolly, in consequence of some rumours that were spread abroad respecting him; and told him to call upon him on the morrow. Aluys did not like the tone of the voice, or the expression of the eye of the learned president, as that functionary looked down upon him. Suspecting that all was not right, he left Aix secretly the same evening, and proceeded to Marseilles. But the police were on the watch for him; and he had not been there four-and-twenty hours, before he was arrested on a charge of coining, and thrown into prison.

As the proofs against him were too convincing to leave him much hope of an acquittal, he planned an escape from durance. It so happened that the gaoler had a pretty daughter, and Aluys soon discovered that she was tender-hearted. He endeavoured to gain her in his favour, and succeeded. The damsel, unaware that he was a married man, conceived and encouraged a passion for him, and generously provided him with the means of escape. After he had been nearly a year in prison he succeeded in getting free, leaving the poor girl behind to learn that he was already married, and to lament in solitude that she had given her heart to an ungrateful vagabond.

When he left Marseilles, he had not a shoe to his foot or a decent garment to his back, but was provided with some money and clothes by his wife in a neighbouring town. They then found their way to Brussels, and by dint of excessive impudence, brought themselves into notice. He took a house, fitted up a splendid laboratory, and gave out that he knew the secret of transmutation. In vain did M. Percel, the brother-in-law of Lenglet du Fresnoy, who resided in that

city, expose his pretensions, and hold him up to contempt as an ignorant impostor: the world believed him not. They took the alchemist at his word, and besieged his doors to see and wonder at the clever legerdemain by which he turned iron nails into gold and silver. A rich *greffier* paid him a large sum of money that he might be instructed in the art, and Aluys gave him several lessons on the most common principles of chemistry. The greffier studied hard for a twelvemonth, and then discovered that his master was a quack. He demanded his money back again; but Aluys was not inclined to give it him, and the affair was brought before the civil tribunal of the province. In the mean time, however, the greffier died suddenly; poisoned, according to the popular rumour, by his debtor, to avoid repayment. So great an outcry arose in the city, that Aluys, who may have been innocent of the crime, was nevertheless afraid to remain and brave it. He withdrew secretly in the night, and retired to Paris. Here all trace of him is lost. He was never heard of again; but Lenglet du Fresnoy conjectures that he ended his days in some obscure dungeon, into which he was cast for coining or other malpractices.

THE COUNT DE ST. GERMAIN.

This adventurer was of a higher grade than the last, and played a distinguished part at the court of Louis XV. He pretended to have discovered the elixir of life, by means of which he could make any one live for centuries; and allowed it to be believed that his own age was upwards of two thousand years. He entertained many of the opinions of the Rosicrucians; boasted of his intercourse with sylphs and salamanders; and of his power of drawing diamonds from the earth, and pearls from the sea, by the force of his incantations. He did not

lay claim to the merit of having discovered the philosopher's stone; but devoted so much of his time to the operations of alchymy, that it was very generally believed, that if such a thing as the philosopher's stone had ever existed, or could be called into existence, he was the man to succeed in finding it.

It has never yet been discovered what was his real name, or in what country he was born. Some believed, from the Jewish cast of his handsome countenance, that he was the "wandering Jew;" others asserted that he was the issue of an Arabian princess, and that his father was a salamander; while others, more reasonable, affirmed him to be the son of a Portuguese Jew established at Bourdeaux. He first carried on his imposture in Germany, where he made considerable sums by selling an elixir to arrest the progress of old age. The Maréchal de Belle-Isle purchased a dose of it; and was so captivated with the wit, learning, and good manners of the charlatan, and so convinced of the justice of his most preposterous pretensions, that he induced him to fix his residence in Paris. Under the marshal's patronage, he first appeared in the gay circles of that capital. Every one was delighted with the mysterious stranger; who, at this period of his life, appears to have been about seventy years of age, but did not look more than forty-five. His easy assurance imposed upon most people. His reading was extensive, and his memory extraordinarily tenacious of the slightest circumstances. His pretension to have lived for so many centuries naturally exposed him to some puzzling questions, as to the appearance, life, and conversation of the great men of former days; but he was never at a loss for an answer. Many who questioned him for the purpose of scoffing at him, refrained in perplexity, quite bewildered by his

presence of mind, his ready replies, and his astonishing accuracy on every point mentioned in history. To increase the mystery by which he was surrounded, he permitted no person to know how he lived. He dressed in a style of the greatest magnificence; sported valuable diamonds in his hat, on his fingers, and in his shoe-buckles; and sometimes made the most costly presents to the ladies of the court. It was suspected by many that he was a spy, in the pay of the English ministry; but there never was a tittle of evidence to support the charge. The king looked upon him with marked favour, was often closeted with him for hours together, and would not suffer any body to speak disparagingly of him. Voltaire constantly turned him into ridicule; and, in one of his letters to the King of Prussia, mentions him as “un comte pour rire;” and states that he pretended to have dined with the holy fathers at the Council of Trent!

In the *Memoirs of Madame du Hausset*, chamber-woman to Madame du Pompadour, there are some amusing anecdotes of this personage. Very soon after his arrival in Paris, he had the *entrée* of her dressing-room; a favour only granted to the most powerful lords at the court of her royal lover. Madame was fond of conversing with him; and, in her presence, he thought fit to lower his pretensions very considerably; but he often allowed her to believe that he had lived two or three hundred years at least. “One day,” says Madame du Hausset, “madame said to him, in my presence, ‘What was the personal appearance of Francis I.? He was a king I should have liked.’ ‘He was, indeed, very captivating,’ replied St. Germain; and he proceeded to describe his face and person, as that of a man whom he had accurately observed. ‘It is a pity he was too ardent. I could have given him some good advice, which would have saved him from all

his misfortunes: but he would not have followed it; for it seems as if a fatality attended princes, forcing them to shut their ears to the wisest counsel.' 'Was his court very brilliant?' inquired Madame du Pompadour. 'Very,' replied the count; 'but those of his grandsons surpassed it. In the time of Mary Stuart and Margaret of Valois, it was a land of enchantment—a temple sacred to pleasures of every kind.' Madame said, laughing, 'You seem to have seen all this.' 'I have an excellent memory,' said he, 'and have read the history of France with great care. I sometimes amuse myself, not by making, but by letting, it be believed that I lived in old times.'

“‘But you do not tell us your age,’ said Madame du Pompadour to him on another occasion; ‘and yet you pretend you are very old. The Countess de Gergy, who was, I believe, ambassadress at Vienna some fifty years ago, says she saw you there, exactly the same as you now appear.’

“‘It is true, madame,’ replied St. Germain; ‘I knew Madame de Gergy many years ago.’

“‘But, according to her account, you must be more than a hundred years old?’

“‘That is not impossible,’ said he, laughing; ‘but it is much more possible that the good lady is in her dotage.’

“‘You gave her an elixir, surprising for the effects it produced; for she says, that during a length of time, she only appeared to be eighty-four; the age at which she took it. Why don’t you give it to the king?’

“‘Oh, madam,’ he exclaimed, ‘the physicians would have me broken on the wheel, were I to think of drugging his majesty.’”

When the world begins to believe extraordinary things of an individual, there is no telling where its extravagance will stop.

People, when once they have taken the start, vie with each other who shall believe most. At this period all Paris resounded with the wonderful adventures of the Count de St. Germain; and a company of waggish young men tried the following experiment upon its credulity: A clever mimic, who, on account of the amusement he afforded, was admitted into good society, was taken by them, dressed as the Count de St. Germain, into several houses in the Rue du Marais. He imitated the count's peculiarities admirably, and found his auditors open-mouthed to believe any absurdity he chose to utter. No fiction was too monstrous for their all-devouring credulity. He spoke of the Saviour of the world in terms of the greatest familiarity; said he had supped with him at the marriage in Canaan of Galilee, where the water was miraculously turned into wine. In fact, he said he was an intimate friend of his, and had often warned him to be less romantic and imprudent, or he would finish his career miserably. This infamous blasphemy, strange to say, found believers; and ere three days had elapsed, it was currently reported that St. Germain was born soon after the deluge, and that he would never die!

St. Germain himself was too much a man of the world to assert any thing so monstrous; but he took no pains to contradict the story. In all his conversations with persons of rank and education, he advanced his claims modestly, and as if by mere inadvertency, and seldom pretended to a longevity beyond three hundred years, except when he found he was in company with persons who would believe any thing. He often spoke of Henry VIII. as if he had known him intimately, and of the Emperor Charles V. as if that monarch had delighted in his society. He would describe conversations which took

place with such an apparent truthfulness, and be so exceedingly minute and particular as to the dress and appearance of the individuals, and even the weather at the time and the furniture of the room, that three persons out of four were generally inclined to credit him. He had constant applications from rich old women for an elixir to make them young again, and it would appear gained large sums in this manner. To those whom he was pleased to call his friends he said his mode of living and plan of diet were far superior to any elixir, and that any body might attain a patriarchal age by refraining from drinking at meals, and very sparingly at any other time. The Baron de Gleichen followed this system, and took great quantities of senna leaves, expecting to live for two hundred years. He died, however, at seventy-three. The Duchess de Choiseul was desirous of following the same system, but the duke her husband in much wrath forbade her to follow any system prescribed by a man who had so equivocal a reputation as M. de St. Germain.

Madame du Hausset says she saw St. Germain and conversed with him several times. He appeared to her to be about fifty years of age, was of the middle size, and had fine expressive features. His dress was always simple, but displayed much taste. He usually wore diamond rings of great value, and his watch and snuff-box were ornamented with a profusion of precious stones. One day, at Madame du Pompadour's apartments, where the principal courtiers were assembled, St. Germain made his appearance in diamond knee and shoe buckles of so fine a water, that madame said she did not think the king had any equal to them. He was entreated to pass into the antechamber and undo them, which he did, and brought them to madame for closer inspection. M. de Gontant, who was present, said

their value could not be less than two hundred thousand livres, or upwards of eight thousand pounds sterling. The Baron de Gleichen, in his *Memoirs*, relates that the count one day shewed him so many diamonds, that he thought he saw before him all the treasures of Aladdin's lamp; and adds, that he had had great experience in precious stones, and was convinced that all those possessed by the count were genuine. On another occasion St. Germain shewed Madame du Pompadour a small box, containing topazes, emeralds, and diamonds worth half a million of livres. He affected to despise all this wealth, to make the world more easily believe that he could, like the Rosicrucians, draw precious stones out of the earth by the magic of his song. He gave away a great number of these jewels to the ladies of the court; and Madame du Pompadour was so charmed with his generosity, that she gave him a richly enamelled snuff-box as a token of her regard, on the lid of which was beautifully painted a portrait of Socrates, or some other Greek sage, to whom she compared him. He was not only lavish to the mistresses, but to the maids. Madame du Hausset says: "The count came to see Madame du Pompadour, who was very ill, and lay on the sofa. He shewed her diamonds enough to furnish a king's treasury. Madame sent for me to see all those beautiful things. I looked at them with an air of the utmost astonishment; but I made signs to her that I thought them all false. The count felt for something in a pocket-book about twice as large as a spectacle-case, and at length drew out two or three little paper packets, which he unfolded, and exhibited a superb ruby. He threw on the table, with a contemptuous air, a little cross of green and white stones. I looked at it, and said it was not to be despised. I then put it on, and admired it greatly. The count begged me to accept it; I

refused. He urged me to take it. At length he pressed so warmly, that madame, seeing it could not be worth more than a thousand livres, made me a sign to accept it. I took the cross, much pleased with the count's politeness."

How the adventurer obtained his wealth remains a secret. He could not have made it all by the sale of his *elixir vitæ* in Germany, though no doubt some portion of it was derived from that source. Voltaire positively says he was in the pay of foreign governments; and in his letter to the King of Prussia, dated the 5th of April 1758, says that he was initiated in all the secrets of Choiseul, Kaunitz, and Pitt. Of what use he could be to any of those ministers, and to Choiseul especially, is a mystery of mysteries.

There appears no doubt that he possessed the secret of removing spots from diamonds; and in all probability he gained considerable sums by buying at inferior prices such as had flaws in them, and afterwards disposing of them at a profit of cent per cent. Madame du Hausset relates the following anecdote on this particular: "The king," says she, "ordered a middling-sized diamond, which had a flaw in it, to be brought to him. After having it weighed, his majesty said to the count, 'The value of this diamond as it is, and with the flaw in it, is six thousand livres; without the flaw, it would be worth at least ten thousand. Will you undertake to make me a gainer of four thousand livres?' St. Germain examined it very attentively, and said, 'It is possible; it may be done. I will bring it you again in a month.' At the time appointed the count brought back the diamond without a spot, and gave it to the king. It was wrapped in a cloth of amianthos, which he took off. The king had it weighed immediately, and found it very little diminished. His majesty then sent it to his jeweller by M. de

Gontant, without telling him of any thing that had passed. The jeweller gave nine thousand six hundred livres for it. The king, however, sent for the diamond back again, and said he would keep it as a curiosity. He could not overcome his surprise, and said M. de St. Germain must be worth millions, especially if he possessed the secret of making large diamonds out of small ones. The count neither said that he could or could not, but positively asserted that he knew how to make pearls grow, and give them the finest water. The king paid him great attention, and so did Madame du Pompadour. M. du Quesnoy once said that St. Germain was a quack, but the king reprimanded him. In fact, his majesty appears infatuated by him, and sometimes talks of him as if his descent were illustrious.”

St. Germain had a most amusing vagabond for a servant, to whom he would often appeal for corroboration, when relating some wonderful event that happened centuries before. The fellow, who was not without ability, generally corroborated him in a most satisfactory manner. Upon one occasion, his master was telling a party of ladies and gentlemen, at dinner, some conversation he had had in Palestine with King Richard I. of England, whom he described as a very particular friend of his. Signs of astonishment and incredulity were visible on the faces of the company; upon which St. Germain very coolly turned to his servant, who stood behind his chair, and asked him if he had not spoken truth? “I really cannot say,” replied the man, without moving a muscle; “you forget, sir, I have only been five hundred years in your service!” “Ah! true,” said his master; “I remember now; it was a little before your time!”

Occasionally, when with men whom he could not so easily dupe, he gave utterance to the contempt with which he could scarcely avoid

regarding such gaping credulity. “These fools of Parisians,” said he to the Baron de Gleichen, “believe me to be more than five hundred years old; and, since they will have it so, I confirm them in their idea. Not but that I really am much older than I appear.”

Many other stories are related of this strange impostor; but enough have been quoted to shew his character and pretensions. It appears that he endeavoured to find the philosopher’s stone; but never boasted of possessing it. The Prince of Hesse Cassel, whom he had known years before, in Germany, wrote urgent letters to him, entreating him to quit Paris, and reside with him. St. Germain at last consented. Nothing further is known of his career. There were no gossiping memoir-writers at the court of Hesse Cassel to chronicle his sayings and doings. He died at Sleswig, under the roof of his friend the prince, in the year 1784.

CAGLIOSTRO.

This famous charlatan, the friend and successor of St. Germain, ran a career still more extraordinary. He was the arch-quack of his age, the last of the great pretenders to the philosopher's stone and the water of life, and during his brief season of prosperity, one of the most conspicuous characters of Europe.

His real name was Joseph Balsamo. He was born at Palermo, about the year 1743, of humble parentage. He had the misfortune to lose his father during his infancy, and his education was left in consequence to some relatives of his mother, the latter being too poor to afford him any instruction beyond mere reading and writing. He was sent in his fifteenth year to a monastery, to be taught the elements of chemistry and physic; but his temper was so impetuous, his indolence so invincible, and his vicious habits so deeply rooted, that he made no progress. After remaining some years, he left it with the character of an uninformed and dissipated young man, with good natural talents but a bad disposition. When he became of age, he abandoned himself to a life of riot and debauchery, and entered himself, in fact, into that celebrated fraternity, known in France and Italy as the "Knights of Industry," and in England as the "Swell Mob." He was far from being an idle or unwilling member of the corps. The first way in which he distinguished himself was by forging orders of admission to the theatres. He afterwards robbed his uncle, and counterfeited a will. For acts like these, he paid frequent

compulsory visits to the prisons of Palermo. Somehow or other he acquired the character of a sorcerer—of a man who had failed in discovering the secrets of alchymy, and had sold his soul to the devil for the gold which he was not able to make by means of transmutation. He took no pains to disabuse the popular mind on this particular, but rather encouraged the belief than otherwise. He at last made use of it to cheat a silversmith named Marano, of about sixty ounces of gold, and was in consequence obliged to leave Palermo. He persuaded this man that he could shew him a treasure hidden in a cave, for which service he was to receive the sixty ounces of gold, while the silversmith was to have all the treasure for the mere trouble of digging it up. They went together at midnight to an excavation in the vicinity of Palermo, where Balsamo drew a magic circle, and invoked the devil to shew his treasures. Suddenly there appeared half a dozen fellows, the accomplices of the swindler, dressed to represent devils, with horns on their heads, claws to their fingers, and vomiting apparently red and blue flame. They were armed with pitchforks, with which they belaboured poor Marano till he was almost dead, and robbed him of his sixty ounces of gold and all the valuables he carried about his person. They then made off, accompanied by Balsamo, leaving the unlucky silversmith to recover or die at his leisure. Nature chose the former course; and soon after daylight he was restored to his senses, smarting in body from his blows and in spirit for the deception of which he had been the victim. His first impulse was to denounce Balsamo to the magistrates of the town; but on further reflection he was afraid of the ridicule that a full exposure of all the circumstances would draw upon him; he therefore took the truly Italian resolution of being revenged on Balsamo, by

murdering him at the first convenient opportunity. Having given utterance to this threat in the hearing of a friend of Balsamo, it was reported to the latter, who immediately packed up his valuables and quitted Europe.

He chose Medina, in Arabia, for his future dwelling-place, and there became acquainted with a Greek named Altotas, a man exceedingly well versed in all the languages of the East, and an indefatigable student of alchymy. He possessed an invaluable collection of Arabian manuscripts on his favourite science, and studied them with such unremitting industry that he found he had not sufficient time to attend to his crucibles and furnaces without neglecting his books. He was looking about for an assistant when Balsamo opportunely presented himself, and made so favourable an impression that he was at once engaged in that capacity. But the relation of master and servant did not long subsist between them; Balsamo was too ambitious and too clever to play a secondary part, and within fifteen days of their first acquaintance they were bound together as friends and partners. Altotas, in the course of a long life devoted to alchymy, had stumbled upon some valuable discoveries in chemistry, one of which was an ingredient for improving the manufacture of flax, and imparting to goods of that material a gloss and softness almost equal to silk. Balsamo gave him the good advice to leave the philosopher's stone for the present undiscovered, and make gold out of their flax. The advice was taken, and they proceeded together to Alexandria to trade, with a large stock of that article. They stayed forty days in Alexandria, and gained a considerable sum by their venture. They afterwards visited other cities in Egypt, and were equally successful. They also visited Turkey,

where they sold drugs and amulets. On their return to Europe, they were driven by stress of weather into Malta, and were hospitably received by Pinto, the Grand Master of the Knights, and a famous alchemist. They worked in his laboratory for some months, and tried hard to change a pewter platter into a silver one. Balsamo, having less faith than his companions, was sooner wearied; and obtaining from his host many letters of introduction to Rome and Naples, he left him and Altotas to find the philosopher's stone and transmute the pewter platter without him.

He had long since dropped the name of Balsamo on account of the many ugly associations that clung to it; and during his travels had assumed at least half a score others, with titles annexed to them. He called himself sometimes the Chevalier de Fischio, the Marquis de Melissa, the Baron de Belmonte, de Pelligrini, d'Anna, de Fenix, de Harat, but most commonly the Count de Cagliostro. Under the latter title he entered Rome, and never afterwards changed it. In this city he gave himself out as the restorer of the Rosicrucian philosophy; said he could transmute all metals into gold; that he could render himself invisible, cure all diseases, and administer an elixir against old age and decay. His letters from the Grand Master Pinto procured him an introduction into the best families. He made money rapidly by the sale of his *elixir vitæ*; and, like other quacks, performed many remarkable cures by inspiring his patients with the most complete faith and reliance upon his powers; an advantage which the most impudent charlatans often possess over the regular practitioner.

While thus in a fair way of making his fortune he became acquainted with the beautiful Lorenza Feliciano, a young lady of noble birth, but without fortune. Cagliostro soon discovered that she

possessed accomplishments that were invaluable. Besides her ravishing beauty, she had the readiest wit, the most engaging manners, the most fertile imagination, and the least principle of any of the maidens of Rome. She was just the wife for Cagliostro, who proposed himself to her, and was accepted. After their marriage, he instructed his fair Lorenza in all the secrets of his calling—taught her pretty lips to invoke angels, and genii, sylphs, salamanders, and undines, and, when need required, devils and evil spirits. Lorenza was an apt scholar; she soon learned all the jargon of the alchemists and all the spells of the enchanters; and thus accomplished the hopeful pair set out on their travels, to levy contributions on the superstitious and the credulous.

They first went to Sleswig on a visit to the Count de St. Germain, their great predecessor in the art of making dupes, and were received by him in the most magnificent manner. They no doubt fortified their minds for the career they had chosen by the sage discourse of that worshipful gentleman; for immediately after they left him, they began their operations. They travelled for three or four years in Russia, Poland, and Germany, transmuting metals, telling fortunes, raising spirits, and selling the *elixir vitæ* wherever they went; but there is no record of their doings from whence to draw a more particular detail. It was not until they made their appearance in England in 1776, that the names of the Count and Countess di Cagliostro began to acquire a European reputation. They arrived in London in the July of that year, possessed of property, in plate, jewels, and specie, to the amount of about three thousand pounds. They hired apartments in Whitcombe Street, and lived for some months quietly. In the same house there lodged a Portuguese

woman, named Blavary, who, being in necessitous circumstances, was engaged by the count as interpreter. She was constantly admitted into his laboratory, where he spent much of his time in search of the philosopher's stone. She spread abroad the fame of her entertainer in return for his hospitality, and laboured hard to impress every body with as full a belief in his extraordinary powers as she felt herself; but as a female interpreter of the rank and appearance of Madame Blavary did not exactly correspond with the count's notions either of dignity or decorum, he hired a person named Vitellini, a teacher of languages, to act in that capacity. Vitellini was a desperate gambler, a man who had tried almost every resource to repair his ruined fortunes, including among the rest the search for the philosopher's stone. Immediately that he saw the count's operations, he was convinced that the great secret was his, and that the golden gates of the palace of fortune were open to let him in. With still more enthusiasm than Madame Blavary, he held forth to his acquaintance, and in all public places, that the count was an extraordinary man, a true adept, whose fortune was immense, and who could transmute into pure and solid gold as much lead, iron, and copper as he pleased. The consequence was, that the house of Cagliostro was besieged by crowds of the idle, the credulous, and the avaricious, all eager to obtain a sight of the "philosopher," or to share in the boundless wealth which he could call into existence.

Unfortunately for Cagliostro, he had fallen into evil hands. Instead of duping the people of England, as he might have done, he became himself the victim of a gang of swindlers, who, with the fullest reliance on his occult powers, only sought to make money of him. Vitellini introduced to him a ruined gambler like himself, named

Scot, whom he represented as a Scottish nobleman, attracted to London solely by his desire to see and converse with the extraordinary man whose fame had spread to the distant mountains of the north. Cagliostro received him with great kindness and cordiality; and “Lord” Scot thereupon introduced a woman named Fry as Lady Scot, who was to act as chaperone to the Countess di Cagliostro, and make her acquainted with all the noble families of Britain. Thus things went swimmingly. “His lordship,” whose effects had not arrived from Scotland, and who had no banker in London, borrowed two hundred pounds of the count. They were lent without scruple, so flattered was Cagliostro by the attentions they paid him, the respect, nay veneration they pretended to feel for him, and the complete deference with which they listened to every word that fell from his lips.

Superstitious like all desperate gamblers, Scot had often tried magical and cabalistic numbers, in the hope of discovering lucky numbers in the lottery or at the roulette-tables. He had in his possession a cabalistic manuscript, containing various arithmetical combinations of the kind, which he submitted to Cagliostro, with an urgent request that he would select a number. Cagliostro took the manuscript and studied it, but, as he himself informs us, with no confidence in its truth. He, however, predicted twenty as the successful number for the 6th of November following. Scot ventured a small sum upon this number out of the two hundred pounds he had borrowed, and won. Cagliostro, incited by this success, prognosticated number twenty-five for the next drawing. Scot tried again, and won a hundred guineas. The numbers fifty-five and fifty-seven were announced with equal success for the 18th of the same

month, to the no small astonishment and delight of Cagliostro, who thereupon resolved to try fortune for himself, and not for others. To all the entreaties of Scot and his lady that he would predict more numbers for them, he turned a deaf ear, even while he still thought him a lord and a man of honour; but when he discovered that he was a mere swindler, and the pretended Lady Scot an artful woman of the town, he closed his door upon them and on all their gang.

Having complete faith in the supernatural powers of the count, they were in the deepest distress at having lost his countenance. They tried by every means their ingenuity could suggest to propitiate him again. They implored, they threatened, and endeavoured to bribe him; but all was vain. Cagliostro would neither see nor correspond with them. In the mean time they lived extravagantly, and in the hope of future, exhausted all their present gains. They were reduced to the last extremity, when Miss Fry obtained access to the countess, and received a guinea from her on the representation that she was starving. Miss Fry, not contented with this, begged her to intercede with her husband, that for the last time he would point out a lucky number in the lottery. The countess promised to exert her influence; and Cagliostro, thus entreated, named the number eight, at the same time reiterating his determination to have no more to do with any of them. By an extraordinary hazard, which filled Cagliostro with surprise and pleasure, number eight was the greatest prize in the lottery. Miss Fry and her associates cleared fifteen hundred guineas by the adventure, and became more than ever convinced of the occult powers of Cagliostro, and strengthened in their determination never to quit him until they had made their fortunes. Out of the proceeds Miss Fry bought a handsome necklace at a pawnbroker's for ninety

guineas. She then ordered a richly-chased gold box, having two compartments, to be made at a jeweller's, and putting the necklace in the one, filled the other with a fine aromatic snuff. She then sought another interview with Madame di Cagliostro, and urged her to accept the box as a small token of her esteem and gratitude, without mentioning the valuable necklace that was concealed in it. Madame di Cagliostro accepted the present, and was from that hour exposed to the most incessant persecution from all the confederates—Blavary, Vitellini, and the pretended Lord and Lady Scot. They flattered themselves they had regained their lost footing in the house, and came day after day to know lucky numbers in the lottery, sometimes forcing themselves up the stairs, and into the count's laboratory, in spite of the efforts of the servants to prevent them. Cagliostro, exasperated at their pertinacity, threatened to call in the assistance of the magistrates, and taking Miss Fry by the shoulders, pushed her into the street.

From that time may be dated the misfortunes of Cagliostro. Miss Fry, at the instigation of her paramour, determined on vengeance. Her first act was to swear a debt of two hundred pounds against Cagliostro, and to cause him to be arrested for that sum. While he was in custody in a sponging-house, Scot, accompanied by a low attorney, broke into his laboratory, and carried off a small box, containing, as they believed, the powder of transmutation, and a number of cabalistic manuscripts and treatises upon alchymy. They also brought an action against him for the recovery of the necklace; and Miss Fry accused both him and his countess of sorcery and witchcraft, and of foretelling numbers in the lottery by the aid of the Devil. This latter charge was actually heard before Mr. Justice Miller.

The action of trover for the necklace was tried before the Lord Chief Justice of the Common Pleas, who recommended the parties to submit to arbitration. In the mean time Cagliostro remained in prison for several weeks, till having procured bail, he was liberated. He was soon after waited upon by an attorney named Reynolds, also deep in the plot, who offered to compromise all the actions upon certain conditions. Scot, who had accompanied him, concealed himself behind the door, and suddenly rushing out, presented a pistol at the heart of Cagliostro, swearing he would shoot him instantly, if he would not tell him truly the art of predicting lucky numbers and of transmuting metals. Reynolds pretending to be very angry, disarmed his accomplice, and entreated the count to satisfy them by fair means, and disclose his secrets, promising that if he would do so, they would discharge all the actions, and offer him no further molestation. Cagliostro replied, that threats and entreaties were alike useless; that he knew no secrets; and that the powder of transmutation of which they had robbed him, was of no value to any body but himself. He offered, however, if they would discharge the actions, and return the powder and the manuscripts, to forgive them all the money they had swindled him out of. These conditions were refused; and Scot and Reynolds departed, swearing vengeance against him.

Cagliostro appears to have been quite ignorant of the forms of law in England, and to have been without a friend to advise him as to the best course he should pursue. While he was conversing with his countess on the difficulties that beset them, one of his bail called, and invited him to ride in a hackney coach to the house of a person who would see him righted. Cagliostro consented, and was driven to

the King's Bench prison, where his friend left him. He did not discover for several hours that he was a prisoner, or, in fact, understand the process of being surrendered by one's bail.

He regained his liberty in a few weeks; and the arbitrators between him and Miss Fry made their award against him. He was ordered to pay the two hundred pounds she had sworn against him, and to restore the necklace and gold box which had been presented to the countess. Cagliostro was so disgusted, that he determined to quit England. His pretensions, besides, had been unmercifully exposed by a Frenchman, named Morande, the editor of the *Courrier de l'Europe*, published in London. To add to his distress, he was recognised in Westminster Hall as Joseph Balsamo, the swindler of Palermo. Such a complication of disgrace was not to be borne. He and his countess packed up their small effects, and left England with no more than fifty pounds, out of the three thousand they had brought with them.

They first proceeded to Brussels, where fortune was more auspicious. They sold considerable quantities of the elixir of life, performed many cures, and recruited their finances. They then took their course through Germany to Russia, and always with the same success. Gold flowed into their coffers faster than they could count it. They quite forgot all the woes they had endured in England, and learned to be more circumspect in the choice of their acquaintance.

In the year 1780, they made their appearance in Strasbourg. Their fame had reached that city before them. They took a magnificent hotel, and invited all the principal persons of the place to their table. Their wealth appeared to be boundless, and their hospitality equal to it. Both the count and countess acted as physicians, and gave money,

advice, and medicine to all the necessitous and suffering of the town. Many of the cures they performed astonished those regular practitioners who did not make sufficient allowance for the wonderful influence of imagination in certain cases. The countess, who at this time was not more than five-and-twenty, and all radiant with grace, beauty, and cheerfulness, spoke openly of her eldest son as a fine young man of eight-and-twenty, who had been for some years a captain in the Dutch service. The trick succeeded to admiration. All the ugly old women in Strasbourg, and for miles around, thronged the saloon of the countess to purchase the liquid which was to make them as blooming as their daughters; the young women came in equal abundance, that they might preserve their charms, and when twice as old as Ninon de l'Enclos, be more captivating than she; while men were not wanting who were fools enough to imagine that they might keep off the inevitable stroke of the grim foe by a few drops of the same incomparable elixir. The countess, sooth to say, looked like an incarnation of immortal loveliness, a very goddess of youth and beauty; and it is possible that the crowds of young men and old, who at all convenient seasons haunted the perfumed chambers of this enchantress, were attracted less by their belief in her occult powers than from admiration of her languishing bright eyes and sparkling conversation. But amid all the incense that was offered at her shrine, Madame di Cagliostro was ever faithful to her spouse. She encouraged hopes, it is true, but she never realised them; she excited admiration, yet kept it within bounds; and made men her slaves, without ever granting a favour of which the vainest might boast.

In this city they made the acquaintance of many eminent persons, and, among others, of the Cardinal Prince de Rohan, who was destined afterwards to exercise so untoward an influence over their fate. The cardinal, who seems to have had great faith in him as a philosopher, persuaded him to visit Paris in his company, which he did, but remained only thirteen days. He preferred the society of Strasbourg, and returned thither with the intention of fixing his residence far from the capital. But he soon found that the first excitement of his arrival had passed away. People began to reason with themselves, and to be ashamed of their own admiration. The populace, among whom he had lavished his charity with a bountiful hand, accused him of being the Antichrist, the Wandering Jew, the man of fourteen hundred years of age, a demon in human shape, sent to lure the ignorant to their destruction; while the more opulent and better informed called him a spy in the pay of foreign governments, an agent of the police, a swindler, and a man of evil life. The outcry grew at last so strong, that he deemed it prudent to try his fortune elsewhere.

He went first to Naples, but that city was too near Palermo; he dreaded recognition from some of his early friends, and, after a short stay, returned to France. He chose Bourdeaux as his next dwelling-place, and created as great a sensation there as he had done in Strasbourg. He announced himself as the founder of a new school of medicine and philosophy, boasted of his ability to cure all diseases, and invited the poor and suffering to visit him, and he would relieve the distress of the one class, and cure the ailings of the other. All day long the street opposite his magnificent hotel was crowded by the populace; the halt and the blind, women with sick babes in their

arms, and persons suffering under every species of human infirmity, flocked to this wonderful doctor. The relief he afforded in money more than counterbalanced the failure of his nostrums; and the affluence of people from all the surrounding country became so great, that the *jurats* of the city granted him a military guard, to be stationed day and night before his door, to keep order. The anticipations of Cagliostro were realised. The rich were struck with admiration of his charity and benevolence, and impressed with a full conviction of his marvellous powers. The sale of the elixir went on admirably. His saloons were thronged with wealthy dupes who came to purchase immortality. Beauty, that would endure for centuries, was the attraction for the fair sex; health and strength for the same period were the baits held out to the other. His charming countess, in the meantime, brought grist to the mill by telling fortunes and casting nativities, or granting attendant sylphs to any ladies who would pay sufficiently for their services. What was still better, as tending to keep up the credit of her husband, she gave the most magnificent parties in Bourdeaux.

But as at Strasbourg, the popular delusion lasted for a few months only, and burned itself out; Cagliostro forgot, in the intoxication of success, that there was a limit to quackery which once passed inspired distrust. When he pretended to call spirits from the tomb, people became incredulous. He was accused of being an enemy to religion, of denying Christ, and of being the Wandering Jew. He despised these rumours as long as they were confined to a few; but when they spread over the town, when he received no more fees, when his parties were abandoned, and his acquaintance turned away

when they met him in the street, he thought it high time to shift his quarters.

HOUSE OF CAGLIOSTRO, PARIS.

He was by this time wearied of the provinces, and turned his thoughts to the capital. On his arrival he announced himself as the restorer of Egyptian Freemasonry, and the founder of a new philosophy. He immediately made his way into the best society by means of his friend the Cardinal de Rohan. His success as a magician was quite extraordinary: the most considerable persons of the time visited him. He boasted of being able, like the Rosicrucians, to converse with the elementary spirits; to invoke the mighty dead from the grave, to transmute metals, and to discover occult things by means of the special protection of God towards him. Like Dr. Dee, he summoned the angels to reveal the future; and they appeared and conversed with him in crystals and under glass bells.⁴⁸ “There was hardly,” says the *Biographie des Contemporains*, “a fine lady in Paris who would not sup with the shade of Lucretius in the apartments of Cagliostro; a military officer who would not discuss the art of war

with Cæsar, Hannibal, or Alexander; or an advocate or counsellor who would not argue legal points with the ghost of Cicero.” These interviews with the departed were very expensive; for, as Cagliostro said, the dead would not rise for nothing. The countess, as usual, exercised all her ingenuity to support her husband’s credit. She was a great favourite with her own sex, to many a delighted and wondering auditory of whom she detailed the marvellous powers of Cagliostro. She said he could render himself invisible, traverse the world with the rapidity of thought, and be in several places at the same time. ⁴⁹

He had not been long at Paris before he became involved in the celebrated affair of the queen’s necklace. His friend the Cardinal de Rohan, enamoured of the charms of Marie Antoinette, was in sore distress at her coldness, and the displeasure she had so often manifested against him. There was at that time a lady named La Motte in the service of the queen, of whom the cardinal was foolish enough to make a confidant. Madame de la Motte, in return, endeavoured to make a tool of the cardinal, and succeeded but too well in her projects. In her capacity of chamber-woman, or lady of honour to the queen, she was present at an interview between her majesty and M. Boehmer, a wealthy jeweller of Paris, when the latter offered for sale a magnificent diamond necklace, valued at 1,600,000 francs, or about 64,000*l.* sterling. The queen admired it greatly, but dismissed the jeweller, with the expression of her regret that she was too poor to purchase it. Madame de la Motte formed a plan to get this costly ornament into her own possession, and determined to make the Cardinal de Rohan the instrument by which to effect it. She therefore sought an interview with him, and pretending to sympathise in his grief for the queen’s displeasure, told him she

knew a way by which he might be restored to favour. She then mentioned the necklace, and the sorrow of the queen that she could not afford to buy it. The cardinal, who was as wealthy as he was foolish, immediately offered to purchase the necklace, and make a present of it to the queen. Madame de la Motte told him by no means to do so, as he would thereby offend her majesty. His plan would be to induce the jeweller to give her majesty credit, and accept her promissory note for the amount at a certain date, to be hereafter agreed upon. The cardinal readily agreed to the proposal, and instructed the jeweller to draw up an agreement, and he would procure the queen's signature. He placed this in the hands of Madame de la Motte, who returned it shortly afterwards, with the words, "Bon, bon—approuvé—Marie Antoinette," written in the margin. She told him at the same time that the queen was highly pleased with his conduct in the matter, and would appoint a meeting with him in the gardens of Versailles, when she would present him with a flower, as a token of her regard. The cardinal shewed the forged document to the jeweller, obtained the necklace, and delivered it into the hands of Madame de la Motte. So far all was well. Her next object was to satisfy the cardinal, who awaited impatiently the promised interview with his royal mistress. There was at that time in Paris a young woman named D'Oliva, noted for her resemblance to the queen; and Madame de la Motte, on the promise of a handsome reward, found no difficulty in persuading her to personate Marie Antoinette, and meet the Cardinal de Rohan at the evening twilight in the gardens of Versailles. The meeting took place accordingly. The cardinal was deceived by the uncertain light, the great resemblance of the counterfeit, and his own hopes; and

having received the flower from Mademoiselle D'Oliva, went home with a lighter heart than had beat in his bosom for many a day.⁵⁰

In the course of time the forgery of the queen's signature was discovered. Boehmer the jeweller immediately named the Cardinal de Rohan and Madame de la Motte as the persons with whom he had negotiated, and they were both arrested and thrown into the Bastille. La Motte was subjected to a rigorous examination, and the disclosures she made implicating Cagliostro, he was seized, along with his wife, and also sent to the Bastille. A story involving so much scandal necessarily excited great curiosity. Nothing was to be heard of in Paris but the queen's necklace, with surmises of the guilt or innocence of the several parties implicated. The husband of Madame de la Motte escaped to England, and in the opinion of many took the necklace with him, and there disposed of it to different jewellers in small quantities at a time. But Madame de la Motte insisted that she had entrusted it to Cagliostro, who had seized and taken it to pieces, to "swell the treasures of his immense unequalled fortune." She spoke of him as "an empiric, a mean alchemist, a dreamer on the philosopher's stone, a false prophet, a profaner of the true worship, the self-dubbed Count Cagliostro!" She further said that he originally conceived the project of ruining the Cardinal de Rohan; that he persuaded her, by the exercise of some magic influence over her mind, to aid and abet the scheme; and that he was a robber, a swindler, and a sorcerer!

After all the accused parties had remained for upwards of six months in the Bastille, the trial commenced. The depositions of the witnesses having been heard, Cagliostro, as the principal culprit, was first called upon for his defence. He was listened to with the most

breathless attention. He put himself into a theatrical attitude, and thus began:—"I am oppressed!—I am accused!—I am calumniated! Have I deserved this fate? I descend into my conscience, and I there find the peace that men refuse me! I have travelled a great deal—I am known over all Europe, and a great part of Asia and Africa. I have every where shewn myself the friend of my fellow-creatures. My knowledge, my time, my fortune have ever been employed in the relief of distress. I have studied and practised medicine; but I have never degraded that most noble and most consoling of arts by mercenary speculations of any kind. Though always giving, and never receiving, I have preserved my independence. I have even carried my delicacy so far as to refuse the favours of kings. I have given gratuitously my remedies and my advice to the rich; the poor have received from me both remedies and money. I have never contracted any debts, and my manners are pure and uncorrupted." After much more self-laudation of the same kind, he went on to complain of the great hardships he had endured in being separated for so many months from his innocent and loving wife, who, as he was given to understand, had been detained in the Bastille, and perhaps chained in an unwholesome dungeon. He denied unequivocally that he had the necklace, or that he had ever seen it; and to silence the rumours and accusations against him, which his own secrecy with regard to the events of his life had perhaps originated, he expressed himself ready to satisfy the curiosity of the public, and to give a plain and full account of his career. He then told a romantic and incredible tale, which imposed upon no one. He said he neither knew the place of his birth nor the name of his parents, but that he spent his infancy in Medina, in Arabia, and was brought

up under the name of Acharat. He lived in the palace of the Great Muphti in that city, and always had three servants to wait upon him, besides his preceptor, named Althotas. This Althotas was very fond of him, and told him that his father and mother, who were Christians and nobles, died when he was three months old, and left him in the care of the Muphti. He could never, he said, ascertain their names, for whenever he asked Althotas the question, he was told that it would be dangerous for him to know. Some incautious expressions dropped by his preceptor gave him reason to think they were from Malta. At the age of twelve he began his travels, and learned the various languages of the East. He remained three years in Mecca, where the cherif, or governor, shewed him so much kindness, and spoke to him so tenderly and affectionately, that he sometimes thought that personage was his father. He quitted this good man with tears in his eyes, and never saw him afterwards; but he was convinced that he was, even at that moment, indebted to his care for all the advantages he enjoyed. Whenever he arrived in any city, either of Europe or Asia, he found an account opened for him at the principal bankers' or merchants'. He could draw upon them to the amount of thousands and hundreds of thousands; and no questions were ever asked beyond his name. He had only to mention the word 'Acharat,' and all his wants were supplied. He firmly believed that the Cherif of Mecca was the friend to whom all was owing. This was the secret of his wealth, and he had no occasion to resort to swindling for a livelihood. It was not worth his while to steal a diamond necklace when he had wealth enough to purchase as many as he pleased, and more magnificent ones than had ever been worn by a queen of France. As to the other charges brought against him by Madame de

la Motte, he had but a short answer to give. She had called him an empiric. He was not unfamiliar with the word. If it meant a man who, without being a physician, had some knowledge of medicine, and took no fees—who cured both rich and poor, and took no money from either, he confessed that he was such a man, that he was an empiric. She had also called him a mean alchemist. Whether he were an alchemist or not, the epithet *mean* could only be applied to those who begged and cringed, and he had never done either. As regarded his being a dreamer about the philosopher's stone, whatever his opinions upon that subject might be, he had been silent, and had never troubled the public with his dreams. Then, as to his being a false prophet, he had not always been so; for he had prophesied to the Cardinal de Rohan, that Madame de la Motte would prove a dangerous woman, and the result had verified the prediction. He denied that he was a profaner of the true worship, or that he had ever striven to bring religion into contempt; on the contrary, he respected every man's religion, and never meddled with it. He also denied that he was a Rosicrucian, or that he had ever pretended to be three hundred years of age, or to have had one man in his service for a hundred and fifty years. In conclusion, he said every statement that Madame de la Motte had made regarding him was false, and that she was *mentiris impudentissime*, which two words he begged her counsel to translate for her, as it was not polite to tell her so in French.

Such was the substance of his extraordinary answer to the charges against him; an answer which convinced those who were before doubtful that he was one of the most impudent impostors that had ever run the career of deception. Counsel were then heard on behalf

of the Cardinal de Rohan and Madame de la Motte. It appearing clearly that the cardinal was himself the dupe of a vile conspiracy, and there being no evidence against Cagliostro, they were both acquitted. Madame de la Motte was found guilty, and sentenced to be publicly whipped, and branded with a hot iron on the back.

Cagliostro and his wife were then discharged from custody. On applying to the officers of the Bastille for the papers and effects which had been seized at his lodgings, he found that many of them had been abstracted. He thereupon brought an action against them for the recovery of his Mss. and a small portion of the powder of transmutation. Before the affair could be decided, he received orders to quit Paris within four-and-twenty hours. Fearing that if he were once more enclosed in the dungeons of the Bastille he should never see daylight again, he took his departure immediately and proceeded to England. On his arrival in London he made the acquaintance of the notorious Lord George Gordon, who espoused his cause warmly, and inserted a letter in the public papers, animadverting upon the conduct of the Queen of France in the affair of the necklace, and asserting that she was really the guilty party. For this letter Lord George was exposed to a prosecution at the instance of the French ambassador, found guilty of libel, and sentenced to fine and a long imprisonment.

Cagliostro and the countess afterwards travelled in Italy, where they were arrested by the Papal government in 1789, and condemned to death. The charges against him were, that he was a freemason, a heretic, and a sorcerer. This unjustifiable sentence was afterwards commuted into one of perpetual imprisonment in the Castle of St. Angelo. His wife was allowed to escape severer punishment by

immuring herself in a nunnery. Cagliostro did not long survive. The loss of liberty preyed upon his mind—accumulated misfortunes had injured his health and broken his spirit, and he died early in 1790. His fate may have been no better than he deserved, but it is impossible not to feel that his sentence for the crimes assigned was utterly disgraceful to the government that pronounced it.

PRESENT STATE OF ALCHYMY.

We have now finished the list of the persons who have most distinguished themselves in this unprofitable pursuit. Among them are men of all ranks, characters, and conditions: the truth-seeking but erring philosopher; the ambitious prince and the needy noble, who have believed in it; as well as the designing charlatan, who has not believed in it, but has merely made the pretension to it the means of cheating his fellows, and living upon their credulity. One or more of all these classes will be found in the foregoing pages. It will be seen, from the record of their lives, that the delusion was not altogether without its uses. Men, in striving to gain too much, do not always overreach themselves; if they cannot arrive at the inaccessible mountain-top, they may perhaps get half way towards it, and pick up some scraps of wisdom and knowledge on the road. The useful science of chemistry is not a little indebted to its spurious brother of alchemy. Many valuable discoveries have been made in that search for the impossible, which might otherwise have been hidden for centuries yet to come. Roger Bacon, in searching for the philosopher's stone, discovered gunpowder, a still more extraordinary substance. Van Helmont, in the same pursuit, discovered the properties of gas; Geber made discoveries in

chemistry which were equally important; and Paracelsus, amidst his perpetual visions of the transmutation of metals, found that mercury was a remedy for one of the most odious and excruciating of all the diseases that afflict humanity.

In our day little mention is made in Europe of any new devotees of the science, though it is affirmed that one or two of our most illustrious men of science do not admit the pursuit to be so absurd and vain as it has been commonly considered in recent times. The belief in witchcraft, which is scarcely more absurd, still lingers in the popular mind; but few are so credulous as to believe that any elixir could make man live for centuries, or turn all our iron and pewter into gold. Alchymy, in Europe, may be said to be almost wholly exploded; but in the East it still flourishes in as great repute as ever. Recent travellers make constant mention of it, especially in China, Hindostan, Persia, Tartary, Egypt, and Arabia.

MODERN PROPHECIES.

AN epidemic terror of the end of the world has several times spread over the nations. The most remarkable was that which seized Christendom about the middle of the tenth century. Numbers of fanatics appeared in France, Germany, and Italy at that time, preaching that the thousand years prophesied in the Apocalypse as the term of the world's duration were about to expire, and that the Son of Man would appear in the clouds to judge the godly and the ungodly. The delusion appears to have been discouraged by the Church, but it nevertheless spread rapidly among the people.⁵¹

The scene of the last judgment was expected to be at Jerusalem. In the year 999, the number of pilgrims proceeding eastward, to await the coming of the Lord in that city, was so great that they were compared to a desolating army. Most of them sold their goods and possessions before they quitted Europe, and lived upon the proceeds in the Holy Land. Buildings of every sort were suffered to fall into ruins. It was thought useless to repair them, when the end of the world was so near. Many noble edifices were deliberately pulled down. Even churches, usually so well

maintained, shared the general neglect. Knights, citizens, and serfs, travelled eastwards in company, taking with them their wives and children, singing psalms as they went, and looking with fearful eyes upon the sky, which they expected each minute to open, to let the Son of God descend in his glory.

During the thousandth year the number of pilgrims increased. Most of them were smitten with terror as with a plague. Every phenomenon of nature filled them with alarm. A thunder-storm sent them all upon their knees in mid-march. It was the opinion that thunder was the voice of God, announcing the day of judgment. Numbers expected the earth to open, and give up its dead at the sound. Every meteor in the sky seen at Jerusalem brought the whole Christian population into the streets to weep and pray. The pilgrims on the road were in the same alarm:

“Lorsque, pendant la nuit, un globe de lumière
S'échappa quelquefois de la voûte de cieux,
Et traça dans sa chute un long sillon de feux,
La troupe suspendit sa marche solitaire.”⁵²

Fanatic preachers kept up the flame of terror. Every shooting star furnished occasion for a sermon, in which the sublimity of the approaching judgment was the principal topic.

The appearance of comets has been often thought to foretell the speedy dissolution of this world. Part of this belief still exists; but the comet is no longer looked upon as the sign, but the agent of destruction. So lately as in the year 1832 the greatest alarm spread over the continent of Europe, especially in Germany, lest the comet, whose appearance was then foretold by astronomers, should destroy the earth. The danger of our globe was gravely discussed. Many persons refrained from undertaking or concluding

any business during that year, in consequence solely of their apprehension that this terrible comet would dash us and our world to atoms.

During seasons of great pestilence, men have often believed the prophecies of crazed fanatics, that the end of the world was come. Credulity is always greatest in times of calamity. During the great plague, which ravaged all Europe between the years 1345 and 1350, it was generally considered that the end of the world was at hand. Pretended prophets were to be found in all the principal cities of Germany, France, and Italy, predicting that within ten years the trump of the archangel would sound, and the Saviour appear in the clouds to call the earth to judgment.

No little consternation was created in London in 1736 by the prophecy of the famous Whiston, that the world would be destroyed in that year, on the 13th of October. Crowds of people went out on the appointed day to Islington, Hampstead, and the fields intervening, to see the destruction of London, which was to be the "beginning of the end." A satirical account of this folly is given in Swift's *Miscellanies*, vol. iii., entitled *A true and faithful Narrative of what passed in London on a Rumour of the Day of Judgment*. An authentic narrative of this delusion would be interesting; but this solemn witticism of Pope and Gay is not to be depended upon.

In the year 1761 the citizens of London were alarmed by two shocks of an earthquake, and the prophecy of a third, which was to destroy them altogether. The first shock was felt on the 8th of February, and threw down several chimneys in the neighbourhood of Limehouse and Poplar; the second happened on the 8th of March, and was chiefly felt in the north of London, and towards Hampstead and Highgate. It soon became the subject of general remark, that there was exactly an interval of a month between the shocks; and a crack-brained fellow, named Bell, a soldier in the Life Guards, was so impressed with the idea that there would be a third in another month, that he lost his senses altogether, and ran about the streets predicting the destruction of London on the 5th of April. Most people thought that the *first* would have been a more appropriate day; but there

were not wanting thousands who confidently believed the prediction, and took measures to transport themselves and families from the scene of the impending calamity. As the awful day approached, the excitement became intense, and great numbers of credulous people resorted to all the villages within a circuit of twenty miles, awaiting the doom of London. Islington, Highgate, Hampstead, Harrow, and Blackheath, were crowded with panic-stricken fugitives, who paid exorbitant prices for accommodation to the housekeepers of these secure retreats. Such as could not afford to pay for lodgings at any of those places, remained in London until two or three days before the time, and then encamped in the surrounding fields, awaiting the tremendous shock which was to lay their high city all level with the dust. As happened during a similar panic in the time of Henry VIII., the fear became contagious, and hundreds who had laughed at the prediction a week before, packed up their goods, when they saw others doing so, and hastened away. The river was thought to be a place of great security, and all the merchant-vessels in the port were filled with people, who passed the night between the 4th and 5th on board, expecting every instant to see St. Paul's totter, and the towers of Westminster Abbey rock in the wind and fall amid a cloud of dust. The greater part of the fugitives returned on the following day, convinced that the prophet was a false one; but many judged it more prudent to allow a week to elapse before they trusted their dear limbs in London. Bell lost all credit in a short time, and was looked upon even by the most credulous as a mere madman. He tried some other prophecies, but nobody was deceived by them; and, in a few months afterwards, he was confined in a lunatic asylum.

A panic terror of the end of the world seized the good people of Leeds and its neighbourhood in the year 1806. It arose from the following circumstances. A hen, in a village close by, laid eggs, on which were inscribed the words, "*Christ is coming.*" Great numbers visited the spot, and examined these wondrous eggs, convinced that the day of judgment was near at hand. Like sailors in a storm, expecting every instant to go to

the bottom, the believers suddenly became religious, prayed violently, and flattered themselves that they repented them of their evil courses. But a plain tale soon put them down, and quenched their religion entirely. Some gentlemen, hearing of the matter, went one fine morning, and caught the poor hen in the act of laying one of her miraculous eggs. They soon ascertained beyond doubt that the egg had been inscribed with some corrosive ink, and cruelly forced up again into the bird's body. At this explanation, those who had prayed, now laughed, and the world wagged as merrily as of yore.

At the time of the plague in Milan, in 1630, of which so affecting a description has been left us by Ripamonte, in his interesting work, *De Peste Mediolani*, the people, in their distress, listened with avidity to the predictions of astrologers and other impostors. It is singular enough that the plague was foretold a year before it broke out. A large comet appearing in 1628, the opinions of astrologers were divided with regard to it. Some insisted that it was a forerunner of a bloody war; others maintained that it predicted a great famine; but the greater number, founding their judgment upon its pale colour, thought it portended a pestilence. The fulfilment of their prediction brought them into great repute while the plague was raging.

Other prophecies were current, which were asserted to have been delivered hundreds of years previously. They had a most pernicious effect upon the mind of the vulgar, as they induced a belief in fatalism. By taking away the hope of recovery—that greatest balm in every malady—they increased threefold the ravages of the disease. One singular prediction almost drove the unhappy people mad. An ancient couplet, preserved for ages by tradition, foretold, that in the year 1630 the devil would poison all Milan. Early one morning in April, and before the pestilence had reached its height, the passengers were surprised to see that all the doors in the principal streets of the city were marked with a curious daub, or spot, as if a sponge, filled with the purulent matter of the plague-sores, had been

pressed against them. The whole population were speedily in movement to remark the strange appearance, and the greatest alarm spread rapidly. Every means was taken to discover the perpetrators, but in vain. At last the ancient prophecy was remembered, and prayers were offered up in all the churches, that the machinations of the Evil One might be defeated. Many persons were of opinion that the emissaries of foreign powers were employed to spread infectious poison over the city; but by far the greater number were convinced that the powers of hell had conspired against them, and that the infection was spread by supernatural agencies. In the mean time the plague increased fearfully. Distrust and alarm took possession of every mind. Every thing was believed to have been poisoned by the Devil; the waters of the wells, the standing corn in the fields, and the fruit upon the trees. It was believed that all objects of touch were poisoned; the walls of the houses, the pavements of the streets, and the very handles of the doors. The populace were raised to a pitch of ungovernable fury. A strict watch was kept for the Devil's emissaries, and any man who wanted to be rid of an enemy, had only to say that he had seen him besmearing a door with ointment; his fate was certain death at the hands of the mob. An old man, upwards of eighty years of age, a daily frequenter of the church of St. Antonio, was seen, on rising from his knees, to wipe with the skirt of his cloak the stool on which he was about to sit down. A cry was raised immediately that he was besmearing the seat with poison. A mob of women, by whom the church was crowded, seized hold of the feeble old man, and dragged him out by the hair of his head, with horrid oaths and imprecations. He was trailed in this manner through the mire to the house of the municipal judge, that he might be put to the rack, and forced to discover his accomplices; but he expired on the way. Many other victims were sacrificed to the popular fury. One Mora, who appears to have been half a chemist and half a barber, was accused of being in league with the Devil to poison Milan. His house was surrounded, and a number of chemical preparations were found. The poor man asserted, that they were

intended as preservatives against infection; but some physicians, to whom they were submitted, declared they were poison, Mora was put to the rack, where he for a long time asserted his innocence. He confessed at last, when his courage was worn down by torture, that he was in league with the Devil and foreign powers to poison the whole city; that he had anointed the doors, and infected the fountains of water. He named several persons as his accomplices, who were apprehended and put to a similar torture. They were all found guilty, and executed. Mora's house was rased to the ground, and a column erected on the spot, with an inscription to commemorate his guilt.

While the public mind was filled with these marvellous occurrences, the plague continued to increase. The crowds that were brought together to witness the executions spread the infection among one another. But the fury of their passions, and the extent of their credulity, kept pace with the violence of the plague; every wonderful and preposterous story was believed. One, in particular, occupied them to the exclusion, for a long time, of every other. The Devil himself had been seen. He had taken a house in Milan, in which he prepared his poisonous unguents, and furnished them to his emissaries for distribution. One man had brooded over such tales till he became firmly convinced that the wild nights of his own fancy were realities. He stationed himself in the market-place of Milan, and related the following story to the crowds that gathered round him. He was standing, he said, at the door of the cathedral, late in the evening; and when there was nobody nigh, he saw a dark-coloured chariot, drawn by six milk-white horses, stop close beside him. The chariot was followed by a numerous train of domestics in dark liveries, mounted on dark-coloured steeds. In the chariot there sat a tall stranger of a majestic aspect; his long black hair floated in the wind—fire flashed from his large black eyes, and a curl of ineffable scorn dwelt upon his lips. The look of the stranger was so sublime that he was awed, and trembled with fear when he gazed upon him. His complexion was much darker than that of any man he

had ever seen, and the atmosphere around him was hot and suffocating. He perceived immediately that he was a being of another world. The stranger, seeing his trepidation, asked him blandly, yet majestically, to mount beside him. He had no power to refuse, and before he was well aware that he had moved, he found himself in the chariot. Onwards they went, with the rapidity of the wind, the stranger speaking no word, until they stopped before a door in the high-street of Milan. There was a crowd of people in the street, but, to his great surprise, no one seemed to notice the extraordinary equipage and its numerous train. From this he concluded that they were invisible. The house at which they stopped appeared to be a shop, but the interior was like a vast half-ruined palace. He went with his mysterious guide through several large and dimly-lighted rooms. In one of them, surrounded by huge pillars of marble, a senate of ghosts was assembled, debating on the progress of the plague. Other parts of the building were enveloped in the thickest darkness, illumined at intervals by flashes of lightning, which allowed him to distinguish a number of gibing and chattering skeletons, running about and pursuing each other, or playing at leap-frog over one another's backs. At the rear of the mansion was a wild, uncultivated plot of ground, in the midst of which arose a black rock. Down its sides rushed with fearful noise a torrent of poisonous water, which, insinuating itself through the soil, penetrated to all the springs of the city, and rendered them unfit for use. After he had been shewn all this, the stranger led him into another large chamber, filled with gold and precious stones, all of which he offered him if he would kneel down and worship him, and consent to smear the doors and houses of Milan with a pestiferous salve which he held out to him. He now knew him to be the Devil, and in that moment of temptation, prayed to God to give him strength to resist. His prayer was heard—he refused the bribe. The stranger scowled horribly upon him—a loud clap of thunder burst over his head—the vivid lightning flashed in his eyes, and the next moment he found himself standing alone at the porch of the cathedral. He repeated this

strange tale day after day, without any variation, and all the populace were firm believers in its truth. Repeated search was made to discover the mysterious house, but all in vain. The man pointed out several as resembling it, which were searched by the police; but the Demon of the Pestilence was not to be found, nor the hall of ghosts, nor the poisonous fountain. But the minds of the people were so impressed with the idea, that scores of witnesses, half crazed by disease, came forward to swear that they also had seen the diabolical stranger, and had heard his chariot, drawn by the milk-white steeds, rumbling over the streets at midnight with a sound louder than thunder.

The number of persons who confessed that they were employed by the Devil to distribute poison is almost incredible. An epidemic frenzy was abroad, which seemed to be as contagious as the plague. Imagination was as disordered as the body, and day after day persons came voluntarily forward to accuse themselves. They generally had the marks of disease upon them, and some died in the act of confession.

During the great plague of London, in 1665, the people listened with similar avidity to the predictions of quacks and fanatics. Defoe says, that at that time the people were more addicted to prophecies and astronomical conjurations, dreams, and old wives' tales than ever they were before or since. Almanacs, and their predictions, frightened them terribly. Even the year before the plague broke out, they were greatly alarmed by the comet which then appeared, and anticipated that famine, pestilence, or fire would follow. Enthusiasts, while yet the disease had made but little progress, ran about the streets, predicting that in a few days London would be destroyed.

A still more singular instance of the faith in predictions occurred in London in the year 1524. The city swarmed at that time with fortune-tellers and astrologers, who were consulted daily by people of every class in society on the secrets of futurity. As early as the month of June 1523, several of them concurred in predicting that, on the 1st day of February 1524, the waters of the Thames would swell to such a height as to overflow

the whole city of London, and wash away ten thousand houses. The prophecy met implicit belief. It was reiterated with the utmost confidence month after month, until so much alarm was excited that many families packed up their goods, and removed into Kent and Essex. As the time drew nigh, the number of these emigrants increased. In January, droves of workmen might be seen, followed by their wives and children, trudging on foot to the villages within fifteen or twenty miles, to await the catastrophe. People of a higher class were also to be seen in wagons and other vehicles bound on a similar errand. By the middle of January, at least twenty thousand persons had quitted the doomed city, leaving nothing but the bare walls of their homes to be swept away by the impending floods. Many of the richer sort took up their abode on the heights of Highgate, Hampstead, and Blackheath; and some erected tents as far away as Waltham Abbey on the north, and Croydon on the south of the Thames. Bolton, the prior of St. Bartholomew's, was so alarmed, that he erected, at a very great expense, a sort of fortress at Harrow-on-the-Hill, which he stocked with provisions for two months. On the 24th of January, a week before the awful day which was to see the destruction of London, he removed thither, with the brethren and officers of the priory and all his household. A number of boats were conveyed in wagons to his fortress, furnished abundantly with expert rowers, in case the flood, reaching so high as Harrow, should force them to go farther for a resting-place. Many wealthy citizens prayed to share his retreat; but the prior, with a prudent forethought, admitted only his personal friends, and those who brought stores of eatables for the blockade.

At last the morn, big with the fate of London, appeared in the east. The wondering crowds were astir at an early hour to watch the rising of the waters. The inundation, it was predicted, would be gradual, not sudden; so that they expected to have plenty of time to escape as soon as they saw the bosom of old Thames heave beyond the usual mark. But the majority were too much alarmed to trust to this, and thought themselves safer ten or

twenty miles off. The Thames, unmindful of the foolish crowds upon its banks, flowed on quietly as of yore. The tide ebbed at its usual hour, flowed to its usual height, and then ebbed again, just as if twenty astrologers had not pledged their words to the contrary. Blank were their faces as evening approached, and as blank grew the faces of the citizens to think that they had made such fools of themselves. At last night set in, and the obstinate river would not lift its waters to sweep away even one house out of the ten thousand. Still, however, the people were afraid to go to sleep. Many hundreds remained up till dawn of the next day, lest the deluge should come upon them like a thief in the night.

On the morrow, it was seriously discussed whether it would not be advisable to duck the false prophets in the river. Luckily for them, they thought of an expedient which allayed the popular fury. They asserted that, by an error (a very slight one,) of a little figure, they had fixed the date of this awful inundation a whole century too early. The stars were right after all, and they, erring mortals, were wrong. The present generation of cockneys was safe, and London would be washed away, not in 1524, but in 1624. At this announcement, Bolton the prior dismantled his fortress, and the weary emigrants came back.

An eye-witness of the great fire of London, in an account preserved among the Harleian Mss. in the British Museum, and published in the transactions of the Royal Society of Antiquaries, relates another instance of the credulity of the Londoners. The writer, who accompanied the Duke of York day by day through the district included between the Fleet-bridge and the Thames, states that, in their efforts to check the progress of the flames, they were much impeded by the superstition of the people. Mother Shipton, in one of her prophecies, had said that London would be reduced to ashes, and they refused to make any efforts to prevent it.⁵³ A son of the noted Sir Kenelm Digby, who was also a pretender to the gifts of prophecy, persuaded them that no power on earth could prevent the fulfilment of the prediction; for it was written in the great book of fate that London was to

be destroyed. Hundreds of persons, who might have rendered valuable assistance, and saved whole parishes from devastation, folded their arms and looked on. As many more gave themselves up, with the less compunction, to plunder a city which they could not save.⁵⁴

The prophecies of Mother Shipton are still believed in many of the rural districts of England. In cottages and servants' halls her reputation is great; and she rules, the most popular of British prophets, among all the uneducated, or half-educated, portions of the community. She is generally supposed to have been born at Knaresborough, in the reign of Henry VII., and to have sold her soul to the Devil for the power of foretelling future events. Though during her lifetime she was looked upon as a witch, she yet escaped the witch's fate, and died peaceably in her bed at an extreme old age, near Clifton in Yorkshire. A stone is said to have been erected to her memory in the churchyard of that place, with the following epitaph:

“Here lies she who never lied,
Whose skill often has been tried:
Her prophecies shall still survive,
And ever keep her name alive.”

“Never a day passed,” says her traditionary biography, “wherein, she did not relate something remarkable, and that required the most serious consideration. People flocked to her from far and near, her fame was so great. They went to her of all sorts, both old and young, rich and poor, especially young maidens, to be resolved of their doubts relating to things to come; and all returned wonderfully satisfied in the explanations she gave to their questions.” Among the rest, went the Abbot of Beverley, to whom she foretold the suppression of the monasteries by Henry VIII., his marriage with Anne Boleyn, the fires for heretics in Smithfield, and the

execution of Mary Queen of Scots. She also foretold the accession of James I., adding that, with him,

“From the cold North
Every evil should come forth.”

On a subsequent visit she uttered another prophecy, which, in the opinion of her believers, still remains unfulfilled, but may be expected to be realised during the present century:

“The time shall come when seas of blood
Shall mingle with a greater flood.
Great noise there shall be heard—great shouts and cries,
And seas shall thunder louder than the skies;
Then shall three lions fight with three and bring
Joy to a people, honour to a king.
That fiery year as soon as o’er,
Peace shall then be as before;
Plenty shall every where be found,
And men with swords shall plough the ground.”

But the most famous of all her prophecies is one relating to London. Thousands of persons still shudder to think of the woes that are to burst over this unhappy realm, when London and Highgate are joined by one continuous line of houses. This junction, which, if the rage for building lasts much longer, in the same proportion as heretofore, bids fair to be soon accomplished, was predicted by her shortly before her death. Revolutions—the fall of mighty monarchs, and the shedding of much blood

are to signalise that event. The very angels, afflicted by our woes, are to turn aside their heads, and weep for hapless Britain.

But great as is the fame of Mother Shipton, she ranks but second in the list of British prophets. Merlin, the mighty Merlin, stands alone in his high pre-eminence—the first and greatest. As old Drayton sings, in his *Poly-olbion*:

“Of Merlin and his skill what region doth not hear?
The world shall still be full of Merlin every year.
A thousand lingering years his prophecies have run,
And scarcely shall have end till time itself be done.”

Spenser, in his divine poem, has given us a powerful description of this renowned seer—

“who had in magic more insight
Than ever him before, or after, living wight.

For he by words could call out of the sky
Both sun and moon, and make them him obey;
The land to sea, and sea to mainland dry,
And darksome night he eke could turn to day—
Huge hosts of men he could, alone, dismay.
And hosts of men and meanest things could frame,
Whenso him list his enemies to fray,
That to this day, for terror of his name,
The fiends do quake, when any him to them does name.

And soothe men say that he was not the sonne
Of mortal sire or other living wighte,

But wondrously begotten and begoune
By false illusion of a guileful sprite
On a faire ladye nun.”

In these verses the poet has preserved the popular belief with regard to Merlin, who is generally supposed to have been a contemporary of Vortigern. Opinion is divided as to whether he were a real personage, or a mere impersonation, formed by the poetic fancy of a credulous people. It seems most probable that such a man did exist, and that, possessing knowledge as much above the comprehension of his age, as that possessed by Friar Bacon was beyond the reach of his, he was endowed by the wondering crowd with the supernatural attributes that Spenser has enumerated.

Geoffrey of Monmouth translated Merlin's poetical odes, or prophecies, into Latin prose; and he was much revered not only by Geoffrey, but by most of the old annalists. In a *Life of Merlin, with his Prophecies and Predictions interpreted and made good by our English Annals*, by Thomas Heywood, published in the reign of Charles I., we find several of these pretended prophecies. They seem, however, to have been all written by Heywood himself. They are in terms too plain and positive to allow any one to doubt for a moment of their having been composed *ex post facto*. Speaking of Richard I., he says:

“The Lion's heart will 'gainst the Saracen rise,
And purchase from him many a glorious prize;
The rose and lily shall at first unite,
But, parting of the prey prove opposite. * * *
But while abroad these great acts shall be done,
All things at home shall to disorder run.
Cooped up and caged then shall the Lion be,

But, after sufferance, ransomed and set free.”

The simple-minded Thomas Heywood gravely goes on to inform us, that all these things actually came to pass. Upon Richard III. he is equally luminous. He says:

“A hunch-backed monster, who with teeth is born,
The mockery of art and nature’s scorn;
Who from the womb preposterously is hurled,
And with feet forward thrust into the world,
Shall, from the lower earth on which he stood,
Wade, every step he mounts, knee-deep in blood.
He shall to th’ height of all his hopes aspire,
And, clothed in state, his ugly shape admire;
But, when he thinks himself most safe to stand,
From foreign parts a native whelp shall land.”

Another of these prophecies after the event tells us that Henry VIII. should take the power from Rome, “and bring it home unto his British bower;” that he should “root out from the land all the razored skulls;” and that he should neither spare “man in his rage nor woman in his lust;” and that, in the time of his next successor but one, “there should come in the fagot and the stake.” Master Heywood closes Merlin’s prophecies at his own day, and does not give even a glimpse of what was to befall England after his decease. Many other prophecies, besides those quoted by him, were, he says, dispersed abroad, in his day, under the name of Merlin; but he gives his readers a taste of one only, and that is the following:

“When hempe is ripe and ready to pull,

Then, Englishman, beware thy skull.”

This prophecy, which, one would think, ought to have put him in mind of the gallows, at that time the not unusual fate of false prophets, he explains thus: “In this word HEMPE be five letters. Now, by reckoning the five successive princes from Henry VIII., this prophecy is easily explained: H signifieth King Henry before-named; E, Edward, his son, the sixth of that name; M, Mary, who succeeded him; P, Philip of Spain, who, by marrying Queen Mary, participated with her in the English diadem; and, lastly, E signifieth Queen Elizabeth, after whose death there was a great feare that some troubles might have arisen about the crown.” As this did not happen, Heywood, who was a sly rogue in a small way, gets out of the scrape by saying, “Yet proved this augury true, though not according to the former expectation; for, after the peaceful inauguration of King James, there was great mortality, not in London only, but through the whole kingdom, and from which the nation was not quite clean in seven years after.”

This is not unlike the subterfuge of Peter of Pontefract, who had prophesied the death and deposition of King John, and who was hanged by that monarch for his pains. A very graphic and amusing account of this pretended prophet is given by Grafton, in his *Chronicles of England*.⁵⁵ “In the meanwhile,” says he, “the priestes within England had provided them a false and counterfeated prophet, called Peter Wakefelde, a Yorkshire man, who was an hermite, an idle gadder about, and a pratlyng marchant. Now, to bring this Peter in credite, and the kyng out of all credite with his people, diverse vaine persons bruted dayly among the commons of the realme, that Christe had twice appered unto him in the shape of a childe, betwene the priestes’s handes, once at Yorke, another tyme at Pomfret; and that he had breathed upon him thrice, saying, ‘Peace, peace, peace,’ and teachyng many things, which he anon declared to the bishops, and bid the people amend their naughtie living. Being rapt also in spirite, they sayde he

behelde the joyes of heaven and sorrowes of hell; for scant were there three in the realme, sayde he, that lived christianly.

“This counterfeated soothsayer prophesied of King John, that he should reigne no longer than the Ascension-day next followyng, which was in the yere of our Lord 1211, and was the thirteenth yere from his coronation; and this, he said, he had by revelation. Then it was of him demanded, whether he should be slaine or be deposed, or should voluntarily give over the crowne? He aunswered, that he could not tell; but of this he was sure (he sayd), that neither he nor any of his stock or lineage should reigne after that day.

“The king, hering of this, laughed much at it, and made but a scoff thereat. ‘Tush!’ saith he, ‘it is but an ideot knave, and such an one as lacketh his right wittes.’ But when this foolish prophet had so escaped the daunger of the kinge’s displeasure, and that he made no more of it, he gate him abroad, and prated thereof at large, as he was a very idle vagabond, and used to trattle and talke more than ynough; so that they which loved the king caused him anon after to be apprehended as a malefactor, and to be throwen in prison, the king not yet knowing thereof.

“Anone after the fame of this phantasticall prophet went all the realme over, and his name was knowen every where, as foolishnesse is much regarded of the people, where wisdom is not in place; specially because he was then imprisoned for the matter, the rumour was the larger, their wonderynges were the wantoner, their practises the foolisher, their busye talkes and other idle doinges the greater. Continually from thence, as the rude manner of people is, old gossyps tales went abroad, new tales were invented, fables were added to fables, and lyes grew upon lyes. So that every daye newe slanders were laide upon the king, and not one of them true. Rumors arose, blasphemyes were sprede, the enemyes rejoyced, and treasons by the

priestes were mainteyned; and what lykewise was surmised, or other subtiltye practised, all was then fathered upon this foolish prophet, as 'thus saith Peter Wakefield;' 'thus hath he prophesied;' 'and thus it shall come to pass;' yea, many times, when he thought nothing lesse. And when the Ascension-day was come, which was prophecyed of before, King John commanded his royal tent to be spread in the open field, passing that day with his noble counseyle and men of honour in the greatest solemnitie that ever he did before; solacing himself with musickale instrumentes and songs, most in sight among his trustie friendes. When that day was paste in all prosperitie and myrth, his enemyes being confused, turned all into an allegorical understanding to make the prophecie good, and sayde, 'He is no longer king, for the pope reigneth, and not he.' [King John was labouring under a sentence of excommunication at the time.]

"Then was the king by his council perswaded that this false prophet had troubled the realme, perverted the heartes of the people, and raysed the Commons against him; for his wordes went over the sea, by the help of his prelates, and came to the French king's eare, and gave to him a great encouragement to invade the lande. He had not else done it so sodeinely. But he was most fowly deceived, as all they are and shall be that put their trust in such dark drowsye dreames of hipocrites. The king therefore commended that he should be hanged up, and his sonne also with him, lest any more false prophets should arise of that race."

Heywood, who was a great stickler for the truth of all sorts of prophecies, gives a much more favourable account of this Peter of Pomfret, or Pontefract, whose fate he would, in all probability, have shared, if he had had the misfortune to have flourished in the same age. He says, that Peter, who was not only a prophet, but a bard, predicted divers of King John's disasters, which fell out accordingly. On being taxed for a lying prophet in

having predicted that the king would be deposed before he entered into the fifteenth year of his reign, he answered him boldly, that all he had said was justifiable and true; for that, having given up his crown to the pope, and paying him an annual tribute, the pope reigned, and not he. Heywood thought this explanation to be perfectly satisfactory, and the prophet's faith for ever established.

But to return to Merlin. Of him even to this day it may be said, in the words which Burns has applied to another notorious personage,

“Great was his power and great his fame;
Far kened and noted is his name.”

His reputation is by no means confined to the land of his birth, but extends through most of the nations of Europe. A very curious volume of his *Life, Prophecies, and Miracles*, written, it is supposed, by Robert de Bosron, was printed at Paris in 1498, which states, that the devil himself was his father, and that he spoke the instant he was born, and assured his mother, a very virtuous young woman, that she should not die in childbed with him, as her ill-natured neighbours had predicted. The judge of the district, hearing of so marvellous an occurrence, summoned both mother and child to appear before him; and they went accordingly the same day. To put the wisdom of the young prophet most effectually to the test, the judge asked him if he knew his own father? To which the infant Merlin replied, in a clear, sonorous voice, “Yes, my father is the Devil; and I have his power, and know all things, past, present, and to come.” His worship clapped his hands in astonishment, and took the prudent resolution of not molesting so awful a child or its mother either.

Early tradition attributes the building of Stonehenge to the power of Merlin. It was believed that those mighty stones were whirled through the air, at his command, from Ireland to Salisbury Plain; and that he arranged

them in the form in which they now stand, to commemorate for ever the unhappy fate of three hundred British chiefs, who were massacred on that spot by the Saxons.

At Abergwylly, near Carmarthen, is still shewn the cave of the prophet and the scene of his incantations. How beautiful is the description of it given by Spenser in his *Faerie Queene*! The lines need no apology for their repetition here, and any sketch of the great prophet of Britain would be incomplete without them:

“There the wise Merlin, whilom wont (they say,)
To make his wonne low underneath the ground,
In a deep delve far from the view of day,
That of no living wight he mote be found,
Whenso he counselled with his sprites encompassed round.

And if thou ever happen that same way
To travel, go to see that dreadful place;
It is a hideous, hollow cave, they say,
Under a rock that lies, a little space
From the swift Barry, tumbling down apace
Amongst the woody hills of Dynevoure;
But dare thou not, I charge, in any case,
To enter into that same baleful bower,
For fear the cruel fiendes should thee unwares devour!

But, standing high aloft, low lay thine eare,
And there such ghastly noise of iron chaines
And brazen caudrons thou shalt rombling heare,
Which thousand sprites with long-enduring paines
Doe tosse, that it will stun thy feeble braines;
And often times great groans and grievous stownds,

When too huge toile and labour them constraines;
And often times loud strokes and ringing sounds
From under that deep rock most horribly rebounds.

The cause, they say, is this. A little while
Before that Merlin died, he did intend
A brazen wall in compass, to compile
About Cayr Merdin, and did it commend
Unto these sprites to bring to perfect end;
During which work the Lady of the Lake,
Whom long he loved, for him in haste did send,
Who thereby forced his workmen to forsake,
Them bound till his return their labour not to slake.

In the mean time, through that false ladie's traine,
He was surprised, and buried under biere,
Ne ever to his work returned again;
Natheless these fiendes may not their work forbear,
So greatly his commandement they fear,
But there doe toile and travaile day and night,
Until that brazen wall they up doe reare."⁵⁶

Amongst other English prophets, a belief in whose power has not been entirely effaced by the light of advancing knowledge, is Robert Nixon, the Cheshire idiot, a contemporary of Mother Shipton. The popular accounts of this man say, that he was born of poor parents, not far from Vale Royal, on the edge of the forest of Delamere. He was brought up to the plough, but was so ignorant and stupid, that nothing could be made of him. Every body thought him irretrievably insane, and paid no attention to the strange, unconnected discourses which he held. Many of his prophecies are believed to have been lost in this manner. But they were not always destined to be

wasted upon dull and inattentive ears. An incident occurred which brought him into notice, and established his fame as a prophet of the first calibre. He was ploughing in a field when he suddenly stopped from his labour, and with a wild look and strange gesture, exclaimed, "*Now, Dick! now, Harry! O, ill done, Dick! O, well done, Harry! Harry has gained the day!*" His fellow-labourers in the field did not know what to make of this rhapsody; but the next day cleared up the mystery. News was brought by a messenger, in hot haste, that at the very instant when Nixon had thus ejaculated, Richard III. had been slain at the battle of Bosworth, and Henry VII. proclaimed king of England.

It was not long before the fame of the new prophet reached the ears of the king, who expressed a wish to see and converse with him. A messenger was accordingly despatched to bring him to court; but long before he reached Cheshire, Nixon knew and dreaded the honours that awaited him. Indeed it was said, that at the very instant the king expressed the wish, Nixon was, by supernatural means, made acquainted with it, and that he ran about the town of Over in great distress of mind, calling out, like a madman, that Henry had sent for him, and that he must go to court, and be *clammed*, that is, starved to death. These expressions excited no little wonder; but, on the third day, the messenger arrived, and carried him to court, leaving on the minds of the good people of Cheshire an impression that their prophet was one of the greatest ever born. On his arrival King Henry appeared to be troubled exceedingly at the loss of a valuable diamond, and asked Nixon if he could inform him where it was to be found. Henry had hidden the diamond himself, with a view to test the prophet's skill. Great, therefore, was his surprise when Nixon answered him in the words of the old proverb, "Those who hide can find." From that time forth the king implicitly believed that he had the gift of prophecy, and ordered all his words to be taken down.

During all the time of his residence at court he was in constant fear of being starved to death, and repeatedly told the king that such would be his

fate, if he were not allowed to depart, and return into his own country. Henry would not suffer it, but gave strict orders to all his officers and cooks to give him as much to eat as he wanted. He lived so well, that for some time he seemed to be thriving like a nobleman's steward, and growing as fat as an alderman. One day the king went out hunting, when Nixon ran to the palace gate, and entreated on his knees that he might not be left behind to be starved. The king laughed, and calling an officer, told him to take especial care of the prophet during his absence, and rode away to the forest. After his departure, the servants of the palace began to jeer at and insult Nixon, whom they imagined to be much better treated than he deserved. Nixon complained to the officer, who, to prevent him from being further molested, locked him up in the king's own closet, and brought him regularly his four meals a day. But it so happened that a messenger arrived from the king to this officer, requiring his immediate presence at Winchester, on a matter of life and death. So great was his haste to obey the king's command, that he mounted on the horse behind the messenger, and rode off, without bestowing a thought upon poor Nixon. He did not return till three days afterwards, when, remembering the prophet for the first time, he went to the king's closet, and found him lying upon the floor, starved to death, as he had predicted.

Among the prophecies of his which are believed to have been fulfilled are the following, which relate to the times of the Pretender:

*“A great man shall come into England,
But the son of a king
Shall take from him the victory.”*

*“Crows shall drink the blood of many nobles,
And the North shall rise against the South.”*

*“The coek of the North shall be made to flee,
And his feather be plucked for his pride,
That he shall almost curse the day that he was born.”*

All these, say his admirers, are as clear as the sun at noon-day. The first denotes the defeat of Prince Charles Edward, at the battle of Culloden, by the Duke of Cumberland; the second, the execution of Lords Derwentwater, Balmerino, and Lovat; and the third, the retreat of the Pretender from the shores of Britain. Among the prophecies that still remain to be accomplished are the following:

*“Between seven, eight, and nine,
In England wonders shall be seen;
Between nine and thirteen
All sorrow shall be done.”*

*“Through our own money and our men
Shall a dreadful war begin.
Between the sickle and the suck
All England shall have a pluck.”*

*“Foreign nations shall invade England with snow on their helmets,
and shall bring plague, famine, and murder in the skirts of their
garments.”*

“The town of Nantwich shall be swept away by a flood.”

Of the two first of these no explanation has yet been attempted; but some event or other will doubtless be twisted into such a shape as will fit them. The third, relative to the invasion of England by a nation with snow on

their helmets, is supposed by the old women to foretell most clearly a coming war with Russia. As to the last, there are not a few in the town mentioned who devoutly believe that such will be its fate. Happily for their peace of mind, the prophet said nothing of the year that was to witness the awful calamity; so that they think it as likely to be two centuries hence as now.

The popular biographers of Nixon conclude their account of him by saying, that “his prophecies are by some persons thought fables; yet by what has come to pass, it is now thought, and very plainly appears, that most of them have proved, or will prove, true; for which we, on all occasions, ought not only to exert our utmost might to repel by force our enemies, but to refrain from our abandoned and wicked course of life, and to make our continual prayer to God for protection and safety.” To this, though a *non sequitur*, every one will cry, Amen!

Besides the prophets, there have been the almanac-makers Lilly, Poor Robin, Partridge, and Francis Moore physician, in England and Matthew Laensbergh, in France and Belgium. But great as were their pretensions, they were modesty itself in comparison with Merlin, Shipton, and Nixon, who fixed their minds upon higher things than the weather, and were not so restrained as to prophesy for only one year at a time. After such prophets the almanac-makers hardly deserve to be mentioned; not even the renowned Partridge, whose prognostications set all England agog in 1708, and whose death while still alive was so pleasantly and satisfactorily proved by Isaac Bickerstaff. The anti-climax would be too palpable, and they and their doings must be left uncommemorated.

MOTHER SHIPTON'S HOUSE. ⁵⁷

FORTUNE-TELLING.

And men still grope t' anticipate
The cabinet designs of Fate;
Apply to wizards to foresee
What shall and what shall never be.

Hudibras, part iii, canto 3.

IN accordance with the plan laid down, we proceed to the consideration of the follies into which men have been led by their eager desire to pierce the thick darkness of futurity. God himself, for his own wise purposes, has more than once undrawn the impenetrable veil which shrouds those awful secrets; and, for purposes just as wise, he has decreed that, except in these instances, ignorance shall be our lot for ever. It is happy for man that he does not know what the morrow is to bring forth; but, unaware of this great blessing, he has, in all ages of the world, presumptuously endeavoured to trace the events of unborn centuries, and anticipate the march of time. He has reduced this presumption into a study. He has divided it into sciences and systems without number, employing his whole life in the vain pursuit. Upon no subject has it been so easy to deceive the world as upon this. In every breast the curiosity exists in a greater or less degree, and can only be conquered by a long course of self-examination, and a firm reliance that the future would not be hidden from our sight, if it were right that we should be acquainted with it.

An undue opinion of our own importance in the scale of creation is at the bottom of all our unwarrantable notions in this respect. How flattering to the pride of man to think that the stars in their courses watch over him,

and typify, by their movements and aspects, the joys or the sorrows that await him! He, less in proportion to the universe than the all-but invisible insects that feed in myriads on a summer's leaf are to this great globe itself, fondly imagines that eternal worlds were chiefly created to prognosticate his fate. How we should pity the arrogance of the worm that crawls at our feet, if we knew that it also desired to know the secrets of futurity, and imagined that meteors shot athwart the sky to warn it that a tom-tit was hovering near to gobble it up; that storms and earthquakes, the revolutions of empires, or the fall of mighty monarchs, only happened to predict its birth, its progress, and its decay! Not a whit less presuming has man shewn himself; not a whit less arrogant are the sciences, so called, of astrology, augury, necromancy, geomancy, palmistry, and divination of every kind.

Leaving out of view the oracles of pagan antiquity and religious predictions in general, and confining ourselves solely to the persons who, in modern times, have made themselves most conspicuous in foretelling the future, we shall find that the sixteenth and seventeenth centuries were the golden age of these impostors. Many of them have been already mentioned in their character of alchemists. The union of the two pretensions is not at all surprising. It was to be expected that those who assumed a power so preposterous as that of prolonging the life of man for several centuries, should pretend, at the same time, to foretell the events which were to mark that preternatural span of existence. The world would as readily believe that they had discovered all secrets, as that they had only discovered one. The most celebrated astrologers of Europe, three centuries ago, were alchemists. Agrippa, Paracelsus, Dr. Dee, and the Rosicrucians, all laid as much stress upon their knowledge of the days to come, as upon their pretended possession of the philosopher's stone and the elixir of life. In their time, ideas of the wonderful, the diabolical, and the supernatural, were rifer than ever they were before. The devil or the stars were universally believed to meddle constantly in the affairs of men; and both were to be consulted with proper ceremonies. Those who were of a

melancholy and gloomy temperament betook themselves to necromancy and sorcery; those more cheerful and aspiring devoted themselves to astrology. The latter science was encouraged by all the monarchs and governments of that age. In England, from the time of Elizabeth to that of William and Mary, judicial astrology was in high repute. During that period flourished Drs. Dee, Lamb, and Forman; with Lilly, Booker, Gadbury, Evans, and scores of nameless impostors in every considerable town and village in the country, who made it their business to cast nativities, aid in the recovery of stolen goods, prognosticate happy or unhappy marriages, predict whether journeys would be prosperous, and note lucky moments for the commencement of any enterprise, from the setting up of a cobbler's shop to the marching of an army. Men who, to use the words of Butler, did

“Deal in Destiny’s dark counsel,
And sage opinion of the moon sell;
To whom all people far and near
On deep importance did repair,
When brass and pewter pots did stray,
And linen slunk out of the way.”

HENRY ANDREWS, THE ORIGINAL “FRANCIS MOORE.”

In Lilly’s *Memoirs of his Life and Times*, there are many notices of the inferior quacks who then abounded, and upon whom he pretended to look down with supreme contempt; not because they were astrologers, but

because they debased that noble art by taking fees for the recovery of stolen property. From Butler's *Hudibras*, and its curious notes, we may learn what immense numbers of these fellows lived upon the credulity of mankind in that age of witchcraft and diablerie. Even in our day, how great is the reputation enjoyed by the almanac-makers, who assume the name of Francis Moore! But in the time of Charles I. and the Commonwealth the most learned, the most noble, and the most conspicuous characters did not hesitate to consult astrologers in the most open manner. Lilly, whom Butler has immortalised under the name of Sydrophele, relates, that he proposed to write a work called *An Introduction to Astrology*, in which he would satisfy the whole kingdom of the lawfulness of that art. Many of the soldiers were for it, he says, and many of the Independent party, and abundance of worthy men in the House of Commons, his assured friends, and able to take his part against the Presbyterians, who would have silenced his predictions if they could. He afterwards carried his plan into execution, and when his book was published, went with another astrologer named Booker to the headquarters of the parliamentary army at Windsor, where they were welcomed and feasted in the garden where General Fairfax lodged. They were afterwards introduced to the general, who received them very kindly, and made allusion to some of their predictions. He hoped their art was lawful and agreeable to God's word; but he did not understand it himself. He did not doubt, however, that the two astrologers feared God, and therefore he had a good opinion of them. Lilly assured him that the art of astrology was quite consonant to the Scriptures; and confidently predicted from his knowledge of the stars, that the parliamentary army would overthrow all its enemies. In Oliver's Protectorate, this quack informs us that he wrote freely enough. He became an Independent, and all the soldiery were his friends. When he went to Scotland, he saw a soldier standing in front of the army with a book of prophecies in his hand, exclaiming to the several companies as they passed

by him, “Lo! hear what Lilly saith: you are in this month promised victory! Fight it out, brave boys! and then read that month’s prediction!”

After the great fire of London, which Lilly said he had foretold, he was sent for by the committee of the House of Commons appointed to inquire into the causes of the calamity. In his *Monarchy or no Monarchy*, published in 1651, he had inserted an hieroglyphical plate representing on one side persons in winding-sheets digging graves; and on the other a large city in flames. After the great fire, some sapient member of the legislature bethought him of Lilly’s book, and having mentioned it in the house, it was agreed that the astrologer should be summoned. Lilly attended accordingly, when Sir Robert Brook told him the reason of his summons, and called upon him to declare what he knew. This was a rare opportunity for the vainglorious Lilly to vaunt his abilities; and he began a long speech in praise of himself and his pretended science. He said that, after the execution of Charles I., he was extremely desirous to know what might from that time forth happen to the parliament and to the nation in general. He therefore consulted the stars, and satisfied himself. The result of his judgment he put into emblems and hieroglyphics, without any commentary, so that the true meaning might be concealed from the vulgar, and made manifest only to the wise; imitating in this the example of many wise philosophers who had done the like.

“Did you foresee the year of the fire?” said a member. “No,” quoth Lilly, “nor was I desirous. Of that I made no scrutiny.” After some further parley, the house found they could make nothing of the astrologer, and dismissed him with great civility.

One specimen of the explanation of a prophecy given by Lilly, and related by him with much complacency, will be sufficient to shew the sort of trash by which he imposed upon the million. “In the year 1588,” says he, “there was a prophecy printed in Greek characters, exactly deciphering the long troubles of the English nation from 1641 to 1660.” And it ended thus: “And after him shall come a dreadful dead man, and with him a royal G, of

the best blood in the world; and he shall have the crown, and shall set England on the right way, and put out all heresies.” The following is the explanation of this oracular absurdity:

“Monkery being extinguished above eighty or ninety years, and the Lord General’s name being Monk, is the dead man. The royal G or C [it is gamma in the Greek, intending C in the Latin, being the third letter in the alphabet] is Charles II., who for his extraction may be said to be of the best blood of the world.”

In France and Germany astrologers met even more encouragement than they received in England. In very early ages Charlemagne and his successors fulminated their wrath against them in common with sorcerers. Louis XI., that most superstitious of men, entertained great numbers of them at his court; and Catherine de Medicis, that most superstitious of women, hardly ever undertook any affair of importance without consulting them. She chiefly favoured her own countrymen; and during the time she governed France, the land was overrun by Italian conjurors, necromancers, and fortune-tellers of every kind. But the chief astrologer of that day, beyond all doubt, was the celebrated Nostradamus, physician to her husband, King Henry II. He was born in 1503 at the town of St. Remi, in Provence, where his father was a notary. He did not acquire much fame till he was past his fiftieth year, when his famous *Centuries*, a collection of verses, written in obscure and almost unintelligible language, began to excite attention. They were so much spoken of in 1556, that Henry II. resolved to attach so skilful a man to his service, and appointed him his physician. In a biographical notice of him, prefixed to the edition of his *Vraies Centuries*, published at Amsterdam in 1668, we are informed that he often discoursed with his royal master on the secrets of futurity, and received many great presents as his reward, besides his usual allowance for medical attendance. After the death of Henry he retired to his native place,

where Charles IX. paid him a visit in 1564; and was so impressed with veneration for his wondrous knowledge of the things that were to be, not in France only, but in the whole world for hundreds of years to come, that he made him a counsellor of state and his own physician, besides treating him in other matters with a royal liberality. “In fine,” continues his biographer, “I should be too prolix were I to tell all the honours conferred upon him, and all the great nobles and learned men that arrived at his house from the very ends of the earth, to see and converse with him as if he had been an oracle. Many strangers, in fact, came to France for no other purpose than to consult him.”

NOSTRADAMUS.—FROM THE FRONTISPIECE TO A COLLECTION OF HIS PROPHECIES,
PUBLISHED AT AMSTERDAM, A.D. 1666.

The prophecies of Nostradamus consist of upwards of a thousand stanzas, each of four lines, and are to the full as obscure as the oracles of old. They take so great a latitude, both as to time and space, that they are almost sure to be fulfilled somewhere or other in the course of a few centuries. A little ingenuity, like that evinced by Lilly in his explanation about General Monk and the dreadful dead man, might easily make events to fit some of them. ⁵⁸

He is to this day extremely popular in France and the Walloon country of Belgium, where old farmer-wives consult him with great confidence and assiduity.

Catherine di Medicis was not the only member of her illustrious house who entertained astrologers. At the beginning of the fifteenth century there was a man, named Basil, residing in Florence, who was noted over all Italy for his skill in piercing the darkness of futurity. It is said that he foretold to Cosmo di Medicis, then a private citizen, that he would attain high dignity, inasmuch as the ascendant of his nativity was adorned with the same propitious aspects as those of Augustus Cæsar and the Emperor Charles V.⁵⁹ Another astrologer foretold the death of Prince Alexander di Medicis; and so very minute and particular was he in all the circumstances, that he was suspected of being chiefly instrumental in fulfilling his own prophecy—a very common resource with these fellows to keep up their credit. He foretold confidently that the prince should die by the hand of his own familiar friend, a person of a slender habit of body, a small face, a swarthy complexion, and of most remarkable taciturnity. So it afterwards happened, Alexander having been murdered in his chamber by his cousin Lorenzo, who corresponded exactly with the above description.⁶⁰ The author of *Hermippus Redivivus*, in relating this story, inclines to the belief that the astrologer was guiltless of any participation in the crime, but was employed by some friend of Prince Alexander to warn him of his danger.

A much more remarkable story is told of an astrologer who lived in Romagna in the fifteenth century, and whose name was Antiochus Tibertus.⁶¹ At that time nearly all the petty sovereigns of Italy retained such men in their service; and Tibertus, having studied the mathematics with great success at Paris, and delivered many predictions, some of which, for guesses, were not deficient in shrewdness, was taken into the household of Pandolfo di Malatesta, the sovereign of Rimini. His reputation was so great, that his study was continually thronged either with visitors who were persons of distinction, or with clients who came to him for advice; and in a

short time he acquired a considerable fortune. Notwithstanding all these advantages, he passed his life miserably, and ended it on the scaffold. The following story afterwards got into circulation, and has been often triumphantly cited by succeeding astrologers as an irrefragable proof of the truth of their science. It was said that, long before he died, he uttered three remarkable prophecies—one relating to himself, another to his friend, and the third to his patron, Pandolfo di Malatesta. The first delivered was that relating to his friend Guido di Bogni, one of the greatest captains of the time. Guido was exceedingly desirous to know his fortune, and so importuned Tibertus, that the latter consulted the stars and the lines on his palm to satisfy him. He afterwards told him with a sorrowful face, that, according to all the rules of astrology and palmistry, he should be falsely suspected by his best friend, and should lose his life in consequence. Guido then asked the astrologer if he could foretell his own fate; upon which Tibertus again consulted the stars, and found that it was decreed from all eternity that he should end his days on the scaffold. Malatesta, when he heard these predictions, so unlikely, to all present appearance, to prove true, desired his astrologer to predict his fate also, and to hide nothing from him, however unfavourable it might be. Tibertus complied, and told his patron, at that time one of the most flourishing and powerful princes of Italy, that he should suffer great want, and die at last like a beggar in the common hospital of Bologna. And so it happened in all three cases. Guido di Bogni was accused by his own father-in-law, the Count di Bentivoglio, of a treasonable design to deliver up the city of Rimini to the papal forces, and was assassinated afterwards, by order of the tyrant Malatesta, as he sat at the supper-table, to which he had been invited in all apparent friendship. The astrologer was at the same time thrown into prison, as being concerned in the treason of his friend. He attempted to escape, and had succeeded in letting himself down from his dungeon-window into a moat, when he was discovered by the sentinels. This being reported to Malatesta, he gave orders for his execution on the following morning.

Malatesta had, at this time, no remembrance of the prophecy; and his own fate gave him no uneasiness; but events were silently working its fulfilment. A conspiracy had been formed, though Guido di Bogni was innocent of it, to deliver up Rimini to the pope; and all the necessary measures having been taken, the city was seized by the Count de Valentinois. In the confusion, Malatesta had barely time to escape from his palace in disguise. He was pursued from place to place by his enemies, abandoned by all his former friends, and, finally, by his own children. He at last fell ill of a languishing disease, at Bologna; and, nobody caring to afford him shelter, he was carried to the hospital, where he died. The only thing that detracts from the interest of this remarkable story is the fact, that the prophecy was made after the event.

For some weeks before the birth of Louis XIV., an astrologer from Germany, who had been sent for by the Marshal de Bassompierre and other noblemen of the court, had taken up his residence in the palace, to be ready, at a moment's notice, to draw the horoscope of the future sovereign of France. When the queen was taken in labour, he was ushered into a contiguous apartment, that he might receive notice of the very instant the child was born. The result of his observations were the three words, *diu, durè, feliciter*; meaning, that the new-born prince should live and reign long, with much labour, and with great glory. No prediction less favourable could have been expected from an astrologer, who had his bread to get, and who was at the same time a courtier. A medal was afterwards struck in commemoration of the event; upon one side of which was figured the nativity of the prince, representing him as driving the chariot of Apollo, with the inscription "Ortus solis Gallici,"—the rising of the Gallic sun.

The best excuse ever made for astrology was that offered by the great astronomer, Kepler, himself an unwilling practiser of the art.

He had many applications from his friends to cast nativities for them, and generally gave a positive refusal to such as he was not afraid of offending by his frankness. In other cases he accommodated himself to the

prevailing delusion. In sending a copy of his *Ephemerides* to Professor Gerlach, he wrote, that *they were nothing but worthless conjectures*; but he was obliged to devote himself to them, or he would have starved. “Ye overwise philosophers,” he exclaimed, in his *Tertius Interveniens*; “ye censure this daughter of astronomy beyond her deserts! *Know ye not that she must support her mother by her charms?* The scanty reward of an astronomer would not provide him with bread, if men did not entertain hopes of reading the future in the heavens.”

NECROMANCY was, next to astrology, the pretended science most resorted to, by those who wished to pry into the future. The earliest instance upon record is that of the witch of Endor and the spirit of Samuel. Nearly all the nations of antiquity believed in the possibility of summoning departed ghosts to disclose the awful secrets that God made clear to the disembodied. Many passages in allusion to this subject will at once suggest themselves to the classical reader; but this art was never carried on openly in any country. All governments looked upon it as a crime of the deepest dye. While astrology was encouraged, and its professors courted and rewarded, necromancers were universally condemned to the stake or the gallows. Roger Bacon, Albertus Magnus, Arnold of Villeneuve, and many others, were accused by the public opinion of many centuries, of meddling in these unhallowed matters. So deep-rooted has always been the popular delusion with respect to accusations of this kind, that no crime was ever disproved with such toil and difficulty. That it met great encouragement, nevertheless, is evident from the vast numbers of pretenders to it; who, in spite of the danger, have existed in all ages and countries.

GEOMANCY, or the art of foretelling the future by means of lines and circles, and other mathematical figures drawn on the earth, is still extensively practised in Asiatic countries, but is almost unknown in Europe.

AUGURY, from the flight or entrails of birds, so favourite a study among the Romans, is, in like manner, exploded in Europe. Its most assiduous professors, at the present day, are the abominable Thugs of India.

DIVINATION, of which there are many kinds, boasts a more enduring reputation. It has held an empire over the minds of men from the earliest periods of recorded history, and is, in all probability, coeval with time itself. It was practised alike by the Jews, the Egyptians, the Chaldeans, the Persians, the Greeks, and the Romans; is equally known to all modern nations, in every part of the world; and is not unfamiliar to the untutored tribes that roam in the wilds of Africa and America. Divination, as practised in civilised Europe at the present day, is chiefly from cards, the tea-cup, and the lines on the palm of the hand. Gipsies alone make a profession of it; but there are thousands and tens of thousands of humble families in which the good-wife, and even the good-man, resort to the grounds at the bottom of their tea-cups, to know whether the next harvest will be abundant, or their sow bring forth a numerous litter; and in which the young maidens look to the same place to know when they are to be married, and whether the man of their choice is to be dark or fair, rich or poor, kind or cruel. Divination by cards, so great a favourite among the moderns, is, of course, a modern science; as cards do not yet boast an antiquity of much more than four hundred years. Divination by the palm, so confidently believed in by half the village lasses in Europe, is of older date, and seems to have been known to the Egyptians in the time of the patriarchs; as well as divination by the cup, which, as we are informed in Genesis, was practised by Joseph. Divination by the rod was also practised by the Egyptians. In comparatively recent times, it was pretended that by this means hidden treasures could be discovered. It now appears to be altogether exploded in Europe. Onomancy, or the foretelling a man's fate by the letters of his name, and the various transpositions of which they are

capable, is a more modern sort of divination; but it reckons comparatively few believers.

The following list of the various species of divination formerly in use, is given by Gaule in his *Magastromancer*, and quoted in Hone's *Year-Book*, p. 1517.

Stereomancy, or divining by the elements.

Aeromancy, or divining by the air.

Pyromancy, by fire,

Hydromancy, by water.

Geomancy, by earth.

Theomancy, pretending to divine by the revelation of the Spirit, and by the Scriptures, or word of God.

Demonomancy, by the aid of devils and evil spirits.

Idolomancy, by idols, images, and figures.

Psychomancy, by the soul, affections, or dispositions of men.

Anthropomancy, by the entrails of human beings.

Theriomancy, by beasts.

Ornithomancy, by birds.

Ichthyomancy, by fishes.

Botanomancy, by herbs.

Lithomancy, by stones.

Kleromancy, by lots.

Oneiromancy, by dreams.

Onomancy, by names.

Arithmancy, by numbers.

Logarithmancy, by logarithms.

Sternomancy, by the marks from the breast to the belly.

Gastromancy, by the sound of, or marks upon the belly.

Omphalomancy, by the navel.
Chiromancy, by the hands.
Podomancy, by the feet.
Onchyomancy, by the nails.
Cephaleonomancy, by asses' heads.
Tephromancy, by ashes.
Kapnomancy, by smoke.
Knissomancy, by the burning of incense.
Ceromancy, by the melting of wax.
Lecanomancy, by basins of water.
Katoptromancy, by looking-glasses.
Chartomancy, by writing in papers, and by Valentines.
Macharomancy, by knives and swords.
Crystallomancy, by crystals.
Dactylomancy, by rings.
Koskinomancy, by sieves.
Axinomancy, by saws.
Chalcomancy, by vessels of brass, or other metal.
Spatilomancy, by skins, bones, &c.
Astromancy, by stars.
Sciomancy, by shadows.
Astragalomancy, by dice.
Oinomancy, by the lees of wine.
Sycomancy, by figs.
Tyromancy, by cheese.
Alphitomancy, by meal, flour, or bran.
Krithomancy, by corn or grain.
Alectromancy, by cocks.
Gyromancy, by circles.

Lampadomancy, by candles and lamps.

ONEIRO-CRITICISM, or the art of interpreting dreams, is a relic of the most remote ages, which has subsisted through all the changes that moral or physical revolutions have operated in the world. The records of five thousand years bear abundant testimony to the universal diffusion of the belief, that the skilful could read the future in dreams. The rules of the art, if any existed in ancient times, are not known; but in our day, one simple rule opens the whole secret. Dreams, say all the wiseacres in Christendom, are to be interpreted by contraries. Thus, if you dream of filth, you will acquire something valuable; if you dream of the dead, you will hear news of the living; if you dream of gold and silver, you run a risk of being without either; and if you dream you have many friends, you will be persecuted by many enemies. The rule, however, does not hold good in all cases. It is fortunate to dream of little pigs, but unfortunate to dream of big bullocks. If you dream you have lost a tooth, you may be sure that you will shortly lose a friend; and if you dream that your house is on fire, you will receive news from a far country. If you dream of vermin, it is a sign that there will be sickness in your family; and if you dream of serpents, you will have friends who, in the course of time, will prove your bitterest enemies; but, of all dreams, it is most fortunate if you dream that you are wallowing up to your neck in mud and mire. Clear water is a sign of grief; and great troubles, distress, and perplexity are predicted, if you dream that you stand naked in the public streets, and know not where to find a garment to shield you from the gaze of the multitude.

In many parts of Great Britain, and the continents of Europe and America, there are to be found elderly women in the villages and country-places whose interpretations of dreams are looked upon with as much reverence as if they were oracles. In districts remote from towns it is not uncommon to find the members of a family regularly every morning narrating their dreams at the breakfast-table, and becoming happy or

miserable for the day according to their interpretation. There is not a flower that blossoms, or fruit that ripens, that, dreamed of, is not ominous of either good or evil to such people. Every tree of the field or the forest is endowed with a similar influence over the fate of mortals, if seen in the night-visions. To dream of the ash, is the sign of a long journey; and of an oak, prognosticates long life and prosperity. To dream you strip the bark off any tree, is a sign to a maiden of an approaching loss of a character; to a married woman, of a family bereavement; and to a man, of an accession of fortune. To dream of a leafless tree, is a sign of great sorrow; and of a branchless trunk, a sign of despair and suicide. The elder-tree is more auspicious to the sleeper; while the fir-tree, better still, betokens all manner of comfort and prosperity. The lime-tree predicts a voyage across the ocean; while the yew and the alder are ominous of sickness to the young and of death to the old.⁶² Among the flowers and fruits charged with messages for the future, the following is a list of the most important, arranged from approved sources, in alphabetical order:

Asparagus, gathered and tied up in bundles, is an omen of tears. If you see it growing in your dreams, it is a sign of good fortune.

Aloes, without a flower, betokens long life; in flower, betokens a legacy.

Artichokes. This vegetable is a sign that you will receive, in a short time, a favour from the hands of those from whom you would least expect it.

Agrimony. This herb denotes that there will be sickness in your house.

Anemone predicts love.

Auriculas, in beds, denote luck; in pots, marriage; while to gather them, foretells widowhood.

Bilberries predict a pleasant excursion.

Broom-flowers an increase of family.

Cauliflowers predict that all your friends will slight you, or that you will fall into poverty and find no one to pity you.

Dock-leaves, a present from the country.

Daffodils. Any maiden who dreams of daffodils is warned by her good angel to avoid going into a wood with her lover, or into any dark or retired place where she might not be able to make people hear her if she cried out. Alas for her if she pay no attention to the warning!

“Never again shall she put garland on;
Instead of it she’ll wear sad cypress now,
And bitter elder broken from the bough.”

Figs, if green, betoken embarrassment; if dried, money to the poor, and mirth to the rich.

Hearts-ease betokens heart’s pain.

Lilies predict joy; *water-lilies*, danger from the sea.

Lemons betoken a separation.

Pomegranates predict happy wedlock to those who are single, and reconciliation to those who are married and have disagreed.

Quinces prognosticate pleasant company.

Roses denote happy love, not unmixed with sorrow from other sources.

Sorrel. To dream of this herb is a sign that you will shortly have occasion to exert all your prudence to overcome some great calamity.

Sunflowers shew that your pride will be deeply wounded.

Violets predict evil to the single, and joy to the married.

Yellow-flowers of any kind predict jealousy.

Yew-berries predict loss of character to both sexes.

It should be observed that the rules for the interpretation of dreams are far from being universal. The cheeks of the peasant girl of England glow with pleasure in the morning after she has dreamed of a rose, while the *paysanne* of Normandy dreads disappointment and vexation for the very

same reason. The Switzer who dreams of an oak-tree does not share in the Englishman's joy; for he imagines that the vision was a warning to him that, from some trifling cause, an overwhelming calamity will burst over him. Thus do the ignorant and the credulous torment themselves; thus do they spread their nets to catch vexation, and pass their lives between hopes which are of no value and fears which are a positive evil.

OMENS. Among the other means of self-annoyance upon which men have stumbled, in their vain hope of discovering the future, signs and omens hold a conspicuous place. There is scarcely an occurrence in nature which, happening at a certain time, is not looked upon by some persons as a prognosticator either of good or evil. The latter are in the greatest number, so much more ingenious are we in tormenting ourselves than in discovering reasons for enjoyment in the things that surround us. We go out of our course to make ourselves uncomfortable; the cup of life is not bitter enough to our palate, and we distil superfluous poison to put into it, or conjure up hideous things to frighten ourselves at, which would never exist if we did not make them. "We suffer," says Addison,⁶³ "as much from trifling accidents as from real evils. I have known the shooting of a star spoil a night's rest, and have seen a man in love grow pale and lose his appetite upon the plucking of a merrythought. A screech-owl at midnight has alarmed a family more than a band of robbers; nay, the voice of a cricket has struck more terror than the roaring of a lion. There is nothing so inconsiderable which may not appear dreadful to an imagination that is filled with omens and prognostics. A rusty nail or a crooked pin shoot up into prodigies."

The century and a quarter that has passed away since Addison wrote has seen the fall of many errors. Many fallacies and delusions have been crushed under the foot of Time since then; but this has been left unscathed, to frighten the weak-minded and embitter their existence. A belief in omens is not confined to the humble and uninformed. A general who led an

army with credit has been known to feel alarmed at a winding-sheet in the candle; and learned men, who had honourably and fairly earned the highest honours of literature, have been seen to gather their little ones around them, and fear that one would be snatched away, because,

“When stole upon the time the dead of night,
And heavy sleep had closed up mortal eyes,”

a dog in the street was howling at the moon. Persons who would acknowledge freely that the belief in omens was unworthy of a man of sense, have yet confessed at the same time that, in spite of their reason, they have been unable to conquer their fears of death when they heard the harmless insect called the death-watch ticking in the wall, or saw an oblong hollow coal fly out of the fire.

Many other evil omens besides those mentioned above alarm the vulgar and the weak. If a sudden shivering comes over such people, they believe that, at that instant, an enemy is treading over the spot that will one day be their grave. If they meet a sow when they first walk abroad in the morning, it is an omen of evil for that day. To meet an ass, is in like manner unlucky. It is also very unfortunate to walk under a ladder; to forget to eat goose on the festival of St. Michael; to tread upon a beetle, or to eat the twin nuts that are sometimes found in one shell. Woe, in like manner, is predicted to that wight who inadvertently upsets the salt; each grain that is overthrown will bring to him a day of sorrow. If thirteen persons sit at table, one of them will die within the year; and all of them will be unhappy. Of all evil omens this is the worst. The facetious Dr. Kitchener used to observe that there was one case in which he believed that it was really unlucky for thirteen persons to sit down to dinner, and that was when there was only dinner enough for twelve. Unfortunately for their peace of mind, the great majority of people do not take this wise view of the matter. In almost every

country of Europe the same superstition prevails, and some carry it so far as to look upon the number thirteen as in every way ominous of evil; and if they find thirteen coins in their purse, cast away the odd one like a polluted thing. The philosophic Beranger, in his exquisite song, *Thirteen at Table*, has taken a poetical view of this humiliating superstition, and mingled, as is his wont, a lesson of genuine wisdom in his lay. Being at dinner, he overthrows the salt, and, looking round the room, discovers that he is the thirteenth guest. While he is mourning his unhappy fate, and conjuring up visions of disease and suffering and the grave, he is suddenly startled by the apparition of Death herself, not in the shape of a grim foe, with skeleton-ribs and menacing dart, but of an angel of light, who shews the folly of tormenting ourselves with the dread of her approach, when she is the friend, rather than the enemy, of man, and frees us from the fetters which bind us to the dust.

If men could bring themselves to look upon death in this manner, living well and wisely till her inevitable approach, how vast a store of grief and vexation would they spare themselves!

Among good omens, one of the most conspicuous is to meet a piebald horse. To meet two of these animals is still more fortunate; and if on such an occasion you spit thrice, and form any reasonable wish, it will be gratified within three days. It is also a sign of good fortune if you inadvertently put on your stocking wrong side out. If you wilfully wear your stocking in this fashion, no good will come of it. It is very lucky to sneeze twice; but if you sneeze a third time, the omen loses its power, and your good fortune will be nipped in the bud. If a strange dog follow you, and fawn on you, and wish to attach itself to you, it is a sign of very great prosperity. Just as fortunate is it if a strange male cat comes to your house and manifests friendly intentions towards your family. If a she cat, it is an omen, on the contrary, of very great misfortune. If a swarm of bees alight in your garden, some very high honour and great joys await you.

Besides these glimpses of the future, you may know something of your fate by a diligent attention to every itching that you may feel in your body. Thus, if the eye or the nose itches, it is a sign you will be shortly vexed; if the foot itches, you will tread upon strange ground; and if the elbow itches, you will change your bedfellow. Itching of the right hand prognosticates that you will soon have a sum of money; and, of the left, that you will be called upon to disburse it.

These are but a few of the omens which are generally credited in modern Europe. A complete list of them would fatigue from its length, and sicken from its absurdity. It would be still more unprofitable to attempt to specify the various delusions of the same kind which are believed among oriental nations. Every reader will remember the comprehensive formula of cursing preserved in *Tristram Shandy*—curse a man after any fashion you remember or can invent, you will be sure to find it there. The oriental creed of omens is not less comprehensive. Every movement of the body, every emotion of the mind, is at certain times an omen. Every form and object in nature, even the shape of the clouds and the changes of the weather; every colour, every sound, whether of men or animals, or birds or insects, or inanimate things, is an omen. Nothing is too trifling or inconsiderable to inspire a hope which is not worth cherishing, or a fear which is sufficient to embitter existence.

From the belief in omens springs the superstition that has, from very early ages, set apart certain days, as more favourable than others, for prying into the secrets of futurity. The following, copied verbatim from the popular *Dream and Omen Book* of Mother Bridget, will shew the belief of the people of England at the present day. Those who are curious as to the ancient history of these observances, will find abundant aliment in the *Every-day Book*.

“*The 1st of January.*—If a young maiden drink, on going to bed, a pint of cold spring water, in which is beat up an amulet, composed of

the yolk of a pullet's egg, the legs of a spider, and the skin of an eel pounded, her future destiny will be revealed to her in a dream. This charm fails of its effect if tried any other day of the year.

“Valentine Day.—Let a single woman go out of her own door very early in the morning, and if the first person she meets be a woman, she will not be married that year; if she meet a man she will be married within three months.

“Lady Day.—The following charm may be tried this day with certain success: String thirty-one nuts on a string, composed of red worsted mixed with blue silk, and tie it round your neck on going to bed, repeating these lines:

“Oh, I wish! oh, I wish to see
Who my true love is to be!

Shortly after midnight, you will see your lover in a dream, and be informed at the same time of all the principal events of your future life.

“St. Swithin's Eve.—Select three things you most wish to know; write them down with a new pen and red ink on a sheet of fine wove paper, from which you must previously cut off all the corners and burn them. Fold the paper into a true lover's knot, and wrap round it three hairs from your head. Place the paper under your pillow for three successive nights, and your curiosity to know the future will be satisfied.

“St. Mark's Eve.—Repair to the nearest churchyard as the clock strikes twelve, and take from a grave on the south side of the church three tufts of grass (the longer and ranker the better), and on going to bed place them under your pillow, repeating earnestly three several times,

‘The Eve of St. Mark by prediction is blest,
Set therefore my hopes and my fears all to rest:
Let me know my fate, whether weal or woe;
Whether my rank’s to be high or low;
Whether to live single, or be a bride,
And the destiny my star doth provide.’

Should you have no dream that night, you will be single and miserable all your life. If you dream of thunder and lightning, your life will be one of great difficulty and sorrow.

“*Candlemas Eve.*—On this night (which is the purification of the Virgin Mary), let three, five, seven, or nine young maidens assemble together in a square chamber. Hang in each corner a bundle of sweet herbs, mixed with rue and rosemary. Then mix a cake of flour, olive-oil, and white sugar; every maiden having an equal share in the making and the expense of it. Afterwards it must be cut into equal pieces, each one marking the piece as she cuts it with the initials of her name. It is then to be baked one hour before the fire, not a word being spoken the whole time, and the maidens sitting with their arms and knees across. Each piece of cake is then to be wrapped up in a sheet of paper, on which each maiden shall write the love part of Solomon’s Songs. If she put this under her pillow she will dream true. She will see her future husband and every one of her children, and will know besides whether her family will be poor or prosperous, a comfort to her or the contrary.

“*Midsummer.*—Take three roses, smoke them with sulphur, and exactly at three in the day bury one of the roses under a yew-tree; the second in a newly-made grave, and put the third under your pillow for three nights, and at the end of that period burn it in a fire of charcoal. Your dreams during that time will be prophetic of your future destiny,

and, what is still more curious and valuable, says Mother Bridget, the man whom you are to wed will enjoy no peace till he comes and visits you. Besides this, you will perpetually haunt his dreams.

“*St. John’s Eve.*—Make a new pincushion of the very best black velvet (no inferior quality will answer the purpose), and on one side stick your name at full length with the very smallest pins that can be bought (none other will do). On the other side make a cross with some very large pins, and surround it with a circle. Put this into your stocking when you take it off at night, and hang it up at the foot of the bed. All your future life will pass before you in a dream.

“*First New Moon of the year.*—On the first new moon in the year take a pint of clear spring water, and infuse into it the *white* of an egg laid by a *white* hen, a glass of *white* wine, three almonds peeled *white*, and a tablespoonful of *white* rose-water. Drink this on going to bed, not making more nor less than three draughts of it; repeating the following verses three several times in a clear distinct voice, but not so loud as to be overheard by any body:

‘If I dream of water pure
 Before the coming morn,
’Tis a sign I shall be poor,
 And unto wealth not born.
If I dream of tasting beer,
Middling then will be my cheer—
Chequer’d with the good and bad,
Sometimes joyful, sometimes sad;
But should I dream of drinking wine,
Wealth and pleasure will be mine.
The stronger the drink, the better the cheer—
Dreams of my destiny, appear, appear!’

“Twenty-ninth of February.—This day, as it only occurs once in four years, is peculiarly auspicious to those who desire to have a glance at futurity, especially to young maidens burning with anxiety to know the appearance and complexion of their future lords. The charm to be adopted is the following: Stick twenty-seven of the smallest pins that are made, three by three, into a tallow candle. Light it up at the wrong end, and then place it in a candlestick made out of clay, which must be drawn from a virgin’s grave. Place this on the chimney-place, in the left-hand corner, exactly as the clock strikes twelve, and go to bed immediately. When the candle is burnt out, take the pins and put them into your left shoe; and before nine nights have elapsed your fate will be revealed to you.”

We have now taken a hasty review of the various modes of seeking to discover the future, especially as practised in modern times. The main features of the folly appear essentially the same in all countries. National character and peculiarities operate some difference of interpretation. The mountaineer makes the natural phenomena which he most frequently witnesses prognosticative of the future. The dweller in the plains, in a similar manner, seeks to know his fate among the signs of the things that surround him, and tints his superstition with the hues of his own clime. The same spirit animates them all—the same desire to know that which Infinite Mercy has concealed. There is but little probability that the curiosity of mankind in this respect will ever be wholly eradicated. Death and ill fortune are continual bugbears to the weak-minded, the irreligious, and the ignorant; and while such exist in the world, divines will preach upon its impiety and philosophers discourse upon its absurdity in vain. Still it is evident that these follies have greatly diminished. Soothsayers and prophets have lost the credit they formerly enjoyed, and skulk in secret now where they once shewed their faces in the blaze of day. So far there is manifest improvement.

THE MAGNETISERS.

Some deemed them wondrous wise, and some believed them mad.

Beattie's Minstrel.

THE wonderful influence of imagination in the cure of diseases is well known. A motion of the hand, or a glance of the eye, will throw a weak and credulous patient into a fit; and a pill made of bread, if taken with sufficient faith, will operate a cure better than all the drugs in the pharmacopœia. The Prince of Orange, at the siege of Breda, in 1625, cured all his soldiers, who were dying of the scurvy, by a philanthropic piece of quackery, which he played upon them with the knowledge of the physicians, when all other means had failed.⁶⁴ Many hundreds of instances, of a similar kind, might be related, especially from the history of witchcraft. The mummeries, strange gesticulations, and barbarous jargon of witches and sorcerers, which frightened credulous and nervous women, brought on all those symptoms of hysteria and other similar diseases, so well understood now, but which were then supposed to be the work of the Devil,

not only by the victims and the public in general, but by the operators themselves.

In the age when alchymy began to fall into some disrepute, and learning to lift up its voice against it, a new delusion, based upon this power of imagination, suddenly arose, and found apostles among all the alchymists. Numbers of them, forsaking their old pursuits, made themselves magnetisers. It appeared first in the shape of mineral, and afterwards of animal, magnetism, under which latter name it survives to this day, and numbers its dupes by thousands.

The mineral magnetisers claim the first notice, as the worthy predecessors of the quacks of the present day. The honour claimed for Paracelsus, of being the first of the Rosicrucians, has been disputed; but his claim to be considered the first of the magnetisers can scarcely be challenged. It has been already mentioned of him, in the part of this work which treats of alchymy, that, like nearly all the distinguished adepts, he was a physician; and pretended, not only to make gold and confer immortality, but to cure all diseases. He was the first who, with the latter view, attributed occult and miraculous powers to the magnet. Animated apparently by a sincere conviction that the magnet was the philosopher's stone, which, if it could not transmute metals, could soothe all human suffering and arrest the progress of decay, he travelled for many years in Persia and Arabia, in search of the mountain of adamant, so famed in oriental fables. When he practised as a physician at Basle, he called one of his nostrums by the name of azoth—a stone or crystal, which, he said, contained magnetic properties, and cured epilepsy, hysteria, and spasmodic affections. He soon found imitators. His fame spread far and near; and thus were sown the first seeds of that error which has since taken root and flourished so widely. In spite of the denial of modern practitioners, this must be considered the origin of magnetism; for we find that, beginning with Paracelsus, there was a regular succession of mineral

magnetisers until Mesmer appeared, and gave a new feature to the delusion.

Paracelsus boasted of being able to *transplant* diseases from the human frame into the earth, by means of the magnet. He said there were six ways by which this might be effected. One of them will be quite sufficient as a specimen. "If a person suffer from disease, either local or general, let the following remedy be tried. Take a magnet, impregnated with mummy,⁶⁵ and mixed with rich earth. In this earth sow some seeds that have a congruity or homogeneity with the disease; then let this earth, well sifted and mixed with mummy, be laid in an earthen vessel; and let the seeds committed to it be watered daily with a lotion in which the diseased limb or body has been washed. Thus will the disease be transplanted from the human body to the seeds which are in the earth. Having done this, transplant the seeds from the earthen vessel to the ground, and wait till they begin to sprout into herbs; as they increase, the disease will diminish; and when they have arrived at their full growth, it will disappear altogether."

Kircher the Jesuit, whose quarrel with the alchemists was the means of exposing many of their impostures, was a firm believer in the efficacy of the magnet. Having been applied to by a patient afflicted with hernia, he directed the man to swallow a small magnet reduced to powder, while he applied at the same time to the external swelling, a poultice made of filings of iron. He expected that by this means the magnet, when it got to the corresponding place inside, would draw in the iron, and with it the tumour; which would thus, he said, be safely and expeditiously reduced.

As this new doctrine of magnetism spread, it was found that wounds inflicted with any metallic substance could be cured by the magnet. In process of time, the delusion so increased, that it was deemed sufficient to magnetise a sword, to cure any hurt which that sword might have inflicted! This was the origin of the celebrated "weapon-salve," which excited so much attention about the middle of the seventeenth century. The following

was the recipe given by Paracelsus for the cure of any wounds inflicted by a sharp weapon, except such as had penetrated the heart, the brain, or the arteries. “Take of moss growing on the head of a thief who has been hanged and left in the air; of real mummy; of human blood, still warm—of each, one ounce; of human suet, two ounces; of linseed oil, turpentine, and Armenian bole—of each, two drachms. Mix all well in a mortar, and keep the salve in an oblong, narrow urn.” With this salve the weapon, after being dipped in the blood from the wound, was to be carefully anointed, and then laid by in a cool place. In the mean time, the wound was to be duly washed with fair clean water, covered with a clean, soft, linen rag, and opened once a day to cleanse off purulent or other matter. Of the success of this treatment, says the writer of the able article on Animal Magnetism, in the twelfth volume of the *Foreign Quarterly Review*, there cannot be the least doubt; “for surgeons at this moment follow exactly the same method, *except* anointing the weapon!”

The weapon-salve continued to be much spoken of on the Continent, and many eager claimants appeared for the honour of the invention. Dr. Fludd, or A. Fluctibus, the Rosicrucian, who has been already mentioned in a previous part of this volume, was very zealous in introducing it into England. He tried it with great success in several cases, and no wonder, for while he kept up the spirits of his patients by boasting of the great efficacy of the salve, he never neglected those common, but much more important remedies, of washing, bandaging, &c. which the experience of all ages had declared sufficient for the purpose. Fludd moreover declared, that the magnet was a remedy for all diseases, if properly applied; but that man having, like the earth, a north and a south pole, magnetism could only take place when his body was in a boreal position! In the midst of his popularity, an attack was made upon him and his favourite remedy, the salve; which, however, did little or nothing to diminish the belief in its efficacy. One “Parson Foster” wrote a pamphlet, entitled *Hypocrisma Spongus; or, a Spunge to wipe away the Weapon-Salve*; in which he

declared, that it was as bad as witchcraft to use or recommend such an unguent; that it was invented by the Devil, who, at the last day, would seize upon every person who had given it the slightest encouragement. "In fact," said Parson Foster, "the Devil himself gave it to Paracelsus; Paracelsus to the emperor; the emperor to the courtier; the courtier to Baptista Porta; and Baptista Porta to Dr. Fludd, a doctor of physic, yet living and practising in the famous city of London, who now stands tooth and nail for it." Dr. Fludd, thus assailed, took up the pen in defence of his unguent, in a reply called *The Squeezing of Parson Foster's Sponge; wherein the Sponge-bearer's immodest carriage and behaviour towards his brethren is detected; the bitter flames of his slanderous reports are, by the sharp vinegar of truth, corrected and quite extinguished; and lastly, the virtuous validity of his sponge in wiping away the-weapon-salve, is crushed out and clean abolished.*

Shortly after this dispute a more distinguished believer in the weapon-salve made his appearance in the person of Sir Kenelm Digby, the son of Sir Everard Digby, who was executed for his participation in the Gunpowder Plot. This gentleman, who, in other respects, was an accomplished scholar and an able man, was imbued with all the extravagant notions of the alchymists. He believed in the philosopher's stone, and wished to engage Descartes to devote his energies to the discovery of the elixir of life, or some other means by which the existence of man might be prolonged to an indefinite period. He gave his wife, the beautiful Venetia Anastasia Stanley, a dish of capons fed upon vipers, according to the plan supposed to have been laid down by Arnold of Villeneuve, in the hope that she might thereby preserve her loveliness for a century. If such a man once took up the idea of the weapon-salve, it was to be expected that he would make the most of it. In his hands, however, it was changed from an unguent into a powder, and was called the *powder of sympathy*. He pretended that he had acquired the knowledge of it from a Carmelite friar, who had learned it in Persia or Armenia, from an oriental

philosopher of great renown. King James, the Prince of Wales, the Duke of Buchingham, and many other noble personages, believed in its efficacy. The following remarkable instance of his mode of cure was read by Sir Kenelm to a society of learned men at Montpellier. Mr. James Howell, the well-known author of the *Dendrologia*, and of various letters, coming by chance as two of his best friends were fighting a duel, rushed between them and endeavoured to part them. He seized the sword of one of the combatants by the hilt, while, at the same time, he grasped the other by the blade. Being transported with fury one against the other, they struggled to rid themselves of the hindrance caused by their friend; and in so doing, the one whose sword was held by the blade by Mr. Howell, drew it away roughly, and nearly cut his hand off, severing the nerves and muscles, and penetrating to the bone. The other, almost at the same instant, disengaged his sword, and aimed a blow at the head of his antagonist, which Mr. Howell observing, raised his wounded hand with the rapidity of thought to prevent the blow. The sword fell on the back of his already wounded hand, and cut it severely. "It seemed," said Sir Kenelm Digby, "as if some unlucky star raged over them, that they should have both shed the blood of that dear friend for whose life they would have given their own, if they had been in their proper mind at the time." Seeing Mr. Howell's face all besmeared with blood from his wounded hand, they both threw down their swords and embraced him, and bound up his hand with a garter, to close the veins which were cut and bled profusely. They then conveyed him home, and sent for a surgeon. King James, who was much attached to Mr. Howell, afterwards sent his own surgeon to attend him. We must continue the narrative in the words of Sir Kenelm Digby: "It was my chance," says he, "to be lodged hard by him; and four or five days after, as I was making myself ready, he came to my house, and prayed me to view his wounds. 'For I understand,' said he, 'that you have extraordinary remedies on such occasions; and my surgeons apprehend some fear that it may grow to a gangrene, and so the hand must be cut off.' In effect, his countenance

discovered that he was in much pain, which, he said, was insupportable in regard of the extreme inflammation. I told him I would willingly serve him; but if, haply, he knew the manner how I could cure him, without touching or seeing him, it might be that he would not expose himself to my manner of curing; because he would think it, peradventure, either ineffectual or superstitious. He replied, ‘The many wonderful things which people have related unto me of your way of medicinement makes me nothing doubt at all of its efficacy; and all that I have to say unto you is comprehended in the Spanish proverb, *Hagase el milagro y hagalo Mahoma*—Let the miracle be done, though Mahomet do it.’

“I asked him then for any thing that had the blood upon it: so he presently sent for his garter, wherewith his hand was first bound; and as I called for a basin of water, as if I would wash my hands, I took a handful of powder of vitriol, which I had in my study, and presently dissolved it. As soon as the bloody garter was brought me, I put it in the basin, observing, in the interim, what Mr. Howell did, who stood talking with a gentleman in a corner of my chamber, not regarding at all what I was doing. He started suddenly, as if he had found some strange alteration in himself. I asked him what he ailed? ‘I know not what ails me, but I find that I feel no more pain. Methinks that a pleasing kind of freshness, as it were a wet cold napkin, did spread over my hand, which hath taken away the inflammation that tormented me before.’ I replied, ‘Since, then, you feel already so much good of my medicament, I advise you to cast away all your plasters; only keep the wound clean, and in a moderate temper betwixt heat and cold.’ This was presently reported to the Duke of Buckingham, and, a little after, to the king, who were both very curious to know the circumstances of the business; which was, that after dinner I took the garter out of the water, and put it to dry before a great fire. It was scarce dry before Mr. Howell’s servant came running, and saying that

his master felt as much burning as ever he had done, if not more; for the heat was such as if his hand were betwixt coals of fire. I answered that, although that had happened at present, yet he should find ease in a short time; for I knew the reason of this new accident, and would provide accordingly; for his master should be free from that inflammation, it might be before he could possibly return to him. But, in case he found no ease, I wished him to come presently back again; if not, he might forbear coming. Thereupon he went, and, at the instant I did put the garter again into the water; thereupon he found his master without any pain at all. To be brief, there was no cense of pain afterwards; but within five or six days the wounds were sicatrised and entirely healed.”

Such is the marvellous story of Sir Kenelm Digby. Other practitioners of that age were not behind him in their pretensions. It was not always thought necessary to use either the powder of sympathy, or the weapon-salve, to effect a cure. It was sufficient to magnetise the sword with the hand (the first faint dawn of the *animal* theory), to relieve any pain the same weapon had caused. They asserted, that if they stroked the sword *upwards* with their fingers, the wounded person would feel immediate relief; but if they stroked it *downwards*, he would feel intolerable pain.⁶⁶

Another very singular notion of the power and capabilities of magnetism was entertained at the same time. It was believed that a *sympathetic alphabet* could be made on the flesh, by means of which persons could correspond with each other, and communicate all their ideas with the rapidity of volition, although thousands of miles apart. From the arms of two persons a piece of flesh was cut, and mutually transplanted, while still warm and bleeding. The piece so severed grew to the new arm on which it was placed; but still retained so close a sympathy with its native limb, that its old possessor was always sensible of any injury done to it. Upon these transplanted pieces were tatoood the letters of the alphabet; so that, when a

communication was to be made, either of the persons, though the wide Atlantic rolled between them, had only to prick his arm with a magnetic needle, and straightway his friend received intimation that the telegraph was at work. Whatever letter he pricked on his own arm pained the same letter on the arm of his correspondent.

Contemporary with Sir Kenelm Digby was the no less famous Mr. Valentine Greatraks, who, without mentioning magnetism, or laying claim to any theory, practised upon himself and others a deception much more akin to the animal magnetism of the present day than the mineral magnetism it was then so much the fashion to study. He was the son of an Irish gentleman, of good education and property, in the county of Cork. He fell, at an early age, into a sort of melancholy derangement. After some time he had an impulse, or strange persuasion in his mind, which continued to present itself, whether he were sleeping or waking, that God had given him the power of curing the king's evil. He mentioned this persuasion to his wife, who very candidly told him that he was a fool. He was not quite sure of this, notwithstanding the high authority from which it came, and determined to make trial of the power that was in him. A few days afterwards, he went to one William Maher, of Saltersbridge, in the parish of Lismore, who was grievously afflicted with the king's evil in his eyes, cheek, and throat. Upon this man, who was of abundant faith, he laid his hands, stroked him, and prayed fervently. He had the satisfaction to see him heal considerably in the course of a few days; and finally, with the aid of other remedies, to be quite cured. This success encouraged him in the belief that he had a divine mission. Day after day he had further impulses from on high that he was called upon to cure the ague also. In the course of time he extended his powers to the curing of epilepsy, ulcers, aches, and lameness. All the county of Cork was in a commotion to see this extraordinary physician, who certainly operated some very great benefit in cases where the disease was heightened by hypochondria and depression of spirits. According to his own account,⁶⁷ such great multitudes resorted to

him from divers places, that he had no time to follow his own business, or enjoy the company of his family and friends. He was obliged to set aside three days in the week, from six in the morning till six at night, during which time only he laid hands upon all that came. Still the crowds which thronged around him were so great, that the neighbouring towns were not able to accommodate them. He thereupon left his house in the country, and went to Youghal, where the resort of sick people, not only from all parts of Ireland, but from England, continued so great, that the magistrates were afraid they would infect the place by their diseases. Several of these poor credulous people no sooner saw him than they fell into fits, and he restored them by waving his hand in their faces, and praying over them. Nay, he affirmed that the touch of his glove had driven pains away, and, on one occasion, cast out from a woman several devils, or evil spirits, who tormented her day and night. "Every one of these devils," says Greatraks, "was like to choke her when it came up into her throat." It is evident from this that the woman's complaint was nothing but hysteria.

The clergy of the diocese of Lismore, who seem to have had much clearer notions of Greatraks' pretensions than their parishioners, set their faces against the new prophet and worker of miracles. He was cited to appear in the Dean's Court, and prohibited from laying on his hands for the future: but he cared nothing for the Church. He imagined that he derived his powers direct from heaven, and continued to throw people into fits, and bring them to their senses again, as usual, almost exactly after the fashion of modern magnetisers. His reputation became, at last, so great, that Lord Conway sent to him from London, begging that he would come over immediately to cure a grievous headache which his lady had suffered for several years, and which the principal physicians of England had been unable to relieve.

Greatraks accepted the invitation, and tried his manipulations and prayers upon Lady Conway. He failed, however, in affording any relief. The poor lady's headache was excited by causes too serious to allow her any

help, even from faith and a lively imagination. He lived for some months in Lord Conway's house, at Ragley, in Warwickshire, operating cures similar to those he had performed in Ireland. He afterwards removed to London, and took a house in Lincoln's-Inn Fields, which soon became the daily resort of all the nervous and credulous women of the metropolis. A very amusing account of Greatraks at this time (1665) is given in the second volume of the *Miscellanies of St. Evremond*, under the title of the Irish prophet. It is the most graphic sketch ever made of this early magnetiser. Whether his pretensions were more or less absurd than those of some of his successors, who have lately made their appearance among us, would be hard to say.

“When M. de Comminges,” says St. Evremond, “was ambassador from his most Christian majesty to the king of Great Britain, there came to London an Irish prophet, who passed himself off as a great worker of miracles. Some persons of quality having begged M. de Comminges to invite him to his house, that they might be witnesses of some of his miracles, the ambassador promised to satisfy them, as much to gratify his own curiosity as from courtesy to his friends; and gave notice to Greatraks that he would be glad to see him.

“A rumour of the prophet's coming soon spread all over the town, and the hotel of M. de Comminges was crowded by sick persons, who came full of confidence in their speedy cure. The Irishman made them wait a considerable time for him, but came at last, in the midst of their impatience, with a grave and simple countenance, that showed no signs of his being a cheat. Monsieur de Comminges prepared to question him strictly, hoping to discourse with him on the matters that he had read of in Van Helmont and Bodinus; but he was not able to do so, much to his regret, for the crowd became so great, and cripples and others pressed around so impatiently to be the first cured, that the

servants were obliged to use threats, and even force, before they could establish order among them, or place them in proper ranks.

“The prophet affirmed that all diseases were caused by evil spirits. Every infirmity was with him a case of diabolical possession. The first that was presented to him was a man suffering from gout and rheumatism, and so severely that the physicians had been unable to cure him. ‘Ah,’ said the miracle-worker, ‘I have seen a good deal of this sort of spirits when I was in Ireland. They are watery spirits, who bring on cold shivering, and excite an overflow of aqueous humours in our poor bodies.’ Then addressing the man, he said, ‘Evil spirit, who hast quitted thy dwelling in the waters to come and afflict this miserable body, I command thee to quit thy new abode, and to return to thine ancient habitation!’ This said, the sick man was ordered to withdraw, and another was brought forward in his place. This new comer said he was tormented by the melancholy vapours. In fact, he looked like a hypochondriac; one of those persons, diseased in imagination, and who but too often become so in reality. ‘Aerial spirit,’ said the Irishman, ‘return, I command thee, into the air;—exercise thy natural vocation of raising tempests, and do not excite any more wind in this sad unlucky body!’ This man was immediately turned away to make room for a third patient, who, in the Irishman’s opinion, was only tormented by a little bit of a sprite, who could not withstand his command for an instant. He pretended that he recognised this sprite by some marks which were invisible to the company, to whom he turned with a smile, and said, ‘This sort of spirit does not often do much harm, and is always very diverting.’ To hear him talk, one would have imagined that he knew all about spirits,—their names, their rank, their numbers, their employment, and all the functions they were destined to; and he boasted of being much better acquainted with the intrigues of demons than he was with the affairs of men. You can hardly imagine what a reputation he gained in a short time. Catholics

and Protestants visited him from every part, all believing that power from heaven was in his hands.”

After relating a rather equivocal adventure of a husband and wife, who implored Greatraks to cast out the devil of dissension which had crept in between them, St. Evremond thus sums up the effect he produced on the popular mind: “So great was the confidence in him, that the blind fancied they saw the light which they did not see—the deaf imagined that they heard—the lame that they walked straight, and the paralytic that they had recovered the use of their limbs. An idea of health made the sick forget for a while their maladies; and imagination, which was not less active in those merely drawn by curiosity than in the sick, gave a false view to the one class, from the desire of seeing, as it operated a false cure on the other from the strong desire of being healed. Such was the power of the Irishman over the mind, and such was the influence of the mind upon the body. Nothing was spoken of in London but his prodigies; and these prodigies were supported by such great authorities, that the bewildered multitude believed them almost without examination, while more enlightened people did not dare to reject them from their own knowledge. The public opinion, timid and enslaved, respected this imperious and, apparently, well-authenticated error. Those who saw through the delusion kept their opinion to themselves, knowing how useless it was to declare their disbelief to a people filled with prejudice and admiration.”

About the same time that Valentine Greatraks was thus *magnetising* the people of London, an Italian enthusiast, named Francisco Bagnone, was performing the same tricks in Italy, and with as great success. He had only to touch weak women with his hands, or sometimes (for the sake of working more effectively upon their fanaticism) with a relic, to make them fall into fits, and manifest all the symptoms of magnetism.

Besides these, several learned men, in different parts of Europe, directed their attention to the study of the magnet, believing that it might be

rendered efficacious in many diseases. Van Helmont, in particular, published a work on the effects of magnetism on the human frame; and Balthazar Gracian, a Spaniard, rendered himself famous for the boldness of his views on the subject. “The magnet,” said the latter, “attracts iron; iron is found every where; every thing, therefore, is under the influence of magnetism. It is only a modification of the general principle, which establishes harmony or foments divisions among men. It is the same agent that gives rise to sympathy, antipathy, and the passions.”⁶⁸

Baptista Porta, who, in the whimsical genealogy of the weapon-salve, given by Parson Foster, in his attack upon Dr. à Fluctibus, is mentioned as one of its fathers, had also great faith in the efficacy of the magnet, and operated upon the imagination of his patients in a manner which was then considered so extraordinary that he was accused of being a magician, and prohibited from practising by the court of Rome. Among others who distinguished themselves by their faith in magnetism, Sebastian Wirdig and William Maxwell claim especial notice. Wirdig was professor of medicine at the university of Rostock in Mecklenburg, and wrote a treatise called *The New Medicine of the Spirits*, which he presented to the Royal Society of London. An edition of this work was printed in 1673, in which the author maintained that a magnetic influence took place, not only between the celestial and terrestrial bodies, but between all living things. The whole world, he said, was under the influence of magnetism; life was preserved by magnetism; death was the consequence of magnetism!

Maxwell, the other enthusiast, was an admiring disciple of Paracelsus, and boasted that he had irradiated the obscurity in which too many of the wonder-working recipes of that great philosopher were enveloped. His works were printed at Frankfort in 1679. It would seem, from the following passage, that he was aware of the great influence of imagination, as well in the production as in the cure of diseases. “If you wish to work prodigies,” says he, “abstract from the materiality of beings—increase the sum of spirituality in bodies—rouse the spirit from its slumbers. Unless you do one

or other of these things—unless you can bind the idea, you can never perform any thing good or great.” Here, in fact, lies the whole secret of magnetism, and all delusions of a similar kind: increase the spirituality—rouse the spirit from its slumbers, or, in other words, work upon the imagination—induce belief and blind confidence, and you may do any thing. This passage, which is quoted with approbation by M. Dupotet⁶⁹ in a work, as strongly corroborative of the theory now advanced by the animal magnetists, is just the reverse. If they believe they can work all their wonders by the means so dimly shadowed forth by Maxwell, what becomes of the universal fluid pervading all nature, and which they pretend to pour into weak and diseased bodies from the tips of their fingers?

Early in the eighteenth century the attention of Europe was directed to a very remarkable instance of fanaticism, which has been claimed by the animal magnetists as a proof of their science. The *Convulsionaries of St. Medard*, as they were called, assembled in great numbers round the tomb of their favourite saint, the Jansenist priest Paris, and taught one another how to fall into convulsions. They believed that St. Paris would cure all their infirmities; and the number of hysterical women and weak-minded persons of all descriptions that flocked to the tomb from far and near was so great as daily to block up all the avenues leading to it. Working themselves up to a pitch of excitement, they went off one after the other into fits, while some of them, still in apparent possession of all their faculties, voluntarily exposed themselves to sufferings which on ordinary occasions would have been sufficient to deprive them of life. The scenes that occurred were a scandal to civilisation and to religion—a strange mixture of obscenity, absurdity, and superstition. While some were praying on bended knees at the shrine of St. Paris, others were shrieking and making the most hideous noises. The women especially exerted themselves. On one side of the chapel there might be seen a score of them, all in convulsions; while at another as many more, excited to a sort of frenzy, yielded themselves up to gross indecencies. Some of them took an

insane delight in being beaten and trampled upon. One in particular, according to Montégre, whose account we quote,⁷⁰ was so enraptured with this ill-usage, that nothing but the hardest blows would satisfy her. While a fellow of Herculean strength was beating her with all his might with a heavy bar of iron, she kept continually urging him to renewed exertion. The harder he struck the better she liked it, exclaiming all the while, "Well done, brother, well done! Oh, how pleasant it is! what good you are doing me! Courage, my brother, courage; strike harder, strike harder still!" Another of these fanatics had, if possible, a still greater love for a beating. Carré de Montgeron, who relates the circumstance, was unable to satisfy her with sixty blows of a large sledge-hammer. He afterwards used the same weapon with the same degree of strength, for the sake of experiment, and succeeded in battering a hole in a stone wall at the twenty-fifth stroke. Another woman, named Sonnet, laid herself down on a red-hot brazier without flinching, and acquired for herself the nickname of the *Salamander*; while others, desirous of a more illustrious martyrdom, attempted to crucify themselves. M. Deleuze, in his critical history of *Animal Magnetism*, attempts to prove that this fanatical frenzy was produced by magnetism, and that these mad enthusiasts magnetised each other without being aware of it. As well might he insist that the fanaticism which tempts the Hindoo bigot to keep his arms stretched in a horizontal position till the sinews wither, or his fingers closed upon his palms till the nails grow out of the backs of his hands, is also an effect of magnetism!

For a period of sixty or seventy years magnetism was almost wholly confined to Germany. Men of sense and learning devoted their attention to the properties of the loadstone; and one Father Hell, a Jesuit, and professor of astronomy at the University of Vienna, rendered himself famous by his magnetic cures. About the year 1771 or 1772 he invented steel-plates of a peculiar form, which he applied to the naked body as a cure for several diseases. In the year 1774 he communicated his system to Anthony Mesmer. The latter improved upon the ideas of Father Hell,

constructed a new theory of his own, and became the founder of ANIMAL MAGNETISM.

It has been the fashion among the enemies of the new delusion to decry Mesmer as an unprincipled adventurer, while his disciples have extolled him to the skies as a regenerator of the human race. In nearly the same words as the Rosicrucians applied to their founders, he has been called the discoverer of the secret which brings man into more intimate connexion with his Creator, the deliverer of the soul from the debasing trammels of the flesh, the man who enables us to set time at defiance, and conquer the obstructions of space. A careful sifting of his pretensions, and examination of the evidence brought forward to sustain them, will soon shew which opinion is the more correct. That the writer of these pages considers him in the light of a man who, deluding himself, was the means of deluding others, may be inferred from his finding a place in these volumes, and figuring among the Flamels, the Agrippas, the Borris, the Böhmens, and the Cagliostros.

He was born in May 1734, at Mersburg, in Swabia, and studied medicine at the University of Vienna. He took his degrees in 1766, and chose the influence of the planets on the human body as the subject of his inaugural dissertation. Having treated the matter quite in the style of the old astrological physicians, he was exposed to some ridicule both then and afterwards. Even at this early period some faint ideas of his great theory were germinating in his mind. He maintained in his dissertation “that the sun, moon, and fixed stars mutually affect each other in their orbits; that they cause and direct in our earth a flux and reflux not only in the sea, but in the atmosphere, and affect in a similar manner all organised bodies through the medium of a subtile and mobile fluid, which pervades the universe, and associates all things together in mutual intercourse and harmony.” This influence, he said, was particularly exercised on the nervous system, and produced two states, which he called *intension* and *remission*, which seemed to him to account for the different periodical

revolutions observable in several maladies. When in after-life he met with Father Hell, he was confirmed by that person's observations in the truth of many of his own ideas. Having caused Hell to make him some magnetic plates, he determined to try experiments with them himself for his further satisfaction.

He tried accordingly, and was astonished at his success. The faith of their wearers operated wonders with the metallic plates. Mesmer made due reports to Father Hell of all he had done, and the latter published them as the results of his own happy invention, and speaking of Mesmer as a physician whom he had employed to work under him. Mesmer took offence at being thus treated, considering himself a far greater personage than Father Hell. He claimed the invention as his own, accused Hell of a breach of confidence, and stigmatised him as a mean person, anxious to turn the discoveries of others to his own account. Hell replied, and a very pretty quarrel was the result, which afforded small talk for months to the literati of Vienna. Hell ultimately gained the victory. Mesmer, nothing daunted, continued to promulgate his views till he stumbled at last upon the animal theory.

One of his patients was a young lady, named Cæsterline, who suffered under a convulsive malady. Her attacks were periodical, and attended by a rush of blood to the head, followed by delirium and syncope. These symptoms he soon succeeded in reducing under his system of planetary influence, and imagined he could foretell the periods of accession and remission. Having thus accounted satisfactorily to himself for the origin of the disease, the idea struck him that he could operate a certain cure if he could ascertain beyond doubt, what he had long believed, that there existed between the bodies which compose our globe an action equally reciprocal and similar to that of the heavenly bodies, by means of which he could imitate artificially the periodical revolutions of the flux and reflux before mentioned. He soon convinced himself that this action did exist. When trying the metallic plates of Father Hell, he thought their efficacy depended

on their form; but he found afterwards that he could produce the same effects without using them at all, merely by passing his hands downwards towards the feet of the patient, even when at a considerable distance.

This completed the theory of Mesmer. He wrote an account of his discovery to all the learned societies of Europe, soliciting their investigation. The Academy of Sciences at Berlin was the only one that answered him, and their answer was any thing but favourable to his system or flattering to himself. Still he was not discouraged. He maintained to all who would listen to him that the magnetic matter, or fluid, pervaded all the universe—that every human body contained it, and could communicate the superabundance of it to another by an exertion of the will. Writing to a friend from Vienna, he said, “I have observed that the magnetic is almost the same thing as the electric fluid, and that it may be propagated in the same manner, by means of intermediate bodies. Steel is not the only substance adapted to this purpose. I have rendered paper, bread, wool, silk, stones, leather, glass, wood, men, and dogs—in short, every thing I touched, magnetic to such a degree, that these substances produced the same effects as the loadstone on diseased persons. I have charged jars with magnetic matter in the same way as is done with electricity.”

Mesmer did not long find his residence at Vienna as agreeable as he wished. His pretensions were looked upon with contempt or indifference, and the case of Mademoiselle Cœsterline brought him less fame than notoriety. He determined to change his sphere of action, and travelled into Swabia and Switzerland. In the latter country he met with the celebrated Father Gassner, who, like Valentine Greatraks, amused himself by casting out devils, and healing the sick by merely laying hands upon them. At his approach, delicate girls fell into convulsions, and hypochondriacs fancied themselves cured. His house was daily besieged by the lame, the blind, and the hysteric. Mesmer at once acknowledged the efficacy of his cures, and declared that they were the obvious result of his own newly-discovered power of magnetism. A few of the father’s patients were forthwith

subjected to the manipulations of Mesmer, and the same symptoms were induced. He then tried his hand upon some paupers in the hospitals of Berne and Zurich, and succeeded, according to his own account, but no other person's, in curing an ophthalmia and a gutta serena. With memorials of these achievements he returned to Vienna, in the hope of silencing his enemies, or at least forcing them to respect his newly-acquired reputation, and to examine his system more attentively.

His second appearance in that capital was not more auspicious than the first. He undertook to cure a Mademoiselle Paradis, who was quite blind, and subject to convulsions. He magnetised her several times, and then declared that she was cured; at least, if she was not, it was her fault and not his. An eminent oculist of that day, named Barth, went to visit her, and declared that she was as blind as ever; while her family said she was as much subject to convulsions as before. Mesmer persisted that she was cured. Like the French philosopher, he would not allow facts to interfere with his theory.⁷¹ He declared that there was a conspiracy against him; and that Mademoiselle Paradis, at the instigation of her family, feigned blindness in order to injure his reputation!

The consequences of this pretended cure taught Mesmer that Vienna was not the sphere for him. Paris, the idle, the debauched, the pleasure-hunting, the novelty-loving, was the scene for a philosopher like him, and thither he repaired accordingly. He arrived at Paris in 1778, and began modestly by making himself and his theory known to the principal physicians. At first, his encouragement was but slight; he found people more inclined to laugh at than to patronise him. But he was a man who had great confidence in himself, and of a perseverance which no difficulties could overcome. He hired a sumptuous apartment, which he opened to all comers who chose to make trial of the new power of nature. M. D'Eslon, a physician of great reputation, became a convert; and from that time, animal magnetism, or, as some called it, mesmerism, became the fashion in Paris. The women were quite enthusiastic about it, and their admiring

tattle wafted its fame through every grade of society. Mesmer was the rage; and high and low, rich and poor, credulous and unbelieving, all hastened to convince themselves of the power of this mighty magician, who made such magnificent promises. Mesmer, who knew as well as any man living the influence of the imagination, determined that, on that score, nothing should be wanting to heighten the effect of the magnetic charm. In all Paris, there was not a house so charmingly furnished as Monsieur Mesmer's. Richly-stained glass shed a dim religious light on his spacious saloons, which were almost covered with mirrors. Orange-blossoms scented all the air of his corridors; incense of the most expensive kinds burned in antique vases on his chimney-pieces; æolian harps sighed melodious music from distant chambers; while sometimes a sweet female voice, from above or below, stole softly upon the mysterious silence that was kept in the house, and insisted upon from all visitors. "*Was ever any thing so delightful!*" cried all the Mrs. Wittitterleys of Paris, as they thronged to his house in search of pleasant excitement; "*So wonderful!*" said the pseudo-philosophers, who would believe anything if it were the fashion; "*So amusing!*" said the worn-out debauchés, who had drained the cup of sensuality to its dregs, and who longed to see lovely women in convulsions, with the hope that they might gain some new emotions from the sight.

The following was the mode of operation: In the centre of the saloon was placed an oval vessel, about four feet in its longest diameter, and one foot deep. In this were laid a number of wine-bottles, filled with magnetised water, well corked-up, and disposed in radii, with their necks outwards. Water was then poured into the vessel so as just to cover the bottles, and filings of iron were thrown in occasionally to heighten the magnetic effect. The vessel was then covered with an iron cover, pierced through with many holes, and was called the *baquet*. From each hole issued a long movable rod of iron, which the patients were to apply to such parts of their bodies as were afflicted. Around this *baquet* the patients were directed to sit, holding

each other by the hand, and pressing their knees together as closely as possible, to facilitate the passage of the magnetic fluid from one to the other.

Then came in the assistant magnetisers, generally strong, handsome young men, to pour into the patient from their finger-tips fresh streams of the wondrous fluid. They embraced the patient between the knees, rubbed them gently down the spine and the course of the nerves, using gentle pressure upon the breasts of the ladies, and staring them out of countenance to magnetise them by the eye! All this time the most rigorous silence was maintained, with the exception of a few wild notes on the harmonica or the piano-forte, or the melodious voice of a hidden opera-singer swelling softly at long intervals. Gradually the cheeks of the ladies began to glow, their imaginations to become inflamed; and off they went, one after the other, in convulsive fits. Some of them sobbed and tore their hair, others laughed till the tears ran from their eyes, while others shrieked and screamed and yelled till they became insensible altogether.

This was the crisis of the delirium. In the midst of it, the chief actor made his appearance, waving his wand, like Prospero, to work new wonders. Dressed in a long robe of lilac-coloured silk richly embroidered with gold flowers, bearing in his hand a white magnetic rod, and with a look of dignity which would have sat well on an eastern caliph, he marched with solemn strides into the room. He awed the still sensible by his eye, and the violence of their symptoms diminished. He stroked the insensible with his hands upon the eye-brows and down the spine; traced figures upon their breast and abdomen with his long white wand, and they were restored to consciousness. They became calm, acknowledged his power, and said they felt streams of cold or burning vapour passing through their frames, according as he waved his wand or his fingers before them.

“It is impossible,” says M. Dupotet, “to conceive the sensation which Mesmer’s experiments created in Paris. No theological controversy, in the earlier ages of the Catholic Church, was ever conducted with greater

bitterness.” His adversaries denied the discovery; some calling him a quack, others a fool, and others again, like the Abbé Fiard, a man who had sold himself to the Devil! His friends were as extravagant in their praise, as his foes were in their censure. Paris was inundated with pamphlets upon the subject, as many defending as attacking the doctrine. At court, the queen expressed herself in favour of it, and nothing else was to be heard of in society.

By the advice of M. D’Eslon, Mesmer challenged an examination of his doctrine by the Faculty of Medicine. He proposed to select twenty-four patients, twelve of whom he would treat magnetically, leaving the other twelve to be treated by the faculty according to the old and approved methods. He also stipulated that, to prevent disputes, the government should nominate certain persons who were not physicians, to be present at the experiments; and that the object of the inquiry should be, not how these effects were produced, but whether they were really efficacious in the cure of any disease. The faculty objected to limit the inquiry in this manner, and the proposition fell to the ground.

Mesmer now wrote to Marie Antoinette, with the view of securing her influence in obtaining for him the protection of government. He wished to have a château and its lands given to him, with a handsome yearly income, that he might be enabled to continue his experiments at leisure, untroubled by the persecution of his enemies. He hinted the duty of governments to support men of science, and expressed his fear, that if he met no more encouragement, he should be compelled to carry his great discovery to some other land more willing to appreciate him. “In the eyes of your majesty,” said he, “four or five hundred thousand francs, applied to a good purpose, are of no account. The welfare and happiness of your people are every thing. My discovery ought to be received and rewarded with a munificence worthy of the monarch to whom I shall attach myself.” The government at last offered him a pension of twenty thousand francs, and the cross of the order of St. Michael, if he had made any discovery in

medicine, and would communicate it to physicians nominated by the king. The latter part of the proposition was not agreeable to Mesmer. He feared the unfavourable report of the king's physicians; and, breaking off the negotiation, spoke of his disregard of money, and his wish to have his discovery at once recognised by the government. He then retired to Spa, in a fit of disgust, upon pretence of drinking the waters for the benefit of his health.

After he had left Paris, the Faculty of Medicine called upon M. D'Eslon, for the third and last time, to renounce the doctrine of animal magnetism, or be expelled from their body. M. D'Eslon, so far from doing this, declared that he had discovered new secrets, and solicited further examination. A royal commission of the Faculty of Medicine was, in consequence, appointed on the 12th of March 1784, seconded by another commission of the Académie des Sciences, to investigate the phenomena and report upon them. The first commission was composed of the principal physicians of Paris; while, among the eminent men comprised in the latter, were Benjamin Franklin, Lavoisier, and Bailly the historian of astronomy. Mesmer was formally invited to appear before this body, but absented himself from day to day, upon one pretence or another. M. D'Eslon was more honest, because he thoroughly believed in the phenomena, which it is to be questioned if Mesmer ever did, and regularly attended the sittings and performed experiments.

Bailly has thus described the scenes of which he was a witness in the course of this investigation. "The sick persons, arranged in great numbers and in several rows around the *baquet*, receive the magnetism, by all these means: by the iron rods which convey it to them from the *baquet*—by the cords wound round their bodies—by the connexion of the thumb, which conveys to them the magnetism of their neighbours—and by the sounds of a piano-forte, or of an agreeable voice, diffusing the magnetism in the air. The patients were also directly magnetised by means of the finger and wand of the magnetiser moved slowly before their faces, above or behind

their heads, and on the diseased parts, always observing the direction of the holes. The magnetiser acts by fixing his eyes on them. But above all, they are magnetised by the application of his hands and the pressure of his fingers on the hypochondres and on the regions of the abdomen; an application often continued for a long time—sometimes for several hours.

“Meanwhile the patients in their different conditions present a very varied picture. Some are calm, tranquil, and experience no effect. Others cough, spit, feel slight pains, local or general heat, and have sweatings. Others again are agitated and tormented with convulsions. These convulsions are remarkable in regard to the number affected with them, to their duration and force. As soon as one begins to be convulsed, several others are affected. The commissioners have observed some of these convulsions last more than three hours. They are accompanied with expectorations of a muddy viscous water, brought away by violent efforts. Sometimes streaks of blood have been observed in this fluid. These convulsions are characterised by the precipitous, involuntary motion of all the limbs, and of the whole body; by the contraction of the throat—by the leaping motions of the hypochondria and the epigastrium—by the dimness and wandering of the eyes—by piercing shrieks, tears, sobbing, and immoderate laughter. They are preceded or followed by a state of langour or reverie, a kind of depression, and sometimes drowsiness. The smallest sudden noise occasions a shuddering; and it was remarked, that the change of measure in the airs played on the piano-forte had a great influence on the patients. A quicker motion, a livelier melody, agitated them more, and renewed the vivacity of their convulsions.

“Nothing is more astonishing than the spectacle of these convulsions. One who has not seen them can form no idea of them. The spectator is as much astonished at the profound repose of one portion of the patients as at the agitation of the rest—at the various

accidents which are repeated, and at the sympathies which are exhibited. Some of the patients may be seen devoting their attention exclusively to one another, rushing towards each other with open arms, smiling, soothing, and manifesting every symptom of attachment and affection. All are under the power of the magnetiser; it matters not in what state of drowsiness they may be, the sound of his voice—a look, a motion of his hand—brings them out of it. Among the patients in convulsions there are always observed a great many women, and very few men.”⁷²

These experiments lasted for about five months. They had hardly commenced, before Mesmer, alarmed at the loss both of fame and profit, determined to return to Paris. Some patients of rank and fortune, enthusiastic believers in his doctrine, had followed him to Spa. One of them named Bergasse, proposed to open a subscription for him, of one hundred shares, at one hundred louis each, on condition that he would disclose his secret to the subscribers, who were to be permitted to make whatever use they pleased of it. Mesmer readily embraced the proposal; and such was the infatuation, that the subscription was not only filled in a few days, but exceeded by no less a sum than one hundred and forty thousand francs.

With this fortune he returned to Paris, and recommenced his experiments, while the royal commission continued theirs. His admiring pupils, who had paid him so handsomely for his instructions, spread his fame over the country, and established in all the principal towns of France, “Societies of Harmony,” for trying experiments and curing all diseases by means of magnetism. Some of these societies were a scandal to morality, being joined by profligate men of depraved appetites, who took a disgusting delight in witnessing young girls in convulsions. Many of the pretended magnetisers were asserted at the time to be notorious libertines, who took that opportunity of gratifying their passions.

At last the commissioners published their report, which was drawn up by the illustrious and unfortunate Bailly. For clearness of reasoning and strict impartiality it has never been surpassed. After detailing the various experiments made, and their results, they came to the conclusion that the only proof advanced in support of animal magnetism was the effects it produced on the human body—that those effects could be produced without passes or other magnetic manipulations—that all these manipulations and passes and ceremonies never produce any effect at all if employed without the patient's knowledge; and that therefore imagination did, and animal magnetism did not, account for the phenomena.

This report was the ruin of Mesmer's reputation in France. He quitted Paris shortly after, with the three hundred and forty thousand francs which had been subscribed by his admirers, and retired to his own country, where he died in 1815, at the advanced age of eighty-one. But the seeds he had sown fructified of themselves, nourished and brought to maturity by the kindly warmth of popular credulity. Imitators sprang up in France, Germany, and England, more extravagant than their master, and claiming powers for the new science which its founder had never dreamt of. Among others, Cagliostro made good use of the delusion in extending his claims to be considered a master of the occult sciences. But he made no discoveries worthy to be compared to those of the Marquis de Puysegur and the Chevalier Barbarin, honest men, who began by deceiving themselves before they deceived others.

The Marquis de Puysegur, the owner of a considerable estate at Busancy, was one of those who had entered into the subscription for Mesmer. After that individual had quitted France, he retired to Busancy, with his brother, to try animal magnetism upon his tenants, and cure the country people of all manner of diseases. He was a man of great simplicity and much benevolence, and not only magnetised but fed the sick that flocked around him. In all the neighbourhood, and indeed within a circumference of twenty miles, he was looked upon as endowed with a power almost divine.

His great discovery, as he called it, was made by chance. One day he had magnetised his gardener; and observing him to fall into a deep sleep, it occurred to him that he would address a question to him, as he would have done to a natural somnambulist. He did so, and the man replied with much clearness and precision. M. de Puysegur was agreeably surprised: he continued his experiments, and found that, in this state of magnetic somnambulism, *the soul of the sleeper was enlarged, and brought into more intimate communion with all nature, and more especially with him, M. de Puysegur.* He found that all further manipulations were unnecessary; that, without speaking or making any sign, he could convey his will to the patient; that he could, in fact, converse with him, soul to soul, without the employment of any physical operation whatever!

Simultaneously with this marvellous discovery he made another, which reflects equal credit upon his understanding. Like Valentine Greatraks, he found it hard work to magnetise all that came—that he had not even time to take the repose and relaxation which were necessary for his health. In this emergency he hit upon a clever expedient. He had heard Mesmer say that he could magnetise bits of wood: why should he not be able to magnetise a whole tree? It was no sooner thought than done. There was a large elm on the village green at Busancy, under which the peasant girls used to dance on festive occasions, and the old men to sit, drinking their *vin du pays*, on the fine summer evenings. M. de Puysegur proceeded to this tree and magnetised it, by first touching it with his hands, and then retiring a few steps from it; all the while directing streams of the magnetic fluid from the branches toward the trunk, and from the trunk toward the root. This done, he caused circular seats to be erected round it, and cords suspended from it in all directions. When the patients had seated themselves, they twisted the cords round the diseased parts of their bodies, and held one another firmly by their thumbs to form a direct channel of communication for the passage of the fluid.

M. de Puysegur had now two “hobbies”—the man with the enlarged soul and the magnetic elm. The infatuation of himself and his patients cannot be better expressed than in his own words. Writing to his brother, on the 17th of May 1784, he says, “If you do not come, my dear friend, you will not see my extraordinary man, for his health is now almost quite restored. I continue to make use of the happy power for which I am indebted to M. Mesmer. Every day I bless his name; for I am very useful, and produce many salutary effects on all the sick poor in the neighbourhood. They flock around my tree; there were more than one hundred and thirty of them this morning. It is the best *baquet* possible; *not a leaf of it but communicates health!* all feel, more or less, the good effects of it. You will be delighted to see the charming picture of humanity which this presents. I have only one regret—it is, that I cannot touch all who come. But my magnetised man—my intelligence—sets me at ease. He teaches me what conduct I should adopt. According to him, it is not at all necessary that I should touch every one; a look, a gesture, even a wish, is sufficient. And it is one of the most ignorant peasants of the country that teaches me this! When he is in a crisis, I know of nothing more profound, more prudent, more clear-sighted (*clairvoyant*) than he is.”

In another letter, describing his first experiment with the magnetic tree, he says, “Yesterday evening I brought my first patient to it. As soon as I had put the cord round him he gazed at the tree; and, with an air of astonishment which I cannot describe, exclaimed, ‘What is it that I see there?’ His head then sunk down, and he fell into a perfect fit of somnambulism. At the end of an hour, I took him home to his house again, when I restored him to his senses. Several men and women came to tell him what he had been doing. He maintained it was not true; that, weak as he was, and scarcely able to walk, it would have been scarcely possible for him to have gone down stairs and walked to the tree. To-day I have repeated the experiment on him, and with the same success. I own to you that my head turns round with pleasure to think of the good I do. Madame

de Puysegur, the friends she has with her, my servants, and, in fact, all who are near me, feel an amazement, mingled with admiration, which cannot be described; but they do not experience the half of my sensations. Without my tree, which gives me rest, and which will give me still more, I should be in a state of agitation, inconsistent, I believe, with my health. I exist too much, if I may be allowed to use the expression.”

In another letter, he descants still more poetically upon his gardener with the enlarged soul. He says, “It is from this simple man, this tall and stout rustic, twenty-three years of age, enfeebled by disease, or rather by sorrow, and therefore the more predisposed to be affected by any great natural agent,—it is from this man, I repeat, that I derive instruction and knowledge. When in the magnetic state, he is no longer a peasant who can hardly utter a single sentence; he is a being, to describe whom I cannot find a name. I need not speak; *I have only to think before him, when he instantly understands and answers me.* Should any body come into the room, he sees him, if I desire it (but not else), and addresses him, and says what I wish to say; not indeed exactly as I dictate to him, but as truth requires. When he wants to add more than I deem it prudent strangers should hear, I stop the flow of his ideas, and of his conversation in the middle of a word, and give it quite a different turn!”

Among other persons attracted to Busancy by the report of these extraordinary occurrences was M. Cloquet, the Receiver of Finance. His appetite for the marvellous being somewhat insatiable, he readily believed all that was told him by M. de Puysegur. He also has left a record of what he saw, and what he credited, which throws a still clearer light upon the progress of the delusion.⁷³ He says that the patients he saw in the magnetic state had an appearance of deep sleep, during which all the physical faculties were suspended, to the advantage of the intellectual faculties. The eyes of the patients were closed, the sense of hearing was abolished; and they awoke only at the voice of their magnetiser. “If any one touched a patient during a crisis, or even the chair on which he was seated,” says M.

Cloquet, "it would cause him much pain and suffering, and throw him into convulsions. During the crisis, they possess an extraordinary and supernatural power, by which, on touching a patient presented to them, they can feel what part of his body is diseased, even by merely passing their hand over the clothes." Another singularity was, that these sleepers who could thus discover diseases, see into the interior of other men's stomachs, and point out remedies, remembered absolutely nothing after the magnetiser thought proper to disenchant them. The time that elapsed between their entering the crisis and their coming out of it was obliterated. Not only had the magnetiser the power of making himself heard by the somnambulists, but he could make them follow him by merely pointing his finger at them from a distance, though they had their eyes the whole time completely closed.
